Interior Settlements.—Space does not permit consideration of the various Jewish settlements and their date of establishment outside of the limits of the 13 colonies. The great majority of Jewish residents of the United States still reside along the eastern coast-line. In time, the westward movement carried Jewish settlers along with it, some into interior cities in the original 13 States, others farther west. By 1800 there were several Jewish residents at Pittsburg. Judah Touro (q.v.), the well-known Jewish philanthropist, went to New Orleans about 1801, and Jews were destined, during the latter half of the 19th century, to achieve considerable political distinction there, though probably there were some Jewish settlers in the Louisiana Territory nearly a century earlier, who were persecuted by reason of the prohibitions in the French "Code Noir" upon Jewish settlement. The first indisputable Jewish resident of Kentucky seems to have settled there about 1808. Ohio appears to have received its first Jewish residents about 1817-19, and after 1830 a considerable tide of German-Jewish immigration flowed toward Cincinnati. In Illinois, which has

to-day a considerable number of Jewish inhabitants (see above), especially in and about Chicago, the first Jewish settler probably arrived about 1841; and after a couple of years, numbers of German Jews began to come. A little later this same tide reached Detroit, Mich. Texas, while still belonging to Mexico, had quite a contingent of Jewish settlers, who began to arrive about 1821. California attracted a considerable number of Jews at the time of the gold discovery in 1849, and in 1850 they had two congregations in San Francisco. It will be observed that the great majority of Jews in the United States are to be found in the large cities.

The reactionary movement that followed the Napoleonic wars in Germany, early in the 19th century, and particularly the barbarous Jewish marriage laws of some of the German states (which, among numerous disabilities from which Jews suffered, were possibly the most objectionable, as they forbade more than a certain number of Jewish couples to live in any district), greatly stimulated German Jewish emigration to the United States from about 1815. After the revolutions of 1848 the political and economic unrest in Germany and throughout Europe caused a particularly valuable and intelligent class of Jewish immigrants to come to this country, including, in addition to Germans, also Hungarians, Poles, and Bohemians; while after 1881 the Russian-Jewish exodus assumed large dimensions, and the Rumanian-Jewish emigration began to be heavy about 1900. The volume of these tides can be gauged by comparing the estimates of Jewish population at various periods, already quoted, with these various dates. The forced emigration of recent years from Russia and Rumania has naturally had the effect of bringing to these shores persons less adequately equipped, and who had known fewer opportunities for development and self-improvement than the earlier immigrants, generally speaking, had enjoyed.

The Jews in American Commerce, Industries, and the Professions.—Reference has already been made to early Jewish activities in the field of commerce, exhibited in Brazil and the West Indies particularly. It is most important here to note the consequences which followed the dispersion of the Jews throughout so many different lands and districts, resulting in their opening of international and intercolonial trade relations with each other long before those having no such ties of relationship or confidence, and no such common language or commercial abilities, were ready for any such mutual intercourse. The result was that in early colonial days Jews were pioneers and prime promoters of intercolonial and foreign commerce in America, which became not merely profitable, but actually indispensable, for the maintenance of the colonies. The most distant points thus became interlinked by means of their Jewish residents. Every industry and branch of trade engaged their attention. Among persons who were particularly prominent in these fields, besides Lopez, Rivera and Touro, already referred to, were Lewis Gomez and his sons, who were exporters of wheat on a very large scale in colonial New York, early in the 18th century; Hayman Levy, the fur-dealer of New York, who had close relations with the

JEWS IN AMERICA

American Indians, and was at one time the employer of the first John Jacob Astor; David Gradiis of Bordeaux, who is described as having "controlled the trade of France with the West Indies," in the 18th century, etc. Aaron Lopez of Newport had a fleet of over 30 vessels shortly before the Revolution, engaged in trade between Newport, the West Indies, and Africa. Newport Jews also created the spermaceti industry. Jews were among the founders of the New York Chamber of Commerce, and one figures on its seal as a member of the committee receiving its charter from the colonial governor. They were also among the founders of the New York Stock Exchange, and ever since that time have been growing in importance in America as bankers, brokers, financiers, and railroad magnates. They have been particularly influential in certain lines of trade, including the cotton, tobacco, sugar, coffee, jewelry, leather, hides, meat-packing, and clothing industries, and department-store activities.

The Jews of America have produced distinguished inventors, lawyers, physicians, rabbis, journalists, scientists, artists, dramatists, and professors, filling chairs at all the leading universities, far in excess of the proportional number of their race in the population of the country. On the other hand, the large immigration of unskilled laborers into the United States has led to the employment of thousands of Jews here in every industrial pursuit, frequently at very low wages and under unfavorable conditions.

Jews in the Army, Navy, and Public Service Generally.—Prior to the American Revolution there were Jews serving in the militia and in the colonial wars. During the Revolutionary War, their numbers on the army rolls far exceeded their ratio to the total population, and a number achieved distinction above the ranks. The New York Jewish congregation concluded, by a decisive majority vote, to disband, rather than to sacrifice patriotism on the altar of religion, and many of its members fled to Philadelphia, just prior to the British occupancy of New York. In the South a corps of volunteer infantry, known as Captain Lushington's company, composed principally of Jews, was organized in Charleston in 1779, and fought in the patriot ranks. A number of Jews had figured as signers to the Non-Importation Agreement of 1765. Among those on the Revolutionary rolls who achieved military distinction are Col. Solomon Bush; Col. David S. Franks, aide-de-camp to Gen. Arnold before the latter's treason, and who was the bearer of the signed definitive treaty of peace, sent abroad by Congress for delivery there; Isaac Franks, who became colonel of Pennsylvania's volunteers soon after the Revolution, after having served long during the war in the ranks; Capt. Jacob de la Motta; Maj. Nones; Lieut. Seixas; and Deputy Commissary-General of Issues Sheftall, of Georgia. During our War of 1812 and the Mexican War many Jews served in the ranks, and occasionally as holders of important military positions; while during the Civil War the number of Jewish soldiers in the field far exceeded their ratio to the whole population of the country, and they held military positions from brigadier-general down. Hon. Simon Wolf, in his work, *'The American Jew as Patriot, Soldier and Citizen,'*

has, by means of enormous labor and investigation, collected available names and records of Jewish soldiers in the Federal army and navy, in which he reports that during the Civil War, no fewer than 7,884 Jews served, and even these numbers are necessarily incomplete. As the Jews were Union men in the North, so those living in the South generally espoused the cause of the Confederacy; but Mr. Wolf's figures include less than 2,000 Confederate Jewish soldiers. The number included by him as serving in the Union and Confederate navies is almost negligible. A similar list of Jews who served during the Spanish-American War has been compiled (*American Jewish Year Book 1900-01*, pp. 527-622), and includes thousands of names, again exceeding the relative ratio based on that of the total number of persons serving to the total population; and President Roosevelt, years later, felt called upon to compliment them publicly upon their bravery, as indicated by instances of Jews who served under him and were commended for gallantry. Neither have Jews failed to enlist in our navy, for since the latter was instituted, a number of Jews have notably risen from the files to naval distinction, as witness the careers of Capt. Etting, Maj. David M. Cohen of the United States Marine Corps, Capt. Levi M. Harby, Capt. Jonas P. Levy, and "Commodore" Uriah P. Levy, who at the time of his death in 1862 was the ranking officer in the United States navy. Nor have Jews failed to render the government signal services in private life. Haym Salomon, the associate of Robert Morris and Madison, was broker to the Office of Finance, and it was through his hands that the loans from France and Holland to the infant republic passed; he made heavy advances to the government, which at the time of his death was indebted to him in hundreds of thousands of dollars, which have never been repaid, in spite of repeated Congressional reports in favor of the claim. During the Revolutionary period, there were still others who aided the government's hazardous financial fortunes. Among the most distinguished Jewish patriots of the Revolution stands Francis Salvador, who was a member of the South Carolina Provincial Congress and of the General Assembly of that State. On the other hand there were, naturally enough, also a few Tories among the Jews, chief among whom were David Franks of Philadelphia, who had been British commissary-general, during the French and Indian war, together with his father, Jacob Franks. David Franks' daughter, Rebecca Franks, was one of the leading belles and wits of Philadelphia and New York during the Revolution. A number of Jews have served in Congress, both in the Senate and the House of Representatives, the most prominent among them having been Judah P. Benjamin (q.v.), who resigned his seat in the Senate to become attorney-general, secretary of war, and then secretary of state of the Confederate States, and subsequently became leader of the English bar. Several Jews have been U. S. ministers to Turkey and consuls-general, one of the former, Oscar S. Straus, now being a member of the Permanent Court of Arbitration at The Hague. Many have been judges in different States, and several have been attorneys-general of their States. A number have been mayors of leading cities, while many others have held local and

JEW'S HARP — JHELAM

State offices. Among those who rendered our government most valuable services in trying financial times are J. & W. Seligman & Co. Several Jews, particularly Moritz Pinner, David Einhorn, and M. Heilprin, were active workers for individual liberty in the anti-slavery movement.

Charities and Other Institutions.—The Jewish charities of the United States are unequalled in magnitude and efficiency, compared with the total Jewish population. Naturally enough, the enormous exodus of well-nigh indigent Jews to these shores has greatly increased the burden falling on their more fortunate coreligionists. The amounts disbursed by the organized Jewish charities in New York city alone exceeds \$1,000,000 per annum. Almost every possible field of charitable endeavor is attended to. New York city, for example, contains three Jewish hospitals, a home for incurables, two Jewish orphan asylums, two Hebrew technical schools, an educational alliance, a home for aged and infirm, and an organization of United Hebrew Charities for direct relief; and these are but a few out of scores of charitable societies and institutions. The pure milk depots opened by Nathan Straus, at a heavy loss to himself, in New York—an example which has been followed in other cities—is one of the most effective forms of charitable endeavor, and has saved thousands of infant lives. Various Jews of the United States have contributed hundreds of thousands of dollars at a time in individual instances to charitable purposes, best known among whom Mr. Jacob H. Schiff of New York, who is credited with observance of the old Jewish practice of giving a tithe of his income to charity. The arbitration movement for settling controversies between capital and labor, known as the Civic Federation, has enlisted several Jews in its directorate. The Jewish charities of the United States are being systematized and organized more and more from year to year; aid is being afforded by the newly instituted annual national conferences of Jewish Charities, and under their auspices, removal offices have been opened within the United States to aid indigent immigrants after arrival, to seek locations for them in the interior of the country, and thus somewhat relieve the congestion of the large Eastern cities. Of course all the local New York charities deal particularly with recent arrivals, but the Baron de Hirsch Fund and the Educational Alliance especially address their efforts toward them.

A number of very large mutual benefit and mutual development societies, taking the form of fraternities of Jewish lodges, exist within the United States and do much good, chief among them being the Independent Order B'nai Brith, the Independent Order Free Sons of Israel, and the Independent Order Sons of Benjamin. The recently organized Zionist movement has appealed greatly to many thousands of Jews in America, particularly to the more orthodox, and they have organized numerous societies to aid in establishing a Jewish state, in Palestine or elsewhere, for the benefit of the persecuted Jews of eastern Europe.

Cor. Sec. American Jewish Historical Society.

Jew's Harp, a small musical instrument held between the lips, the sound coming from the vibrations of a tongue of metal, bent at a right angle, which is set in motion by being twirled with the fore-finger. The sound is increased in intensity by the breath, and altered in pitch by the shape of the cavity of the mouth, which acts as a reflector. The name some derive from *jeu*, play, from the fact of its being a toy; but more probably it is a derisive allusion to the harp of David.

Jew's Mallow, a pot-herb. See CORCHORUS.

Jex-Blake, Sophia, English physician: b. Sussex January 1840. She was the daughter of a physician, studied medicine in Boston, Mass., 1866-8, and returning to England matriculated at the University of Edinburgh, but was not allowed to complete her studies there and take the degree of M.D., which she subsequently obtained at the University of Bern. She founded the London School of Medicine for Women, the Edinburgh School of Medicine for Women in 1886, and retired from active practice in 1899. She has published 'American Schools and Colleges' (1866); 'Medical Women' (1872); 'Puerperal Fever' (1877); 'The Care of Infants' (1884).

Jez'ebel, the Phoenician wife of Ahab, king of Israel. She was the evil genius of her husband, favored the idolatrous worship of Baal in Palestine, and persecuted the prophets of Jehovah. Her name left a dark stain upon the annals of Israel and survived to the later dispensation where it occurs in the Book of Revelations (Rev. xi., 20) as a symbol of feminine depravity and impiety.

Jhelam, jē'lām, or **Jhelum** (ancient Hydaspes), a river which has its rise in Kashmir. An octagonal tank has been built in a garden at Vernag, and into this reservoir flow springs

JIG—JOACHIM

from the Western Himalayas, which form the head waters of the Jhelam. The river flows northwest to the Wular Lake, about 10 miles from Srinagar; then southwest and northwest, forming a curve from Wular Lake through Barambula Pass to Mazufurabad, where it turns south, and flows along the boundary between Punjab and Kashmir, a distance of about 100 miles. Leaving the boundary line at Jhelam it flows southwest into the Chenab River. Its whole course is about 500 miles, nearly all of which it is navigable. The first part of its course is through remarkable mountain scenery and the last through a rich agricultural region. It is the thoroughfare for a number of large cities and small towns. This is the river upon the banks of which Alexander the Great built a war fleet in 326 B.C. and fought a battle with Porus.

Jig, a light quick tune or air to be found in the sonatas of Corelli, Handel, and other composers till toward the middle of the 18th century. The Irish jig, played to a dance also called a jig, is a lively tune of two or three sections written in 6-8 time. The jig is popular among many nations, is distinguished by various titles, and has a certain amount of difference in the steps according to the habits and customs of the people by whom it is adopted. With some it is a sober, steady country dance; with others it is a wild, savage exercise, without point or meaning. With some it is made a means of displaying the agility of the lower limbs of a combined company of dancers; with others it is a terpsichorean drama for two performers, in which all the emotions excited by love are represented by gestures and cries.

Jig'ger, the corrupt current form of "chigoe," the South American name of a small arachnid, or red bug (*Sarcopsylla penetrans*), which abounds in tropical America, and is troublesome by working its way under the skin, especially of the feet, where, unless speedily removed, it produces eggs and forms a bad sore.

Jihad, ji-häd', **Jehad**, or **Tihad** (Arab. "zeal, endeavor") the term applied to the religious war, as undertaken by Mohammedans against those who did not believe in the mission of the Prophet, for the purpose of promoting the spread of Islam. The Jihad was a religious duty, imposed upon the faithful both by the Koran and the concurrence of sacred tradition. Its purpose was ostensibly the Mohammedanization of the unbelieving, and it was carried on in a systematic manner. The disposition of the peoples conquered in the Jihad was prescribed by law. Captives and others who fell into the hands of the Mohammedan hosts had the choice of three things given them. Either they were to deny their own faith and accept that of Islam, or to consent to pay a poll tax to their conquerors. If they refused both of these alternatives they were put to death by the sword. Consult: Baillie, 'Of Jihad in Mohammedan Law' (1871); T. T. Hughes, 'Dictionary of Islam' (1886).

Jihson. See **Oxus**.

Jim'son-weed. See **DATURA**.

Jingal, jing'gäl, a large heavy musket used in eastern Asia, especially by the Chinese. It is fired on a rest, or swivel, from a wall, or the bulwark of a boat or ship.

Jingo, a word first used as a political term in the Russo-Turkish War of 1877-8, and was applied to a class of British politicians who continually urged on Disraeli, then the prime minister, the necessity of taking sides with the Turks. The word was adopted from "McDermott's War Song"—that is, the song sung in music halls by McDermott and very popular at the time. The chorus ran thus:

We don't want to fight, but, by Jingo! if we do,
We've got the ships, we've got the men, we've got the money, too.

Since the Spanish-American War, and the conquest of the Philippines, the word has been used in the United States as meaning one who advocates a spirited and aggressive foreign policy.

Jinn, jin, in Mohammedan mythology, a race of genii, angels, or demons, fabled to have been created several thousand years before Adam. They are not immortal; they are to survive mankind, but to die before the general resurrection. Some are good and obedient to the will of God; others are disobedient and malignant. They can assume the shape of lower animals, and are visible or invisible as they please. Their chief residence is the mountain Kâf in Arabia. The jinn are frequently introduced in the 'Arabian Nights,' and one of Victor Hugo's most effective poems is entitled 'Les Djinns.'

Jinrikisha, jin-rík'ishä ("man-power vehicle"), a two-wheeled carriage, resembling a gig, and drawn by a human runner between the shafts, universally used in Japan since 1868.

Joab, jo'äb, the son of King David's sister Zeruiah, and commander-in-chief of David's army. He is first mentioned as the leader of David's men in an expedition against Abner. When Joab treacherously murdered Abner in revenge for the death of Asahel, David dared not punish the deed, and thus showed the ascendancy which Joab had acquired over him. After David had been established king in Jerusalem, Joab conducted all his wars with uniform success. He remained faithful to him during the rebellion of Absalom. When he had slain that ungrateful son, David made a weak attempt to supersede him in favor of Amasa, the general of Absalom. Joab slew Amasa and resumed his post, a proceeding in which the king tacitly acquiesced. He further supported David by assisting in the murder of Uriah the Hittite. Toward the close of David's reign he joined in the rebellion of Adonijah, for which Solomon, by the advice of David, put him to death. He was an able leader and astute statesman, and when his own ambition did not interfere gave many proofs of steadfastness and moderation.

Joachim, yo'ä-Him, **Joseph**, Hungarian violinist: b. Kittsee, near Presburg, 28 June 1831. He studied under Szervaczinsky, the opera concert-meister at Budapest, with Böhm at Vienna, and Hauptmann at the Vienna Conservatory, and after appearances in concert, continued his studies at Leipsic. In 1849 he became concert-meister of the Weimar grand-ducal orchestra, of which Liszt was then conductor, in 1854-66 was solo-violinist and conductor of concerts to the king of Hanover, and in 1868 became director of the Hochschule für ausübende Tonkunst at Berlin. He became known, both

JOACHIM—JOB'S TEARS

as an interpreter of the best music and as an executant, as the greatest violinist of his time, and particularly as a quartette player gained an almost classic reputation. His compositions include the 'Hungarian Concerto' in D-minor for violin and orchestra, his most important work; ballads, trios, overtures, marches, and works for violin and pianoforte.

Joachim, jō'a-kim, Saint, Order of, an order of knighthood founded 20 June 1755, under the title "Order of Jonathan for the purpose of defending the honor of Divine Providence." It consisted of 14 dukes, princes, counts and nobles, and its grandmaster was Prince Franz Christian of Saxe-Coburg. Its object was by the establishment of commanderies to stir up the rich to philanthropic work among the lower classes. This order was still in existence in 1820, but it has since then been dissolved.

Joan (jo-ān or jōn) of Arc (JEANNE D'ARC—properly DARC), the Maid of Orleans, heroine in French history: b. Domrémy, Basse Lorraine, now department of the Vosges, 6 Jan. 1412; d. Rouen 30 May 1431. While she was still a girl she began to be deeply affected by the woes of her country, much of which was conquered by the English and their Burgundian allies, leaving only a small portion to the French king, Charles VII. From about 13 she declared she heard heavenly voices, which at last became very definite in their commands to go to the aid of Charles and liberate France. At first she was regarded as insane, but eventually she found her way to the king and his councilors, and having persuaded them of her sincerity, received permission to hasten with Dunois to the deliverance of Orleans. In a male dress, fully armed, she bore the sword and the sacred banner, as the signal of victory, at the head of the army. The first enterprise was successful. With 10,000 men she marched from Blois, and on 29 April 1429 reached Orleans with supplies. By bold sallies, to which she animated the besieged, the English were forced from their intrenchments, and Suffolk abandoned the siege (8 May 1429). Other successes followed; Charles entered Rheims in triumph; and at the anointing and coronation of the king, 17 July, Joan stood at his side. She then asked to be allowed to return home, but at the urgent request of King Charles, remained with the army. She was later less successful and failed to capture Paris. On 24 May 1430 she entered Compiègne, then besieged by the Burgundians, and on the same day, in a sally from the town, was taken prisoner. Subsequently she was delivered to the English, who, with the University of Paris and the bishop of Beauvais, demanded her execution as a sorceress. She was taken to Rouen, and after a long mock-trial, accompanied with many shameful circumstances, condemned to death. On submitting to the church, however, and declaring her revelations to be the work of Satan, her punishment was commuted to perpetual imprisonment. But pretexts were soon found to treat her as a relapsed criminal, and as such she was burned at Rouen, and her ashes were thrown into the Seine. She died with undaunted fortitude. Her recantation is now doubted by some historians. Voltaire, in a notorious burlesque, 'La Pucelle,' Southe, Schiller, and others have made her the subject of their verse. Schiller's drama, 'Die Jungfrau von Orleans,' still remains the worthiest monu-

ment of her fame. A revision of the trial was later had, and she was declared innocent (1456). From 1875 the question of her canonization was discussed at Rome, and in 1902 she had been pronounced "venerable." Consult: Quicherat, 'Condamnation et Rehabilitation de Jeanne Darc' (1841-9); Marin, 'Jeanne Darc, Tacticien et Stratégiste' (1891); Oliphant, 'Jeanne d'Arc' (1896); Murray, 'Jeanne d'Arc' (1902).

Joan of Arc, Personal Recollections of, a historical novel by "Mark Twain" (S. L. Clemens), published in 1896. It professes to be a translation by Jean François Alden from the ancient French of the original unpublished MS. in the national archives of France, written by the Sieur Louis de Conte, her page and secretary. The historical facts are closely followed.

Job, jōb, Book of, title of a book in the Old Testament, so called from the man whose history it relates. It cannot be ascertained with certainty when the book was produced. Job himself belongs to the patriarchal age, but the book was written at a period when great calamities had fallen upon the people of God, and they had been driven by bitter experience to consider the nature and object of His providential workings. It is probably later than Jeremiah (626 B.C.) or Habakkuk (604 B.C.), both of whom had paid some attention to this problem.

The prologue (ch. i. ii.) is written in prose. Satan is permitted to test Job's trust in God, and the patriarch is suddenly stripped of his possessions and bereaved of his children. Yet Job ascribes no wrong to God. He himself is smitten with deadly leprosy. Job's three friends came to see him and he bursts into a despairing cry for death.

The debate between Job and his three friends (ch. iv.-xxxii.) is written in poetry. These friends attribute Job's affliction to his sin and hypocrisy. They are answered by Job's self-vindication; he adjures God to reveal the cause of his chastisement. In the speech of Elihu, a youth, who has listened to the debate, the goodness of God is asserted. He afflicts men to deter them from sin.

Then the Lord speaks out of the whirlwind (ch. xxxviii.-xlii. 6) and shows his power as Creator and Preserver of all things in the material world. Job answers, "I have heard of Thee with the hearing of the ear, but now mine eyes see Thee." The epilogue is in prose. Job is restored to health and prosperity.

The meaning of the book seems to be, that suffering or calamity is not a proof of guilt in the sufferers; the ways of God are so high, His power so vast in creation, in the government of nations and in the realm of mind, that man is incapable of gauging His methods of overruling human life.

Job's Tears, a stout grass (*Coix lachryma-jobi*), allied to maize, and which is sometimes seen six or eight feet in height. It is a native of southern Asia, is naturalized in Spain, and in other countries is sometimes grown in hot-houses. The hard, round, shining seed-capsules, from whose fanciful resemblance to tears the plant derives its name, are used in making rosaries and ornamental articles, as medicine by the Chinese, and as a staple food among some of

JOCELYN — JOHANNESBURG

the hill-tribes of northern India. See also, GRASSES IN THE UNITED STATES.

Jocelyn, jōs'ē-lin, Ada Maria Jenyns, English novelist: b. Aldershot, Hampshire, 7 Sept. 1860. She was married to Colonel R. J. O. Jocelyn in 1892. Among her numerous fictions may be mentioned 'A Distracting Guest' (1889); 'Only a Horse Dealer' (1892); 'Pamela's Honeymoon' (1894); 'Lady Mary's Experiences' (1897); 'The Seat of Fortune' (1901).

Jocelyn, Nathaniel, American portrait painter: b. New Haven, Conn., 31 Jan. 1796; d. there 13 Jan. 1881. At 18 he was apprenticed to an engraver, but after three years his early love for painting asserted itself and he established himself as a portrait painter at New Haven in 1820. He was for some time resident in Savannah, where he painted many portraits, but returned to his native town where his work was very popular and where from 1825 to 1835 he painted the portraits of many notables, not a few of which are preserved in Alumni Hall at Yale. His fame extended beyond the limits of his State and he exhibited at the Academy of Design on several occasions. At the age of 80 he painted 'Ocean Breezes,' a successful work of fancy, and his only one. His portraits have been greatly prized by critics. Jocelyn was a staunch anti-slavery man, and his home in New Haven was long one of the stations on the Underground Railroad. He was for many years the senior partner of a bank-note engraving company in New York which subsequently became the American Bank Note Company, resigning from the latter in 1867.

Joe Miller, the name attached to a well known collection of jests, first published in 1739. The name belonged to a comic actor, Joseph Miller (1684-1738), who had then a great reputation as a wit and humorist. The real compiler, however, was a certain John Mottley, an obscure author (1692-1750). The term is now often applied to any stale or worn out jest.

Joe Pye Weed. See EUPATORIUM.

Joel, jō'ēl, one of the minor prophets. He most probably flourished about 770 B.C., a few years before Amos and Hosea, whose writings have many correspondences with his. Joel's prophecy is full of Oriental symbolism, and is pervaded by a tone of solemn warning. He announces what he calls "a day of Jehovah," that is, a day of judgment and vengeance for Judah and Jerusalem. This is typified by a plague of locusts whose devastations are vividly described. The prophet appeals to the people to meet the impending judgment by prayer and fasting. Jehovah himself is represented as giving his answer to the cry for help; relief from famine, abundant rain, rich harvests are to bring relief. Moreover a new spirit is to be poured out upon the people so that in the day of trial they shall call upon God and be saved. The people of Jehovah sold into captivity by Phoenicians and Philistines are to be restored. The nations are to be called to judgment, and in that fearful day Jerusalem shall find refuge in Jehovah. The style of the prophet is gorgeous in its profusion of imagery; metaphor and hyperbole have to be interpreted, and fact discerned amid the maze of fancy. Yet the lan-

guage is smooth and flowing without the strain and abruptness of Hosea and Jeremiah, and we are compelled to look upon Joel as a man of calm and settled mind, without any of the doubts and struggles that racked the minds of other Hebrew poets and prophets.

Jogues, zhōg, Isaac, French missionary among the North American Indians: b. Orleans 10 Jan. 1607; d. Ossernenon, near the present Awnesville, Montgomery County, N.Y., 18 Oct. 1646. He became a Jesuit at Rouen in 1624, and, after some years passed in study and teaching, was ordained in 1636. At his own request he was immediately sent to the Huron mission in Canada. In 1639 he undertook a mission to the Tobacco Nation, in 1641 preached to the Algonquins at Sault Sainte Marie, not long after went to Three Rivers for supplies for the Huron Mission, and upon his return was captured by the Mohawks and severely tortured. He remained among the Indians as a slave, until the summer of 1643, when he made his escape to the Dutch settlement of Rensselaerswyck (Albany), and was conveyed thence to New Amsterdam. He finally reached France, where he was treated with great consideration, and invited to court. Returning to Canada, he traveled to the Mohawk country in May 1646, in the capacity of an ambassador to conclude a treaty between that people and the French. Ascending the Sorel, he passed through Lake Champlain and Lake George, which he named Lac Saint Sacrement. Having ratified the peace he returned to Quebec, and after a few days rest set out for the Mohawks again, this time as the founder of the Mission of the Martyrs. He was soon tortured as a sorcerer, and finally killed. Consult: Martin, trans. by Shea, 'Father Isaac Jogues' (1896); Parkman, 'The Jesuits in North America' (new ed. 1898).

Johannesburg, yō-hän'nēs-boorg or jō-hän'nēs-berg, South Africa, the metropolis of the Transvaal Colony, situated 5,500 feet above the sea, about 30 miles southwest of Pretoria, with which and with Delagoa Bay 397 miles, Durban 483 miles, East London 668 miles, Port Elizabeth 715 miles, and Cape Town 1,015 miles, it is in railway communication. It is the recognized business centre of the rich gold fields of the Witwatersrand, and the largest town in the Transvaal. In 1886 it was represented by a few shanties, but the discovery of gold and the development of gold mining made it within a comparatively few years one of the most important towns of South Africa. Municipal government was conferred upon the city by the Transvaal authorities in 1896, when the population within a three-mile radius was 102,078, of whom 50,907 were whites, 67 per cent of these being of British origin, while the Boer citizens numbered 6,205. The great Uitlander agitation which culminated in the Transvaal war 1899-1902, centred in Johannesburg, which was occupied by Lord Roberts in 1900. Since the close of the war, important public improvements to cost \$30,000,000 have been begun. These include many miles of well-paved streets, an elaborate electric car system, new waterworks, sanitation system, a factory section, and handsome suburbs. Mementoes of the former Boer rule are an imposing but dismantled

JOHN

fortress which dominates the town, and the monument near Krugersdorp which commemorates the declaration of Boer independence in 1880. Among the notable buildings and institutions are: many fine hotels, clubs, etc.; a handsome railway station lighted by electricity; the market buildings, in the large Market Square, where also are the post and telegraph offices and the buildings of the chamber of mines; the fine public library building; the stock exchange; the court-house; many churches; a synagogue; a good hospital; a jail and a police barracks, and a new theatre and opera house. The town is lighted partly by gas but mainly by electricity.

In 1903 there were 160 incorporated mining companies employing 40,000 natives. Prior to the war 96,000 natives were working in the mines; 124 of the mining claims are located on the main reef and the others in the neighborhood of Klerksdorp. Prior to the war the gold production was valued at \$7,000,000 a month, and the machinery employed was estimated at \$100,000,000. The industry is fast recovering itself, and it is estimated that within a few years the annual production of gold will be equal to \$121,500,000. The international peace exhibition of South Africa, to be held at Johannesburg 1904-5, is expected to fully rehabilitate commercial interests, and it is predicted that within six years Johannesburg will have a population of 200,000.

John, the name of 23 popes, as follows:

John I., Saint: b. Tuscany; d. 526. He succeeded Hormisdas in 523, and was a friend of Boethius, who dedicated to him several of his works. Theodoric sent him to Constantinople, to induce the Emperor Justin to adopt milder measures toward the Arians. Though received with uncommon pomp, his mission was fruitless, and on his return Theodoric threw him and his companions into prison, where he died. He is commemorated by the Roman Catholic Church 27 May.

John II. (MERCURIUS, mér-kū'ri-üs): d. Rome 27 May 535. He was a Roman and was surnamed Mercurius by reason of his eloquence. He became pope in 532.

John III.: d. Rome 12 July, 572. He was a Roman and became pope in July 560. During his time the Lombards frequently ravaged Italy.

John IV.: b. Salona in Dalmatia; d. Rome 11 Oct. 642. He was elevated to the papal chair in December 640 and was noted for zeal and orthodoxy. He formally condemned the Monothelite statement of faith which Sergius had drawn up at the desire of the Emperor Heraclius.

John V.: b. Antioch, Syria; d. Rome 2 Aug. 686. He was the earliest of several pontiffs of Oriental origin and had been sent to the sixth General Council by Pope Agatho as legate. He became pope, 24 July 685.

John VI., he was a Greek by birth; d. Rome 9 Jan. 705. He became pope in 701, and when appealed to with reference to the long dispute between Saint Wilfred of York and the archiepiscopal see of Canterbury, decided in favor of the latter.

John VII., a Greek: d. Rome 17 Oct. 707. He became pope 1 March 705.

John VIII., a Roman: d. Rome 15 Dec. 882. He became pope in 872. The Saracens during his pontificate pushed their ravages to the gates of Rome, and he was compelled in 877 to pay them tribute. He crowned three emperors, Charles the Bald, 875; Louis the Stammerer, 878; and Charles the Fat, 881. He attempted, but unsuccessfully, to unite the Greek and Latin churches.

John IX.: b. Tibur; d. May 900. He belonged to the Benedictine order and became pope, as the choice of the Frankish party, in June 898.

John X.: b. Romagna; d. July 929. He was a man of great ability and of virtuous character notwithstanding the aspersions Liutprand casts upon him. He was archbishop of Ravenna in 905 and became pope in 914. He placed himself at the head of an army and drove the Saracens from Italy, but his determination to rule independently of any faction aroused the anger of his opponents and he was imprisoned, and at length murdered, by Theodora's daughter, Marozia, whose ambitions he had thwarted.

John XI.: b. 906; d. 936. He was the son of Marozia (q.v.) and Guy, duke of Spoleto. He was elected pope while under age in 931, and governed through the influence of his mother. His brother Alberic II. revolted and imprisoned the pope and his mother in the castle of San Angelo, where John died.

John XII. (OCTAVIAN): d. Rome 14 May 964. He was the son of Alberic and grandson of Marozia. He became pope in 956, after the death of Agapetus II., though only 18, and was the first pope who changed his name on accession to the papal dignity. He applied to the emperor Otho I. for assistance against Berengarius II., crowned the emperor 962, and swore allegiance to him, but soon after revolted against Otho, who caused him to be deposed by a council, in 963, and Leo VIII. to be elected. On Otho's death, in 964, John returned and excommunicated his rival.

John XIII., a Roman: d. Rome 6 Sept. 972. He was bishop of Narni, was made pope in 965 by the influence of the emperor Otho I., and was expelled by the Roman nobles. Otho II. restored him to Rome, and was crowned by him. The Poles and Hungarians were converted during his pontificate.

John XIV. (PETER): b. Pavia; d. Rome 20 Aug. 984. He was bishop of Pavia and had been chancellor to Otho II. who made him pope in November 983, in place of the anti-pope Boniface VII. The latter had seized the papacy after the death of Otho I. Boniface now returned from Constantinople and imprisoned John in the castle of San Angelo, where he died soon after.

John XV.: d. Rome April 996. He did not reach the blood-stained throne of his predecessor. He died within the month of his election, even before his consecration.

John XVI. (PHILAG'ATHUS), a Greek of Calabria: d. 996. He became pope in 986. He solemnly canonized St. Udalric, bishop of

JOHN

Augsburg. This is the first historical mention we find of a solemn pontifical canonization.

John XVII. (*Sic'co*): b. Ripa Jani; d. Rome 7 Dec. 1003. An anti-pope intruded during the pontificate of Gregory V.

John XVIII. (*Phasianus*, *fa-sē-ā'nūs*). He became pope on Christmas Day 1003, and in May 1009, resigned his office and entered a monastery.

John XIX., a Roman: d. January 1033. He succeeded his brother Benedict VIII. He was disposed to concede the title Ecumenical to the Patriarch of Constantinople, but this met with so much opposition from the Latin Church that he was obliged to withdraw the concession.

John XX., frequently called **John XXI.** (*Pedro*, *pā'drō*): b. Lisbon, Portugal; d. Viterbo, Italy, 20 May 1277. He became in 1273 cardinal-bishop of Frascati and pope in September 1276. He was learned in philosophy and medicine and wrote several treatises still of interest as showing the status of mediæval medicine.

John XXI. See **JOHN XX.**

John XXII. (*Jacques D'Euse*, *zhāk dēs*): b. Cahors about 1244; d. Avignon 4 Dec. 1334. He was archbishop of Avignon, and was elected pope at Lyons 1316, after the death of Clement V. He resided at Avignon, but had many adherents in Italy. He is important in German history on account of the active part he took in the disputes of the emperors Louis of Bavaria and Frederick of Austria. Louis intruded the anti-pope Nicholas V. and declared John XXII. deposed. Several theological controversies filled his pontificate with ecclesiastical strife, the most notable being the question of absolute Evangelical poverty raised by the Franciscans and that of nominalism led by William Ockam. He published in 1317 the 'Constitutions of Clement V.', a manual of canon law, since known by the title 'Clementines' (q.v.). He was also the author of the decretals called 'Extravagantes.' See **CANON LAW**.

John XXIII. (*Baldassare Cossa*, *bāl-dā-sā'rā kōs'sā*): b. Naples; d. Florence 22 Dec. 1419. He was elected pope in 1410, by the Council of Pisa, after the death of Alexander V., on condition that, if Gregory XII. and Benedict XIII. would resign, he would also retire to end the schism. He summoned the Council of Constance, demanded by the Emperor Sigismund, in 1415, where he confirmed his resignation 2 March; but 20 March he fled secretly from Constance to Schaffhausen, and revoked his resignation. He was cited before the council, but not appearing, he was suspended, and finally deposed. He was imprisoned four years. Pope Martin V. subsequently pardoned him and made him cardinal bishop of Tuscoli, and dean of the college of cardinals.

John, king of England: b. Oxford 24 Dec. 1166; d. Newark, Nottinghamshire, 19 Oct. 1216. He was the youngest son of Henry II., by Eleanor of Aquitaine. Being left without any particular provision he received the name of *Sans Terre* or Lackland; but his brother, Richard I., on his accession conferred large possessions on him. He obtained the crown on the death of Richard in 1199, although the

French provinces of Anjou, Touraine, and Maine declared for his nephew, Arthur of Brittany, who was lineally the rightful heir, then with the king of France. A war ensued, in which John recovered the revolted provinces and received homage from Arthur. In 1201 disturbances again broke out in France, and Arthur, who had joined the malcontents, was captured and confined in the castle of Rouen, and never heard of more. John was universally suspected of his nephew's death, and in the war which followed, he lost Normandy, Anjou, Maine, and Touraine. In 1205 his quarrel with the pope began regarding the election to the see of Canterbury, to which the pope had nominated Stephen Langton. The result was that Innocent III. laid the whole kingdom under an interdict, and 1211 issued a bull deposing John. Thereupon John made abject submission to the pope, even agreeing to hold his kingdom as a vassal of the pope (1213). His arbitrary proceedings led to a rising of his nobles, and he was compelled to sign the Magna Charta or Great Charter 15 June 1215. But he did not mean to keep the agreement, and obtaining a bull from the pope annulling the charter, raised an army of mercenaries and commenced war. The barons, in despair, offered the crown of England to the dauphin Louis, who accordingly landed at Sandwich 30 May 1216, and was received as lawful sovereign. The issue was still doubtful when John died. Consult: Stubbs, 'Constitutional History of England,' Vol. I.; Norgate, 'England under the Angevin Kings' (1887), and 'John Lackland' (1902).

John II., king of France, surnamed the "Good": b. about 1319; d. London 8 April 1364. He was the son of Philip VI. and was a monarch distinguished alike for his incapacity and his misfortunes. In 1356 he was defeated and taken prisoner by the Black Prince at the battle of Poitiers, and detained at Bordeaux and at London till released at a heavy expense to his country by the Peace of Brétigny in 1360. On learning that his son, the duke of Anjou, who had been left as a hostage in England, had effected his escape, he returned to London, where he died.

John III. (*Sobieski*), king of Poland: b. Olesko, Galicia, 2 June 1624; d. 17 June 1696. John Casimir appointed him standard-bearer to the crown, and he distinguished himself in the war against the Russians and Swedes, which terminated with the Peace of Oliva in 1660. In 1669 Michael Koribut was chosen king on the resignation of John Casimir against a party who preferred Sobieski. On the death of Michael he was chosen king, 21 May 1674. A new war with the Turks was concluded after varying success by a peace, 27 Oct. 1676. The anarchy in which Poland was constantly kept by the turbulence of its aristocracy was aggravated during the reign of Sobieski by the intrigues of his wife, and his own talent for administration was not equal to his capacity as a general. Besides internal troubles, European politics at this time occupied the attention of Sobieski, whose alliance was solicited both by Louis XIV. and the emperor. He at length concluded (31 March 1683) an alliance with the latter against the Turks, who had allied themselves with the

JOHN

malcontents in Hungary and threatened a most formidable invasion of the empire. Uniting with the Austrian forces 9 September, at the head of a combined force of 83,000 men, he inflicted a decisive defeat on the Turks, and compelled them to raise the siege of Vienna, 12 Sept. 1683. He terminated the campaign with the capture of Gran (27 October), which had been in the possession of the Turks for nearly a century and a half. In 1686 he overran Moldavia and Wallachia, but failed to make a permanent conquest.

John of Austria, commonly called **Don John of Austria**, Spanish general: b. Ratisbon, Bavaria, 24 Feb. 1547; d. near Namur, Belgium, 1 Oct. 1578. He was an illegitimate son of the emperor Charles V. In 1570 he conducted a campaign against the Moors of Granada with great vigor and relentlessness, and in the following year commanded the allied fleet which won the great naval battle of Lepanto over the Turks (7 Oct. 1571). In 1576 he was appointed governor of the Netherlands, and had won with the Prince of Parma the victory of Gembloux (1578) over William the Silent, when he died, not without suspicion of having been poisoned by his jealous half-brother, Philip II., but for this belief there is no evidence. Consult: Motley, 'The United Netherlands'; Stirling-Maxwell, 'Don John of Austria' (1883).

John of Gaunt, gānt or gānt, **DUKE OF LANCASTER**, English soldier: b. Ghent, Flanders, (whence his name) 1340; d. London 3 Feb. 1399. He was the fourth son of Edward III. and his queen, Philippa of Hainaut. He was created Duke of Lancaster in 1362; served in the French wars, and became governor of Guienne. He assumed in right of his wife the title of King of Castile, invaded that kingdom to assert his claims, but relinquished them in favor of Prince Henry of Castile, his son-in-law. He was a supporter of the reformer John Wyclif, and a patron of the poet Chaucer. Shakespeare introduces him as a prominent figure in the play of 'Richard II.' His eldest son, Bolingbroke, became king of England as Henry IV. Consult: Longman, 'Life and Times of Edward III.' (1869); Trevelyan, 'England in the Age of Wycliffe' (2d ed. 1899).

John of Leyden, lī'dēn. See **ANABAPTISTS**.

John, Epistles of, three letters upon Christian doctrine and conduct attributed to Saint John the Divine, the fourth Evangelist.

The First Epistle of Saint John.—This epistle was attributed to the apostle and evangelist by writers of the generation succeeding that in which he lived. Its thought, diction and style are those of the fourth gospel, though nothing indicates whether it was written before or after that book. Its date cannot be earlier than 90 A.D. nor later than 100 A.D. Critics generally agree that it was written from Ephesus. It was addressed to certain Christians of Ephesus and its vicinity who had fallen into error. These were *Docetæ* (q.v.) and failed therefore to reach true fellowship in Christ. The apostle presents Jesus as Christ and shows that we come into fellowship with God through Him, and inculcates faith in a real Redeemer, as a means of crushing the practical error whose result was barrenness in religion.

The book is a pastoral letter of instruction and exhortation, not a theological tract or a commentary on the Gospel. The purpose is set forth in chapter v. 13. The epistle falls into three main divisions: (1) God is light (i. 5–ii. 28), (2) God is righteous, or God is love (ii. 29–v. 5), (3) Jesus is the Son of God; fellowship with God comes through him. Sometimes the second division is subdivided under the headings (1) God is love, (2) God is righteous. But the writer evidently intends these two truths to stand as different aspects of the same truth, for as the love of God springs from his righteousness so his righteousness is the outcome of his love.

The Second Epistle of Saint John.—All evidence conclusively points to the apostle Saint John as author of this epistle. It is directed "to the elect lady and her children," who must have been an individual Christian woman; other views are attended with grave grammatical difficulties, whether we translate it to "the lady Elect" or "the elect Kyria." Her name is in fact unknown. The apostle had been met by some of her children and had rejoiced in their conduct, but warns them against defection.

The letter opens with a greeting; expresses joy in her sons' behavior (verse 4); exhorts all to abound in love (verses 5, 6); warns against deceivers (verses 7, 8), in closing the writer expresses a hope of visiting her, and delivers her sister's greeting.

The Third Epistle of Saint John.—It is addressed to Gaius, who cannot be identified with any person of that name mentioned in the New Testament (Acts xix. 29; xx. 4; Rom. xvi. 23; 1 Cor. i. 14). He lived near Ephesus, and was hospitable to the preachers sent by the apostle (verses 2–4). The character of Diotrephes (verses 9–11) Demetrius, who probably bore the letter is commended (verse 12). A vivid glimpse of church life at the close of the 1st century is given in these letters which reveal the Church in Asia Minor infected with speculative error, personal ambition, and insubordination to apostolic authority, and points to opposition which local leaders sometimes exhibited toward the delegates of the central authorities.

John, Order of Saint, a military religious order of mediæval origin. The Knights Hospitallers of Saint John, subsequently known as Knights of Rhodes, and lastly as Knights of Malta, were once a great power in Christian Europe. The origin of the order is unknown, but most probably it was early in its history that a rich merchant of Amalfi built not far from the Holy Sepulchre at Jerusalem a certain church known as Santa Maria della Latina, with a monastery for monks, under the rule of Saint Benedict, and a hospital for pilgrims. The first patron of the order seems to have been Saint John the Compassionate, patriarch of Alexandria in the 7th century. Afterward Saint John the Baptist was chosen patron, and the Benedictine brethren assumed the title of Johannites, or Brothers Hospitallers of Saint John. Pope Paschal II. in 1113 gave them the privilege of electing their own rector. Later, in addition to the vow of poverty, chastity and obedience they were pledged to make war upon the infidels, and assumed a black cloak with a white cross on the left side. The members were divided

JOHN—JOHN DORY

into three classes, knights of noble birth, the fighting class, priests bound to the service of the church, and brethren of service who took care of the sick and acted as guides to the pilgrims. In 1291 the order was driven from Palestine by the conquests of the Saracens, and after holding Cyprus for a time they occupied Rhodes in 1309, from which they were ultimately driven by Sultan Soliman II. in 1522. After that the knights retired to Candia and other places, but finally to Malta, which Charles V. granted them in 1530. Here they continued to be a bulwark of western Europe against the Turkish navies till modern times. The chief of this order, which had great possessions in almost every part of Europe, was called "Grandmaster of the Holy Hospital of St. John of Jerusalem, and Guardian of the Army of Jesus Christ." He lived at Valetta, in the island of Malta.

The military duty of the knights consisted in taking the field at least three times against the Turks or the pirates of Barbary. In war they wore a red jacket or tabard, charged with a white cross. In 1798 Malta was unexpectedly attacked and taken by Bonaparte, and about the same time the extensive properties belonging to the order in various countries were confiscated. This may be considered the end of the order as a vital institution, although shortly after the capture of Malta, Paul I., who had been chosen grand-master, took the order under his protection, and it still exists nominally at least. After the death of Paul the nomination of the head of the order was vested in the pope.

John, yōn, Eugenie, "E. MARLITT," German novelist: b. Arnstadt, Thuringia, Germany, 5 Dec. 1825; d. there 22 June 1887. She was the daughter of a portrait painter, and after pursuing the study of music at Vienna, lived at court for some years. She then returned to her native town and took up novel writing, using the pseudonym of "E. Marlitt." Her works, which are very numerous, have been translated into English by Mrs. A. L. Wistar, and have been very popular in this country. Among them are 'Gold Elsie' (1868); 'Old Mamselle's Secret' (1868); 'Countess Gisela' (1870); 'Princess of the Moor' (1872); 'The Second Wife' (1874); 'In the Counselor's House.'

John, Saint, Gospel of. See GOSPELS.

John B. Stetson University, a coeducational school founded in 1883, at De Land, Fla., under the auspices of the Baptist denomination. The institution was first called De Land University, but in honor of John Batterson Stetson (q.v.), who has given large gifts to the institution, nearly all of the buildings and the campus, the name has been changed. The departments are a preparatory, schools of music, law, art, and technology, a normal and practice school for teachers, a business college, and a college of liberal arts. The courses lead to the degrees of bachelor of arts, laws, and philosophy, and to degrees of bachelor of civil, electrical, and mechanical engineering. The school in 1898 made arrangements with the University of Chicago, whereby the graduates of the college of liberal arts, who have a high standing in their studies, may receive corresponding degrees from

the Chicago institution. In 1902 the number of students in attendance was nearly 450, the number of professors and instructors 40. The endowment fund amounted to about \$210,500.

John Baptist, the forerunner of the Messiah and the Elijah, or Elias of the New Testament. About five years before the Christian era the Angel Gabriel, according to St. Luke's Gospel, appeared to the aged priest Zacharias and announced the birth of John by Elizabeth, the priest's wife. John was to be filled with the Holy Ghost and to go before the Lord in the spirit and power of Elisha to prepare a people for Him. This was some months before the angel announced in Nazareth, to a maiden called Mary that she should bear a son, whose name was to be Jesus, "the son of God." John Baptist, born 5 B.C. spent his early manhood in the desert. He announced the coming Messiah, and preached repentance, baptizing as a symbolic rite of purification and pardon. He was naturally the first publicly to recognize Jesus Christ and salute him as the "Lamb of God." Herod Antipas (q.v.) then ruled Palestine, his throne being under the protection of Augustus, and he imprisoned the Baptist in the gloomy fortress of Machaerus, east of the Dead Sea, being offended by the plain speaking of the stern ascetic. At a birthday feast given to his Galilean nobles Herod was fascinated by the dancing of Salome, the daughter of Herodias, the wife of his brother Philip, whom he had taken to wife, although her lawful husband still survived. The rebuke administered to Herod for his adultery by John had incensed Herodias and she was bent on vengeance. When Antipas swore to give Salome whatever she might ask to the half of his kingdom, she at her mother's suggestion, asked for the head of John Baptist on a charger or large dish. This was the occasion of the Baptist's martyrdom. The place where this incident happened was the Golden House of Tiberias, whose ruins are still pointed out as Kasr Bint-el-Melek, "Palace of the King's Daughter."

John Brown's Body, a famous marching song of the Civil War, the origin of which has for years been in dispute. It has been generally credited to C. S. Hall of Charleston, Mass. (1861). The words were applied to an old tune common in England in the 18th century.

John Bull, a name first used by the English humorist, Arbuthnot, and since popularized as a typical name suggesting a humorous or burlesque representation of the English character. He is represented as a bluff, jolly, bull-headed farmer.

John C. Green School of Science. See GREEN, J. C.

John Chrysostom. See CHRYSOSTOM, JOHN.

John Doe, a fictitious name given to unknown plaintiffs or defendants in law. In former times the name was applied to the fictitious lessee of the plaintiff in the mixed action of ejection, that of the fictitious defendant being "Richard Roe."

But if the lessor made out his title in a satisfactory manner, then judgment and a writ of possession were awarded to John Doe, the nominal plaintiff, who by this trial had proved the right of John Rogers, his supposed lessor.—Blackstone.

John Dory. A fish. See DORY.

JOHN HALIFAX — JOHNS HOPKINS UNIVERSITY

John Halifax, Gentleman, a novel by Dinah Maria Muloch Craik (1856), in which the hero, John Halifax, one of "nature's noblemen," beginning life as a poor boy, works his way up to prosperity and happiness, by means of his high principles, undaunted courage, and nobility of character. The heroine is Ursula March; and the simple domestic story includes few minor characters. The interest lies in the development of character: and the author's assertion is that true nobility is of the soul, and does not inhere in wealth, in learning, or in position; and that integrity and loftiness of purpose form the character of a true gentleman.

John Paw, a large and beautiful grouper (*Epinephelus Drummond-Hayi*), which is dark umber brown densely covered with small white pearly spots. It inhabits the Gulf of Mexico and is valued as a food fish in Florida. It is also known in the Bermudas, where it is called "speckled hind."

John Strange Winter. See STANNARD, HENRIETTA.

John Ward, Preacher, a novel by Margaret Deland, published in 1888. A Presbyterian minister named Ward, a logical Calvinist, is assured that belief in election and reprobation, eternal punishment, and kindred doctrines, is necessary to salvation; and so preaches them with force and conviction. While his congregation agrees with him, his wife entertains decidedly broad theological views in general. The couple love each other with that singleness of devotion without which the course of the story would be manifestly improbable; for it depends upon the question whether love will be able to hold together what conscientious habits of thought and ethical convictions tend to drive apart.

John's, Eve of Saint, the survival of a popular celebration of remote antiquity, held on the 23d of June, which in Christian times became the vigil or eve of the feast of the nativity of St. John Baptist, 24 June (Midsummer Day). On the eve of the feast it was the custom in former times to kindle fires called St. John's fires. This was indeed a continuance of those Teutonic and Scandinavian pagan festivals, which at the winter solstice were observed with Yule-fires, and at the summer solstice with similar beacon-fires, originally intended to communicate through the country the changes in the seasons announced by the priesthood, so as to direct the activities of agriculture and navigation. The burning of the Yule log at Christmas is a survival of these observances.

Johns Hopkins University, a university at Baltimore, Md., founded by Johns Hopkins, who was born in Maryland and amassed a fortune in Baltimore. He died in 1873 and bequeathed \$3,500,000 to found a university. Opened in 1876, it is now one of the foremost universities in the United States. The students are distinguished by the title of graduates and undergraduates, the former being such as have received a degree at this university or elsewhere, and who desire to carry their studies further, special attention being here given to the most advanced subjects, as well as to original research. The buildings of the university include

McCoy Hall, in which are the library, assembly room, and rooms appropriated to literary and historical studies; Levering Hall, the building of the Young Men's Christian Association; Hopkins Hall, equipped for the study of geology and mineralogy; a chemical laboratory; a biological laboratory; a physical laboratory; a gymnasium; an administration building; and four buildings for medical instruction.

In 1902 a large tract of land in the suburbs of the city, comprising 176 acres, was presented by several friends as a future site for the University, and it is expected that before many years it will be possible to remove the philosophical department thereto. This noteworthy gift was followed within a few months by a generous contribution, from alumni and citizens of Baltimore, of \$1,000,000 toward the permanent endowment of the institution.

Connected with the university is the Johns Hopkins Press, from which issue the 'American Journal of Mathematics'; 'The American Chemical Journal'; 'The American Journal of Philology'; 'Memoirs from the Biological Laboratory'; 'Studies in Historical and Political Science'; 'Journal of Experimental Medicine'; 'Beiträge zur Assyriologie'; 'Modern Language Notes'; 'Johns Hopkins University Circulars'; 'Terrestrial Magnetism and Atmospheric Electricity'; etc.

The degrees of Bachelor of Arts, Doctor of Philosophy, and Doctor of Medicine are conferred. Advanced and graduate students have elective courses, but each instructor has a discretion of his own with regard to admission to his classes. The university reported at the close of 1903: Professors and instructors, 147; students, 695; number of graduates, 1,535; volumes in the library, 115,000; productive funds, \$3,488,843; grounds and buildings valued at \$1,157,881; value of books and apparatus, \$350,000; income, \$250,454.

An important place at Johns Hopkins University has always been held by the "fellows." Twenty fellowships are awarded each year to the most promising among the many candidates, without preference of college; each fellowship is of the annual value of \$500, though it does not exempt from charges for tuition. In the language of the official announcement of the university, the fellowships are bestowed "almost exclusively on young men desirous of becoming teachers of science and literature, or proposing to devote their lives to special branches of learning which lie outside of the ordinary studies of the lawyer, the physician and the clergyman." The university also extends the privilege of "fellowships by courtesy" (without emolument) to certain individuals.

The university receives as students the following classes: (1) College graduates, who may proceed to the degree of doctor of philosophy, or may work for longer or shorter periods in the various seminaries or laboratories without reference to a degree. (2) Undergraduate students looking forward to the degree of bachelor of arts and following one of seven parallel groups of study. (3) Candidates for the degree of doctor of medicine, for whom a four-year course is provided, and who may be either men or women. (4) Doctors of medicine desiring to pursue certain special courses. (5) Students

JOHNSON

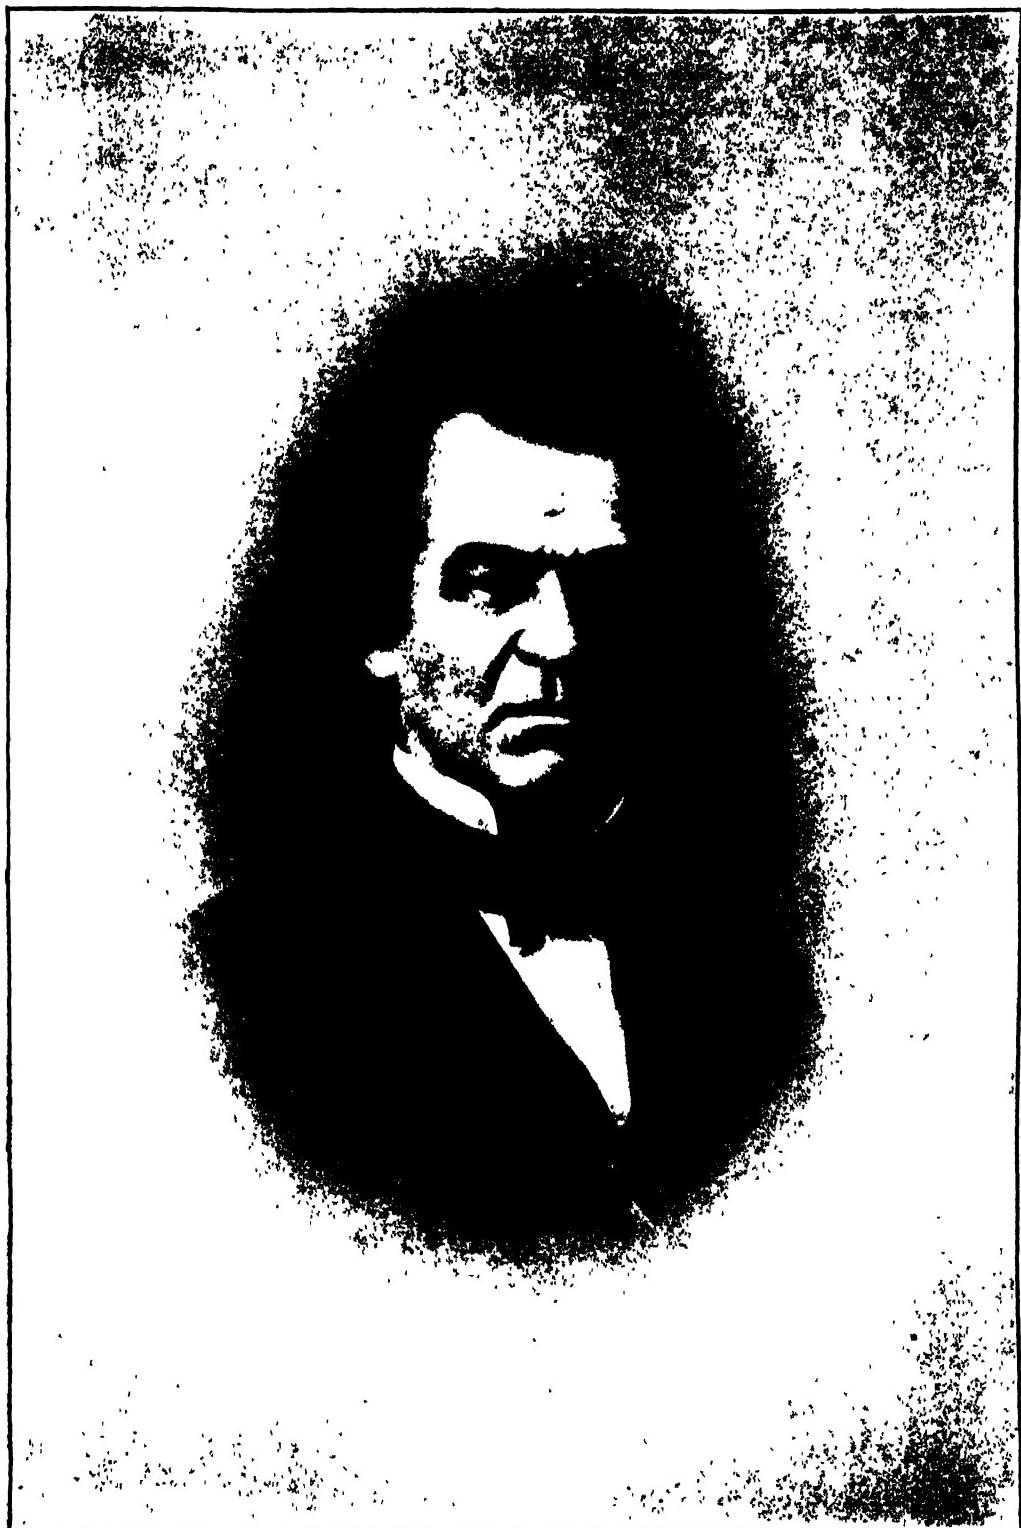

who have not taken a degree, and are not looking forward to a degree, but who desire to avail themselves for a brief period of the opportunities here offered. The courses of study under 1, 3 and 4 are entirely closed to those who are still candidates for a baccalaureate degree. The Johns Hopkins University, although giving little attention to applied science and technology, has been a very large factor in determining the character and methods of instruction to which these schools owe their success. It is impossible to overestimate its influence upon higher education in this country, and especially is this true in all things relating to science. There is scarcely an American college faculty that has not been enriched by the presence of one or more of its graduates, bringing with them at least something of the spirit of that institution, its respect for exact scholarship and regard for scientific truth.

Johnson, jön'són, Alvin Jewett, American publisher: b. Wallingford, Vt., 28 Sept. 1827; d. New York 22 April 1884. He worked on a farm, taught school in Virginia, went to New York in 1853, published 'Johnson's Illustrated Atlas,' a reconstruction of 'Colton's Atlas,' and thereafter several works, including 'Johnson's Universal Cyclopaedia,' now known in a revised form as 'The Universal Cyclopaedia.'

Johnson, Andrew, the 17th president of the United States: b. Raleigh, N. C., 29 Dec. 1808; d. near Carter's Station, Tenn., 31 July 1875. In 1810 he was apprenticed to a tailor at Raleigh, in 1824-6 worked as a journeyman at Laurens Court House, S. C., and then removed to Greenville, Tenn., where also he worked at his trade. At that time the State of Tennessee was controlled by the landed proprietors, who formed an aristocratic class. Johnson made himself the leader of an opposition or working-man's party, in 1828-30 was an alderman of Greenville, and in 1830-3 its mayor. In 1834 he was a leading advocate of the new State constitution, by means of which the power of the greater landholders was reduced. He was elected to the State legislature in 1835 and again in 1839, as a Democrat of the Jacksonian type. A Democratic elector for the State in 1840, he stumped effectively for the Van Buren ticket, and gained considerable reputation as an orator. In 1840 he was elected to the State senate from the counties of Greene and Hawkins, and during his term urged that the basis of representation should be the white vote without consideration of slave-ownership. In 1843 he was chosen to Congress, to which he was four times re-elected. While in the House he supported the restoration to General Jackson of the fine imposed upon him for the imprisonment of a judge at New Orleans in 1815; the annexation of Texas; the homestead law, distasteful to the Southern slaveholding class; the compromise of 1850; and the presidential veto-power. He was opposed to disregard of economy in the expenditure of public moneys. In 1853 he was elected governor of Tennessee, and in 1855 re-elected after a bitter campaign. He sat in the United States Senate in 1857-62, and there opposed the grant for the construction of a Pacific railway and strongly attacked secession. His vigorous Union attitude rendered him so unpopular in the South that he was several times burned in effigy, and upon

his return to Tennessee his life was endangered. Appointed military governor of the State, with rank of brigadier-general of volunteers, 4 March 1862, he displayed great prudence in the employment of his autocratic powers. On 6 June 1864 he was nominated Vice-President of the United States by the national Republican convention assembled at Baltimore, and, elected with Lincoln, entered on his office 4 March 1865. President Lincoln died by assassination 15 April, and Johnson became President. His policy toward the seceded States was, contrary to expectation, one of leniency. On 22 May he opened all Southern ports save four in Texas, to foreign commerce, and 29 May he proclaimed general amnesty to all except 14 specified classes. These and similar measures aroused the opposition of the majority of Republicans in Congress, and thenceforward differences between the executive and legislative branches of the government were constantly arising. Johnson established provisional governments, afterward disallowed by Congress, in seceded States, and Congress retaliated by passing over his veto of 27 March 1866 the civil rights act, admitting freedmen to full citizenship rights. In August 1866 he undertook a tour of the Northern States which became known as "swinging 'round the circle," and in the course of which he denounced Congress and advocated his own plan of reconstruction. Other bills, including one for the arrangement of the Southern States, with the exception of Tennessee, into military districts; and the tenure-of-office act, were passed over the President's veto. In August 1867 Johnson removed from office Stanton, secretary of war, and appointed Grant to the post; but in September following Congress refused to ratify the removal, Grant resigned, and Stanton resumed his former duties. On 21 Feb. 1868 Johnson dismissed Stanton and appointed Gen. Lorenzo Thomas secretary ad interim. Two unsuccessful attempts to impeach the President had already been made. On 24 February a resolution of impeachment was passed by the House and on 5 March the trial began. Eleven articles charged the President with high crimes and misdemeanors in connection with five various matters, most important of which were the removal of Stanton in disregard of the tenure-of-office act and the appointment of Thomas. The trial was presided over by Chief Justice Chase. On 16 May a test vote resulted in 35 for conviction, 19 against; and the requisite two thirds vote not having been obtained, the President was acquitted. The result is now generally approved. "The single vote by which Andrew Johnson escaped conviction," says Dunning, "marks the narrow margin by which the Presidential element in our system escaped destruction." In January 1875 he was chosen to the Senate, and 5 March took his seat in the extra session. He was sincere and able, and if Congress viewed his procedure as usurpation no less did he believe that of Congress to be unconstitutional. Consult: Dunning, 'Essays on the Civil War and Reconstruction' (1898); and Dewitt, 'The Impeachment and Trial of Andrew Johnson' (1903), a spirited defense. See also UNITED STATES — RECONSTRUCTION.

Johnson, Bradley Tyler, American lawyer: b. Frederick, Md., 29 Sept. 1829; d. 5 Oct. 1903.

ANDREW JOHNSON,
17TH PRESIDENT OF THE UNITED STATES.

JOHNSON

He was graduated from Princeton in 1849, studied law at Harvard in 1850-1, entered practice at Frederick in 1851, became in that year State's attorney for Frederick County, was a delegate to the National Democratic Convention at Charleston and Baltimore in 1860, withdrew from the convention, and supported the Breckinridge and Lane ticket. At his own expense he organized a company for the Confederate service, in which he rose to be brigadier-general of cavalry (1864). Subsequent to the War he practised law at Richmond in 1865-79, at Baltimore in 1879-90; and was a member of the State senate of Virginia in 1875-90. His works include: 'Reports of Chase's Decisions' (1875) 'Memoir of J. E. Johnston' (1891); a 'Life of General Washington'; etc.

Johnson, Bushrod Rust, American soldier: b. Belmont County, Ohio, 7 Oct. 1817; d. Brighton, Ill., 11 Sept. 1880. He was graduated at West Point in 1840. He saw service in the Florida and Mexican wars, resigning his commission in 1847 to become professor in the Western Military Institution of Kentucky, at Georgetown. He entered the Confederate army as a brigadier-general at the commencement of the Civil War, and in 1864 became a major-general. He commanded a division under General Lee till the surrender at Appomattox. He subsequently became superintendent of the Military College in the University of Nashville, and chancellor of that institution.

Johnson, Cave, American politician: b. Robertson County, Tenn., 11 Jan. 1793; d. Clarksville, Tenn., 23 Nov. 1866. Admitted to the bar, he practised at Clarksville, in 1820 became a judge of the State circuit court, and was a Democratic representative in Congress in 1829-37 and again in 1839-45. In 1845 he was appointed postmaster-general, from which post he retired at the close of Polk's administration (1849). He was president of the Tennessee State bank in 1850-9, and was elected to the State senate as a Unionist in 1863, although unable to serve because of ill-health.

Johnson, Clifton, American author and illustrator: b. Hadley, Mass., 25 Jan. 1865. He obtained a secondary education, worked on a farm, was clerk in a book-shop and school-teacher, studied in the New York art-schools, published in 1892 'The New England Country,' an illustrated study of farm-folk, and later was much abroad obtaining notes and pictures for works on foreign life. Other volumes of which he is author and illustrator are: 'The Country School' (1893); 'The Farmer's Boy' (1894); 'What They Say in New England' (1896); 'Among English Hedge Rows' (1899); etc.

Johnson, David, American painter: b. New York May 1827. He was self-taught, excepting for the few lessons he received from Jasper F. Cropsey, and chose American landscape as his specialty. Among his works are: 'Echo Lake' (1869); 'Lake George' (1876); 'Greenwood Lake' (1878).

Johnson, E. Pauline, Canadian poetess: b. Chieftwood, Ont., 1862; the daughter of George Johnson, head chief of the Mohawk Indians, and of his English wife. She has written several striking poems on Indian subjects and has given

public recitals from her works. 'The White Wampum' appeared in 1894.

Johnson, Eastman, American painter: b. Lowell, Maine, 29 July 1824. He began his art studies at Dusseldorf (1849-51) and developed a distinct talent for genre, with a leaning toward domestic and sentimental incident. He afterward traveled in France, Italy, and Holland, and spent four years at The Hague. Among his pictures painted in Europe are the 'Savoyard,' and the 'Card Players,' in which he showed the influence of the Dutch school. He returned to the United States in 1856 and devoted himself for some years to the study of rustic and negro life and he has painted some of the most popular pictures ever produced by a native painter; many of them have been engraved and chromolithographed. The best known are 'Old Kentucky Home'; 'Husking Bee'; and the 'Boyhood of Abraham Lincoln.' He has also produced excellent likenesses of Grover Cleveland, Benjamin Harrison and other eminent men.

Johnson, Edward, American colonial historian: b. Herne Hill, Kent, England, about 1599; d. Woburn, Mass., 23 April 1672. He emigrated to America probably with Governor Winthrop in 1630. In 1632 he was engaged in trade at Merrimack, and was on the committee appointed to superintend the foundation of a new town and church at the place now called Woburn. In 1643 he was elected by the town of Woburn a member of the legislature of Massachusetts, in which he continued to sit till 1671, with the exception of 1648. In 1655 he was chosen speaker of the house. He was recorder of Woburn from the time of its incorporation till his death. In 1665 he was one of the members deputed to hold conference with the commissioners sent from England by Charles II. He wrote a 'History of New England from the English Planting in 1628 till 1652, or Wonder-Working Providence of Zion's Saviour' (1654).

Johnson, Edward, American soldier: b. Chesterfield County, Va., 16 April 1816; d. Richmond, Va., 22 Feb. 1873. Graduated from the United States Military Academy in 1838, he fought in the Florida wars, for his services in which he was brevetted captain, and subsequently in the Mexican War, being brevetted major for his conduct at Chapultepec. He received his captain's commission in 1851, but in 1861 resigned to enter the army of the Confederate States as colonel of the 12th Georgia volunteers. He was promoted brigadier-general in 1862 and major-general in 1863. At Gettysburg he commanded a division. He was captured with his entire force at Spottsylvania (12 May 1864) and retaken in the following December. Subsequent to the war he was a farmer in Chesterfield County, Va.

Johnson, Franklin, American Baptist clergyman and scholar: b. Frankfort, Ohio, 2 Nov. 1836. He was graduated from the Colgate Theological Seminary (Hamilton, N. Y.), in 1861, held pastorates in Michigan, New Jersey, and at Cambridge, Mass., in 1862-88, was co-editor of 'The Watchman' in 1876, and in 1890-2 president of Ottawa University. In 1892 he was appointed professor of history and homiletics in the University of Chicago. Among his writings, besides translations and an annotated edition of St. Matthew, are: 'Moses and Israel'; 'Heroes and Judges from the Lawgiver to the

JOHNSON

King'; 'The New Psychic Studies in their Relation to Christian Thought.'

Johnson, Helen Kendrick, American author: b. Hamilton, N. Y., 4 Jan. 1843. She was the daughter of A. C. Kendrick (q.v.) and was married to Rossiter Johnson (q.v.) in 1869. Beside editing several compilations of verse she has published 'The Roddy Books,' popular juvenile tales (1874-6); 'Our Familiar Songs' (1881); 'Raleigh Westgate' (1889); 'Woman and the Republic' (1897). She has been an active member of the Association Opposed to the Extension of Suffrage to Women.

Johnson, Herschel Vespasian, American jurist and politician: b. Burke County, Ga., 8 Sept. 1812; d. Jefferson County, Ga., 16 Aug. 1880. He was graduated from the University of Georgia in 1834, studied law, practised there, from 1844 at Milledgeville, and in 1848 was appointed to the Senate of the United States to fill the seat of W. T. Colquitt, resigned. A strong advocate of Clay's compromise scheme, he identified himself with the Southern Unionists. In 1849-53 he was a judge of the Georgia superior court, in 1853-7 governor of the State. He was nominated by the northern Democracy in 1860 as vice-president on the presidential ticket with Douglas. Though opposed to secession, he followed his State, and in 1862 was elected to the Confederate Congress. Elected United States senator in 1866, he was refused his seat because of war disabilities. He was a judge of the Georgia superior court from 1873 until his death.

Johnson, Horace Chauncey, American artist: b. Oxford, Conn., 1 Feb. 1820. He was a pupil of A. H. Emmons at Hartford, and of the antique school of the National Academy, New York; studied also in Rome (1856-8); established his studio in Italy, and later at Waterbury, Conn. His works include: 'Roman Peasants on the Campagna'; 'Grape Gatherers of Gensano'; 'Italian Kitchen'; 'Azrael'; etc.

Johnson, Sir John, American colonial soldier: b. near Johnstown, N. Y., 5 Nov. 1742; d. Montreal 4 Jan. 1830. He was the son of Sir William Johnson (q.v.), was knighted in 1765 and succeeded to his father's estates and baronetcy in the Mohawk Valley in 1774. When the Revolution came on he escaped to Canada in 1776 with 700 loyalists. He organized the corps known as the Queen's Own American Regiment, of which he was commissioned colonel. In July 1777, he took part in the siege of Fort Stanwix (q.v.). He defeated General Herkimer in the latter's brilliant attempt to cause the besiegers to abandon their operations; but was himself subsequently defeated. During the next two years he continued active in northern and central New York, and the Indian massacres of Cherry Valley and Wyoming formed some of the most painful incidents of the war. He was, however, crushingly defeated at Newton 29 Aug. 1779, and retired to Montreal. His influence over the Indians had always been remarkable and the British government appointed him superintendent-general of Indian affairs in British North America, besides making him extensive land grants, to replace the Mohawk family estates which had been confiscated.

Johnson, Lionel Pigot, English poet: b. Broadstairs, Kent, March 1867; d. 9 Oct. 1902.

He was educated at Winchester College, and Oxford University. He published 'Poems'; 'Ireland and Other Poems'; and 'The Act of Thomas Hardy'; and contributed to 'The Academy' and other literary journals. His verse though often obscure exhibited much command of metre and was full of promise.

Johnson, Oliver, American reformer and editor: b. Peacham, Vt., 27 Dec. 1809; d. Brooklyn, N. Y., 10 Dec. 1889. He became editor of 'The Christian Soldier' in 1831, and from that year to 1865 was engaged in the anti-slavery cause as a lecturer and editor. He was one of the founders of the New England Anti-Slavery Society in 1832. He was editor of the 'Independent' from 1865 to 1870; became editor of the 'Christian Union' in 1872; and published 'William Lloyd Garrison and his Times' (1880).

Johnson, Owen, American novelist: b. New York 27 Aug. 1878. He is a son of R. U. Johnson (q.v.) and was graduated from Yale in 1900. He has published 'Arrows of the Almighty' (1901).

Johnson, Reverdy, American jurist: b. Annapolis, Md., 21 May 1796; d. there 10 Feb. 1876. He was educated at St. John's College in that city, and at 17 began to study law. In 1815 he was admitted to the bar, in 1817 removed to Baltimore and subsequently devoted his time mainly to the arguing of cases before the United States Supreme Court. He reported seven volumes of the decisions of the Maryland court of appeals, known as 'Harris's and Johnson's Reports,' 1820. In 1821 he was elected a State senator, and at the expiration of his term in 1825 was re-elected for a second term. In 1845 he was chosen a United States senator, resigning in 1849 on being appointed attorney-general of the United States. On the succession of Mr. Fillmore, after the death of President Taylor, he resigned that office, and resumed in Baltimore the practice of the law. In 1861 he was a member of the peace commission, was United States senator 1863-8, and succeeding Charles Francis Adams as minister to England in 1868 negotiated the treaty for the adjustment of the Alabama claims, afterward rejected by the Senate.

Johnson, Richard Mentor, American statesman and soldier: b. Floyd's Station, near Louisville, Ky., 17 Oct. 1780; d. Frankfort, Ky., 19 Nov. 1850. He was educated at Transylvania University, and subsequently studied law and practised with success. He commenced his public career as a member of the Kentucky legislature, to which he was elected at 23, and in 1807 was returned to Congress, and remained a member of the House until 1819. He was a firm supporter of the administration of Madison, and upon the commencement of the War of 1812 raised a body of Kentucky mounted riflemen, whom he commanded, on the Canadian frontier. The decisive charge of his mounted volunteers mainly contributed to the brilliant victory gained over the British and Indians at the battle of the Thames, 5 Oct. 1813, and it was by his hand that the Indian leader Tecumseh is commonly supposed to have fallen. In 1819 he was elected to fill a vacancy in the United States senate, of which he continued a member until 1829, when he was again returned to the House of Representatives. He remained a member until his election by the Senate in March, 1837, as Vice-President of the United States.

JOHNSON

He discharged the duties of presiding officer of the senate for four years, and in the Presidential election of 1840 was an unsuccessful candidate of the Democratic party for Vice-President. He thenceforth lived chiefly in retirement. He was, however, serving a term in the State legislature at the time of his death. In Congress his chief efforts were against the discontinuance of the Sunday mails, and in behalf of soldiers of the Revolution or of the War of 1812, who applied for pensions. He was the author of the law abolishing imprisonment for debt in Kentucky.

Johnson, Richard W., American military officer: b. near Smithland, Ky., 7 Feb. 1827; d. St. Paul, Minn., 21 April 1897. He was graduated at West Point in 1849, in 1861 became colonel of the 3d Kentucky cavalry, 11 October was appointed brigadier-general of volunteers, and later commanded a division at Murfreesboro, and with his division fought under Thomas at Chickamauga (19-21 Sept. 1863). He commanded the 12th division of the Army of the Cumberland in the invasion of Georgia and a division of cavalry at Nashville, was brevetted brigadier-general, United States army, for his services (13 March 1865), and, having been mustered out of the volunteer service, became provost-marshal of the military division of the Tennessee. In 1867 he resigned from the service with rank of major-general, changed by act of Congress (1875) to brigadier. Among his writings were: 'Life of Gen. G. H. Thomas' (1881); and 'A Soldier's Reminiscences' (1886).

Johnson, Robert Underwood, American editor and poet: b. Washington, D. C., 12 Jan. 1853. He became associate editor of the 'Century Magazine' in 1881. His efforts as secretary of the American Copyright League in behalf of the establishment of international copyright greatly aided in obtaining the law of 1891. He edited, with C. C. Buel, the notable 'Battles and Leaders of the Civil War' (1887-8), and has published three volumes of verse: 'The Winter Hour and Other Poems' (1891); 'Songs of Liberty and Other Poems' (1897); and 'Poems' (1902).

Johnson, Rossiter, American author and editor: b. Rochester, N. Y., 27 Jan. 1840. He was graduated from the University of Rochester in 1863 and was associate editor of the Rochester *Democrat* 1864-8. From 1869 to 1872 he edited the *Concord* (N. H.) *Statesman*; and in 1873-7 was associated with George Ripley and Charles A. Dana in editing the *American Cyclopædia*, while in 1879-80 he aided Sydney Howard Gay in his 'History of the United States.' Since 1883 he has been editor of the 'Annual Cyclopædia.' He edited the series of 'Little Classics' (8 vols. 1874-80), and was editor-in-chief of the 'World's Great Books' (50 vols. 1898-1901). His original works include 'Phae-ton Rogers,' a novel of boy life (1881); 'A History of the French War ending in the Conquest of Canada' (1882); 'History of the War of 1812' (1882); 'Idler and Poet,' verse (1883); 'Short History of the War of Secession' (1888); 'The End of a Rainbow,' a story (1892); 'The Hero of Manila' (1899); 'Short History of the War with Spain' (1899).

Johnson, Samuel, American college president, first president of King's College (now

Columbia University): b. Guilford, Conn., 14 Oct. 1696; d. Stratford, Conn., 6 June 1772. He was graduated at Yale College in 1714, and two years later appointed tutor there. In 1720 he resigned to receive ordination as a Congregational minister, and settled at West Haven. He relinquished his charge in 1722, and soon after sailed for England, where he received Episcopal ordination in 1723. Shortly after he returned to America, bearing a commission as missionary of the Society for the Propagation of the Gospel in Foreign Parts, and settled in Stratford, Conn., as rector of an Episcopal church there. In 1743 he received the degree of D.D. from the University of Oxford. In 1746 he published 'A System of Morality,' and in 1752 a compend of logic and metaphysics, and another of ethics; the two latter were printed in Philadelphia by Franklin as text-books for the University of Pennsylvania. In 1755 he was offered the presidency of that university, but declined it. In 1753 he was invited to accept the presidency of the newly founded King's College in New York, in all the plans for which he had been consulted. He did so, but in 1763 resigned and returned to Stratford, where he resumed his parochial duties, revised his previous works, and published an 'English and a Hebrew Grammar' (1767). Consult Beardsley, 'Life of Samuel Johnson, D.D.' (1876).

Johnson, Samuel, English lexicographer, poet and essayist: b. Lichfield, Staffordshire, 19 Sept. 1709; d. London 13 Dec. 1784. He was the son of a Lichfield bookseller and was educated mainly in the grammar school of that city; although perhaps the best part of his education he gave himself, in the free run which he had of the books in his father's shop. Lichfield was the literary centre of a large district and old Michael Johnson supplied scholars with their folios, as well as less severe readers with romances, poems, essays, and pamphlets. Samuel read with wonderful rapidity, ravenously as if he devoured the book, and what he read his powerful memory retained. At 19 he entered Pembroke College, Oxford, "the best qualified for the university that his tutor had ever known come there." Thence he was driven by poverty after a residence of only 14 months. During the next few years he lived partly by teaching. At 26 he married. Two years later he went up to London with a half-finished tragedy in his pocket, and David Garrick as his companion. There for five-and-twenty years he lived the hard life of a poor scholar. His wife died after a long illness. In this period of his life he did most of his work. He wrote the 'Debates of Parliament,' which were wholly in form and mainly in substance his own invention; his great 'Dictionary'; his two poems 'London' (1738); and 'The Vanity of Human Wishes' (1749); the 'Rambler,' the 'Idler,' and 'Rasselas' (1759), and numerous minor pieces. He published moreover 'Observations on Macbeth,' and made a beginning of his edition of Shakespeare. In 1762 a pension of £300 from the king freed him from the pressure of poverty and the rest of his life he passed in modest comfort. A friendship which he formed a little later added greatly to his happiness. A wealthy London brewer of the name of Thrale, a man of such rugged strength that he sought a comrade in his rough genius, gave him a second home. His pen had

JOHNSON

long intervals of rest. He finished his Shakespeare, wrote four political tracts which added nothing to his reputation, and his 'Journey to the Western Islands' (1775). Happily he was roused from his indolence by the request of the booksellers that he should undertake that one of all his works by which he is best known,—the 'Lives of the English Poets' (1779-81). "I wrote it," he says, "in my usual way, dilatorily and hastily: unwilling to work, and working with vigor and haste." The indolence into which he seemed to have sunk was more apparent than real. That powerful mind was seldom long at rest. "He was a kind of public oracle, whom everybody thought they had a right to visit and consult." David Hume might complain that "men of letters have in London no rendezvous, and are indeed sunk and forgotten in the general torrent of the world." They who knew Johnson felt no such want. "His house became an academy." So did the taverns which he frequented, whose chairs he looked upon as so many thrones of human felicity. Among his friends he numbered Reynolds, Burke, Goldsmith, Garrick, and Boswell. They were all members of that famous club of which he was the light and centre. In the world of letters his opinion was eagerly awaited. "What does Johnson say of such a book?" was the question of every day. This, the happiest period of his life, was brought to an end by the death of Mr. Thrale in 1781. Though the ranks of his friends were thinning and his strength was failing he did not lose heart. He tried "to keep his friendships in constant repair," and he struggled hard for life. "I will be conquered," he said; "I will not capitulate." Death had always been terrible to him. He now faced it month after month in the gloom of solitude. "His death," wrote one of his contemporaries, "kept the public mind in agitation beyond all former example." "It made a kind of era in literature," said Hannah More. Harriet Martineau was told, by an old lady who well remembered the time, that "the world of literature was perplexed and distressed as a swarm of bees that have lost their queen." High as Johnson still stands as a writer, his great reputation rests mainly on his talk and on his character as a man, full as it was of strange variety, rugged strength, great tenderness, dogged honesty and truthfulness, a willingness to believe what was incredible combined with "an obstinate rationality" which ever prevented him, and Toryism with the spirit of a rebel glowing beneath. It is in the pages of his friend and disciple that he lives for us as no other man has ever lived. Of all men he is best known. In his early manhood he set up an academy, and failed. The school which he founded in his later years still numbers its pupils by thousands and tens of thousands. "We are," said Sir Joshua Reynolds, "of Dr. Johnson's school. He may be said to have formed my mind, and to have brushed from it a great deal of rubbish. He qualified it to think justly." He still qualifies the mind to think; he still clears it of cant; he still brushes from it all that rubbish which is heaped up by affectation, false sentiment, exaggeration, credulity and indolence in thinking. Even in his lifetime his written style was censured as "involved and turgid, and abounding with antiquated and hard words." Macaulay went so far as to pronounce it "systematically vicious." In the structure of his sentences he is as often at fault as in

the use of big words. He praised Temple for giving a cadence to English prose, and he blamed Warburton for having "his sentences unmeasured." His own prose is too measured and has too much cadence. It is in his 'Rambler' that he is seen at his worst, and in his 'Lives of the Poets' at his best. He often rose to noble heights of eloquence; while in the power of his honest scorn he had scarcely a rival. His letters to Lord Chesterfield and James Macpherson are not surpassed by any in our language. In his criticisms he is admirably clear. Whether we agree with him or not, we know at once what he means; while his meaning is so strongly supported by argument that we can neither neglect it nor despise it. He may put his reader into a rage, but he sets him thinking. Of his original works, 'Irene' (1749) was the first written, though not the first published. It is a declamatory tragedy. He had little dramatic power, and he followed a bad model, for he took Addison as his master. It was in his two imitations of Juvenal's Satires, 'London' and the 'Vanity of Human Wishes,' that he first showed his great powers. In their kind they are masterpieces. Sir Walter Scott "had more pleasure in reading them than any other poetical composition he could mention. In the 'Rambler' he teaches the same great lesson of life as in his serious poems. He gave variety, however, by lighter papers modeled on the 'Spectator,' and by critical pieces. 'Rasselas,' struck off at a heat when his mother lay dying, tells in prose what the 'Vanity of Human Wishes' tells in verse. It is little known to the modern reader, who is not easily reconciled to its style. At no time could it have been a favorite with the young and thoughtless. Nevertheless, as years steal over us, we own, as we lay it down with a sigh, that it gives a view of life as profound and true as it is sad. His 'Dictionary,' faulty as it is in its etymologies, is a very great performance. Its definitions are admirable; while the quotations are so happily selected that they would afford the most pleasant reading were it possible to read a heavy folio with pleasure. That it should be the work of one man is a marvel. He had hoped to finish it in three years; it took him more than seven. In the notes to his edition of Shakespeare he anticipated modern critics in giving great weight to early readings. He was unwilling to meddle with the text so long as it gave a meaning. Many of his corrections are ingenious, but in this respect he came far behind Theobald. In his 'Journey to the Western Islands' he describes the tour which he made with Boswell in 1773, and takes the part of the oppressed tenants against their chiefs. His narrative is interesting; while the facts which he gathered about a rapidly changing society are curious. His last work was the 'Lives of the English Poets.' It was undertaken at the request of the chief London booksellers, "who had determined to publish a body of English poetry," for which he was to furnish brief prefaces. These prefaces swelled into Lives. For payment he had required only two hundred guineas. "Had he asked one thousand, or even fifteen hundred," said Malone, "the booksellers would doubtless readily have given it." In this great work he traveled over the whole field of English poetry, from Milton who was born in 1608 to Lyttleton who died in 1773. To such a task no man ever came better equipped. In these 'Lives,' and in

JOHNSON

his own 'Life' as told by Boswell, we have given us an admirable view of literature and literary men, from the end of the age of Elizabeth to close upon the dawn of the 19th century. Consult: Boswell, 'Life of Johnson' ed. by Hill (1887); Hill, 'Dr. Johnson, his Friends and his Critics' (1878); 'Lives' by Stephen (1878); Grant (1887).

Johnson, Samuel, American preacher and author: b. Salem, Mass., 10 Oct. 1822; d. North Andover 19 Feb. 1882. He was graduated from Harvard in 1842, and from the Harvard Divinity School in 1846. He joined no religious denomination, and save for one year with a Unitarian church in Dorchester, was not settled as a minister until 1853, when he established in Lynn, Mass., an independent society, with which he remained till 1870, then withdrew to complete studies of many years, the results of which appeared later in his publications. With Samuel Longfellow (q.v.) he compiled a 'Book of Hymns' (1846) and 'Hymns of the Spirit' (1864). Some of his own inspiring hymns in these books are now found in the collections of various denominations. His critical study 'The Worship of Jesus' (1868), written in accordance with his views of universal religion, is described by O. B. Frothingham as "perhaps the most penetrating and uplifting essay on that subject in any language." He printed notable essays on religion, reform, etc., in 'The Radical' and other periodicals. His great work 'Oriental Religions,' including 'India' (1872), 'China' (1877), and 'Persia' (1885)—the last containing an introduction and a critical estimate of Johnson by O. B. Frothingham—represents what Johnson himself calls his "purely humanistic point of view." His philosophy was highly transcendental; but being versed in many languages, he was acquainted with all schools, and with the results of history, literature, science, and criticism in every department. 'Oriental Religions,' in the task of writing which scholars have compared his competence, patience, and thoroughness with the same qualities in Darwin, has taken its place among the most learned and liberal contributions to the study of comparative religion and civilization. Prof. E. J. Eitel, the German Orientalist, wrote of "Johnson's pre-eminent merits as the historian of universal religion," and F. Max Müller paid him tribute as the finder of "a religion behind all religions." His 'Theodore Parker' (1890) is a profoundly spiritual interpretation of that preacher and reformer, whose work on the intellectual side was surpassed by Johnson's, while on the moral side, as in the anti-slavery conflict, they stood as equal comrades. A little volume of Johnson's hymns, with other poems, was published in 1899. Consult Longfellow, 'Lectures, Essays, and Sermons by Samuel Johnson, with a Memoir.' This volume contains some of Johnson's best papers, including brilliant lectures on 'Switzerland' and 'Florence,' the outgrowth of searching observations in Europe, 'Equal Opportunity for Woman,' 'Labor Parties and Labor Reform,' and an illuminative essay on 'Transcendentalism.'

Johnson, Samuel Frost, American painter: b. New York 1835. He received his art education in New York, Düsseldorf, Antwerp, and Paris, in which last place he was a pupil at the Ecole des Beaux Arts. He afterward went to

Ecouen and worked under the direction of Edouard Frère, the celebrated painter of children. He produces genre, still life and portraits. Among his genre subjects may be mentioned 'Caught at It'; 'Study of an Interior'; 'Roasted Chestnuts'; 'Good Night'; and 'A Thirsty Party.'

Johnson, Samuel William, American chemist: b. Kingsboro, N. Y., 3 July 1830. He studied at Yale Scientific School and the Universities of Leipsic and Munich. In 1856 he became professor of analytical and agricultural chemistry in the Sheffield Scientific School of Yale and since 1866 professor emeritus. He has published 'Essays on Peat Muck and Commercial Manures' (1859); 'How Crops Feed' (1870); etc.

Johnson, Thomas, American statesman: b. St. Leonard's, Md., 1732; d. 1819. He studied law at Annapolis, was elected to the first Continental Congress (1774), was again sent to Congress in 1776, and in the latter year became brigadier-general of Maryland militia. In 1777 he was chosen governor of Maryland, remaining in office until the close of 1779. In 1780 he entered the provincial congress and the house of delegates, in 1781-7 was in the Continental Congress, in 1791 became an associate justice of the United States Supreme Court, and later declined the office of chief justice.

Johnson, Tom Loftin, American capitalist and politician: b. Georgetown, Ky., 18 July 1854. He was clerk in a street railway office (1869-75), and invented several street railway devices; became owner of a street railway in Indianapolis and later acquired large interests in Cleveland and other cities; he was also interested in the iron manufacture in Cleveland. He has been prominent in politics as a member of the Democratic party, and is known as an advocate of the single tax (q.v.), and public ownership of public utilities. Though opposed to the free coinage of silver, he supported Bryan in 1896 and 1900, and the State convention which he controlled unanimously endorsed the Kansas City platform. He was a member of Congress from 1891-5. In 1901 he was elected mayor of Cleveland, and was reelected in the spring of 1903. In this position he has been an advocate of three cent street railway fares. In the fall of 1903 he was Democratic candidate for governor of Ohio, but was defeated by a large plurality.

Johnson, Virginia Wales, American novelist: b. Brooklyn, N. Y., 28 Dec. 1849. Since 1875 she has lived in Florence, Italy. Her publications include: 'Kettle Club Series' (1870); 'Travels of an American Owl' (1870); 'Joseph the Jew' (1873); 'A Sack of Gold' (1874); 'The Catskill Fairies' (1875); 'The Calderwood Secret' (1875); 'A Foreign Marriage' (1880); 'The Neptune Vase,' her finest work (1881); 'The Fainails of Tipton' (1885); 'Tulip Place' (1886); 'Miss Nancy's Pilgrimage' (1887); 'The House of the Musician' (1887); and other fictions, and several descriptive works, such as 'Genoa, the Superb'; 'The Lily of the Arno'; 'Lake Como.'

Johnson, Walter Rogers, American chemist: b. Leominster, Mass., 21 June 1794; d. Washington, D. C., 26 April 1852. He was graduated from Harvard in 1818, taught for many years in Framingham, and Salem, Mass., and in

JOHNSON—JOHNSON'S ISLAND

Philadelphia, and was professor of physics in the University of Pennsylvania, 1839–43. He was the first secretary of the Association for the Advancement of Science, and published ‘Use of Anthracite’ (1841); ‘Report on Coals’ (1844); ‘Coal Trade of British America’ (1850); etc.

Johnson, Sir William, British superintendent-general of Indian affairs in North America: b. Smithtown, County Meath, Ireland, 1715; d. near Johnstown, N. Y., 11 July 1774. His uncle, Sir Peter Warner, offered his nephew the management of his entire property in New York, if the latter would undertake its improvement and settlement. Johnson accepted the offer, and in 1738 established himself upon a tract of land on the south side of the Mohawk, about 25 miles from Schenectady, which Sir Peter had called Warrensburgh. In addition to the settling and improving of the country, he embarked in trade with the Indians, whom he always treated with perfect honesty and justice. He became a master of their language, speaking many of their dialects as perfectly as they did themselves, and was thoroughly acquainted with their beliefs and customs. He was adopted by the Mohawks as one of their own tribe, chosen a sachem, and named Wariaghejaghe, or Warraghiahy, “he who has charge of affairs.” In 1744 he was appointed colonel of the Six Nations, in 1746 commissioner of New York for Indian affairs. In 1750 he became a member of the provincial council. In 1754 he attended as one of the delegates from New York the congress of Albany, and also the great council held with the Indians on that occasion, at which they strongly urged his reappointment as their superintendent. At the council of Alexandria, 14 April 1755, he was sent for by Braddock and commissioned by him “sole superintendent of the affairs of the Six United Nations, their allies and dependents.” He was also, pursuant to the determination of that council, created a major-general, and commander-in-chief of the provincial forces destined for the expedition against Crown Point. At the head of these forces, in September 1755, he defeated Baron Dieskau at Lake George. This victory saved the colony from the French, and Johnson received the thanks of parliament for his victory, was voted £5,000, and on 27 Nov. 1755, created a baronet of Great Britain. On his arrival at Lac St. Sacrement a few days before this battle, he gave to it the name of Lake George, “not only in honor of his majesty, but to assert his undoubted dominion here.” In March 1756 he received from George II. a commission as “colonel, agent, and sole superintendent of the affairs of the Six Nations, and other northern Indians.” He held this office for the rest of his life. In 1758 was present with Abercrombie at Ticonderoga. General Prideaux led the expedition against Fort Niagara in 1759. Johnson was second in command, and upon the death of Prideaux, before that fort, succeeded to the command in chief. With upward of 1,000 Indian allies he continued the siege with great vigor and cut to pieces the French army. He led the same Indian allies the following year in the Canadian expedition of Amherst, and was present at the capitulation of Montreal and the surrender of Canada to the British arms in 1760. The war was now at an end, and the king granted to Sir William for his services a tract of about 100,000 acres of land, north of the Mohawk. In 1764,

the country being at peace, and the Indians perfectly contented, Sir William erected Johnson hall, a large wooden edifice still standing. The village of Johnstown, with stores, an inn, a court-house, and an Episcopal church, was soon laid out. In 1772 it became the shire town of Tryon County. Johnson lived in the style of an old English baron of former days, and exercised a liberal hospitality. In 1768 he concluded the treaty of Fort Stanwix. Consult the ‘Life’ by Stone (1865).

Johnson, William Henry, American historical novelist: b. Beaufort, S. C., 29 March 1845. He studied for the Episcopal ministry in the Theological Seminary of Virginia, served in the Confederate army during the Civil War, and in 1872 took orders in the Episcopal Church. In 1886 he withdrew from the Episcopal Church to enter the Unitarian, and was pastor for several years of a Unitarian church at Wilmington, Del. He has published ‘The King's Henchman’ (1898); ‘King or Knave: Which Wins?’ (1899); ‘The World's Discoverers’ (1900).

Johnson, William Samuel, American jurist: b. Stratford, Conn., 7 Oct. 1727; d. there 14 Nov. 1819. He was graduated from Yale in 1744, was admitted to the bar, practised in the New York and Connecticut courts, in 1761 and 1765 represented Stratford in the Connecticut general assembly, or lower house, and in the latter year was a Connecticut delegate to the Stamp-act congress at New York. In 1766 he became a member of the governor's council, or upper house of the Connecticut legislature, in 1766–71 was in England as special agent for the colony in defense of its title to land obtained from the Mohegan Indians, in 1771 re-entered the council, and for a time in 1772 was a judge of the superior court of the colony. After Lexington, he was a member of a committee sent to General Gage on the unsuccessful mission of inquiring into possible means of peace. Opposed to the Revolution, he remained in private life during its progress, but in 1784–7 was a member of the Continental Congress, in 1787–9 sat in the Connecticut assembly, in 1787–1800 was president of Columbia College, and from 1789 to 1791, when he resigned, was the first United States senator from Connecticut. His letters to the governors of Connecticut during his residence in Great Britain have been published in the ‘Collections’ of the Massachusetts Historical Society, 5th series, Vol. IX. (1885).

Johnson City, Tenn., city in Washington County, on the Southern railroad, 106 miles north of Knoxville. Its elevated location and picturesque mountain scenery make it a favorite summer resort for Southern people. Here is located the mountain branch of the National Soldiers' Home. The manufacturing interests include iron furnaces, rolling mills, machine shops, tanneries and brickmaking plants. The city was settled in 1870 and is governed under a charter of 1897, by a mayor and council elected biennially. Pop. (1890) 4,161; (1900) 4,645.

Johnson Grass. See GRASSES IN THE UNITED STATES.

Johnson's Island, Ohio, an island located at the mouth of Sandusky Bay, overlooking Lake Erie, about a mile long and a mile and a half wide. The island was used during the Civil War as a prison for captured Confederates. It

JOHNSTON

was an ideal spot for a prison post. No prisoner was ever known to escape from it. The grounds were enclosed within a fence 12 feet high, with a platform top, upon which sentinels paced to and fro day and night. To the north Lake Erie stretches away for 50 miles; on the east, separated by three miles of water, lies Sandusky, while west and south of the island are broad stretches of Sandusky Bay. The island was used almost exclusively as a prison for officers, the total number confined there from first to last aggregating over 15,000. The first prisoners were taken there in April 1862, and in September 1865 the last of them were sent to Fort Lafayette, and Johnson's Island was abandoned as a prison post. The men confined on Johnson's Island represented the flower of the chivalry of the South. They were largely professional men and planters, among them being many who were prominent in science, literature and art.

Johnston, jön-stōn, Albert Sidney, American general: b. Mason County, Ky., 3 Feb. 1803; d. Shiloh, Miss., 6 April 1862. General Johnston had but a brief career in the Confederate army, and the first part of that career was one of great disaster and consequently of severe criticism; but he fell "on the field of glory" at Shiloh, and not a few endorse the opinion of President Davis that he was the greatest general whom the war produced. Descended from a long line of illustrious ancestors, he obtained his literary education at Transylvania University, and was graduated at West Point 30 June 1826, being number eight in a brilliant class of which Jefferson Davis was a member. He was brevetted second lieutenant in the 2d infantry, transferred to the 6th infantry in 1827, was regimental adjutant from 1828 to 1832, aid to General Atkinson a year, and acting assistant adjutant-general to Illinois volunteers during the Black Hawk War—in all of which positions he showed the qualities of an accomplished soldier. He resigned his commission in the United States army 31 May 1834, having determined to settle in Texas and cast in his fortunes with the "Lone Star" Republic.

The battle of San Jacinto was fought 21 April 1836, and soon after Johnston arrived in Texas and enlisted as a private soldier in the Texan army. His merit soon brought him promotion, and he was made adjutant-general of the Army of Texas, and not long after brigadier-general and chief commander of the army in the place of General Felix Houston. As a result of jealousy growing out of this promotion there was an unfortunate duel between Houston and Johnston, in which the latter was wounded. He continued in command of the Texan army until 1838, when he was made secretary of war of the Republic of Texas. In 1839 he led an expedition against the hostile Cherokee Indians, and in a battle on the Neches, defeated and routed them with great slaughter. He used all of his abilities and wide influence in bringing about the annexation of Texas to the United States, and promptly enlisted when the Mexican War broke out, being colonel of a regiment of Texas volunteers. He was distinguished in various battles, especially at Monterey, where he had three horses shot from under him, and was highly complimented by General Butler on whose staff he was serving.

On 31 Oct. 1849 he was appointed by President Taylor paymaster in the United States army, with the rank of major, and when the 2d cavalry regiment was formed he was appointed, 3 March 1855, its colonel on the recommendation of his old classmate and lifelong friend, Jefferson Davis, who was at that time the able and efficient secretary of war. In 1857 he was put in command of an expedition to Utah to force the Mormons to submit to the laws of the United States Government, and overcame great difficulties and showed such ability and tact in the delicate mission that he was made brevet brigadier-general. When the War between the States broke out General Johnston was in command of the department of the Pacific, but he very promptly resigned his commission, and with a small party made his way across the plains, passing through New Orleans and reached Richmond on 2 September, where he had a cordial reception and was made a full general, and assigned to the command of the department of Kentucky, whither he went at once, beginning the able and efficient discharge of his duties there.

It could not be published at the time that he had a force barely 20,000 to defend that long line against overwhelming numbers of the enemy, and he was severely criticised in the newspapers for not being more aggressive, and when Forts Henry and Donelson fell, and he was compelled to fall back and abandon to the enemy so large a section of Confederate territory that abuse and severest criticism were heaped upon him, he was denounced as incompetent and his removal from command was demanded. President Davis calmly said: "If Albert Sidney Johnston is not a general, then I have none to put in his place." He wrote his old friend a noble letter, and Johnston replied in the same spirit, concluding with this sentiment: "The test of merit in my profession, with the people, is success. *It is a hard rule, but I think it right.* If I join this corps to the forces of General Beauregard (I confess a hazardous experiment), then those who are now exclaiming against me will be without an argument." He alluded to his plan of uniting with Beauregard to strike Grant before Buell and Mitchel could join him, and in pursuance of which plan he marched from Corinth, Miss., on 3 April, intending to attack Grant at Pittsburg Landing, or Shiloh Church, twenty miles off, on 4 April. There was delay on the part of some of the troops so that the attack could not be made until the morning of the 6th, but with his 40,000 men Johnston attacked Grant's 50,000 with such impetuosity, skill, and dash, that the Federals were driven back at every point, were huddled together at Pittsburg Landing, and there seemed to be lacking at 2:30 p. m. only one more vigorous advance to annihilate Grant's army. But just at this moment the great commander who had just remarked to one of his staff: "The victory is ours. We shall soon water our horses in the Tennessee River," was struck by a minie ball in his leg, and bled to death in 15 minutes. In the confusion which followed, the advance was not made. Beauregard (who had been ill in his ambulance all day and did not appreciate the real situation) ordered the Confederate lines to fall back. Buell and Mitchel came up that night with 55,000 fresh troops, and thus the fruits of Johnston's great

JOHNSTON

victory were lost, and the next day the Confederates were compelled to fall back to Corinth.

No nobler eulogy could be pronounced on Albert Sidney Johnston than that of President Davis in a special message to the Confederate Congress, in which he said: "Without doing injustice to the living, it may safely be said that our loss is irreparable. Among the shining hosts of the great and good who now cluster around the banner of our country, there exists no purer spirit, no more heroic soul than that of the illustrious man whose death I join you in lamenting. In his death he has illustrated the character for which, through life, he was conspicuous—that of singleness of purpose and devotion to duty with his whole energies. Bent on obtaining the victory which he deemed essential to his country's cause, he rode on to the accomplishment of his object, forgetful of self, while his very life blood was fast ebbing away. His last breath cheered his comrades on to victory. The last sound he heard was their shout of victory. His last thought was his country, and long and deeply did his country mourn its loss."

It is scarcely extravagant to say that had Albert Sidney Johnston lived the victory at Shiloh would have been complete, the whole character of the campaign in the West would have been changed, and with Lee in Virginia and Johnston in the West, the result of the War might have been different. The monument to Albert Sidney Johnston in New Orleans is one of the most beautiful in the country; he is buried in Austin, the capital of his adopted State, and Texas proposes to honor herself by erecting to his memory a fitting monument.

J. W. M. JONES,
Author and Lecturer.

Johnston, Alexander, American historian: b. Brooklyn, L. I., 29 April 1849; d. Princeton, N. J., 21 July 1889. He was graduated from Rutgers College, N. J., in 1870, studied law and was admitted to the bar in 1876. He did not practise, however, and was professor of jurisprudence and political economy at Princeton University from 1883 till his death. He was the author of 'History of American Politics' (1879); 'Connecticut: a Study of a Commonwealth-Democracy' (1887); 'History of the United States for Schools' (1886); and 'The United States: its History and Constitution,' reprinted from the 'Encyclopædia Britannica' (1887).

Johnston, Alexander Keith, Scottish cartographer: b. Kirkhill, Edinburgh, Scotland, 28 Dec. 1804; d. 10 July 1871. His first important work, the 'National Atlas,' was published in 1843. At the suggestion of Humboldt, he visited Germany and gathered material for his 'Physical Atlas of Natural Phenomena' (1847-9), and his 'Royal Atlas of Geography' (1861) was one of the most beautiful and minutely accurate atlases ever published up to that time. His son of the same name (b. 1846; d. 28 June 1879) continued his father's enterprises.

Johnston, Gabriel, American colonial governor of North Carolina: b. Scotland 1609; d. 1752. Very little is known of his personal history. He was educated at the University of St. Andrew's, with a view to the medical profession, which he seems not to have practised. He

was for a while professor of Oriental languages at St. Andrew's, and then removed to London, where he was engaged with Pulteney and Bolingbroke in writing for the 'Craftsman.' By the influence of the Earl of Wilmington he was appointed governor of North Carolina, and took the oath of office at Brunswick 2 Nov. 1734. He was the ablest and most successful of all the colonial governors, holding the reins of power up to the time of his death.

Johnston, Harriet Lane, American gentlewoman: b. Mercersburg, Pa., 1833; d. Narragansett Pier, R. I., 3 July 1903. She was the niece of James Buchanan, afterward President of the United States, and on the death of her mother, Buchanan's sister, in 1839, was brought up under the care of her uncle. When the latter was minister to Great Britain, the niece presided over the hospitalities of the legation in London, and during his occupancy of the White House was its mistress, receiving among other distinguished guests the Prince of Wales, now Edward VII. On the occasion of his coronation in 1902 she was among the specially invited guests in recognition of the courtesies extended to him at the White House so long before. In 1866 she was married to Henry Elliott Johnston of Baltimore.

Johnston, Sir Harry Hamilton, English traveler: b. London 12 June 1858. He was educated at King's College, London, and the Royal Academy of Arts, traveled in North Africa, 1879-80, and Portuguese West Africa, and the Kongo region, 1882-3. He commanded a scientific expedition to Mount Kilimanjaro in 1884 and has held various consular posts in Africa. He has published 'Essays on the Tunisian Question' (1880-1); 'The River Congo' (1884); 'Kilimanjaro' (1885); 'History of a Slave' (1889); 'Life of a Livingstone' (1891); 'British Central Africa' (1897); 'History of the Colonization of Africa by Alien Races' (1899); 'The Uganda Protectorate' (1902).

Johnston, Henry Phelps, American historical writer: b. 1842. He is professor of history in the College of the City of New York, and has published 'The Battle of Harlem Heights'; 'Loyalist History of the Revolution'; 'The Yorktown Campaign'; etc.

Johnston, James Steptoe, American Episcopal bishop: b. Church Hill, Miss., 9 June 1843. He was educated at the University of Virginia, served as 2d lieutenant in the Confederate cavalry during the Civil War, subsequently studied law and was admitted to the bar. After practising for a short time he took orders in the Episcopal Church in 1869 and after holding rectorships at Port Gibson, Miss., six years; Mount Sterling, Ky., four years; and Mobile, Ala., eight years, became bishop of western Texas in January 1888.

Johnston, John, American Indian agent: b. Ballyshannon, Ireland, March 1775; d. Washington, D. C., 19 April 1861. He came to Cumberland County, Pa., in 1786, obtained a post in the War Department, in 1792 went to the Ohio Valley, later became a United States factor at Fort Wayne, Ind., and at the beginning of the War of 1812 was appointed Indian agent for Ohio, with headquarters at Piqua. President Harrison appointed him agent to the Senecas, with headquarters at Upper Sandusky, and in that capacity negotiated with the Senecas the

JOHNSTON

treaty whereby they agreed to move westward across the Mississippi. He was president of the Historical and Philosophical Society of Ohio, and wrote: 'Present State of the Indian Tribes Inhabiting Ohio,' printed in 'Archæologia Americana' (transactions and collections of the American Antiquarian Society), Vol. I. (6 vols., 1820-74).

Johnston, Joseph Eggleston, American soldier: b. Cherry Grove, Va., 3 Feb. 1807; d. Washington, D. C., 21 March 1891. He was graduated at West Point in 1829; and served with distinction in the Black Hawk and Seminole wars. In the Mexican War he distinguished himself also and was brevetted major and colonel United States army for bravery at Cerro Gordo. He was promoted quartermaster-general of the army with the rank of brigadier-general in June 1860, but resigned his commission when Virginia seceded. He was then made major-general of Virginia volunteers and later full general in the Confederate service, taking an active part in the first battle of Bull Run, 21 July 1861, where he personally led a charge with the colors of the 4th Alabama regiment in his hands. At the battle of Fair Oaks, 31 May 1862, Johnston was severely wounded and was disabled for service for several months. In November he again reported for duty and was assigned to the Military Department of Tennessee. In the operations of Grant before Vicksburg he did everything possible to prevent the shutting up of General Pemberton in Vicksburg, telegraphing him May 2: "If Grant crosses, unite all your troops to beat him. Success will give back what was abandoned to win it." Although similar orders were repeatedly sent to Pemberton, they were disregarded; Pemberton allowed himself to be shut up in Vicksburg, and the siege and surrender on 4 July followed. In December of the same year he took command of Bragg's army at Dalton, Ga., and by the spring of 1864 brought it to a state of efficiency which it had not previously had, though it contained only 45,000 men against Sherman's 98,797. The campaign from Dalton to Atlanta, a distance of 100 miles, was a series of severe engagements without a general battle, Johnston's friends claiming "the retreat had been the masterpiece of Johnston's life, and one of the most skilful and successful that had ever been executed." On 17 July 1864 Johnston was superseded in this command by General Hood. In the early part of 1865 he was several times defeated by Sherman, to whom he surrendered at Durham Station, N. C., on 26 April, the terms of capitulation resembling those granted to Lee at Appomattox. After the war Johnston engaged in business, and was member of Congress 1876-8. He was United States Commissioner of Railways 1885-9, and the author of 'A Narrative of Military Operations During the Late War' (1874). Consult: Hughes, 'General Johnston' (1893).

Johnston, Mary, American novelist: b. Buchanan, Botetourt County, Va., 21 Nov. 1870. In 1898 she became suddenly famous through her 'Prisoners of Hope: a Tale of Colonial Virginia,' and her next book 'To Have and to Hold' (1900) was even more popular. She has since published 'Audrey' (1902).

Johnston, Richard Malcolm, American author: b. Powelton, Ga., 8 March 1822; d. Baltimore, Md., 23 Sept. 1898. He was graduated at Mercer University in 1841; was admitted to the bar in 1843; and began practice in Sparta, Ga., the same year. He was professor of literature in the University of Georgia in 1857-61 and served as colonel in the Confederate service during the Civil War. At its close he established a boys' boarding school at Sparta, which he removed in 1867 to Baltimore, and of which he was the head for many years. His publications include: 'Historical Sketch of English Literature'; 'Life of Alexander H. Stephens' (1883); 'Dukesborough Tales' (1883); 'Old Mark Langston'; 'Ogeechee Cross-Firings' (1889); 'Mr. Absalom Billingslea and Other Georgia Folk' (1887); 'Studies Literary and Social' (1891-2); 'The Primes and Their Neighbors'; 'Mr. Billy Downs and his Likes.' The usual theme of his longer as well as his shorter fictions is the life of the middle class Georgian in the ante-bellum period.

Johnston, Samuel, American lawyer and statesman, nephew of Gabriel Johnston (q.v.): b. Dundee, Scotland, 15 Dec. 1733; d. near Edenton, N. C., 18 Aug. 1816. His father, John, came to North Carolina in 1736, became surveyor-general, and acquired large landed estates. The son chose the profession of the law, and was clerk of the superior court in Chowan County for five years from 1767, and served there also as naval officer under the crown. Elected to the assembly in 1769 from the first he espoused the popular side, and in 1773 the assembly placed him on its standing committee of inquiry and correspondence, the organ by which it sought to co-operate with the other provinces. This was the first decisive step toward revolution taken by the legislature of North Carolina. He was an active member of the first two provincial congresses in this province. The 3d and 4th met at his summons, and he presided over the deliberations of both. In the 3d, August 1775, the political organization of the province was decided on, and the supreme executive authority was entrusted to a provincial council, of which he was made the chairman, and so virtually the governor of the province. In September 1775 he was chosen treasurer for the northern district of North Carolina. In 1781-2 he was a member of the Continental Congress. In 1787 he was elected governor of the State, and in 1788 presided over the convention which rejected the Federal Constitution, which, however, he supported with all his influence. He was United States senator 1789-93, and judge of the superior court 1800-03.

Johnston, William Preston, American educator: b. Louisville, Ky., 5 Jan. 1831; d. Lexington, Va., 16 July 1899. He was a son of A. S. Johnston (q.v.) and was graduated at Yale in 1852 and from the Louisville Law School in 1853. He served as colonel and aide-de-camp to Jefferson Davis in the Confederate army during the Civil War, and soon after its close became professor of history and literature at the Washington and Lee University, remaining there till 1877. In 1880 he became president of the Louisiana State University, and after its union with Tulane University, New Orleans, in 1884, was president of that institution till his death. His

JOHNSTOWN—JOINT

publications include: 'Life of General Albert Sidney Johnston'; 'The Johnstons of Salisbury'; 'The Prototype of Hamlet'; and 'Seekers after God' (poem).

Johnstown, jōnz'town, N. Y., city and county-seat of Fulton County, on Cayadutta Creek, and on the Fonda, J. & G. railroad, 44 miles northwest of Albany. In 1771, a few years after its settlement, it was named after its founder, Sir William Johnson, whose mansion, built here 10 years earlier, still stands almost as it was left by him. In 1808 Johnstown was incorporated as a village, and in 1805 it received a city charter. The court-house and jail, built by Sir William Johnson in 1772, occupy with Johnson Hall an interesting place in local history. The city has a public library building which was the gift of Andrew Carnegie. The industries of Johnstown include a variety of important manufactures, chief among which are those of gloves and mittens, knit goods of different kinds, leather, gelatin, lumber, grist-mill and machine-shop products, etc. The municipal government is well supported by public spirit, and the city's affairs are efficiently managed. The people elect the water board and the school board, and the waterworks are owned and operated by the city. Pop. (1890) 7,768; (1900) 10,130.

Johnstown, Pa., city, county-seat of Cambria County; on the Conemaugh River, and on the Baltimore & O. and the Pennsylvania R.R.'s; about 80 miles east of Pittsburgh. The Little Conemaugh River and Stony Creek unite at Johnstown and form the Conemaugh River. The area of the city is about five square miles, and the valley in which it is located is about 1,200 feet above sea-level. Johnstown was settled about 1790, but was not incorporated until 1889. Its situation, in a coal and iron ore region, combined with its great water power, has made it an important manufacturing centre. Fire-clay and limestone are also found in the vicinity. Some of its industrial establishments are the Cambria Steel Company works, where about 10,000 men are employed, the Lorain Steel Company, iron and steel works, iron-plate mills, street-car rail factory, planing-mills, cement works, furniture factories, potteries, breweries, brick-yards, machine-shops, foundries, furnaces, wire works, leather, and woolen goods. Some of the noted public buildings are the Cambria Free Library, the Conemaugh Valley Memorial Hospital, several churches, the Franciscan Monastery, the city hall, and the high school. The number and arrangement of the parks add to the beauty of the place. In Grand View Cemetery are the graves of 800 unidentified dead who perished in the "Johnstown Flood." This disastrous flood occurred on 31 May 1889, and was the result of the destruction of a dam across South Fork, a small branch of the Conemaugh River. Heavy rains had fallen and the mountain streams of the vicinity had become roaring torrents. The dam kept back the waters of Conemaugh Lake, about two and one half miles long, one and one half miles wide, and averaging over 50 feet in depth; in some places the water of the lake was 100 feet in depth. The direct distance from the city was about 12 miles, but along the river the distance was five or six miles longer. In a very short time after the dam had burst, the valley was flooded and

Johnstown and several small villages were under water. The loss of lives was 2,235 or more, and the loss of property was estimated to be about \$10,000,000. Aid for the sufferers came from all parts of the country; and the city was soon rebuilt, and its industries re-established. Pop. (1890) 21,805; (1900) 35,936.

Joint, in anatomy, an articulation or connection between bones. Many of the immovable joints are so close in their union that the two bones practically become one, as in the dovetailed sutures of the skull. In the make-up of a movable joint there are the two bones, and covering the surface of each a layer of tissue of rubbery consistency called cartilage; binding the bones together are firm inelastic bands of tissue called ligaments. Over the surface of the cartilage and the inner surfaces of the ligaments there is a thin smooth layer of tissue, the synovial membrane, which is kept constantly moist with an oily fluid to prevent friction. Joints are classified according to the variety of motions they allow: the freest is the ball-and-socket joint, as seen in the hip and shoulder.

Diseases of Joints.—Joint-diseases are distinguished by names that indicate the principal structure involved and the causes of disease. Where the cause is a specific disorder, as tuberculosis, rheumatism, syphilis or gonorrhœa, the name of that particular malady is given to the inflammation. The only structure of a joint that is apt to be involved alone is the synovial membrane, and inflammation of this structure is called synovitis. Inflammation of all the joint-structures is called arthritis, and where the bone is the primary seat of the trouble, or is principally involved, the name osteo-arthritis is used.

Synovitis.—This condition results from injuries (sprains, bruises, and wounds), from overuse, acting as an injury, and from poisons circulating in the blood. The joint is painful, moves with greater pain, and may be red outside. Blood-serum is poured out, and the synovial sac is distended. (This condition constitutes "water on the knee.") The general symptoms and severity depend on the cause of the trouble. Absolute rest of the joint and pressure by a snug bandage hasten recovery. When such injuries are repeated, or when the inflammation is slight but persistent, painting with iodine tincture may be of value. When the condition of inflammation reaches the suppurative stage all the structures of the joint are involved, and the condition is considered under the term "arthritis."

Arthritis (non-specific).—This is due to the extension of disease of contiguous bone, or it may result from wounds or in the course of various diseases. The joint becomes swollen, red, very painful, and the general symptoms are severe. When the poison is sufficiently virulent, suppurative arthritis results, and the pus collects in the synovial sac. (See INFLAMMATION.) In this condition the joint becomes "boggy," and the poisoning of the entire system is so severe as to warrant the most radical measures for relief. Opening the joint and allowing the escape of the pus, with thorough cleansing, may be sufficient, or the limb may have to be sacrificed. See ARTHRITIS; ARTHRITIS DEFORMANS; GOUT; RHEUMATISM; SYPHILIS.

JOINT GRASS — JOINVILLE

Knock-knee.—This is a deformity of the legs, consisting in the angular projection of the knee inward, and is sometimes called in-knee. It arises in children learning to walk who are affected with rickets (q.v.). The deformity is due to the faulty growth of the bones which enter into the joint. In early life, correction of it may be secured by splints and braces; but when the bones become less pliable, the femur, the tibia, or both may have to be severed by chiseling and the bones held in the normal line by plaster casts until union has taken place.

Charcot's Disease.—The peculiar form of arthritis thus named occurs in the course of locomotor ataxia, the knee-joint usually being the one affected. The joint swells painlessly, the structures are worn away, and the function of the joint is lost.

Injuries of Joints.—See DISLOCATION.

Sprains.—These are wrenches resulting in more or less stretching or laceration of ligaments, hemorrhage in and around the joint, and sometimes the displacement of tendons. The part usually swells at once, and movement causes severe pain. This injury may closely resemble a joint-fracture. Absolute rest of the joint must be insisted upon, as synovitis may follow. Alternating hot and cold applications, if started early, lessen the damage. The joint should then be snugly bandaged and kept so until swelling and tenderness disappear.

Wounds of Joints.—Injuries of this nature may cause damage directly to the structures or by infecting the joint and producing arthritis. Penetration into the synovial sac is indicated by an escape of the viscid fluid.

Floating Cartilages.—These are rarely seen except in the knee-joint, where they are ordinarily due to a small portion of cartilage being bitten off between the bones; this piece then floats around in the synovial sac, and causes trouble when the bones lock together on it. When this occurs, the patient falls to the ground because of the severe pain. The synovial membrane is injured, and is apt to be mildly inflamed. These bodies may sometimes be felt through the skin, and can be held, by holding the joint in the same position, until an opening is made; but ordinarily when the attacks become so frequent as to be unbearable the joint has to be opened and searched.

Joint or Knot Grass. See GRASSES IN THE UNITED STATES.

Joint-snake. See GLASS-SNAKE.

Joint Tenants, persons who hold or own lands jointly, by title created expressly by one and the same deed or will. It has been uniformly held by the courts that a unity of possession derived by several and distinct conveyances does not constitute a joint tenancy, but rather a tenancy in common. Joint tenants must have the same interest, derived from the same conveyance, commencing at one and the same time, and held by a united possession. The duration of the estates must be alike in both, and also the interest. Should one hold under the conveyance for a term of years, and the other for life, the possession even for a term of years would not be a joint tenancy. The estate must vest in each tenant at the same time. In the case of a will which gives one an interest to commence at a day named and another an

interest to commence a year later, no joint tenancy is created thereby. Should one receive an interest absolute and another an interest for life, the relation of joint tenants would not be created. The doctrine of survivorship is the distinguishing incident of title by joint tenancy. In the event of the death of one of the joint tenants, the survivor is entitled to the whole property, and the full title immediately vests in him. This is not an incident of tenancy in common. Many of the States of the Union have abolished title by survivorship in joint tenancy by constitutional provisions or by express statute enactments. In other States acts have been passed abrogating the distinction between joint tenants and tenants in common; and inheritance by survivorship not being an incident of tenancy in common, such acts are construed by the courts as abolishing such inheritance. Such acts do not apply to existing joint tenancies, but only to such as may be created after the enactment.

Joint-worm, the larva of chalcid flies (see CHALCIS) which make galls near the "joints" of grass-plants, and thus are sometimes of great injury to cereal crops, especially wheat and barley. See WHEAT INSECT-PESTS.

Jointure, join'tür, a settlement of lands and tenements made to a woman in consideration of marriage, as a substitute for dower. Originally it was a joint estate limited to both husband and wife as a joint tenancy and subjected to survivorship. The wife takes nothing under the settlement until after the death of the husband, unless special provisions are incorporated, which in reality modifies the effect of a regular jointure. In some settlements, denominated jointures, provisions are inserted to the effect that they are not to exclude enjoyment of dower; but such provisions are an innovation upon the established province of jointures. A good jointure must provide that it shall take effect, in possession and profit, immediately after the death of the husband; that it shall be for the life of the wife herself, and cannot be left in trust for her use and benefit. It should be provided that it is in settlement of all dower interest, in order to maintain its distinctive features of jointure. The settlement must be executed before marriage, as marriage constitutes the entire consideration for the jointure. Such an instrument properly executed before marriage is binding on the wife and a complete bar to dower in any dowable lands owned or conveyed by the husband during the marital relations. Without the intervention and assistance of legislative action, no other form of agreement is effectual to bar dower. It sometimes happens that the wife is deprived of her jointure by lawful acts to which she is not a party, as by the lands being taken for public purposes, or in some other manner equally legitimate. In such a case the settlement does not bar her claim against the husband's estate to the extent to which she is deprived of her jointure.

Joinville, Jean, zhōñ zhwān-vēl, SIEUR DE, French historian: b. Champagne 1224; d. 11 July 1317. He early entered the service of Thibaut, king of Navarre, and in 1248 raised a troop of 9 knights and 700 armed soldiers, and accompanied Louis IX. in his first crusade to

JOKAI—JOLLY BALANCE

the Holy Land. He rose high in favor with Louis, shared his captivity, returned with him to France in 1254, and spent much of his time at court. His 'Histoire de St. Louis,' which is one of the most valuable specimens of early French prose, has been often reprinted.

Jokai, yō'kä-i, **Maurus**, Hungarian novelist: b. Komorn 19 Feb. 1825; d. Budapest 5 May 1904. In 1846 he received his advocate's diploma, but never practised, and from a very early age devoted himself to literary work. In 1842 he produced a drama, 'The Jew Boy,' in 1846 his first novel, 'Work-Days,' was published, and in 1847 he issued a collection of stories entitled 'Flowers of the Desert.' His 'Revolution and Battle Pictures' appeared in 1849, and after that he devoted himself with extraordinary energy to journalistic and literary work, producing in all more than 300 volumes. He was a member of the Hungarian parliament and the recognized leader of the Liberal opposition since the restoration of the constitution, and in 1897 was appointed a life member of the House of Magnates. He was a successful newspaper editor continuously from 1858 till his death, his last paper being the 'Nemzet' (Nation). He is best known by his numerous romances and novels. Among the latter are 'Transylvania's Golden Age' (1851); 'The Man with Two Horns' (1852); 'The Turks in Hungary' (1852); 'A Hungarian Nabob' (1854); 'Kárpáthy Zoltan' (1855); 'Political Fashions' (1861); 'The New Landlord' (1862); 'Dr. Dumany's Wife' (Eng. trans. 1891); 'In Love With the Czarina' (Eng. trans. 1894); 'The Nameless Castle' (Eng. trans. 1891); 'The Green Book' (Eng. trans. 1897); 'The Lion of Janina' (Eng. trans. 1897); 'The Poor Plutocrats' (Eng. trans. 1899); 'Debts of Honor' (Eng. trans. 1900); 'The Baron's Son' (Eng. trans. 1900); 'The Day of Wrath' (Eng. trans. 1900). His best plays are: 'King Koloman' (1855); 'Manlius Sinister' (1856); 'Georg Dózsa' (1858); 'The Martyrs of Szigetvár' (1859); and 'Milton' (1878). His 'Political Poems' appeared in 1880. In his novels Jokai has been chiefly influenced by French schools, formerly by Hugo, latterly by Zola. Consult Nevai, 'M. Jokai' (1894).

Joliet, Charles, shär'l zhō-lé-ä, French journalist and miscellaneous writer: b. St. Hippolyte-on-the-Doubs 8 Aug. 1832. He has contributed to every periodical of note in Paris, and has published an extraordinary number of books, among which may be noted 'The Athenians,' poems; 'The Story of Two Young Wives,' a novel (1866); 'Mademoiselle Cherubin' (1870); 'Trois Uhlan's' (1872); 'Roman incoherent: Scènes de la vie d'artiste' (1887).

Joliet, jō'lé-ät, Fr. zhō-lé-ä, **Louis**, American explorer: b. Quebec 21 Sept. 1645; d. Canada May 1700. He was educated at the Jesuit College of Quebec, and subsequently engaged in the fur trade on the western frontier, thereby becoming familiar with the missionaries, and with the habits and languages of various Indian tribes. Such was his reputation for prudence and experience that he was selected by the governor Frontenac to ascertain the direction and mouth of the Mississippi, a few of whose affluents had already been visited by mission-

aries and traders. Starting with his companion, the illustrious Father Marquette (q.v.), and five other Frenchmen, from Green Bay in June 1673, he ascended the Fox River, and descended the Wisconsin to its confluence with the Mississippi, down which they sailed as far as the country of the Chickasaws, below the entrance of the Arkansas. Having ascertained with tolerable accuracy the general course of the stream, they returned to Green Bay, by the way of Illinois River, Chicago, and Lake Michigan, whence Joliet started alone for Quebec. The whole route traveled by them is estimated at 2,500 miles. He lost his journal and other papers in the rapids above Montreal, but wrote out from recollection a few pages of manuscript, which agree with the narrative of Marquette. In the same manner he prepared a map of the region explored. The French government inadequately rewarded him for his services with the island of Anticosti at the mouth of the St. Lawrence, where he built a house and fort for his family, intending to embark in trade. He appears, however, to have been subsequently employed in the West. In 1691 his island was captured by a British fleet and his property destroyed. In 1697 the seignory of Joliet, Canada, was assigned to him. Joliet, the capital of Will County, Ill., is named after him. Consult: Parkman, 'La Salle' (1869); Winsor, 'Narrative and Critical History of America' (1884-7).

Joliet, jō'lé-ät, Ill., city, county-seat of Will County; on the Des Plaines River, and on the Chicago, R. I. & P., the Michigan C., the Atchison, T. & S. F., the Elgin, J. & E., the Lake Shore & E., and the Chicago & A. R.R.'s; about 30 miles southwest of Chicago. The first permanent settlement was made in 1831 and the city was chartered in 1859. The place was named in honor of Louis Joliet, a Canadian navigator and one of the party who with Marquette visited this place in 1673. The Illinois and Michigan Canal and the Joliet River supply the city with good water power. The city is situated in a rich agricultural region, and large limestone quarries are in the vicinity. Its chief manufacturing establishments are the American Steel and Wire Company works, the Illinois Steel Company factory, the American Tin Plate Company, machine-shops, agricultural implement works, foundry and furnace products, breweries, flour-mills, boot and shoe factories, and furniture factories. Some of the public institutions are the State penitentiary, Silver Cross and Saint Joseph's hospitals, Saint Mary and Saint Francis academies, and a public library which contains about 16,000 volumes. The Illinois Steel Company Atheneum, a club-house for workingmen, is a fine institution. Several of the churches and public schools are good buildings. The city owns and operates the waterworks. Pop. (1890) 23,264; (1900) 29,353.

Jolly Balance, a spring balance devised by Prof. Philipp von Jolly, of the University of Munich, for determining the specific gravities of small objects. In its usual form it consists essentially of a long spiral spring of fine wire, to the lower end of which two pans are attached, one above the other. The lower pan is kept immersed in water, while the upper one remains in the air. The object whose specific gravity is to be determined is placed in the upper

JONAH—JONES

pan first, and the extension of the spring due to the weight of the object in the air is noted. The specimen is then transferred to the lower pan (where it will be under water), and the extension of the spring under these new conditions is also noted. The specific gravity of the specimen is then obtained by dividing the extension of the spring when the object is in the air by the difference between the two extensions as observed for air and water, respectively. The extension of the spring is observed by means of a graduated scale engraved upon a mirror that is placed back of the spring, and parallel to it. In taking a reading, the eye is brought into such a position that the image of the pupil is seen in the mirror directly behind the image of the pointer at the lower end of the spring. In this way errors of parallax are avoided in the readings. The Jolly balance is chiefly used for the rapid determination of the specific gravities of minerals and similar objects, where great precision is not essential.

Jonah, jō'na, a Hebrew prophet: b. Gath-hepher, Galilee. He flourished in the early years of Jeroboam II., king of Israel, who acceded to the throne 781 B.C. In 2 Kings xiv. 20 we are told that Jonah predicted to Jeroboam his victories over the Syrians. In the narrative of this so-called prophecy of Jonah we see the son of Amitai despatched on an errand of unique importance. He is to go to Nineveh to warn the inhabitants of the destruction of their city, which is to follow within 40 days. The Assyrians at that time were in a reduced condition, their power was broken, and they were inclined to heed the warning. A fast was proclaimed and the threatened judgment was thus averted. Chapter 1st of the book tells the story of Jonah's refusal to obey the command to go to Nineveh; his flight westward, his miraculous arrest, ending in his imprisonment in the belly of a large fish. Then follows a psalm of thanksgiving for deliverance from the fish. The 3d chapter relates to the preaching of Jonah and the repentance of the Ninevites followed by the reprieve of their city. Finally Jonah is rebuked for his anger at the sparing of Nineveh, by which his prophetic reputation ran the risk of being discredited. The book is in no proper sense a prophecy, but is intended to rebuke the haughty exclusiveness of Israel. The Jews were inclined to rejoice at the calamities of the heathen, and the present reprimand is all the more severe because the Assyrians had been and were afterward again to be the most powerful and dangerous foe to the peace of Palestine.

Jonah Crab, a crab of southern New England (*Cancer borealis*) related to the common edible species, but more robust, and with a thicker, harder shell. It is eaten locally.

Jo'nas, Benjamin Franklin, American lawyer and politician: b. Williamston, Ky., 19 July 1834. He was graduated from the law department of the University of Louisiana in 1855, and on the outbreak of the Civil War entered the Confederate army as private and rose to the rank of adjutant. In 1865 he was elected to the Louisiana legislature, to the State senate in 1872, and was then chosen city attorney of New Orleans. After a second term in the State legislature, he was elected to the United States Senate from Louisiana and served from 1879

to 1885. He was appointed by President Cleveland collector of the port of New Orleans (1885-9).

Jonas, yō'nās, **Justus** (originally **Joest Koch**), German religious reformer: b. Nordhausen, Saxony, 5 June 1493; d. Eisfeldt 9 Oct. 1555. He accompanied Luther to the diet at Worms, assisted him in translating the Old Testament, took part in the Marburg Conference as well as in drawing up the so-called articles of Torgau and was present at the Diet of Augsburg. He did good service to the cause of the Reformation not only by his preaching but by his vigorous translations into German of the Latin works of Luther and Melanchthon.

Jon'athan, son of Saul, king of Israel. He carried on the war against the Philistines for some time with victorious success, but in the battle of Gilboa (1033 B.C.) was slain. His friendship for David is one of the most beautiful incidents in Old Testament history, and the elegy or dirge composed by David on his death—'The Song of the Bow'—is in the highest strain of Hebrew poetry.

Jonathan. See BROTHER JONATHAN.

Jones, Alexander, American inventor and journalist: b. North Carolina about 1802; d. New York 25 Aug. 1863. He studied medicine in Philadelphia, entered practice in Mississippi, there became interested in cotton cultivation, and made important improvements in the cotton-gin which soon were in general use at the South. In 1840 he was invited by the East India Company to visit India and develop cotton culture there, but declined. He invented also a street-sweeping machine. He became an agent of the Associated Press in 1850, and subsequently commercial reporter of the New York *Herald*. His published volumes are: 'Cuba in 1851' (1851); 'Historical Sketch of the Electric Telegraph' (1852); and 'The Cymri of '76' (1855).

Jones, Alfred Gilpin, Canadian statesman: b. Weymouth, Nova Scotia, September 1824. After a secondary education, he entered mercantile life, opposed confederation in 1865, sat in the Dominion Parliament for Halifax in 1867-72 and again in 1874-8, was a member of the privy council, and in 1878 was minister of militia. In 1887-91 he was a third time in Parliament. At first a Conservative, he later identified himself with the Liberals, and favored a trade-union with the United States.

Jones, Amanda Theodosia, American poet: b. East Bloomfield, Ontario County, N. Y., 19 Oct. 1835. Some of her war songs were very popular. She published: 'Ulah and Other Poems' (1860); 'Atlantis and Other Poems' (1866); 'A Prairie Idyl, and Other Poems' (1882).

Jones, Anson, last president of the Republic of Texas: b. Great Barrington, Mass., 20 Jan. 1798; d. Houston, Texas, 7 Jan. 1858. He commenced the study of medicine in Litchfield, Conn., in 1817, and in 1820 was licensed to practise. He established himself in 1833 in Brazoria, Texas, and upon the outbreak of the troubles between Texas and Mexico, became one of the earliest advocates of the severance of the two countries. In the succeeding war of independence he served as a private soldier, and as surgeon in the Texan army. In 1837-8 he

JONES

was a representative in the Texan congress from Brazoria County; in 1838 was sent as minister to Washington, where he endeavored, though unsuccessfully, to secure the annexation of Texas to the United States, and on his return to Texas took his seat in Congress as senator from Brazoria, and in 1841 was appointed by President Houston his secretary of state, which office he filled three years. In September 1844 he was elected President of Texas for three years from the ensuing December, and held that office until the annexation of Texas to the United States. He succeeded in maintaining a footing of equality in negotiations with England, France, and the United States; and by the intervention of the two former powers the government of Mexico was induced to acknowledge the independence of Texas.

Jones, Charles Colcock, Jr., American author: b. Savannah, Ga., 28 Oct. 1831; d. 19 July 1893. He was graduated at Princeton (1852), at Harvard Law School (1855), and was admitted to the bar in 1856. He served as colonel of artillery in the Confederate army during the War for the Union, and on the return of peace removed to New York, where he practised law. In 1877 he returned to Georgia and devoted his time to the study of the history and archaeology of that State. He wrote: 'Negro Myths from the Georgia Coast, Told in the Vernacular' (1888); 'The History of Georgia' (1883).

Jones, David Phillips, American naval engineer: b. Philadelphia 1841; d. Pittsburg 30 Jan. 1903. He entered the navy in 1862, during the Civil War took part in the operations on the James (Va.) and the St. John's (Fla.), and was present at Bermuda Hundred, and in 1869 attained the grade of chief engineer. In 1874-9 he was instructor in steam engineering at the Naval Academy, Annapolis, and from 1889 to 1892, when he was retired, was on duty at the naval training-station at Newport, R. I. He was chief inspector of steel for the district at Pittsburg during the Spanish-American war.

Jones, Edward Franc, American soldier and manufacturer: b. Utica, N. Y., 3 June 1828. He was colonel of the 6th regiment of Massachusetts volunteers, which he led through Baltimore at the opening of the Civil War, and which was attacked by the mob. He was subsequently brevetted a brigadier-general of United States volunteers. He was a member of the Massachusetts Legislature in 1865, but removed to Binghamton, N. Y., the same year. He was lieutenant-governor of New York 1886-91, and originated the familiar phrase, "He pays the freight." He published 'The Origin of the Flag': etc.

Jones, Henry Arthur, English dramatist: b. Grandborough, Buckinghamshire, England, 28 Sept. 1851. After a secondary education, he took up writing as a means of livelihood, and in 1879 appeared as playwright with 'A Clerical Error,' performed by Wilson Barrett at the Court Theatre. He followed this by a series of comedies of modern life, clever in dialogue and stagecraft, which have been very popular, particularly with English audiences. They include: 'Silver King' (1882); 'Saints and Sinners' (1884); 'Middleman' (1889); 'Judah' (1890); 'The Dancing Girl' (1891); 'The Tempter' (1893); 'The Masqueraders' (1894);

'The Triumph of the Philistines' (1895); 'The Rogue's Comedy' (1896); 'The Liars' (1897); 'The Manœuvres of Jane' (1898); 'Carnac Sahib' (1899); 'The Princess' Nose' (1902); 'Chance the Idol' (1902).

Jones, Inigo, English architect: b. London July 1573; d. there 21 July 1652. He was the son of a clothworker and began life as a carpenter, but showing a taste for painting, William, earl of Pembroke, supplied him with the means of visiting Italy for the purpose of studying landscape painting. At Venice, the works of Palladio inspired him with a taste for architecture. He was appointed first architect to Christian IV., king of Denmark, but in 1605 he returned to his native country. After being employed for a time as a scenic and stage artist, he was appointed in 1610 surveyor of the works to Henry, Prince of Wales. After the death of the prince he again visited Italy, and extended his knowledge and improved his taste from the examination of the models of ancient and modern art. The banqueting house at Whitehall is a monument of his skill and science. At Winchester Cathedral he erected a screen in the style of classic antiquity. Like Wren he seems not to have duly appreciated the Pointed style of building. He built the front of Wilton House, in Wiltshire, for Philip, earl of Pembroke, and was much employed by the court and by many of the nobility and gentry. He also designed the scenery and decorations for masks—a species of dramatic entertainment fashionable in the early part of the 17th century. In these pieces the dialogues and songs were composed by Ben Jonson, who quarreled with Jones, and abused him in epigrams and satires. Being a Roman Catholic, and a partisan of royalty, he suffered in the civil war, and in 1646 was forced to pay a heavy fine as a malignant or cavalier. As an author he is known by a work on Stonehenge, composed by command of King James I., in which he undertook to prove that Stonehenge was erected by the Romans, and was a hypæthral temple dedicated to the god Cœlus. He was the reviver of classical architecture in England, but he blended Gothic elements with the Italian style. Among his works besides those mentioned are the Greenwich Hospital, the old London Exchange, and the portico of St. Paul's Church, and Earl Pembroke's house.

Jones, Jacob, American naval officer: b. near Smyrna, Del., March 1768; d. Philadelphia 3 Aug. 1850. He entered the United States navy in 1799 as a midshipman and while serving in the war with Tripoli, was captured in 1803 and held a prisoner for 18 months. In 1812 he became commander of the Wasp and with her captured the English brig Frolic 18 Oct. 1812, but on the following day encountered the English war vessel Poictiers, 74 guns, by which both the Wasp and its prize were taken. He was released on parole at Bermuda and for his victory over the Frolic was voted a gold medal by Congress, and \$25,000 was granted to him and his crew in payment of the personal loss they had sustained. He subsequently commanded squadrons in the Mediterranean and the Pacific.

Jones, Jenkin Lloyd, American Unitarian clergyman: b. Llandyssil, Cardiganshire, Wales, 14 Nov. 1843. He came to America with his

JONES

parents while an infant, served in a Wisconsin regiment during the Civil War, and was graduated from the Meadville (Pa.) Theological Seminary in 1870. He was pastor of All Souls Unitarian Church, Janesville, Wis., 1874-83; was secretary of the Western Unitarian Conference for nine years, and since 1883 has been pastor of All Souls Church, Chicago. He has been prominent among the more radical members of the Unitarian body and has published: 'The Faith that Makes Faithful,' with W. C. Gannett (1886); 'Practical Piety' (1890); 'Word of the Spirit' (1897); 'Bits of Wayside Gospel' (1899); etc.

Jones, John, American surgeon: b. Jamaica, L. I., 1729; d. 1791. He studied medicine in Europe and returning to America practised in New York, becoming professor of surgery in King's College, and, with Dr. Bard, founding the New York Hospital in 1771. After the occupation of New York by the English forces in 1777 he removed to Philadelphia, there being one of the physicians of the Pennsylvania Hospital, and in 1787 vice-president of the College of Physicians. He was the friend and physician of both Washington and Franklin, attending the latter in his last illness. He published, 'Plain Remarks upon Wounds and Fractures' (1775).

Jones, John Edward, American journalist: b. Washington, D. C., 21 Feb. 1867. He was educated in Georgetown and Columbian Colleges, was a delegate to the Republican National Convention in 1900 and served as assistant secretary to the Republican National Committee.

Jones, John Paul, American sailor: b. Arbigland, Scotland, 6 July 1747; d. Paris 18 July 1792. His family name was Paul, the name of Jones being assumed later. At 12 he was bound apprentice to a merchant of Whitehaven, in the American trade. His first voyage was to Virginia, where his elder brother was established as a planter. He was then engaged for some time in the slave-trade, but quitted it in disgust; was afterward in command of the *Betsy* of London, and remained some time in the West Indies, engaged in commercial pursuits and speculations. In 1773 he was in Virginia, arranging the affairs of his brother, who had died intestate and childless, and about this time took the name of Jones. On the outbreak of the Revolution he offered his services to Congress and when the naval force was organized he was appointed senior lieutenant on the flagship *Alfred*, and with a small squadron sailed to the Bahamas, where they did considerable injury to British shipping; in May 1776 he was appointed to command the *Providence*, a small vessel, and cruising from Bermuda to Nova Scotia captured 16 prizes in less than seven weeks and destroyed the shipping and fishery at Canso and the Isle Madame, Nova Scotia. Later in that year he made a second cruise in the *Alfred* and captured a number of vessels of the Cape Breton coal fleet and destroyed fishing vessels. At this time he earnestly advocated in letters to Congress the development of the American navy; urging the need of cruising in small squadrons on the enemy's coast, where shipping was inadequately protected, thus diverting the attention of the enemy and drawing their force from the

American coast. In 1776 he was made captain, but 13 officers were given seniority over him; Jones protested against this as an injustice, but in vain. In 1777 he was assigned to the command of the *Ranger* with orders to cruise along the British coast; on this ship he raised the new American flag, the Stars and Stripes, for the first time in the history of the navy; he went first to France to convoy some merchant vessels to Quiberon Bay, where they were placed under the protection of a French fleet; here he obtained a salute to the American flag from the French. He also carried to France the despatches with the news of Burgoyne's surrender. In April 1778, he left Brest and sailed for Whitehaven, England, where he spiked the guns of the fort but failed to burn the shipping in the port, as he had planned; a few ships only were destroyed. He also attempted to capture the earl of Selkirk, but failed on account of the earl's absence from his estate; his crew took a part of the family plate, but this was afterward bought up by Jones and restored to Selkirk. Later on this cruise the *Ranger* met the *Drake*, a ship of superior armament, and after a short fight compelled her surrender, and took her as a prize into Brest. Jones was then promised the command of a squadron by the French and waited in France till February 1779, when he was finally given command of the *Duras*, a name which he changed to the *Bonhomme Richard*, and in August of that year he sailed from France with a squadron of five ships including his own, being later joined by two French privateers. He cruised about the Irish and English coasts, and captured 26 vessels; he was continually harassed by the insubordination of some of his officers, especially Capt. Vandais of the *Alliance*; three of his squadron, including the two privateers parted company in the early part of September. On 23 September, when off Flamborough head, he sighted the Baltic fleet under convoy of the *Serapis* and the *Countess of Scarborough*, and after a long and desperate fight the *Serapis* surrendered to the *Bonhomme Richard*, the *Scarborough* being taken by the *Pallas*. The *Richard* sunk the next day, but the *Serapis* was taken into port. (For account of the battle see **BONHOMME RICHARD**.) The sensation produced by this victory was very great, and his reception at Paris, whither he went on the invitation of Franklin, was of the most flattering kind. The king presented him with a gold sword, and invested him with the military order of merit. On his return to America in 1781 Congress highly complimented him for his zeal, prudence, and intrepidity, voted him a gold medal, and promised him the command of a new ship then building, which was, however, given to France. He subsequently went on board the French fleet, where he remained until the conclusion of peace, and then went to Paris as agent for prize-money. He afterward was invited into the Russian service, with the rank of rear-admiral, but owing to a quarrel with the admiral and intrigues at court soon retired from the service. He returned to Paris where he died. A public funeral was given him by the National Assembly.

The exact place of his burial in Paris was for a long time unknown. In October 1899, a search for it was commenced by several learned

JONES

societies; the merit of locating the site is mainly due to Monsieur de Ricaudy who found the correspondence of the gatekeeper of the cemetery for foreign Protestants. This shows that Jones was buried in a small cemetery northwest of the Hospital St. Louis, at the corner of the Rue des Ecluses Saint-Martin and the Rue de la Grange aux Belles; the cemetery was closed in 1793, and the site is now occupied by unimportant buildings. There is no documentary evidence to prove that Jones was buried in a lead coffin or in naval uniform, the buttons or sword of which might serve for identification, so that it is probable that identification is impossible.

Consult: Buell, 'John Paul Jones, the Founder of the American Navy'; Hapgood, 'Paul Jones'; Brady, 'Commodore Paul Jones'; Laughton, 'Studies in Naval History.'

Jones, John Percival, American politician: b. Herefordshire, England, 1830. He came to the United States in 1831, was educated in the schools of Cleveland, Ohio, in the early days of California gold-mining went to that State where he acquired mining interests, and in 1863-7 was a member of the State senate. In 1867 he removed to Nevada, where he became a proprietor and the superintendent of the "Crown Point" silver mine, through which he realized a fortune. He was elected to the United States Senate from Nevada in 1873, and this office he held by re-election until 1903. He was originally a Republican, was elected to the Senate as a "Silverite" in 1897, and from 1900 was a "Silver" Republican. In 1896 he was an advocate of the election of W. J. Bryan, but not so in 1900. During his service in the Senate he was an important member of the Committee on Mines and Mining.

Jones, John William, American Baptist clergyman and author: b. Louisa, Va., 25 Sept. 1836. He was graduated from the University of Virginia in 1859 and from the Southern Baptist Theological Seminary, and during the Civil War served as private and then chaplain in the Confederate army. He was pastor of a Baptist church in Lexington, Va., 1865-71, and chaplain of Washington College during Lee's presidency, and since the last named date has been successively agent of various Southern institutions, chaplain of the University of Virginia, and pastor of several churches. Besides editing 14 volumes of the 'Southern Historical Papers' he has published 'Personal Reminiscences, Anecdotes and Letters of R. E. Lee' (1874); 'Christ in the Camp, or Religion in Lee's Army'; 'Memorial Volume of Jefferson Davis'; 'School History of the United States'; etc. He has delivered many historical lectures, and is the chaplain general of the United Confederate Veterans. He was for 12 years secretary of the Southern Historical Society, and is now secretary and superintendent of the general Confederate Memorial Association with headquarters in Richmond, Va.

Jones, Joseph Stevens, American playwright: b. 1811; d. Boston, Mass., 30 Dec. 1877. After his graduation from the Harvard Medical School in 1843, he practised medicine for several years; but was subsequently proprietor and manager of the Tremont, Old National, and other theatres in Boston at various times. Among the nearly 200 plays of which he was the author may

be named: 'Solon Shingle'; 'The Liberty Tree'; 'The Siege of Boston'; 'Moll Pitcher'; 'The Last Dollar'; 'The People's Lawyer'; 'Paul Revere'; 'The Silver Spoon.'

Jones, Leonard Augustus, American jurist: b. Templeton, Mass., 13 Jan. 1832. He was graduated from Harvard in 1855 and from Harvard Law School in 1858. He was admitted to the Suffolk bar in 1858 and since 1884 has been one of the editors of the 'American Law Review.' Among his many legal works are: 'Law of Mortgages and Real Property' (1878-94); 'Law of Mortgages of Personal Property' (1881-94); 'Law of Easements' (1898). He was appointed judge of the court of land registrations in 1898.

Jones, Owen, English architect: b. London 15 Feb. 1809; d. there 19 April 1874. In 1834 he traveled in Spain and studied the art monuments of Granada, after which he visited Egypt. On returning to England he published his great work on the Alhambra. In 1851 he undertook the decoration of the Crystal Palace at the first Universal Exhibition. He also furnished the various courts of different architecture, notably the "Alhambra Court." His researches and publications had a wonderful influence on the decorative art of England, especially his 'Grammar of Ornament' in which he illustrated the decorative devices of all nations. He published: 'Plans, Elevations, Sections and Details of the Alhambra' (1845).

Jones, Samuel M., American manufacturer and politician: b. 3 Aug. 1846 in Wales, d. Toledo, Ohio, 12 July 1904. He came to the United States with his parents, when three years old; at 18 he was working in the oil-fields of Titusville, Pa. In 1893 he invented improved oil well apparatus and set up the Acme Sucker Rod Factory in Toledo, Ohio. Here he introduced reforms in the condition of his employees, fixed a minimum wage, gave an eight-hour day, and introduced a system of profit-sharing; he also opened a pleasure ground adjoining the factory known as "Golden Rule" Park. In 1897 he was nominated for mayor of Toledo by the Republican party and elected; but his subsequent advocacy of municipal ownership of public utilities and of the abolition of the system of private contract in doing city work alienated the support of his party. His administration was, however, very popular, and he was re-elected as independent candidate in 1899 and 1901. In 1900 he was non-partisan candidate by petition for governor of Ohio, but was defeated.

Jones, Samuel Porter, commonly known as SAM JONES, American Methodist revival preacher: b. Chambers County, Ala., 16 Oct. 1847. He was admitted to the Georgia bar in 1869, but his drinking habits put an end to his career as a lawyer. Becoming converted in 1872 he was admitted to the ministry of the Methodist Church South, the same year, and has since devoted himself to evangelistic work, his marked eccentricities of speech and manner probably contributing somewhat to his popularity. He has published: 'Sermons and Sayings'; 'Music Hall Sermons'; 'Sam Jones' Own Book'; etc

Jones, Thomas ap Catesby, American naval officer: b. Virginia 1787; d. 1858. Having entered the navy in 1805, he was employed in

JONES—JONESBORO

police duty in the Gulf, saw service in the latter part of the War of 1812, and was unsuccessful in an attempt to prevent the passage of Vice-Admiral Cochrane's fleet across Lake Borgne. In 1826 he was sent to the Hawaiian Islands to settle the difficulties arising through the efforts of a local party to make the islands a British dependency. Upon the declaration of war between the United States and Mexico, he feared that the British man-of-war Dublin intended the annexation of California, and imprudently landed at Monterey and took possession. He was therefore removed temporarily from his command.

Jones, Sir William, English lawyer and Oriental scholar: b. London 28 Sept. 1746; d. Calcutta 27 April 1794. He was educated at Harrow and Oxford, and early acquired a reputation as a linguist, Hebrew, Persian, Arabic, and even Chinese, besides German, Italian, French, Spanish, and Portuguese, being among his acquisitions. In 1770 his translation (in French) of the life of Nadir Shah from the Persian appeared; in 1771 his grammar of the Persian language; in 1774 his 'Poeos Asiaticæ Commentariorū Libri Scx.' and in 1781 his translation of the seven Arabic poems known as the 'Moallakat.' He had been called to the bar in 1774, and in 1783 was nominated judge in the supreme court of judicature, Bengal, and knighted. Here he did much for the furtherance of Oriental studies, being one of the first Europeans to study Sanskrit, founding the Royal Asiatic Society, in 1784 translating the Sakuntala, the Ordinances of Manu, besides tales, poems, extracts from the Vedas, etc. He also undertook a digest of the Hindu and Mohammedan laws, which he did not, however, live to complete.

Jonesboro, jōnz'bür-ō, Ark., city, county-seat of Craighead County; on the Kansas City, Ft. S. & M., the St. Louis S. W., and the Jonesboro L. E. R.R.'s; about 120 miles northeast of Little Rock. It was first settled in 1870, although some settlements had been made earlier on farms in the vicinity. It was incorporated in 1882. It is situated in an agricultural and lumbering region, and the railroad facilities make it the trade centre for quite an extent of country. The chief manufactures are flour, lumber, staves and headings, boxes, and wagons. In addition to the manufactures there is considerable trade in grain, live stock, and some dairy products. Pop. (1890) 2,065; (1900) 4,508.

Jonesboro, Ga., city, county-seat of Clayton County; on the Central of Georgia railroad; about 16 miles south of Atlanta. It is situated in a fertile agricultural region, but its nearness to Atlanta and lack of water power are hindrances to manufacturing. Its chief trade is in fertilizers, cotton, and farm products. At this point, August 1864, was fought a hotly contested battle with Gen. Howard of Sherman's army, in command of the Federal troops, and Gen. Hardee of Hood's army, in command of the Confederates. See JONESBORO, BATTLE OF.

Jonesboro, Battle of, and Fall of Atlanta. After the battle of Ezra Church (q.v.), 28 July 1864, Gen. Sherman, unable fully to invest Atlanta, drew the Fourteenth corps and Schofield's Army of the Ohio from the left, and extended his lines on the right nearly to East Point, about six miles below Atlanta, the

junction of the two railroads leading from the south, upon which the city and Hood's army depended for supplies. Hood made a corresponding movement to cover the roads, meeting Sherman's advance with strong, well-intrenched lines, and, 6 August, severely handling two of Schofield's brigades that had crossed Utoy Creek, killing and wounding over 300 men and taking two colors. To compel Sherman to relinquish his movement and raise the siege of Atlanta, Hood, 10 August, sent Wheeler with about 5,000 cavalry to operate upon his line of communication with Nashville. Wheeler moved promptly, struck and destroyed the railroad near Marietta, Calhoun, Adairsville, and Dalton, captured over 1,000 head of beef-cattle and other supplies, and, after demonstrating on Dalton and Resaca, was driven into East Tennessee. Sherman had issued an order, 16 August, for a general movement on the 18th upon the West Point and Macon railroads, for the purpose of forcing Hood from Atlanta, but hearing of Wheeler's raid, he suspended the order, and directed Gen. Kilpatrick, with 5,000 cavalry, to move on the night of the 18th against the West Point and Macon roads and destroy them completely. Kilpatrick started from near Sandtown, crossed the West Point road at Fairburn, and struck the Macon road a short distance north of Jonesboro, some 26 miles from Atlanta, where he encountered Ross' brigade of cavalry, which was driven through Jonesboro. But little of the railroad had been destroyed when Jackson's brigade of cavalry and an infantry brigade, coming up from the south, compelled Kilpatrick to retreat. Making a circuit, he again struck the railroad at Lovejoy's, about six miles south of Jonesboro, and encountered a Confederate force, through which he cut his way and reached Decatur, near Atlanta, on the 22d. As Sherman was satisfied that Kilpatrick had not greatly damaged the railroad, he renewed his order for the movement of the whole army. On the night of the 25th the siege of Atlanta was raised. The sick and wounded, spare artillery, and surplus transportation were sent back to the Chattahoochee bridge; Stanley's Fourth corps drew out from the left and moved to the right, closing up with the Fourteenth near Utoy, and the Twentieth corps fell back to an entrenched position covering the Chattahoochee bridge and the hospitals. On the night of the 26th the Army of the Tennessee (Gen. Howard) drew out, rapidly made a wide circuit, and came up on the right of the Army of the Cumberland, under Gen. Thomas, along Utoy Creek, facing south. The Army of the Ohio remained in position, now on the extreme left. On the 28th, making a general left wheel, pivoting on Schofield's army, both Thomas and Howard reached the West Point road extending from East Point to Red Oak and Fairburn, Schofield closing in upon the left of Thomas, but a short distance from the Confederate works covering the junction of the road at East Point. The next day was devoted to the railroad, of which nearly 13 miles was destroyed, and on the 30th the entire army moved eastward for the Macon railroad. Schofield, on the left, approached it near Rough and Ready, and presented a bold front toward East Point; Thomas, in the centre, reached Couch's, on the Fayetteville and Decatur road, with but little opposition; and Howard, on the right, driving before him the enemy's cavalry, saved the bridge

JONESVILLE—JONSON

over Flint River after a sharp engagement, then, crossing part of his command, halted at night within half a mile of Jonesboro. On the morning of the 31st Howard, finding himself in the presence of a large force, disposed the Army of the Tennessee for battle and intrenched. Logan's Fifteenth corps on the left, Ransom's Sixteenth corps on the right, and Blair's Seventeenth corps in rear of Logan's left. When Sherman began his movement on the night of the 25th S. D. Lee's corps of Hood's army covered the railroad from near Atlanta to a place nearly a mile south of East Point. Hardee's corps was on Lee's left, while Hood held Atlanta with Stewart's corps and the Georgia militia. Hood had been deceived; he knew of Sherman's earlier movement, but misinterpreted it as preliminary to a retreat across the Chattahoochee; but when undeceived on the 30th, he ordered Hardee with his own corps and Lee's to move rapidly to Jonesboro and crush Howard on the morning of the 31st. Hardee, who was near Rough and Ready, four miles below East Point, began moving about 4 P.M., followed later by Lee, and at noon of the 31st both were in Howard's front. At 3 P.M. Hardee attacked with Lee's corps and part of his own, under Cleburne, with the expectation of driving Howard into the river, and for two hours the fighting was severe, but Hardee was repulsed. Lee, who, on the Confederate side, bore the brunt of the fight, says: "The attack was a feeble one and a failure, with a loss to my corps of about 1,300 men killed and wounded." Hardee's entire loss was about 1,700. The Union loss was 179 killed and wounded, almost entirely of Logan's corps.

When Sherman heard the noise of this battle he was with Thomas, who, with Schofield, had reached and was destroying the road from Rough and Ready southward. Thomas and Schofield were marched to the assistance of Howard, and Kilpatrick was sent down the western bank of the Flint to strike the road south of Jonesboro. Davis' Fourteenth corps joined Howard's left at noon of 1 September, relieving Blair, who was disposed to support Kilpatrick. Lee's corps had gone, but Hardee's was still in position and intrenched, covering Jonesboro on the north. At 4 P.M. Davis charged Hardee's works and, after a hard fight, carried parts of them, capturing Gen. Govan and the greater part of his brigade and two batteries of four guns each. Stanley and Schofield reached the field too late to take part in the engagement. During the night Hardee retreated to Lovejoy's station, and next morning Sherman started in pursuit. The Union loss 1 September was 223 killed, 946 wounded, and 105 missing. The Confederate loss is not fully known; of the three divisions engaged Cleburne's sustained a loss of 55 killed, 197 wounded, and 659 missing. There is no return of losses in the other two divisions.

The result of the battle of Jonesboro was the fall of Atlanta. Six hours before Hood heard of the result of Hardee's attack 31 August, he sent an order to Lee to return in the direction of Atlanta, to make a movement on Sherman's flank, or to cover the evacuation of the city. Lee received the order at midnight, and was halted next morning about six miles from Atlanta. Meanwhile Hood had heard of the result of Hardee's attack; its "failure necessitated the evacuation of Atlanta." Lee was ordered to

join Hardee, which he did on the 2d, and at 5 P.M. of the 1st Hood marched out of the city with Stewart's corps on the McDonough road; the Georgia militia was sent to Covington, and at night the rear-guard blew up some abandoned ammunition-trains. Slocum's Twentieth corps entered the city on the morning of the 2d. Sherman received the news on the 4th, and, turning his back on the Confederates at Lovejoy's, marched his army to East Point and Atlanta.

The campaign for Atlanta, which began 6 May 1864, was marked by brilliant flanking movements, on both sides, by almost uninterrupted skirmishing, growing at times to the dimensions of a battle, and by many heavy engagements, most of them of a desperate character. The Union losses in the entire campaign were 4,423 killed, 22,822 wounded, and 4,442 missing, a grand aggregate of 31,687. The Confederate losses were 3,044 killed and 18,952 wounded. Add to this the number of prisoners captured, 12,938, makes a grand aggregate of 34,979. Consult: "Official Records," Vol. XXXVIII.; Cox, "Atlanta"; Van Horne, "History of the Army of the Cumberland," Vol. II.; "Life of Gen. George H. Thomas"; Bowman, "Sherman and his Campaigns"; Sherman, "Personal Memoirs," Vol. II.; the Century Company's "Battles and Leaders of the Civil War," Vol. IV.

E. A. CARMAN.

Jonesville, jōnz'vīl, Va., the scene of a Civil War action. On 1 Jan. 1864 Major Beeres, who had been operating with a battalion of the 16th Illinois cavalry and a battery, near Cumberland Gap, attacked and drove a small Confederate cavalry force from Jonesville and occupied the place. On the morning of the 3d he was attacked by Gen. W. E. Jones' cavalry brigade and, after a spirited resistance, continuing nearly the entire day, in which he lost 10 killed and over 40 wounded, was finally surrounded and obliged to surrender. The Confederates reported that he surrendered 383 officers and men, 45 of whom were wounded, 3 pieces of artillery, and 27 wagons. The Confederate loss was about 30 killed and wounded. Consult "Official Records," Vol. XXXII.

E. A. CARMAN.

Jonquil, jōn'kwil. See NARCISSUS.

Jon'son, Ben or **Benjamin**, English dramatic poet, the contemporary and friend of Shakespeare: b. Westminster 1573; d. London 6 Aug. 1637. He was the posthumous son of a clergyman, and was placed at the Westminster grammar-school, where he laid the foundation of his learning, but was ultimately withdrawn, it is said, by his stepfather, a master bricklayer, who wanted his assistance in the business. He soon tired of this occupation, entered the army as a private soldier, and showed much personal courage during a campaign in Holland. Returning to England he began his career as an actor, and in 1598 his drama, "Every Man in his Humour," was performed at the Globe, with Shakespeare in the cast. About this time Jonson killed an actor, Spenser by name, in a duel, was branded on the left thumb, and deprived of his personal effects. In 1599 he brought out his comedy of "Every Man out of his Humor," followed by "Cynthia's Revels" (1600); the "Poetaster" (1601); "Sejanus," a tragedy (1603); "Volpone" (1605); "Epicene, or the Silent Woman" (1609), the best of his comedies; "The

JOPLIN—JORDAN

Alchemist' (1610); and 'Bartholomew Fair' (1614). The festivities which welcomed the new king, James I., gave a new impulse to the representation of masques, in the composition of which the ready talent of Jonson was employed by the court itself, the celebrated Inigo Jones doing the decorations. In 1604 he had some share with Chapman and Marston in writing 'Eastward Ho,' certain passages of which, reflecting satirically on the Scottish nation, drew down the anger of the king. Chapman and Marston were imprisoned, and Jonson voluntarily served the sentence with them. In 1613 Jonson made a tour in France as governor of Sir Walter Raleigh's eldest son. In 1618 he visited Scotland, staying for some time with Drummond of Hawthornden, whose notes of his guest's conversation are amongst the best accounts we have of Jonson's personality. In 1619 he returned to England, and on the death of the poet laureate was appointed his successor, and the salary raised to the sum of £100 by Charles I. Much of his time was spent at the Apollo, Mermaid, and other taverns, engaging in those brilliant contests of wit in which in earlier days Shakespeare also took part. His latter days were spent in fame and honor, as the acknowledged chief of English literature, and he enjoyed a pension of £200 from the crown. He died leaving behind him an unfinished pastoral drama of great beauty, 'The Sad Shepherd.' He was buried in Westminster Abbey, where a monument was erected to his memory with the inscription, 'O rare Ben Jonson.' Jonson's best dramas are based on the method of ancient comedy, are excellent in plot and development, and have strongly conceived characters and excellent traits of humor. He is sometimes forced and unnatural, and deals perhaps too much with passing manners and eccentricities. He had a genuine lyrical power, seen in his short poems and the songs such as 'Still to be neat, still to be drest,' interspersed in his masques. Jonson was also considered one of the leading scholars of his time, and his own dramatic works evince profound knowledge of the classical literatures. There is a collective edition by Gifford (9 vols. 1716; 2d ed. 1875). Consult the 'Life' by Symonds (1883); Swinburne, 'Study of Jonson' (1889); Fleay, 'English Drama' (1891); Koepel, 'Quellen-Studien zu den Dramen Ben Jonsons' (1895).

Joplin, Mo., city, one of the county-seats of Jasper County; on the Kansas C. S., the Missouri, K. & T., the Missouri P., and the St. L. & S. F. R.R.'s; about 68 miles west by south of Springfield and 138 miles south of Kansas City. Joplin is situated in an agricultural region, and also in the midst of the zinc and lead fields in the southwestern part of the State. The place was first settled about 1870 and incorporated three years later. The chief industrial establishments are foundries, machine-shops, smelting-works, paint-works, flour-mills, white-lead works, and lumber-mills. Some of the prominent public buildings are a Carnegie library, established in 1903, a Federal government building, a courthouse, an opera house, and the Y. M. C. A. building. The value of the output of zinc and lead in the Joplin district for the year 1902 was about \$10,000,000. The government, except that of the schools, is vested in a mayor, who holds office two years, and a city council. The Board

of Education consists of six members, two of which are elected each year on an independent and separate ticket. The city owns and operates the light plant. Joplin has grown rapidly and has made many public improvements. Pop. (1890) 9,943; (1900) 26,023.

Jop'pa. See JAFFA.

Jo'ram, or Jehoram, name of two Hebrew kings, one of Israel (851-842 B.C.) and the other of Judah (848-844 B.C.). (1) JEHORAM king of Israel was the second son of Ahab, and succeeded his brother Ahaziah. He revived the worship of Jehovah, and repressed the worship of Baal. He joined with the king of Judah in a war with the Moabites. In his reign Benhadad king of Damascus invaded Israel, and besieged Samaria, but retreated to meet a hostile invasion in his own country. In a battle with Hazan king of Syria Jehoram was wounded and retired to Jezreel, where he was slain by Jehu whom Elisha had anointed king over Israel.

(2) JORAM king of Judah was the son and successor of Jehosaphat and for four years from 848 B.C. had a luckless reign. The Edomites revolted in the land and Libna joined them, while Bedouin tribes of Arabia sacked Jerusalem and carried off the wives and son of the king, who died horribly of an intestinal disease, as had been foretold by the prophet Elisha.

Jordaens, Jacob, yä'kōb yör'däns, Flemish painter: b. Antwerp 19 May 1593; d. there 18 Oct. 1679. From his early boyhood in 1607 he was the pupil of Van Noort, whose daughter he afterward married, and in 1615 was made master in the Guild of St. Luke at Antwerp. He was the most eminent painter of the Flemish school next to Rubens, upon whose death he was acknowledged to be the first painter in Flanders. While as a colorist and draftsman he was much indebted to the influence of Rubens, it must be admitted that he embodies the characteristics of the Flemish school in a much more real and wider sense than that master does. This is due to his love of humor which is not a characteristic of Rubens. Nor does he show the influence of the Italian style, which gave such unique splendor to the creations of Rubens. While he painted religious pictures his strength lies in his humorous delineations of popular life. These spirited, genial and lifelike genres are found in all the principal galleries of Europe. The most renowned among his religious pictures are 'The Last Supper' in the Antwerp Museum; and 'The Martyrdom of St. Apollonia' in the church of the Augustines, Antwerp. He painted also a great many mythological subjects, bacchanalians, satyrs, Dianas and nymphs; and executed two allegorical pictures in the royal summer palace "Huis ten Bosch" (Castle in the Wood) near The Hague, the subjects being 'Death Triumphant over Envy' and 'The Triumph of Henry of Orange over his Enemies of all Sorts.'

Jordan, jör'dan, Conrad N., American financier: b. New York 20 April 1830; d. there 26 Feb. 1903. He entered a printing office, but soon exchanged this for a banking establishment, was cashier of a New York bank in 1864-80, and in 1880-4 was treasurer of the New York, Ontario and Western railroad. In 1885-7 he was treasurer of the United States, and introduced in the accounts of the treasury a revised

JORDAN—JOSEPH

form of debt and cash statements. He was an organizer of the Western National Bank of New York and for a time its president. In 1893 at the recommendation of all important New York banks, he was appointed assistant United States treasurer in New York, and this post he held until his death.

Jordan, David Starr, American college president and naturalist: b. Gainesville, N. Y., 19 Jan. 1851. He was graduated from Cornell University in 1872 and was instructor in botany there 1871–2. He was professor of natural history at Lombard University, Ill., 1872–3, and taught the same subject in the Indianapolis High School, 1874–5. From 1875 to 1879 he was professor of biology at Butler University, Indianapolis; professor of zoology at Indiana University 1879–85, and president of the last named institution, 1885–91. Since 1891 he has been president of Leland Stanford Junior University. Beside innumerable scientific monographs and reports, among which may be named 'Synopsis of the Fishes of North America' with C. H. Gilbert (1882); enlarged in 1896 with title 'Check List of the Fishes and Fish-Like Vertebrae of North and Middle America'; and 'Report of Far Sea Investigations'; he has published 'Science Sketches' (1896); 'Footnotes to Evolution' (1898); 'Imperial Democracy' (1899); etc. He was president of the California Academy of Sciences 1896–8 and 1901–3, and has been commissioner in charge of the United States Fish Commission investigations in the Pacific Ocean from 1901, and of the salmon investigations for Alaska from 1903.

Jordan, Elizabeth Garver, American journalist: b. Milwaukee, Wis., 9 May 1867. She is editor of 'Harper's Bazaar' and has published 'Tales of the City Room' (1898).

Jordan, Jules, American composer: b. Willimantic, Conn., 10 Nov. 1850. He is the author of several cantatas, including 'Barbara Frietchie' and 'Wind Swept Wheat'; and many sacred and secular songs.

Jordan, Thomas, American soldier: b. Luray, Va., 30 Sept. 1819; d. New York 27 Nov. 1895. He was graduated from West Point in 1840; and distinguishing himself in the Mexican War, was promoted captain in March 1847. He was stationed on the Pacific coast in 1856–60, during which time he introduced steam navigation above the Dalles, on the Columbia River. He served in the Confederate army during the Civil War and was promoted brigadier-general for gallantry at the battle of Shiloh. In 1869 he went to Cuba, where he was made chief of the general staff of the insurgent army and soon afterward commander-in-chief of the revolutionists, winning a battle at Guarimar, in January 1870. In the following year he resigned and settled in New York, where he became editor of 'The Financial and Mining Record.' He published 'Campaigns of Lieutenant-General Forrest' (with J. B. Pryor, 1868).

Jordan, William George, American journalist: b. New York 6 March 1864. He was graduated at the College of the City of New York; and became managing editor of the 'Ladies' Home Journal' in 1897, and was editor of 'The Saturday Evening Post' in 1898–9. He has published 'Mental Training by Analysis, Law and Analogy'; 'Mental Training a Remedy for

Education'; 'The Kingship of Self Control'; and 'The Majesty of Calmness.'

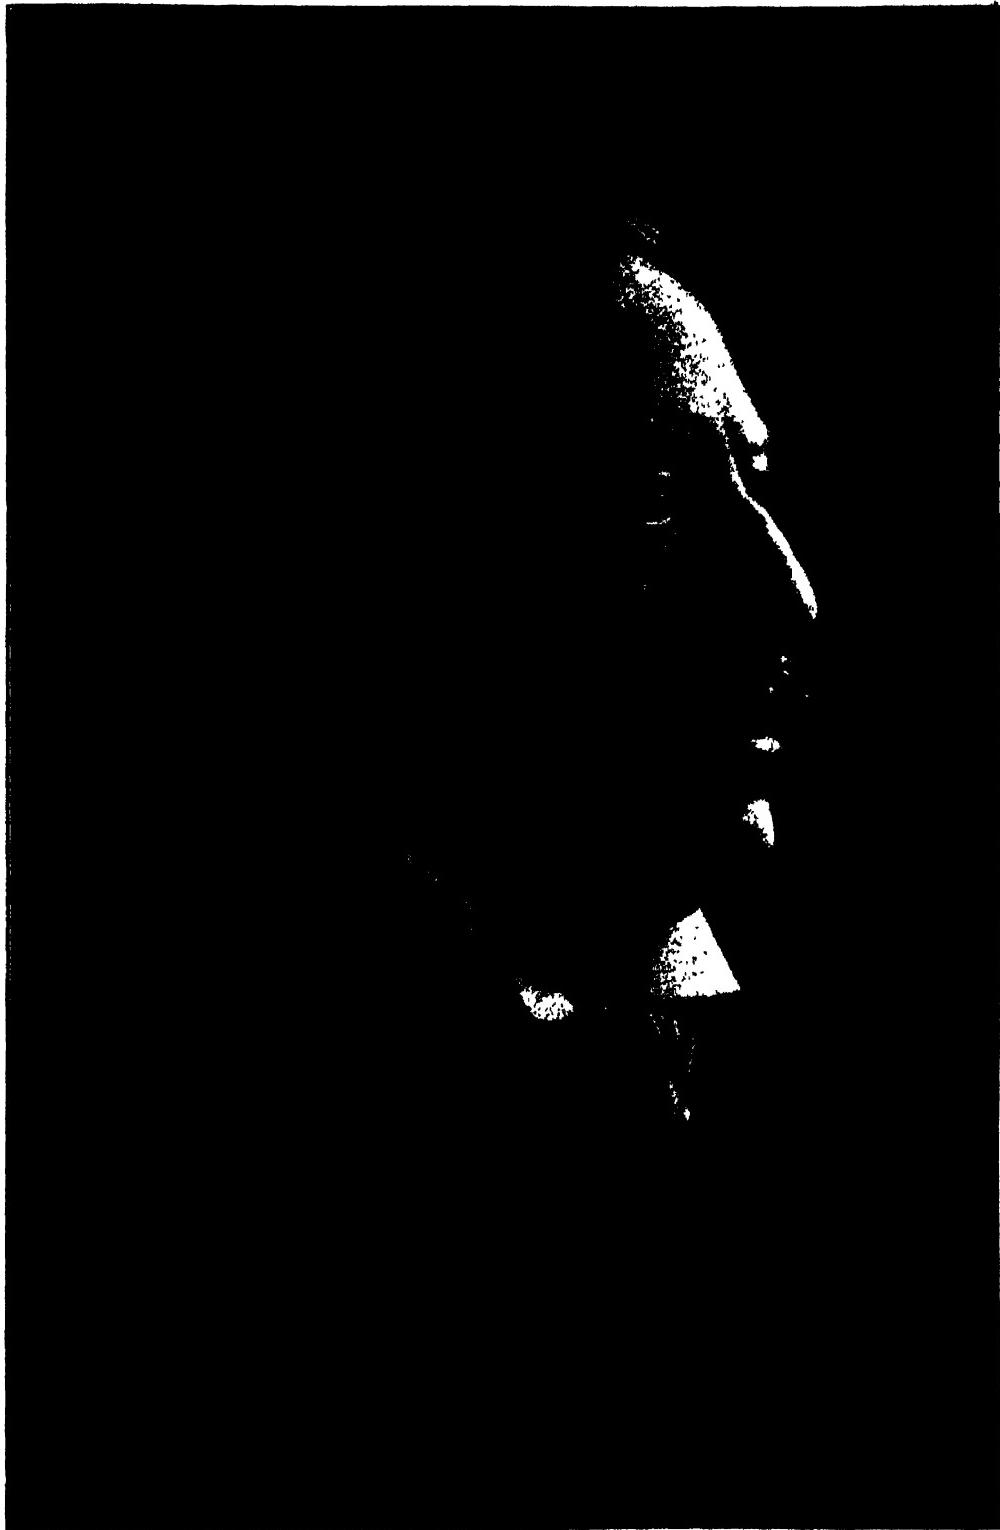

Jordan, the largest river of Palestine, and one of the most celebrated in the world. It rises from three main sources at the foot of Hermon, and these upper streams unite in Lake Huleh, the ancient Waters of Merom. From this point it sinks with a rapid current in a narrow rocky bed below the level of the sea, and falls after a course of 9 miles into the Lake of Galilee. Shortly after leaving the south end of this lake it enters a broad valley called by the Arabs Ghôr, and in the Bible "the plain"; and continuing a singularly crooked course of about 65 miles direct distance, or 200 including windings, falls into the north end of the Dead Sea, having received the Zerka or Jabbok and numerous smaller affluents. The Ghôr expands at Bethlehem and Jericho into a wide plain, but elsewhere is from three to five miles across. The upper part of the valley of the Jordan is hilly, arid, and barren, but it becomes more level and fertile as it approaches the Zerka. The river is muddy and full of small fish. In the dry season it is shallow, with an average width of from 30 to 50 yards. At its mouth it is about 180 yards broad and about 3 feet deep. It is subject to great inundations during the winter season. The valley of the Jordan forms one of the most remarkable depressions in the world, the Dead Sea being 1,312 feet below sea-level, and the total fall of the river being about 2,300 feet.

Consult: 'Official Report' (Washington, 1852); 'Survey of Western Palestine' (London, 1859); Smith, 'Historical Geography of the Holy Land'; Molyneux (in the 'Journal' of the Royal Geographic Society 1848); Lynch, 'Narrative of the United States Expedition to the River Jordan and the Dead Sea' (1849); McGregor, 'Rob Roy on the Jordan' (1870); Costello, 'Gospel Story'; Macmillan, 'Guide to Palestine and Egypt'; Thomas, 'Two Years in Palestine.'

Jorullo, hö-rool'yō, a volcano of Mexico in the State of Michoacan, 160 miles southwest of Mexico, and 80 miles from the Pacific. The district had continued undisturbed from the discovery of the New World when, in June 1750, earthquakes occurred, followed 29 September by one more violent. On the line of a chasm which was made, six volcanic cones were formed, the loftiest, Jorullo, 1,600 feet above the plain. The total height of the volcano above the sea is 4,265 feet. It shows but few signs of activity at present.

Joseffy, yō-séf'i, Rafael, Hungarian-American pianist. b. Miskolcz, Hungary, 1853. He was a pupil of Moscheles at the Leipsic Conservatory and of Tausig at Berlin, won distinction in a concert tour of Holland and Germany, and later appeared with large success throughout Europe and the United States. For several years he was a professor in the National Conservatory at New York, where he resided from about 1880. As a virtuoso he evinces great facility and technical finish, and won particular recognition through his interpretations of Chopin. His compositions include: 'Ungarisches Album' (6 works for pianoforte); 'Die Mühle' (op. 23); a 'Marche Turque'; and 'Conzert-Studien nach Chopin.'

Joseph, Saint, the husband of Mary the mother of Jesus Christ, was a descendant of the

DAVID STARR JORDAN.

PRESIDENT LELAND STANFORD JUNIOR UNIVERSITY

JOSEPH — JOSEPHUS

house of David, born at Bethlehem, but resident at Nazareth, where he practised the trade of a carpenter. Tradition and art represent him as an old man at the time of Christ's birth and he is said to have died before the beginning of Christ's public ministry. His day in the Roman Catholic calendar is 19 March.

Joseph, a son of the patriarch Jacob by his favorite wife Rachel. His father's preference for him and his own relation of dreams which predicted his future exaltation above those of his household drew upon him the envy of his brothers, who sold him to Ishmaelites and Midianite slave-dealers, by whom he was sold to Potiphar, a captain of the guard in Egypt. The story of his condemnation to prison on the false accusation of Potiphar's wife, of his release and subsequent elevation to the position of vice-regent of Egypt and the final settlement there of his father and brothers is related in the Book of Genesis. Authorities still differ as to the period in Egyptian history to which Joseph's life belongs, but the majority agree in placing it under the Hyksos or shepherd kings.

Joseph of Arimathea, member of the Jewish Sanhedrin, who believed in Jesus, but had not the courage to make profession of faith. He was born in Rathaim, a city of Benjamin, near Lydda. After the crucifixion he went to Pilate, begged the body of Jesus, wound it in fine linen and buried it in his own new tomb. According to tradition he came as apostle to Glastonbury, England. His day is 17 March in the Roman Catholic calendar, and 31 July in the Greek Church.

Joseph I., emperor of Germany: b. Vienna 26 July 1678; d. 17 April 1711. He succeeded his father, Leopold I., and was employed for nearly the whole of his reign in war. With England and Holland he continued the war against France, to seat the Archduke Charles on the throne of Spain. The great victories gained by the allies under Marlborough in the Low Countries, and Prince Eugene on the Rhine, made the reign of Joseph especially noteworthy. He was equally triumphant in Italy and Hungary; in the latter kingdom driving the revolted Bagotski from the country, and forcing him to seek safety in Turkey; while in the Italian peninsula, great cities from Mantua to Genoa were laid under heavy contributions.

Joseph II., German emperor, son of Francis I. and Maria Theresa: b. Vienna 13 March 1741; d. there 20 Feb. 1790. He was elected king of the Romans in 1764, and on the death of his father, 1765, German emperor. His mother declared him co-regent in the hereditary states of the house of Austria, and gave him the command of the army; but the real authority remained in her hands. In the earlier part of his reign he employed his time in traveling and becoming acquainted with his states. In 1780 Joseph came into the possession of full dominion over his hereditary states. He allowed a greater freedom of the press, put an end to the connection between Rome and the religious orders, diminished the pensions, placed the Jews on a better footing, abolished bondage, suppressed all nunneries, and many monasteries, particularly those of the purely contemplative orders. All branches of the government, public education, the police, and the peasantry, were reformed. By a

new code of laws capital punishments were abolished. On 9 Feb. 1788 he declared war against the Turks. By the defeat at Lugas (20 Sept. 1788) the army was obliged to retreat, but in the following year fortune favored the Austrian arms, and Belgrade surrendered. With the tax law, introduced in November 1789, nobility and peasantry showed themselves equally dissatisfied, and the signal was given for open rebellion. The Netherlands declared themselves independent, and expelled the imperial forces from all the provinces, and Luxemburg alone remained in the possession of the imperial troops. The Hungarians also rebelled, and demanded the restoration of their ancient rights and constitution. Joseph, in January, 1790, declared all the acts of his government in that country revoked, even to the edict of toleration (22 June, 1781). Joseph was a man of considerable ability, but arbitrary and despotic. Whatever his own reflections or his knowledge of other countries showed to be useful, he wished to introduce. But he did not sufficiently consider that he had to do with men who would not see things in the same light as himself; and that long habit rendered it difficult to change, at once, usages sanctified by time. Being a freethinker he often grossly overrode the rights of the Church. Consult Gross-Hoffinger, 'Lebens- und Regierungs-Geschichte Josephs II.' (1835-7); Brunner, 'Joseph II.' (1885); Schlitter, 'Pius VI. und Joseph II.' (1894).

Josephine (Fr. zhō-zé-fēn), empress of the French: b. Trois Islets, Martinique, 24 June 1763; d. Malmaison, near Paris, 29 May 1814. She was the daughter of Lieutenant Tascher de la Pagerie, and was married in 1779 to Vicomte Alexandre Beauharnais, by whom she had two children, Eugène and Hortense. In 1794 her husband, who had been commander of the army of the Rhine, was executed by order of the Convention. She herself had a narrow escape, having been included in the list of proscription. After the fall of Robespierre she paid a visit to Napoleon to thank him for restoring the sword of her husband, and so pleased him that he soon after married her (1796). When Napoleon became emperor in 1804 she was crowned with him. But the fact that the union was childless stood in the way of Napoleon's ambition to become the founder of a dynasty, and accordingly in 1809 Josephine was divorced, retiring to her seat of Malmaison, with the title of empress-queen-dowager and an annual grant of two million francs. Consult: Aubenay, 'Histoire de l'Impératrice Josephine' (1859); Welschinger, 'Le Divorce de Napoléon I.' (1889); Ober, 'Josephine, Empress of the French' (1901).

Josephus, jō-sē'fus, **Flavius** (Jewish name, JOSEPH BEN MATTHIAS), Jewish historian: b. Jerusalem 37 A.D.; d. about 95 A.D. He was carefully educated and in 64 A.D. he made a journey to Rome. On his return he found his countrymen preparing to throw off the Roman yoke, and having tried in vain to persuade them of the hopelessness of such a struggle, accepted the post of defending the province of Galilee, and actually held the fortified town of Jotapata against the whole Roman army for 47 days. He was captured at the fall of the city, was afterward present in the Roman army at the destruction of Jerusalem (70 A.D.), and went with Titus to Rome, where, assuming the family name

JOSH BILLINGS—JOULE

his patron, Flavius, he lived in learned leisure. Here he wrote (in Greek) 'The History of the Jewish War' and 'The Antiquities of the Jews,' being a history of the Jews from the earliest times to the reign of Nero.

Josh Billings. See SHAW, HENRY WHEELER.
Joshua, the leader of the Israelites after the death of Moses. He was the son of Nun, of the tribe of Ephraim, and upon him fell the task of conducting the people over the Jordan, and commanding their armies in battle against the heathen they were ordained to dispossess. He succeeded in ravaging a large portion of Palestine, and dividing it among the people. He died at the age of 110 and was buried at Timnath-Serah, in Mount Ephraim.

Joshua, Book of, a historical book of the Old Testament, sometimes classified as the last division of a Hexateuch, and containing an account of Joshua's leadership in Israel from the death of Moses until his own death. While it has many resemblances in style and arrangement to the Pentateuch, or first five books of Moses, it must have been early separated from them, if ever it was included in the same series, for the Samaritans, though they have had the Pentateuch since the 8th century before Christ, have never acknowledged the Book of Joshua. The contents of the book may be divided into three parts: the conquest of Canaan; the partition of the land among the 12 tribes; and the parting address made by Joshua to the assembled people. The first part is a narrative of the manner in which Joshua prepared to cross the Jordan at the head of the Israelites. The miraculous passage of the Jordan is accomplished, circumcision is performed, and the Passover observed on the soil of the Promised Land. Jericho and Ai are captured; the covenant confirmed at Ebal and Gerizim; the Gibeonites secure a treaty of peace through guile. The decisive battle of Bethhoron ends in the rout of the leagued kings. The second part is topographical and statistical, gives a general view of the land, with some account of its apportionment, and the setting aside of the Cities of Refuge. The third and concluding section is in the style of Deuteronomy. The people are exhorted to remain faithful to Jehovah, to eschew idolatry, and at Shechem, to which place the bones of Joseph had been brought, the covenant is renewed. The death and burial of Joshua and Eleazar make up a narrative which closes the book.

Josiah, king of Judah. He succeeded his father Amon (638 B.C.). He is said in the Scriptures to have done "that which was right in the sight of the Lord." He took an active part in the reform of temple worship, and in the abolition of idolatry throughout the land, and commenced the restoration of the temple, during the progress of which the high-priest Hilkiah discovered the book of the law, that is, the book of Deuteronomy. In his 30th year he marched out against Pharaoh Necho, king of Egypt, who was on his way to attack the kingdom of Assyria. Josiah was slain in the battle at Megiddo where he had attempted to check the northward march of the Egyptians.

Josiah Allen's Wife. See HOLLEY, MARIETTA.

Joss, the penates of the Chinese; every

family has its joss. A temple is called a joss house. The joss is an idol, usually of wood and decorated in colors, mostly in gold and red. There are three large joss houses in San Francisco, one in Chicago and two in New York. A Chinese upon entering the presence of a joss falls upon his knees, and touches his forehead thrice upon the floor, as a preliminary of worshipping the joss. See CHINESE; IDOLATRY; IMAGE WORSHIP.

Jo'tham, king of Israel and Judah, who succeeded (735 B.C.) Uzziah, his father. He ascended the throne at the age of 25 and reigned 16 years.

Joubert, yow'bërt, Petrus Jacobus, Boer military officer: b. Cape Colony 1831; d. Pretoria 27 March 1900. After an elementary education he settled as a farmer in the Wakkerstroom district of the Transvaal, about 1863 was elected for that district to the Volksraad, and in 1870 became attorney-general of the South African Republic. During the visit of President Burgers to Europe in 1874 he was acting president. In 1880 he became commander-in-chief of the Boer forces at the outbreak of the war with England, and three times defeated the British, at Laing's Nek, Ingogo, and Majuba Hill, the last battle (27 Feb. 1881) deciding the war in favor of the Boers. He was again acting president during the absence of President Kruger in Europe in 1883-4. He twice unsuccessfully contested the presidency with Kruger, the vote being 7,881 to 7,000 in 1893 and 12,858 to 2,001 in 1898. In the second Boer war also he was commandant-general, and directed the campaign in northern Natal which resulted in a succession of disasters for the British. He became ill early in 1900, however, and was obliged to withdraw from active service. He was the ablest of the Boer military leaders.

Jouett, jow'ët, James Edward, American naval officer: b. Lexington, Ky., 27 Feb 1828; d. Sandy Spring, Md., 1 Oct. 1902. He entered the navy in 1841, served during the Mexican War, was graduated from the United States Naval Academy in 1847, in 1861 with a detachment of marines entered Galveston harbor and destroyed the Confederate war-vessel Royal Yacht, and for his services was appointed to the command of the United States steamship Montgomery. As lieutenant-commander, he was prominent in Farragut's entrance of Mobile Bay (August 1864), and in 1885, when in command of the North Atlantic squadron he opened the transit across the Isthmus of Panama, closed by the rebels. He was promoted rear-admiral in 1886, subsequently president of the Board of Inspection and Survey, and in 1890 was retired.

Jouffroy d'Abbans, Claude François Dorothee, klöd frān-swä dō-ro-tä zhoo-frwa dāb-bāñ, MARQUIS DE, French inventor: b. Franche-Comte 30 Sept. 1751; d. Paris 1832. He is claimed by the French as the inventor of steam navigation. He served in the army, and in 1783 succeeded in propelling a small paddle-wheel steamboat up the Rhone at Lyons—the connection between piston and paddle-wheel axle being rack-and-pinion.

Joule, James Prescott, English physicist: b. Salford, Lancashire, 24 Dec. 1818; d. Sale, Cheshire, 11 Oct. 1889. He was chiefly his own educator, but received special instruction in

JOURNALISM

physics from John Dalton (q.v.). While associated in business with his father, a brewer, he early developed an enthusiasm for original scientific research, and described in the 'Annals of Electricity' (January 1838) an electromagnetic engine he had invented. While it was afterward found that this invention was impracticable as a substitute for the steam-engine, the further investigation to which it led brought to light many important facts concerning the laws of heat, its electrical and mechanical nature and evolution, chemical affinity as related to heat, etc. The mechanical equivalent of heat (see HEAT) was first ascertained by Joule, who also, in 1847, announced the doctrine of the correlation and conservation of energy, in a paper read at Manchester which failed at the time to impress men of science, as did also an address of like import before the British Association, but which was taken up by William Thomson (Lord Kelvin), by whom its momentous significance was brought home to the scientific world. No principle of science is now more fully established than Joule's law for determining the energy developed by an electric current in overcoming the resistance of a circuit, a law which he verified by experiment. He received the highest honors of scientific bodies and universities, and in 1873 was made president of the British Association for the Advancement of Science. His writings are to be found mainly in the proceedings of scientific societies and in English periodicals, but in 1885 and 1887 appeared, in two volumes, his 'Scientific Papers.'

Journalism. Journalism is a comprehensive term which signifies the business of producing a public journal. In a general way it is applied to the vocation of making newspapers. Broadly speaking it is both a business and a profession, though the name of journalist as commonly understood is limited to those who are engaged on the editorial or news or literary side of the production rather than on the business side. While editor and journalist are not strictly synonymous—the former meaning the head of a paper or a department and the latter any literary worker on a newspaper—they are often used as convertible terms.

In a large sense the subject involves the functions of journalism as collector and purveyor of news and as leader and exponent of public opinion; the ethics of journalism in its various fields of political, religious, literary, social and commercial aim and representation; the relations of the counting room to the editorial department; the training and qualifications of the journalist; in short, the mission, methods, responsibilities and obligations of journalism. All of these general phases are deeply affected by the physical conditions of the business. Within the last twenty-five years these conditions have been practically revolutionized. In the mechanical facilities of production, in the cheapening of white paper and in the instrumentalities of news collection there has been an extraordinary advance. This great change in the material factors has wrought a corresponding change in the scope and character of journalism. Not only as a business enterprise but as a public influence it takes on new aspects.

The remarkable development of later years touches every side of the material production of

a newspaper. The old, limited, slow-moving printing press has been transformed into the ingenious and gigantic quadruple or octuple which converts the plain white roll into complete, folded papers, at the rate of thirty to forty thousand an hour. The number of pages may be determined at will, even at the last moment before going to press, thus responding to the exigencies of the news; and the application of the half tone and of color at undiminished speed permits pictorial effects. Simultaneously with this improvement in the printing press has come the linotype which substitutes machine type setting for hand composition. A third vital advance has been the perfection of the process of making paper out of wood-pulp which has vastly increased the supply and greatly decreased the cost of white paper.

These radical changes in the elemental business factors have largely modified the conditions of journalism. They have opened the way to unlimited production and have enormously cheapened the cost of the single copy. Penny and two-cent papers have become the prevailing rule. Immense circulations have thus been rendered possible, and where twenty-five years ago the edition even of the most widely read papers was comparatively limited, not a few now issue scores and even hundreds of thousands of copies a day. At the same time the initial cost of the newspaper plant with its expensive machinery and the magnitude of the daily transactions require a far larger outlay than in the earlier time and the business has come to be one demanding much greater capital.

All of these circumstances have inevitably and powerfully moulded the course and character of journalism. They have given increased importance to its business side, and have tended to make business considerations in the publication still more dominant. The effect has been two-fold and somewhat contradictory. The great capabilities of the business with the reduced cost of telegraphing have stimulated and quickened journalistic enterprise and have broadened the range of the journalistic field. The scope of journalism has been enlarged and in many cases its standard has been elevated. Within a sphere, perhaps too limited, the best and worthiest effort is accepted as the best business. But, on the other hand, the competition for great circulations has bred sensationalism and a pandering to the taste for personal and piquant matters. There is an eager and feverish struggle for the unusual, the dramatic and the spectacular, a constant straining for effect, a lavishness of "scareheads" and garish pictures, a studied and persistent search for objects of criticism and attack. The appetite for the effervescent grows by what it feeds on, and must be met by new excitation. This rivalry of explosive and paroxysmal journalism is carried on with too little sense of responsibility and verification, and while the notable manifestations are exceptional, and it would not be just to say that the infection has extended through journalism, it is nevertheless true that its injurious influence is widely perceptible.

In one important and conspicuous respect the development of journalism as a business has palpably improved its character. It has produced a greater degree of independence than

JOURNALISM

ever distinguished it before. In the earlier days political and official advertising might be a large item in the income of a newspaper. Its monetary value gave it potency in controlling editorial policy. But in the expansion of the business under modern conditions official patronage is unimportant compared with general commercial advertising, and its relative decline in value has greatly reduced its power of influencing newspaper expression. The favor of the public is far more advantageous than that of the party manager. It brings popular circulation and consequently business advertising, and there is less concern about the crumbs that fall from the official table. Even party journalism has greatly advanced in independence. While standing as the recognized exponents of party principles and policies the important party papers have become much more free in their judgment of men, methods and measures. A more critical standard is applied and a more rigorous public accountability is enforced under which there has been a visible improvement in general civic administration.

Under the same influences distinctive independent journalism has increased. It professes to have no connection with any party and disclaims a representative party position. Its theory is that it addresses itself not to party sentiment but to independent public judgment, and its claim for support is based on its journalistic quality without regard to political association. It is the extraordinary advance of newspaper-making as a business that has rendered independent journalism on a large scale possible. A quarter of a century ago it would have been difficult to name more than two or three important examples in the United States. Now there are many conspicuous and successful papers which are thus classed, and even more significant of the change in journalism is the greater independence of the party journals already referred to. Indeed, in essential independence, which consists of free judgment and candid expression on public questions, the line of demarcation between the better class of party papers and the professedly independent papers is scarcely perceptible and it would be hard to distinguish between them.

There has been a signal advance in other directions. Against the false and meretricious tendencies to sensationalism which have been indicated must be placed a higher and broader treatment of all the varied interests of life. In news collection the journalism of to-day is as much ahead of that of 25 years ago as the railroad express is ahead of the stage coach. It spares no expense, reaches everywhere, sends its correspondents to all parts of the world, employs the best experts and specialists, caters equally to the lover of literature and the lover of sports, keeps pace with scientific discovery and development, rivals the best periodicals in commanding the most famous writers and artists, makes its own special missions of public service, reports all business, social, educational, philanthropic and religious movements, and, in short, treats whatever concerns mankind as within its boundless domain. Its range, enterprise and comprehensiveness are a constant marvel. With all its faults the breadth, fullness and accuracy which are combined with so much celerity of action attest a thoroughness of organ-

ization and extent of resources never before equalled.

There are marked differences, however, in its development in different lands. Continental journalism in Europe is of a type quite distinct from English journalism, and that again is unlike American. In Paris the news is not the conspicuous feature of the newspapers. It holds a subordinate place and is limited in its quantity. Literary and dramatic criticism and political discussion command the first rank, and the feuilleton is a popular and important part. Literary excellence with a flavor of characteristic French wit is the dominant trait. The Parisian type with variations, generally soberer and heavier, is the prevailing continental model. English journalism is weightier and more enterprising in news. It covers the field of international politics and war with special thoroughness. It lacks the variety and vivacity of American newspapers, but within its chosen and more limited range it is more complete. Its reports of parliamentary proceedings and of important political, social and scientific meetings are copious and intelligent, and its discussions are distinguished by sobriety and information.

In life, spirit, minuteness of news gleaning, emphasis of display, and preponderance of personal flavor American journalism far outstrips all others. It does not surpass, oftentimes does not equal, British journalism in the presentation of great events, but in the multiplicity of its news of all sorts not only from its own country, but from all the world, there is no approach to it elsewhere. Its dominant tone is a light and airy freedom. There is a manifest tendency even on the part of the most respectable newspapers to avoid being heavy. The general aim is to be breezy, pungent and picturesque, and this often leads to the flippancy which is remarked in American papers. Perhaps the public taste which is thus indicated and cultivated will serve to explain in part why there are no serious and masterful weekly journals of literary and political discussion in the United States like the 'Spectator' and the 'Saturday Review,' and why even the monthly periodicals run chiefly to fiction and light matter. There are excellent trade journals of a high grade, showing a demand for the searching and careful treatment of special interests, but outside of these immediate representatives of the stupendous material enterprises of the land, the trend is towards the lighter vein.

Somewhat analogous is the explanation of the fact that journalism has grown more impersonal in its sources and impress. It is no longer distinguished by the great overshadowing personalities which marked it a generation ago. No editorial chief puts his individual stamp on a paper as Horace Greeley did, with his controversial power, his moral earnestness and his incisive force, which seemed to make the whole paper breathe his spirit and speak his voice. There are no successors to Raymond, Bennett, Weed, Bowles, and Dana. Henry Watterson is perhaps the only survivor of the old school of journalists. The difference is due, however, not so much to the lack of men as to the change of conditions. In its immeasurably wider range and larger demands the great journal of to-day is the product of no single mind, but of a vast organization and of a whole galaxy of stars. The elder journalism was largely political

JOURNALISM

pamphleteering. The later journalism is the complete mirror of daily life, and no individual throws so great a shadow across its comprehensive face.

It is a question much mooted whether journalism has declined in influence. It never was as universally read as now; it never was so much a common practice to read several newspapers; and whether in this multiplicity of reading and frequent contrariety of representation as serious an impression is made as when the appeal was more earnest and less divided may well be doubted. The editorial page has not actually fallen off in interest and importance; on the contrary, it is all in all better written, more varied and more instructive than when it had more of a polemic character. But in the broad development and great advance of the news departments the editorial page has receded in relative importance, and the drift to the light treatment of topics has tended to detract from its distinct and superior position. The greater absorption of the public mind in multiplied interests operates in the same direction. In the stress of modern business life and in the variety of diversions the body of readers have less time to follow public discussion. If it be true, as it often is, that the favorite journal does the thinking for its readers on current questions, it is equally true that many of the questions take less hold than when life was more simple and feeling more tense. When the press is in substantial accord on any public matter, except where party tradition rules, it generally carries the public judgment, and united expression makes it invincible; but when there is a discord of journalistic voices little heed is apt to be paid to any. The power of the press in its aggregate force, in the sweep of its activities and in a certain apprehension of its publicity, has steadily augmented, but at the same time the impression that it is too intrusive, too little restrained, too little governed by a just sense of responsibility, has grown and has impaired the influence it would otherwise exert.

It remains true, however, and probably grows more true with the decadence of other influences, that the press is the most effective force in protecting the moral and social well-being of the community. It is the belief of many observers that under our modern conditions the weight of mere authority is declining. In the intense strife and eagerness of the times the efficacy of the old standards in enforcing true principles and restraining wrongdoing grows weaker. With this advance of individual assertion and independence the power of public opinion is becoming the surest defence of social and business morality. The blaze of publicity gives a protection which nothing else furnishes. In the financial and social world there is a wide margin along the shadowy and undefined line between law and lawlessness, between ethical duty and questionable interest, where the search-light of exposure is the only security. Much would be done under cover of darkness which fears the light. Despite a freedom which often degenerates into license the press is thus recognized not only as the most effective safeguard against political and administrative debauchery but as the best bulwark against that social and business misconduct which becomes a public offence.

The relation of the counting-room to the

Vol. 9—22

editorial department involves both the business and the ethics of journalism. The business side cannot be disregarded. In its ultimate purpose it is a commercial proposition. Newspapers are published to make money. The counting-room considers both income and outgo. It adjusts expenditures to receipts. It properly studies to augment revenue in every legitimate way. But while newspapers are business enterprises they are such with recognized limitations and obligations. They are not simply business undertakings but public representatives, and the former object, while consistent with the latter, is subordinate to it. The foundation of the newspaper is the confidence of the public. It is the history of yesterday and the interpreter and teacher of to-day. In the very nature of the relation it assumes distinct obligations. It is bound to give the news and to treat public questions in absolute good faith. The counting-room is warranted in doing business in every way compatible with the fulfillment of that duty, but in all legitimate journalism it is a fundamental rule that editorial opinion and news publication must be beyond the reach of any questionable influence. The editorial department must be entirely free from commercialism. Public confidence and moral power depend on full faith that editorial and news conduct is honest, fearless and upright. The publication of a newspaper, like any other enterprise, is founded on business principles; its sphere or field of operations, whether general, political, literary or other, is chosen; the relation of counting room and editorial room in organizing and maintaining it on a sound business basis is of the most intimate character; but when the general lines of the enterprise are determined, the independence and integrity of the editorial management and fidelity to its declared aim as a public representative within its chosen sphere are absolutely indispensable. This rule lies at the foundation of the whole ethical code of journalism.

The question of the training and qualifications of the journalist has assumed new interest and importance both through the general growth of the profession and through special movements for its advancement. Schools or chairs of journalism have been established in a few instances and in a limited way, and the munificent endowment by Mr. Pulitzer of a College of Journalism in Columbia University—the first large and distinct project of the kind—has presented the proposition in a practical and definite form. There are two systems of thought on the subject. The first holds that the best and most efficient school of journalism is the newspaper office. It believes that the true journalist is born, not made; that knack, aptitude, native talent, the sense of news and proportion lie at the foundation of success; and that the most useful training is that of actual experience. It does not dispute that broad education and culture are essential to the journalist, and recognizes that particular studies, like history, political economy, the fundamentals of law, social science, and kindred matters, may be followed with special advantage. But it urges that these may be gathered from the general college course, and that the college or university has no distinctive professional knowledge to teach journalists in the special sense that it has to teach lawyers or physicians. The technical-

JOURNALISM — JOVELLANOS

ties of the newspaper art—a suitable style, phonography, proof reading, the treatment of news and the like—are best acquired in practice, and the rest is the quickest and surest application of knowledge which is power, and of instinct or intuition which in dealing with public intelligence and currents is no less power, to the activities of the world.

The other system of opinion is represented in the scheme and scope of Mr. Pulitzer's College of Journalism. It is based on the theory that the journalist can be prepared for his vocation, like the lawyer, by a special course of study adapted to its requirements. Its aim and its tendency are to elevate and dignify the profession, and to establish a higher standard both of obligation and of performance. It seeks to teach not merely the technical necessities in newspaper-making but the true ideals of public service to which the newspaper should be dedicated, and the wide range of knowledge with which the journalist should be equipped. This includes style, ethics, law, literature, history, sociology, statistics, and particularly the principles and methods of journalism. It embraces an examination and comparison of existing newspapers by experts, an exposition of the functions of editor, correspondent and reporter, and the production of an experimental journal under the necessary limitations with its practical application of the instruction. In its main features this plan is an enlargement of the ordinary academic course directed to a particular end, and it is claimed that the establishment of such a college with liberal endowment would not only provide a large body of trained journalists but would set a standard for the profession.

On the whole, notwithstanding the faults of the "new journalism," the position of the press in the public estimate is increasing. One evidence of this truth is the more liberal character of libel legislation. In some States the greater license has prompted efforts at more restrictive measures, but the general trend of legislation has been toward reasonable liberality with just accountability. The prevailing movement has been to provide reparation for any wrong or injury that may be done, to assure just restitution for actual damages, but not to permit punitive damages or trammel the free expression of opinion. Journalism is advancing and is acquiring a higher position and recognition as a distinct profession. With the enlightened spirit of the age and with the marvellous agencies of instant and united expression the power of public opinion steadily grows, and the journalist is its medium and prophet. See AMERICAN Newspapers; PERIODICAL LITERATURE.

CHARLES EMORY SMITH,
Editor ('The Press,' Philadelphia

Journalism, School of, a college of journalism, endowed by a gift of \$2,000,000 by Joseph Pulitzer, editor and proprietor of the *New York World*, to Columbia University, New York, in 1903. With the advance of civilization and general culture and intelligence the demands upon the journalists of the present day are constantly becoming greater, and this college is the recognition of the importance and place of journalism as a profession, and a practical endeavor to equip those who adopt it, by a course of thorough instruction for its exacting and laborious duties. Mr. Pulitzer consid-

ers the creation and rendering effective of public opinion (see PUBLIC OPINION, POWER OF) a task of which the press alone is capable of successfully accomplishing. The College of Journalism will therefore be a means to an end—to raise the character and standing of journalism, to increase its power and prestige, and to attract to the profession men of the highest capacity and the loftiest ideals, who, because of special training, will advance the professional to a higher standard of thought and action. This school is the first institution of the kind in the world. See JOURNALISM.

Joveite, *jōv'īt*, is a nitro-substitution explosive used in blasting, and as charges for high-explosive shells, which was invented by J. E. Blomen, Washington, D. C. It consists of nitronaphthalenes 6 to 8 per cent, nitro-phenols, 16 to 30 per cent, and nitrate of soda 64 to 76 per cent. It is made by melting the nitro-naphthalenes in a steam-jacketed kettle, adding the nitro-phenols and continuing the heating until they are melted, and then stirring into this liquid mixture the solid nitrate of soda in a finely ground and perfectly dry condition until each of the solid particles of the nitrate is coated and impregnated with the liquid. On cooling, the particles of the nitrate are protected from deliquescence by the coating of scarcely soluble nitro-substitution compounds, while on explosion, the nitrate causes the reaction to be most complete. For blasting purposes this explosive is used in a granulated condition, but in loading armor-piercing projectiles it is poured into the shell while in the plastic condition and on cooling sets to a hard mass which completely fills the cavity except for a canal in the centre where the fuse is placed. For blasting purposes the explosive is fired by means of a mercuric fulminate detonator, but the charges in shells are fired by means of gunpowder fuses. In tests of the explosive by the United States navy, made at Indian Head, Md., in 1897, a 10-inch Carpenter armor-piercing shell containing 8.25 pounds of joveite, fired with a velocity of 1,860 foot-seconds at a Harveyized nickel-steel armor plate, 14.5 inches thick, passed completely through the plate and burst on the other side. See EXPLOSIVES.

Jovianus, *jō-vi-ā-nūs*, **Flavius Claudius**, Roman emperor: d. Dadastana, Bithynia, 17 Feb. 364 A.D. He was originally captain of the household troops of the emperor Julian, whom he accompanied in the disastrous campaign against the Persians in which Julian lost his life (363 A.D.). After Julian's death he was proclaimed emperor by the troops, but could only extricate his army by ceding to the Persian monarch the five provinces beyond the Tigris. He was succeeded by Valentinianus I.

Jovellanos, *hō-vēl-yā-nōs*, **Gaspar Melchior de**, Spanish statesman and writer: b. Gijon, Spain, 5 Jan. 1744; d. Vega, Spain, 27 Nov. 1811. He was educated at the universities of Oviedo, Avila, and Alcalá, became in 1770 a member of the Royal Academy, in 1778 chief justice of the criminal court at Madrid, and in 1780 a member of the council of state. Subsequently he was for a time minister of justice, but in 1801, through the agency of his enemy, Don Manuel Godoy (q.v.), was imprisoned at Majorca. Released at the French invasion (1808),

JOWETT—JUAREZ

he joined the patriots, and became a member of the supreme junta. His writings are various, including treatises on political economy, a dissertation on English architecture, a 'Memoir on Law Applied to Agriculture,' the tragedy 'El Pelayo,' and 'El Delincuente Honrado' ('The Honorable Delinquent'), a comedy.

Jowett, Benjamin, English scholar and educator: b. Camberwell, London, 1817; d. Oxford 1 Oct. 1893. He studied at Oxford, was ordained in 1842, and became regius professor of Greek in 1855. In 1855 he published a notable commentary on the Epistles of St. Paul. In 1860 he contributed an essay 'On the Interpretation of Scripture' to the celebrated volume 'Essays and Reviews,' for which he was tried on a charge of heresy before the chancellor's court, but was acquitted. In 1870 he became master of Balliol College, and in 1871 published his most important work, a translation of the 'Dialogues of Plato,' of which a fifth edition was issued in 1892. He subsequently published translations of Thucydides (1881) and the 'Politics' of Aristotle (1885). He was vice-chancellor of the university in 1882-6.

Joy, Charles Arad, American chemist: b. Ludlowville, N. Y., 1823. He was educated at Union College and the Harvard Law School, and after a few years spent as professor of chemistry at Union, became in 1857 professor of chemistry at Columbia, where he remained for 20 years. In 1866 he became president of the Lyceum of Natural History and was long one of the editorial staff of the 'Scientific American.'

Joy, George William, English painter: b. Dublin, Ireland, 1844. He was educated at Harrow, and studied art at Kensington, at the Royal Academy, and under Charles Jalabert and Bonnat, at Paris. He has won gold medals at Paris, Munich and Berlin. His principal pictures are 'Domenica'; 'Chess Players'; 'Laodamia'; 'Young Nelson's First Farewell'; 'Wellington at Angers'; 'Prince Charlie and Flora Macdonald'; 'The Death of General Gordon'; 'Princess Alice of Albany' (for Queen Victoria); 'Reverie' (for the New Zealand Government); 'Truth' (German Government); 'Joan of Arc' (bought by French Government); 'Lear and Cordelia'; etc.

Joy, Thomas, American colonist: b. Norfolk, England, 1610; d. Boston 1678. Upon emigrating to America in 1635 he established himself in Boston as an architect and builder, and in 1657 erected the Townhouse of Boston, the earliest civic structure of any note in New England. In 1646 for his share in the 'Child Memorial,' protesting against both the civil and ecclesiastical government of the Bay Colony, he was fined and imprisoned.

Joyce, Robert Dwyer, Irish poet and physician: b. in County Limerick, September 1836; d. Dublin 23 Oct. 1883. In 1866 he came to the United States and practised medicine for several years in Boston, Mass., contributing during that period to the 'Pilot' and other Irish journals. He published 'Ballads, Romances, and Songs' (1872); 'Deirdre,' a much admired epic poem, which appeared anonymously as one of the 'No Name Series' (1876); 'Legends of the Wars in Ireland' (1888); 'Fireside Stories of

Ireland' (1871); 'Blanid,' a poem (1879); 'The Squire of Castleton'; etc.

Joyeuse Entrée, zhwā-yēz öñ-trā, the name given to the important privileges of the estates of Brabant and Limburg, with Antwerp, which the dukes were obliged to swear to maintain before they were allowed to enter the ducal residence, from which circumstance the name was taken. The most important of these privileges was that the people were released from an allegiance whenever the duke should attempt to violate their rights. So important were these privileges considered that many women went to Brabant to be confined there, that their children might enjoy the rights of a citizen of Brabant.

Joynes, Edward Southey, American educator: b. Accomac County, Va., 2 March 1834. He was educated at the University of Virginia and at Berlin, in 1858 was appointed professor of Greek at William and Mary College, in 1866-75 was professor of modern languages at Washington College (now Washington and Lee University, Lexington, Va.), and subsequently held chairs in Vanderbilt University and the University of Tennessee. In 1882 he became professor of modern languages in South Carolina College (Columbia). He published text-books of French and German, most important of which is the 'Joynes-Meissner German Grammar' (1887).

Juan Fernandez, joo'an fér-nän'déz (Sp. hoo-án' fér-nan'déth), so called from the name of its discoverer, also sometimes Más-á-Tierra, an island in the South Pacific Ocean, about 350 miles west of the coast of Chile, to which it belongs. It is 12½ miles long and 5 miles broad at the broadest part, mountainous, and of rugged aspect. Parts of it are fertile, producing various kinds of timber, peaches, figs, grapes, cherries, etc. There are excellent fish. The island is inhabited by a few settlers, whose chief occupation is the providing of fresh vegetables, water, and wood for the whaling or other vessels that call here. Defoe is said to have founded his 'Robinson Crusoe' on the history of the solitary residence here for over four years (1704-9) of a Scotch sailor, Alexander Selkirk.

Juan de Fuca, joo'an dě fū'ka (Sp. hoo än' dā foo'kā), Strait of, an ocean passage between the State of Washington and Vancouver Island. It connects the Pacific with the Strait of Georgia on the north and Puget Sound on the south. It is 100 miles long and about 15 miles wide. It contains several islands, some of which were at one time in dispute between the United States and Great Britain.

Juarez, Benito Pablo, bā-nē'tō pāb'lō hoo-ä'reth, Mexican statesman: b. San Pueblo Guelatao, Oajaca, 21 March 1806; d. Mexico 18 July 1872. He was admitted to the bar in 1834; became a judge of the civil court in 1842; in 1847-52 was governor of the state of Oajaca, in which post he greatly improved provincial conditions; and after a period of exile (1853-5) joined the revolutionists under Alvarez, by whom he was later made minister of justice and ecclesiastical affairs. In 1855 he was appointed provisional governor of Oajaca by Comonfort, the successor of Alvarez, and in 1857 elected constitutional governor. He was made secretary of the interior and chief justice in the latter

JUAREZ CELMAN — JUDAISM

year (the office of chief justice being by the constitution the equivalent of a vice-presidency), and when Comonfort was driven from power (1858), duly succeeded to the presidency, was recognized by the Mexican states and the United States, but was opposed by the conservatives in a long civil war, and did not enter Mexico City until 11 Jan. 1861. In March he was elected president for a four-years' term. The bankrupt government published a decree suspending for two years the payment on the foreign debt, and an alliance of intervention was at once entered into by England, Spain, and France. On Juarez' agreement to protect the interests of foreign debtors, the English and Spanish troops evacuated the country, but France proceeded to a war of conquest. Juarez was driven to the extreme north and Maximilian assumed imperial power. Upon the interference of the United States, however, the French troops were withdrawn in 1867, and in the same year Maximilian was executed and Juarez elected president. He was re-elected in 1871. His vigorous and liberal policy was of great benefit to the nation, and he has sometimes been called the "Mexican Washington." Consult Baz, "Vida de Benito Juarez" (1874); and the "Life" by Burke (1894).

Juarez Celman, Miguel, mē-gēl' hoo-ā'rēth sāl-mān', Argentine statesman: b. Cordoba, Argentina, 29 Sept. 1844. He was graduated from the university of Cordoba in 1870 and after holding several political posts became governor of his province of Cordoba, and in 1884 a senator in the national Congress. In 1886 he was chosen president and the speculation rife during his administration, as well as the inflation of the currency and the magnitude of the public works undertaken at this time, induced a financial panic in 1890. The Celman administration was held responsible for this disaster and the president himself charged with having amassed a fortune from sums known to have been taken from the treasury. The cabinet resigned, but revolt broke out in Buenos Ayres 26 July 1890, and fighting in the streets continued for several days. On 6 August, however, the president resigned and the vice-president, Pellegrini, assumed his duties for the remainder of the term.

Juba (joo'bā) Islands. See DUNDAS ISLANDS.

Juba River, in eastern Africa, a large stream which flows into the Indian Ocean at about lat. 0° 5' S. Its mouth marks the north boundary of the coast placed under British control by the agreement with Germany in 1890. The river has been explored to beyond lat. 3° N., and Cecchi identifies the Umo as its upper waters; so that it probably takes its rise in the same mountains as the feeders of the Nile.

Jubal, joo'bal, or **Jabal**, son of Lamech and Adah. According to Genesis iv. 21, the inventor of the reed-flute and harp or lyre, and the father, or predecessor, of all them who play upon such instruments, that is, the discoverer of musical science.

Jubilee, an observance among the Jews which recurred every fiftieth year; the land was to rest, as in sabbatical years; land and houses in the open country and in unwalled villages reverted to their original owners or the heirs

of such; all slaves were to go free. The law as a whole was distinctly theocratic; it vindicated the absolutism of Jehovah; it meant that Hebrews were the servants of Him, and could not therefore continue to be the slaves of their fellow men; the land belonged to Him, and was only lent to the Hebrew tribes and families, who could not therefore be driven out by any human arrangement.

In the Roman Catholic Church a Jubilee occurs every twenty-fifth year in which the Pope proclaims a remission, from Christmas to Christmas, of the penal consequences of sin, on condition of repentance, restitution and the performance of certain pious works. The first Roman Catholic Jubilee was given in 1300.

Juch, yook, **Emma Johanna Antonia**, American opera singer: b. Vienna 4 July 1803. She came with her parents to the United States when an infant and was educated in the public schools of New York. She studied singing under Murio-Celli for three years, making her concert début in Chickering Hall, New York, and her operatic début as Felina in "Mignon" in London 1881. She sang for three seasons in the Mapleson opera company, and under the management of Theodore Thomas in the United States sang the part of Elsa in "Lohengrin" on alternate nights with Nilsson. She was the prima donna of the American Opera Company for three seasons, and has sung in the Emma Juch English Opera Company and other organizations. She was married in 1894 to Francis L. Wellman, of New York.

Judaism, Reformed, in America finds its roots in the beginning of the Reform movement that took place in Germany in the first quarter of the 19th century. The cause of the religious advance of the Jew in Europe was the breaking up of the Ghetto in the latter half of the 18th century. As long as the Jew was excluded from the world, its culture and its opportunities, he found his greatest comfort in his Hebrew studies and in his religion. The latter developed only along its own narrow lines and was protected from every admixture of foreign elements. The Jew, as it were, built a "fence around the law." When the bars of the Ghetto fell and the Jew was initiated into a new world of thought, language, literature and activity, he found the old religion incongruous with modern life and the rabbinical law too rigid for the new conditions. Reconciliation between the two was difficult. A bitter struggle ensued between the old religion and the new life. A compromise was the only solution. Judaism was equal to the demand. Heartburnings, personalities, domestic schism, often followed in the wake of innovations. The wheels of progress, however, could not be stayed.

Moses Mendelssohn translated parts of the Bible into German and thus opened up a new field of study for the Jew. This was followed by a translation of the Prayer Book into German by David Friedlander. The Talmudic regulations were either openly isolated or interpreted in a liberal spirit. Religious schools for instructing the younger generation in the principles and practices of Judaism as well as in the literature and history of Israel, were instituted and conducted according to modern pedagogical methods. Religious services in many

JUDAISM

synagogues were modified, rituals were shortened, objectionable features were omitted, and prayers, sermons and hymns in the vernacular were introduced. Israel Jacobson was the first who successfully established reformed religious schools and services in Germany and later built a Reform Temple at Sessan, which was consecrated 17 July 1810. This Reform movement soon spread to Berlin and Hamburg and before long it reached America and found expression here in 1788 in the city of Charleston in the organization of the "Reform Society" of Israelites, which instituted divine services that consisted of a short ritual with sermons, etc., in English and the abolition of offerings during the divine service. A great ecclesiastical battle resulted and many questions of reform were delayed for several years. An organ was purchased and the system of family pews adopted in spite of much opposition. It may here be mentioned to the everlasting credit of Reformed Judaism, that it instituted family pews and gave to women the right to worship in the same pew with their husband and sons. The practice of the orthodox wing, which still prevails in many congregations, of isolating women in a screened gallery, is both improper and without warrant in this age of enlightenment. Reform differs further from Orthodoxy in the interpretations put upon the Scriptures and the Talmud and the authority with which they are severally credited. Orthodoxy gives to both Scripture and Talmud a binding authority over Jews without regard to circumstances of time and place. Reform seeks to set up a higher standard of authority than merely the literal texts and to find a way of reconciling ancient laws and traditions, if possible, with modern requirements. The usual custom of Reformers is to be reasonable and to discriminate between the essentials and the non-essentials of Judaism. Reformed Judaism has discarded belief in bodily resurrection, in the coming of a personal Messiah, in the national restoration of Palestine and the re-institution of the ancient temple with its Levitical cults. Reformed Judaism is also manifested in a refusal to abide by the rigorous enforcement of the Mosaic and Rabbinical dietary laws and in certain changes in the ritual and religious observances. The reform instituted at Charleston soon spread to the North where in the city of New York the Temple Emanu-El was organized in 1845 under the leadership of Rev. Dr. Leo Merzbacher who formed his own ritual for the congregation. Temple Emanu-El has led the van of the Reformed Jewish congregations of America for over half a century and has given much impetus to the progress of Israel. Under Dr. Samuel Adler and Dr. Gustav Gottheil, this congregation made vast strides and is now the largest and wealthiest Jewish congregation of the world. Its place of worship is situated at the corner of Fifth Avenue and 43d Street, and its present rabbi is the Rev. Dr. Joseph Silverman. Har Sinai congregation was soon organized in Baltimore under the banner of Reform and adopted the prayer book of the Hamburg Temple. Some of its noted rabbis were Dr. David Einhorn, Dr. Samuel Sale, Dr. D. Philipson, and Dr. F. Shanfarber. The present incumbent is Rabbi Charles Rubenstein. A stronger note than all these, however, was

sounded in the early days of reform at Albany where Rev. Dr. I. M. Wise officiated from 1846 to 1854. He had come from Germany, impregnated with the new spirit of progress, and at once carried his cherished ideals into practice in this country. He fought some of the early battles of Reform in America which went far beyond the expectations or desires of the Reformers of Europe. He contended for choir and organ and for a prayer book in the vernacular and his *Minhag America* (the American Ritual) was acceptable to most American Reform congregations for almost 50 years. It later became the basis of the Union Prayer Book now generally in use. Wise was not alone in his strenuous battles for progress. Leo Merzbacher, Max Libenthal, Samuel Adler, David Einhorn, and Samuel Hirsch ably entered the lists and contributed valuable aid to the new movement. These men were later reinforced by such valiant Reform leaders as B. Felsenthal, J. K. Gutheim, and Gustav Gottheil. Rev. Dr. Isaac M. Wise rightly called the father of American Reformed Judaism, gave to this movement a greater impetus than it had ever received, when in 1873 he organized the Union of American Hebrew Congregations and under its auspices, in 1875, the Hebrew Union College, a theological seminary for the training of American rabbis. A great drawback to the progress of the reform element was the lack of leaders and rabbis with modern scholastic education who could enter into the spirit of American conditions and the needs of Israel in this country. In the last 25 years over 100 graduates of this college have found pulpits in reform congregations where, with their modern culture and the ability to appeal to the younger generation, they have had eminent success and have given reformed (or Progressive Judaism, as it is sometimes called) a firm foothold on American soil. The Union of American Hebrew Congregations is now actively engaged in providing circuit preachers for small congregations and in organizing congregations and religious schools in communities where none exist. Another source of active strength to Reformed Judaism has been the Central Conference of American Rabbis, which the late Rev. Dr. I. M. Wise called into existence in Detroit in July 1889. This had been preceded by several Reformed Rabbinical Conferences which from time to time discussed burning ecclesiastical and ritual questions. The most noted of the conferences was the Pittsburg Conference held in November, 1885, at which the following platform of Reformed Judaism was adopted and which in the main, has been approved by nearly all Reformed Rabbis and teachers and been generally accepted by the laity.

Act. 1.—Judaism conveys the highest conception of God and of his relation to Man. God is the Creator and Ruler of the world, Father and Educator of the human race.

Act. 2.—The Holy Scriptures are the record of Divine Revelation and of the consecration of the Jewish people as the missionaries of the one God. In composition and literary arrangement the Scriptures are only the work of men with the unavoidable limitations of their age.

Act. 3.—The results of natural science are the best helps to the understanding of the working of Divine Love in the world, the Bible serv-

JUDAS — JUDD

ing as guides to illustrate the working of Divine Power within us.

Act 4.—The Mosaic laws are intended for the training of the Jews of Palestine in their former surroundings; only the moral laws are divine; all social, political, and priestly statutes, inconsistent with our modern habits and views, are to be rejected.

Act 5.—The Mosaic-rabbinical laws on diet, purity and dress fail to imbue modern Jews with the spirit of priestly holiness; their observance to-day would obstruct rather than enhance moral and spiritual elevation.

Act 6.—Israel's Messianic hope relates to the establishment of the authority of peace, truth, justice and love among men. No return to Palestine is expected, nor the re-institution there of a Jewish state, or of a worship conducted by descendants of Aaron.

Act 7.—Judaism is an ever growing, progressive and rational religion of modern civilization and asserts the necessity of preserving identity with the great past of the Jewish nation.

Act 8.—Judaism hails the efforts made by various religious denominations toward removing the barriers separating sect from sect.

Act 9.—It is the duty of Jews to spread the knowledge of their religious truths and mission amongst Jews and non-Jews.

Act 10.—The present agitated state of Judaism is a period of transition from a blind belief in authority and exclusion to a rational and humanitarian conception of religion; the masses, therefore, should be enlightened as to the history and mission of the Jewish people and their social and spiritual condition elevated through press, pulpit, and school.

The Central Conference of American Rabbis has, under the regime of its founder and first president, Dr. I. M. Wise (1889-1898), and its second president, Dr. Joseph Silverman (1899-1903), formulated many decisions which have been put into practice by the people at large, the most important of which are the abrogation of circumcision for adult proselytes, permission to the rabbis to officiate at cremations, the interdiction of rabbis from officiating at intermarriages (between Jews and non-Jews), etc. The most important work of the Conference has been the publication of the Union Prayer Book and Union Hymnal both of which have become very popular and have been the means of bringing unity into the religious services of almost 200 reformed congregations and of abolishing the many different rituals which had been a source of confusion in modern Judaism. Of late years some reformed congregations have been holding Sunday services in addition to the regular Sabbath services and many people have had grave fears lest this movement might lead to the substitution of Sunday for the Jewish Sabbath. The Central Conference of American Rabbis at its convention at Detroit July 1903, allayed those fears by adopting a resolution to the effect that this Conference favors adherence to the historical Sabbath as the fundamental institution of Judaism, and that Sunday services, whenever held, must only be regarded as supplementary to the regular Sabbath services. The future of Reformed Judaism in this country is pregnant with great possibilities. It is to be shaped, in the main, by the Union of American

Hebrew Congregations, the Central Conference of American Rabbis and the Hebrew Union College (Cincinnati, O.) presided over by Dr. K. Kohler, the successor of Dr. I. M. Wise, and by the graduates of this college of whom the older and more prominent are: A. Aaron, H. Berkowitz, Jos. Krauskopf, Louis Grossman, R. Grossman, M. Heller, David Phillipson, Jos. Stoltz, Jos. Silverman. Among the scholarly and leading Reform rabbis of America may be counted E. G. Hirsch, K. Kohler, S. Sale, Leon Harrison, I. S. Moses, M. Samfield, J. Vooranger, S. Shulman, M. H. Harris. It is hoped that the new Jewish Theological Seminary of America (New York), Dr. S. Schechter, President, will also in time add power and influence to progressive Judaism in America, notwithstanding its present conservative tendency. The main problem for the reformers of the future will be how to promote assimilation with modern conditions without sacrificing the integrity of Judaism. Consult: 'Reports of the Union of American Hebrew Congregations'; 'Reports of the Central Conference of American Rabbis'; 'Yearbooks of the American Jewish Historical Society'; 'Reminiscences of I. M. Wise'; Phillipson Grossman, 'Life and Writings of I. M. Wise'; Kohler, 'Settlement of Jews in North America'; and 'The Jewish Encyclopedia.'

JOSEPH SILVERMAN, D.D.,
Temple Emanu-El, New York City.

Judas, or Jude, one of the twelve apostles. He appears in the apostolic catalogue of St. Luke as "Judas of James," that is, son or brother of James; in St. Mark's and St. Matthew's list he is styled Thaddæus, of which Judas may be an abbreviation. Nothing is known of his life except what is ascribed to him by widely spread tradition. According to western legend he went in company with Simon the Canaanite to evangelize the Persians, and closed his life by martyrdom. In the calendar of the Book of Common Prayer as well as in the Roman Catholic calendar the festivals of St. Simon and St. Jude occur together on 28 October, and in the Greek Church on 16 May.

Judas Iscariot, is-kär'i-öt (that is, of the family of Cariot in the tribe of Judah). One of the twelve apostles of Christ. He is styled the son of Simon, and was treasurer to the little company that attended Jesus, whom he betrayed with a kiss into the hands of the Jewish priests, for thirty pieces of silver. His divine Master addressed to him the mild reproof—"Dost thou betray the Son of Man with a kiss?" Remorse drove him to suicide. Nothing is known of his life previous to the appearance of his name in the lists of the apostles.

Judas Maccabæus, mäk-a-bé'üs. See MACCAEBS.

Judas-tree. See CERCIS.

Judd, Garrett Parmlee, Hawaiian statesman: b. Paris, Oneida County, N. Y., 23 April 1803; d. Honolulu, Hawaiian Islands, 12 July 1873. In 1828 he went to Honolulu as a medical missionary, and in 1842 was appointed recorder and interpreter to the native government. He organized the first Hawaiian ministry for Kamehamaha III. in 1843, and held the portfolio of finance from 1844 until his retirement in 1853. He placed Hawaiian finance on a sound basis,

JUDD — JUDGE

and was a predominant influence in native politics.

Judd, Norman Buel, American lawyer and politician: b. Rome, N. Y., 1815; d. 1878. After studying law he was admitted to the New York bar in 1836 and at once going to Chicago began practice there, being the first city attorney of that city. He sat in the Illinois legislature 1844-60, becoming a member of the Republican party in 1856. He was minister to Prussia 1861-5, and was successful in preventing Prussia from recognizing the Confederacy. He was collector of the United States customs at Chicago in 1873 and was long prominent as one of the foremost railway lawyers in the country.

Judd, Orange, American journalist: b. near Niagara Falls, N. Y., 26 July 1822; d. Chicago, Ill., 27 Dec. 1892. He was graduated from Wesleyan University in 1847, became editor of the 'American Agriculturist' in 1853, was its owner and publisher in 1856-81, and in 1855-63 was also agricultural editor of the New York *Times*. At Chicago he edited the 'Prairie Farmer' (1883-8), which became the 'Orange Judd Farmer.' In 1871 he gave to Wesleyan University the Orange Judd hall of natural science, in which he established in 1875 the first State agricultural experiment station. He did much to promote American agriculture.

Judd, Sylvester, American author and Unitarian clergyman: b. Westhampton, Mass., 23 July 1813; d. Augusta, Maine, 20 Jan. 1853. He was graduated at Yale College in 1836, and subsequently becoming a Unitarian studied theology at the Harvard Divinity School. In 1840 he was ordained as pastor of the East parish in Augusta, Maine, and continued to hold that pastorate till his death. In 1845 he published 'Margaret, a Tale of the Real and Ideal,' a very noteworthy example of American fiction, to which Lowell in his 'Fable for Critics' makes extended allusion and which was illustrated by a much admired series of outline drawings by Felix O. C. Darley (q.v.) (1856). In 1850 he published 'Philo, and Evangeliad,' a didactic poem in blank verse, and in the same year 'Richard Edney,' a romance. 'The Church,' a collection of sermons, appeared in 1855.

Jude, jood. See *JUDAS*.

Jude, Epistle of, a general or ecumenical letter reckoned among the canonical writings of the New Testament. The writer, while speaking with something like apostolic authority, does not claim to be an apostle. He is merely "the brother of James," probably James the Just, the author of another general epistle. Difficulties have been raised about this book because of its resemblance to II. Peter, and it is quite uncertain which epistle was written first. It also contains references to two apocryphal books, the 'Assumption of Moses' and the 'Book of Enoch,' but as in the New Testament citations are made not only from uninspired, but even from heathen writers, this does not impair the authority or authenticity of the epistle. As to its date, the earliest probable is 64 A.D. and the latest 67 or 68 A.D. The contents include address and salutation; false teachers are condemned, their fate illustrated by Biblical examples; their wickedness specifically described and woe is pronounced upon them. The letter concludes with an ex-

hortation, to consider how the apostles predicted the coming of these mockers; to cling to the love of God; to treat such perverted ones with discrimination.

Judge, a public officer to whom is committed the exercise of judicial power of the State in the administration of justice in its courts. It is his province to decide questions of law, and in cases in which facts are to be decided by a jury to instruct the jury as to the law which is applicable and to point out to them what the exact questions for their determination are. (See *JURY*.) He pronounces the sentence, or enters the judgment, of the court. It is to be understood that the foregoing is an attempt to state the functions of a modern judge. In the early stages of society there are complexities of social relations which disappear with advancing civilization. In England, for example, there were formerly local courts and ecclesiastical courts, the judges of which can scarcely be said to have exercised the power of the state, if by state we mean the general government; nor were the judicial powers entirely distinct from the administrative. (See *JURISDICTION*.) But from the time when the King's Court began to assume importance in the 12th century, and to be held by professional judges, the judicial office began to approach its modern character. This character had long been established when the United States government was formed.

The word is not a technical one. The officers of the King's Court, when that tribunal began to take definite shape, were known officially as justices. Until the recent Judicature Acts in England it was customary formally, as well as popularly, to speak of the Judges of the superior courts at Westminster, though the members of the courts of King's Bench and Common Pleas were properly justices, and of the Court of Exchequer barons, and at the present time the members of the Supreme Court of Judicature, including the Lord Chancellor, the Lord Chief Justice, the Master of the Rolls and the Lords of Appeal are spoken of as the judges of that court. English judges are appointed by the Crown (this patronage being exercised by the Lord Chancellor, who is the head of the legal profession) from the leaders of the Bar, and hold office during good behavior.

In all the Federal courts, in all the higher courts of the several States and in most of the inferior courts, judges must be trained in the law, though lay judges were common in the State courts of first instance until quite recent times. Federal judges are appointed by the President, by and with the advice and consent of the Senate, and hold office during good behavior, being removable only by impeachment. Any Federal judge who has served for ten years and is 70 years of age may retire on full pay for life. The choice of judges in the States is determined by the State constitutions. As a general rule they are elected for a term of years. The fear was quite generally expressed at the time the tendency to make the office an elective one became general, that judges so chosen would be inferior to those appointed by the State governors, but does not seem to have been justified by the result. In most of the State courts the small salaries paid and

JUDGE-ADVOCATE — JUDGMENT

the limited terms of office prevent the leading members of the bar from seeking, and in many cases from accepting, the office of judge.

A judge must be impartial and any interest in the cause or the parties will disqualify him from presiding at the trial. While in office he is precluded from practising before the court of which he is a member, and he is commonly, and should be universally, precluded from practising before any court. He is not answerable to any suitor for the correctness of his rulings or decisions, and in the absence of positive fraud is not answerable in damages for any decision he may render. Every judge has power to punish for contempt of court in case of acts committed during the court's session, and even of such acts committed outside the court, though this latter power is to be exercised with care, and its limits are naturally not defined with certainty. For the peculiar functions exercised by American judges as interpreters of the Federal and State constitutions, see JURISDICTION.

JOHN DOUGLASS BROWN,
Philadelphia.

Judge-advocate, a title given the prosecutor in a court-martial or military commission. In the United States the judge-advocate is generally a member of the judge-advocate-general's department. In Great Britain the duties of judge-advocate usually devolve upon a detailed staff officer, or the prisoner's commanding officer. The prisoner has a right to call on any regimental officer to speak in his behalf. See LAW, MILITARY.

Judge Lynch. See LYNCH LAW.

Judges, Book of, a book of the Hebrew scriptures which relates the exploits of successive rulers of Israel who delivered the land from the heathen, 'judge' in the Hebrew sense being used to designate the defender of a cause, and not necessarily a judicial magistrate. These judges were raised up at times of national emergency to assert the independence of the nation. Abimelech attempted to maintain the succession to this office as being the son of Gideon, but he failed, and the office was never hereditary. Samuel did indeed appoint his sons judges, but the government was at that time undergoing a transition to the settled form of hereditary dynasty.

The period comprised in the book of Judges is from Joshua to Samuel and Saul. In 1 Kings vi. 1, it is stated that from the Exodus to the building of the first temple was 480 years, and the time enumerated by the writer of the Book of Judges amounts to 410 years, but on the very probable hypothesis that some of these judges were of merely local authority, and judged Israel contemporaneously, this will be reduced to 299 years. As the accession of Saul is reckoned at 1037 B.C., we may roughly estimate that the judges ruled Palestine from 1336 to 1037 B.C. The book opens with a preliminary review of the condition of the tribes at the close of Joshua's

wars, for the purpose of showing how imperfectly they had carried out the command "Go in and possess the land." The succession of judges, occupied in repelling the encroachments, is the result of this dilatoriness and neglect. The main section of the work is taken up with the exploits of the judges, namely Othniel, who broke the yoke of Mesopotamia; Ehud, who threw off the oppression of Moab; Deborah and Barak, who drove off the northern Canaanites; Gideon, who repelled the Midianites; Jephthah, who fought with the Canaanites; and Samson, who contended with the Philistines. In regard to the public services of the other six we are told little. These are Shamgar, Tola, Jair, Ibzan, Elon, and Abdon. As an epilogue or appendix comes in the stories of idolatrous Micah, and the hideous outrage at Gibeah. The experience of Israel under the judges was educative. In their distress they appeal to Jehovah for deliverance and every answer to their prayer is a rebuke to their forgetfulness and a reminder of their duty to conquer and possess the land.

Judges' Cave, a crevice between some large fallen rocks on West Rock, New Haven, Conn., now a municipal park, which in 1661 was a temporary hiding-place for Goffe and Whalley, two of the English regicides.

Judgment, the decision rendered by the authority to which a question or issue has been submitted for determination. In a more restricted sense, the decision by a court of law of an issue raised by parties litigant, or the determination and declaration by such court of a legal right. There are many rulings by such a court which are not judgments, but determine merely some incidental question, and there are judgments which are interlocutory, as well as final judgments which put an end to the controversy. But every judgment in a judicial proceeding is an adjudication by the court of some right of a suitor, and until set aside or reversed, is the law governing such right.

In early times the solemn character of a court record and the means which the law furnished for the enforcement of an obligation thus established caused such a record to be adopted for the purpose of entering into an obligation as distinguished from resort to a court for the vindication of the obligation when disputed by the other party. A modern survival is found in the confession of judgment, by which a man causes his obligation to pay a sum of money to be entered upon the court records in the form of a judgment against him for the amount due. In consequence of the early practice—aided also by the fact that a judgment may be sued upon outside the jurisdiction of the court in which it was entered, like a contract—the older legal writers speak of judgments as a species of contract. But this classification has been shown to be unscientific by recent writers, since the courts have pointed out that these obligations are not contractual in either their origin or their incidents, and it is now customary to speak of them as *quasi-contracts*.

It is stated above that a judgment is interlocutory or final. In a suit for partition of real estate a judgment that partition be made is interlocutory, and is the basis of further

JUDICA—JUDITH

proceedings which result in the final judgment establishing the partition. A final judgment is one which ends the controversy, at least as to some of the parties. It is a general rule that no appeal can be taken, except from a final judgment, and while there can rarely be a case of doubt as to the finality of a technical judgment, that is the decision rendered by a court of common law jurisdiction, questions frequently arise as to the finality of decrees (which correspond to judgments) entered by courts of equity. The test is whether the right is finally settled by the decree; for example, when a creditor has claimed to intervene in an equity proceeding to establish his right to share in a fund being distributed, a decree excluding him is final as to him and appealable, though in all other respects the suit remains undetermined by the court below.

A judgment of a competent court having jurisdiction of the parties and the subject matter is conclusive, except so far as it may be the subject of appeal to a higher court. The direct issue thus determined will not be re-tried by another court, and such a determination cannot be attacked collaterally except on the ground of fraud or lack of jurisdiction of the court in which the judgment was rendered. A judgment *in personam* binds only parties to the cause and those in privity with them; a judgment *in rem*, which is a judgment determining the *status* of person or property, binds all the world. Decrees of courts of admiralty are judgments *in rem* and conclusive of the *status* of the subject-matter of the cause upon every one. Decrees of divorce are judgments *in rem*, and determine the *status* of the parties to the proceeding. In the United States they are pronounced by the State courts in the administration of very diverse statutes relating to the subject of divorce, and as the courts of all the States, in addition to the general principles of comity observed between courts of different jurisdictions, are bound by the mandate of the Federal constitution requiring that "Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State" many perplexing questions have arisen. These cases afford good illustrations of successful collateral attacks upon judgments on the ground of fraud or lack of jurisdiction of the court entering the judgment. It is now well settled that a decree of divorce may be successfully attacked collaterally on the ground of fraudulent collusion between the parties or lack of jurisdiction of the court pronouncing it over the person of the defendant. It is to be observed that a final judgment is conclusive of the particular cause, and finally determines the right therein litigated, and may be pleaded in bar of any future attempt to assert the right, except in a case in which there has been no determination on the merits; as for example, where the plaintiff has suffered a voluntary non-suit, that is, has elected in advance of a verdict to abandon his case. He loses that particular case and must pay the costs, but is not prevented from bringing another action.

In most of the United States a judgment for a sum of money found to be due, from the date of its entry, and without the issuance of a writ of execution, constitutes a lien upon the real estate of the judgment debtor; that is,

a claim which must be paid out of the proceeds of any judicial sale of the property in its due order of priority as compared with other liens upon the same property. This lien usually extends only to real estate within the jurisdiction of the court in which the judgment was entered with provision for filing a transcript to create a lien in other counties of the same State in which the debtor owns real estate. A foreign judgment, in which are included the judgments of others of the United States, must be sued on and a judgment recovered upon it to make it effective in any of the States. In such suit no defense which could have been interposed in the original suit will be allowed to the judgment debtor.

JOHN DOUGLASS BROWN,
Philadelphia.

Judica, joo'di-kä ("judge," or "give sentence"), the first word in the 43d Psalm, used as an introit in the Church of England (1549) for the 3d Sunday in Lent, and in the Roman Catholic Church for the 5th Sunday in Lent. Hence "Judica Sunday" as a term to designate those several days.

Judiciary, that branch of government concerned with the administration of justice, in cases civil or criminal; the system of courts of justice in a country; the judges collectively. For judiciary in the United States, see COURT.

Judiciary in the Philippines. The United States government organized in 1902 a complete judicial system covering the whole archipelago, the municipal code providing for the trial of violators of municipal ordinances by the local *presidente*, other special laws authorizing the appointment of justices of the peace for trial of minor offenses, civil actions involving small amounts and the preliminary investigation of higher crimes, creating courts of first instance that are courts of record and of general jurisdiction, one being provided for each province, except in the city of Manila, where there are two judges. The courts of first instance hold sessions at least twice a year in the smaller provinces and in the more important ones three or four times. The archipelago is divided into 14 judicial districts outside the city of Manila, one judge for each judicial district, with a special tribunal for disposing of arrearsages of litigation in the island of Negros. There is a Supreme Court, consisting of a chief justice and six associate justices, with adequate provisions for reporting the decisions of the court, and for representation of the government, general and local, in all litigation by the attorney-general, solicitor-general and their assistants, and provincial fiscals, with a special municipal system of courts for the city of Manila and with a notarial system for the archipelago. A considerable number of the judges in the various courts are native Filipinos. All the fiscals, or prosecuting officers in the islands are natives.

Judith, Jewish heroine. She was the widow of Manasses, a citizen of Bethulia. When Holofernes, general of King Nebuchadnezzar, according to the Book of Judith, besieged Bethulia, a city of unknown geographical position, she went armed with faith in Jehovah to the tent of the invader and was admitted because of her stately beauty. While he slept she cut off his head with his own sword, and thus de-

JUDSON

livered Israel. This incident has been a favorite subject with artists, for in the first place the Book of Judith is written with abundant literary point and skill and is naturally suggestive to the sculptor or painter. It is the subject of Donatello's bronze group in the Lanzi palace at Florence, and of many pictures, notably that of Cranach in the Dresden gallery, and those of Horace Vernet, 'Judith on Her Way to Holofernes'; and 'Judith in the Tent of Holofernes.'

Judson, Adoniram, American Baptist missionary: b. Malden, Mass., 9 Aug. 1788; d. at sea 12 April 1850. He was graduated from Brown University in 1807, and immediately after opened a private school in Plymouth, Mass. Skeptical views which he had held were overcome by his examination of the evidences of Christianity, and he was graduated from Andover Theological Seminary in 1810. With some of his fellow students at Andover he addressed a letter to the General Congregational association of Massachusetts which ultimately led to the formation of the American board of commissioners for foreign missions. Impatient at the slow progress of the American movement he embarked for England to consult with the directors of the London Missionary Society in regard to co-operation with that society by the newly formed American board. On his return to America he and three others were appointed missionaries to the Burman empire by the American board; they were ordained 6 Feb. 1812 and Dr. Judson, with his wife, sailed on the 19th for Calcutta. They were subjected for a full year to much annoyance by the East India Company's regulations, and finally took refuge in Rangoon (July 1813). Meanwhile they had adopted Baptist views, and had surrendered their connection with the American board. The Baptist general convention (now the American Baptist Missionary Union) organized in 1814 and immediately appointed Mr. and Mrs. Judson its missionaries. Established in Rangoon they applied themselves to the learning of the language, without grammar or dictionary; in April 1819 the first *saya* was opened for Christian worship, and in 1820 the number of baptized converts was 10. The growth of the mission had excited the displeasure of the new viceroy, and Dr. Judson determined to appeal to the king for protection, but the plea was unavailing; later, however, their mission was transferred to Ava, at the request of the king. The sudden breaking out of war between the East India Company and the Burman government brought upon the missionaries the severest privations; in June 1824 Dr. Judson was arrested and thrown into prison, enduring the most brutal treatment until February 1826, when he was released on the demand of Sir Archibald Campbell, the English general. Removing to territory ceded by the Burman government to the English, he and his wife commenced missionary work at Amherst; shortly after Judson went with an embassy to Ava to negotiate a new treaty, and during his absence his wife died. On his return to Amherst he took up again his missionary work, where he was chiefly occupied in the translation of the Bible (completed 1834); and the preparation of a Burman-English dictionary. In April 1834, he married Mrs. Sarah Hall Boardman, and remained in Burma till 1845, when he visited the United States. Mrs. Judson died on

the voyage. He was received in the United States with distinguished marks of respect by public meetings in many cities, especially by the Baptist missionary conventions at New York and Richmond. In July 1846, he again sailed for Burma with his third wife, Emily Chubbuck, and settled at Maulmain; took the pastorate of the Burman church there, and continued his work on the dictionary. In 1849, illness forced him to leave Maulmain, and he died on the voyage to the Isle of Bourbon. Consult: Lives by his son, Edward Judson (q.v.) (1883); Wayland (1853); Conant, 'The Earnest Man' (1856).

Judson, Ann Hasseltine, American missionary, wife of Adoniram Judson (q.v.): b. Bradford, Mass., 22 Dec. 1789; d. Amherst, Burma, 24 Oct. 1826. She was married to Dr. Judson in 1812, and sailed with him to Burma, where she took active part in all his missionary work. Her health compelled her to visit the United States in 1822-3, where her personal appeals were the means of largely increasing the missionary interest in the churches. Shortly after her return to Burma, her husband and other foreign residents at Ava were imprisoned, and she herself suffered many indignities; but by constant appeals to the king and the wise use of money and presents she was successful in relieving somewhat the sufferings of her husband and the other prisoners. She wrote 'History of the Burman Missions' (1822).

Judson, Edward, American Baptist clergyman: b. Maulmain, Burma, 27 Dec. 1844. He is the son of Adoniram Judson (q.v.) and came to the United States in 1850 after the death of his father. He studied at Madison (now Colgate) University, and was graduated from Brown in 1865. He was principal of the academy at Townsend, Vt. (1865-7) and subsequently professor of Latin at Madison (now Colgate) University. In 1875 he accepted the pastorate of the Baptist Church at Orange, N. J., then became pastor of the Berean Baptist Church, New York city, and later secured a site on Washington Square, New York, and erected the Judson Memorial Church (in memory of his father) of which he is pastor. Here he has built up an institutional church, with many different lines of work, including gymnasium classes, a dispensary, and a children's fresh air fund.

Judson, Emily Chubbuck ("FANNY FORRESTER"), American writer: b. Eaton, Madison County, N. Y., 22 Aug. 1817; d. Hamilton, N. Y., 1 June 1854. She was the third wife of Rev. Adoniram Judson (q.v.) to whom she was married in 1846. As "Fanny Forrester" she achieved some little reputation as a writer of graceful sketches and poems, and besides the life of the second Mrs. Judson (1850), published 'Alderbrook' (1846); 'The Kathayan Slave' (1853); 'An Olio of Domestic Verses' (1852); 'Trippings in Author Land' (1846); 'My Two Sisters' (1854).

Judson, Harry Pratt, American educator: b. Jamestown, N. Y., 20 Dec. 1849. He was graduated from Williams College in 1870, was professor of history in the University of Minnesota 1885-92, and has been professor of political science in the University of Chicago since the

JUDSON — JULIAN

latter date. His works include: 'Caesar's Army, a Study of the Military Art of the Romans' (1888); 'Europe in the Nineteenth Century'; 'The Growth of the American Nation' (1895); 'The Higher Education as a Training for Business' (1896); 'The Government of Illinois' (1900); etc.

Judson, Sarah Hall Boardman, American missionary: b. Alstead, N. H., 4 Nov. 1803; d. St. Helena 1 Sept. 1845. She was married on 4 July 1825, to Rev. George Dana Boardman, and on 16 July they embarked for Calcutta. They established the mission station at Maulmain, and Mrs. Boardman made rapid progress in the acquisition of the language. Transferred to Tavoy for a similar service, they worked among the Karen partly at the schools at Tavoy and partly by visiting their villages in the wilderness. After two years Mr. Boardman died, but she continued her missionary labors, and beside managing a school with great success, was accustomed to make long journeys among the mountains. In these excursions, assemblies of hundreds gathered around her and she conducted the worship and gave them religious instruction. In April 1834, she became the wife of Adoniram Judson (q.v.). She was perfectly familiar with the Burman language, and translated into Burmese the first part of Bunyan's 'Pilgrim's Progress' and various tracts, prepared a hymn book, and several volumes of Scripture questions for Sunday schools. Before the Peguans had a missionary, she acquired their language, and translated or superintended the translation of the New Testament and the principal Burman tracts into the Peguan tongue.

Juggernaut, jūg'ér-nāt. See JAGANNATH.

Jugular (joo'gū-lar) **Vein**, one of the large trunks by which the greater part of the blood that has circulated in the head, face and neck is returned to the heart. There are two on each side, an external or superficial, and an internal or deeper.

Jugurtha, joo-gér'thā, king of Numidia: d. Rome 104 B.C. He was a natural son of Masinissa. Micipsa, his father's brother, and king of Numidia after Masinissa (149 B.C.), adopted him and brought him up with his own sons, Adherbal and Hiempsal. Micipsa did his best to conciliate him, and declared him joint-heir to the crown with his two sons. But after the death of Micipsa, Jugurtha had Hiempsal murdered and drove Adherbal from the country. Adherbal appealed to Rome, and after several Roman expeditions into Numidia, Jugurtha was captured (106 B.C.), led in the triumph of Marius at Rome, and finally thrown into a dungeon, where he was starved to death.

Jujube, joo'joob, a spiny and deciduous shrub of the order *Rhamnaceæ* and genus *Zizyphus*, a native of Syria, whence it was introduced into Europe. The fruit is blood-red or saffron-colored, with a sweet, granular pulp. The species are numerous, and of several the fruit is wholesome and pleasant to eat, both fresh and dried, and forms an article of commerce; and in southern Europe it is used at table in desserts as a dry sweetmeat. *Z. Lotus*, which gave its name to the ancient *Lotophagi*, a shrub 2 or 3 feet high, is a native of Persia and the north of Africa. Its

berries, which are about as large as a sloe, are collected for food by the Arabs of Barbary, are made into cakes, and a kind of wine is sometimes made from them. *Z. spina-christi*, or Christ's thorn, is said to have furnished the branches of which Jesus' crown of thorns was made.

Jujuy, hoo-hwē', Argentine, a province situated in the extreme northwest of the republic, between Bolivia and the province of Salta. Nearly the entire area, estimated at 18,977 square miles, is occupied by mountains in which are extensive deposits of gold, silver, copper, mercury, salt, petroleum, and asphalt. Fertile valleys in the eastern part of the province produce sugar-cane, wheat, tobacco, and rice. There are immense forests and an abundant supply of water. The provincial capital, also called Jujuy, a town of about 10,000 inhabitants, is connected by railway with Buenos Ayres, and has two banks, a custom-house, a national college, a normal school for girls, and 7 public schools. The population of the province, according to the census of 1895, was 49,713. Estimated population in 1903, about 57,000.

Jukes, The, the name given to a family of New York State that had an unusual record of crime and pauperism. In 1874, Mr. R. L. Dugdale, while making investigations in behalf of the New York Prison Association, found several of the same family imprisoned for various crimes. Becoming interested in the subject, he traced the history of the family through several generations; they were descendants of the two sons of a backwoodsman, called Max, who married two of the Jukes sisters, one of whom is known as "Margaret, the Mother of Criminals." Exact information was obtained in relation to 709 out of the 1,200 descendants and blood relations; of these, 140 had been imprisoned for crime, 280 had been paupers, dependent upon public support, and the large majority were of low physical and moral standard. Consult: Dugdale, 'The Jukes.'

Julia, only child of the emperor Augustus; b. 39 B.C.; d. 14 A.D. She was his daughter by his second wife Scribonia, and was first married (25 B.C.) to her cousin, the young Marcellus, and afterward to Marcus Vipsanius Agrippa, to whom she bore three sons and two daughters. On Agrippa's death, in 12 B.C., she was married to Tiberius, who left her on account of her licentiousness. Augustus banished her to Pandataria, a desolate island on the coast of Campania, ultimately allowing her to live in Rhegium. After the death of the emperor, Tiberius treated her with great severity. She died in poverty and distress. Her son, Agrippa, had been put to death by Tiberius shortly before.

Julia Domna, Roman empress: b. Emesa, Syria, 170 A.D.; d. 217 A.D. She was the second wife of the Emperor Severus, and mother of Caracalla and Geta, and a distinguished patroness of art and science.

Julian, joo'lyan, FLAVIUS CLAUDIUS JULIANUS), Roman emperor, surnamed the Apostate: b. Constantinople 17 November 331; d. 26 June 363. When hardly six years old his father and several members of his family were murdered by the soldiers of his cousin, the Emperor Constantius. He was brought up in the Christian religion, studied philosophy and letters,

JULIAN — JULIUS

and resided in Athens, where he was induced to embrace Paganism. Having received command of an army against the Germans, he defeated them at Strasburg, and drove them beyond the Rhine. He also displayed great talent as an administrator in Gaul. The emperor now became jealous of Julian, and recalled his best troops under pretense that he wanted to employ them against the Persians. This order caused a rebellion among the soldiers, who proclaimed their leader Julian emperor in March 360, in spite of his own resistance. Constantius prepared to proceed against him, but soon after died, and Julian was generally recognized as emperor. He began by putting a stop to many abuses, and limiting the splendor of his court, and was thus able to remit to the people the fifth part of all their taxes. He sought to restore the heathen worship in all its splendor, and on that account opposed Christianity as much as was in his power, without, however, persecuting the Christians themselves. In 363 he headed an expedition against the Persians and took several cities. He was an able ruler, and had also a reputation as an author. Some of his works have come down to us, including speeches, letters, and satirical pieces; the latter are distinguished for wit and humor. He wrote also a work against the Christian religion, of which we have yet some extracts. Consult: Schwartz, 'De Vita et Scriptis Iuliani Imperatoris' (1888); Hoffmann, 'Julianus der Abtrünnige' (1880); Gardner, 'Julian: Philosopher and Emperor' (1895); Dill, 'Roman Society' (1899).

Julian, George Washington, American politician: b. Centerville, Ind., 5 May 1817; d. Irvington, Ind., 7 July 1890. He studied law and was admitted to the bar at the age of 21. In 1845 he was elected to the State legislature, as a Whig, but being a strong opponent of slavery he severed his party connection with the Whigs and became one of the founders of the Free Soil party in 1848. In 1849 he was elected to Congress; in 1852 was candidate for vice-president of the Free Soil party, and in 1856 a delegate to the first national convention of the Republican party, where he was vice-president of the convention and chairman of the committee on organization. In 1860 he was again elected to Congress, and served continuously for ten years. He was a member of the committees on the conduct of the war, on reconstruction, on the preparation of the articles of impeachment against President Johnson, and on public lands, being chairman of the latter. He opposed any monopoly of the public lands, was an advocate of the homestead system, and strongly favored giving the franchise to the negro. In 1868 he proposed a constitutional amendment providing for woman's suffrage. In 1872 he joined the Liberal Republicans, and after that became a Democrat; in 1885-9 was surveyor-general of New Mexico; and after 1889 retired from public life. He published 'Speeches on Political Questions' (1872); 'Political Recollections' (1884); and 'Life of Joshua R. Giddings' (1892).

Julian Calendar. See CALENDAR; EPOCH.

Julien, Alexis Anastay, American geologist: b. New York 13 Feb. 1840. He was graduated from Union College in 1859, was resident chemist at the guano island of Sombrero 1860-4,

studied geology and natural history there, and on the establishment of the Columbia School of Mines became an assistant in the quantitative laboratory. He was in charge of the department of microscopy there, 1885-97, and subsequently became instructor in geology. He has published valuable scientific reports included in the Geological Survey's 'Geology of Michigan,' vol. II. (1872); and 'Geology of Wisconsin,' vol. III. (1880); etc.

Julien, zhü-lí-äñ, Stanislas Aignan, French sinologist: b. Orleans 20 Sept. 1799; d. Paris 14 Feb. 1873. Possessed of an extraordinary linguistic faculty, he taught himself Greek, English, Italian, Spanish, Portuguese, and German, and in 1823 commenced the study of Chinese. At the end of a year he published a Latin translation of the philosopher Mencius. Henceforth ancient and modern Chinese, Manchu, the Mongolian tongues, and Sanskrit, were the subjects of exact and profound study. In 1832 he became professor of Chinese at the Collège de France; librarian at the Bibliothèque Nationale, 1839; president of the college, 1855; commander of the Legion of Honor, 1863. His most important works are: 'Voyages des Pérelins Boudhistes' (1853-8); 'Syntaxe nouvelle de Langue chinoise' (1869-70). Julien was the foremost Chinese scholar of his time.

Julius I., pope: d. 12 April 352. He became pope in February, 337, and was a staunch defender of Athanasius, who, under the protection of Julius, sought refuge in Rome against the enmity of the Eastern prelates.

Julius II., pope (GIULIANO DELLA ROVERE, joo-le-a-nô dêl'lâ rô-vâ'râ): b. Albezuola 1443; d. Rome 21 Feb. 1513. He was elevated by his uncle Sixtus IV. to the rank of a bishop and cardinal in 1471, and subsequently held eight bishoprics and the archbishopric of Avignon. He was appointed papal legate to France in 1480 and in 1503 was elected pope. Immediately on his elevation to the pontificate he planned the complete re-establishment of the papal sovereignty in its ancient territory, and the extinction of foreign domination, and influence in Italy. Refusing to attend the Council of Pisa convened by the king of France, he in 1511 formed the "Holy League," to which Spain, England, and Switzerland were parties. In 1512 he made open war against Louis XII., and the Fifth Lateran Council was convoked by him in the same year. The French defeated the papal army near Ravenna, but were soon after driven out of Italy. He was a far-sighted and patriotic sovereign, and a liberal and judicious patron of art and literature. Michelangelo, Raphael, and other great artists of the time receiving commissions from him. To procure means for building St. Peter's he ordered the preaching of indulgences, which was one of the immediate causes of the Reformation. Consult: 'Life,' by Du Mesnil (1873); Brosch, 'Papst Julius II., und die Gründung des Kirchenstaates' (1878).

Julius III., pope (GIOVANNI MARIA DEL MONTE, gö-van'në mä-ré'a dël mòn'tâ): b. Arezzo 10 Sept. 1487; d. Rome 23 March 1555. He was made archbishop of Siponto in 1512 and of Pavia in 1520, and was appointed cardinal by Paul III. in 1536. He took an active part in the Council of Trent as papal legate, was

JULIUS CÆSAR—JUNCTION CITY

elected pope in 1550, and in the following year reopened the Council of Trent, which had been suspended for two years. He endeavored to effect a union with the Nestorians, and commissioned Cardinal Pole to organize, in conjunction with Mary, the reunion of England with Rome.

Julius Cæsar. See CÆSAR, GAIUS JULIUS.

Julius Cæsar, Play of. The material for this stately drama, the noblest of Shakespeare's historical plays, was taken from Plutarch. The action covers nearly two years,—46 to 44 B.C. See CÆSAR, GAIUS JULIUS.

July, the 7th month of the calendar, which in the Roman year bore the name of *Quintilis*, as the fifth in the computation of Romulus, even after Numa had prefixed January and February. Mark Antony effected a change in its name in honor of Julius Cæsar, who was born on the 12th of the month, and thenceforward by a decree of the senate it was called *Julius*. It originally contained 36 days. It is said that Romulus reduced them to 31 and Numa to 30. Julius Cæsar fixed the number at 31, which is still retained. The Dog-days are supposed to commence on the 3d of this month.

Jumbo, the name of a large African elephant for 25 years on exhibition at the Royal Zoological Gardens in London. The animal was purchased in 1882 by P. T. Barnum (q.v.), American showman, for \$10,000, and for three years was exhibited in the United States. Jumbo was killed in 1885 by a railroad train in Canada. He was 11 feet 6 inches in height, and weighed 6 tons. His skeleton is preserved at the Smithsonian Institution, Washington, D. C.

Jumel, zhū'mēl, **Eliza,** American heiress, b. at sea 1769, d. New York 16 July 1865. Her maiden name was Capet, and after her mother's death she was adopted by Mrs. Thompson, of Newport. She was a wayward, beautiful girl; at 17 she eloped with a British officer named Peter Croix, with whom she lived in New York. There she was greatly admired, and soon after her first husband's death married Stephen Jumel, who took her to Paris, where her social success was as great as in New York. After Jumel's death, she married at 61 Aaron Burr (q.v.), from whom she separated soon afterward. Her home during her last years was the famous Jumel mansion, built by Roger Morris in 1758, the home of Mary Philipse Rogers (q.v.) and Washington's headquarters during the New York campaign. It was bought by Madame Jumel in 1810, and is still preserved, its site being in Roger Morris Park, New York, which was opened 28 Dec. 1903.

Jum'na, or Jamna (Sanskrit YAMUNA), a river of India which rises in the Himalayas, at the height of 10,849 feet. It flows in its upper course in a generally southwest direction, then bends to the southeast and, passing the cities of Delhi and Agra, falls into the Ganges, of which it is the chief tributary, at Allahabad (q.v.) after a course of 860 miles. Important irrigation works derive their supply of water from this river.

Jumpers, a class of religionists who manifest their devotion and feeling by jumping from the ground during the time they are assembled for worship and exhortation. They are said to have originated in the Methodist congregations of Wales during the preaching of Whitfield (1760). They were also called "Barkers" from the incoherent guttural sounds they uttered during their excitement. They still exist in some parts of the Eastern States, having emigrated to America after being repudiated by English Methodists.

Jumping Beans, various large seeds of euphorbiaceous plants infested with the larvæ of certain small moths (*Carpocapsa saltitans* and *Grapholitha sebastiana*), which by their movements make the seeds roll, and even jump as if alive. The larvæ spin cocoons in the seeds, a large part of the interior of which they have devoured, and when ready to emerge as adults, push open a previously cut circular door which has been held shut by silken threads. Both species are found in Central America, Mexico, and the southwestern United States, where they are called "broncho beans."

Jumping Hare, or **Springhaas,** a jerboa-like animal (*Pedetes caffer*) of South Africa, as large as a hare, and much resembling one, which is now set apart in a family (*Pedetidae*) by itself. It will leap 25 or more times its own length, and where numerous does great damage at night to growing crops.

Jumping Mouse. See JERBOA.

Jumping Shrew, a curious little animal of Africa, one of the insectivora of the Elephant-shrew family (*Macroscelidæ*), which has very large hindquarters and moves by leaping like a jerboa. They inhabit rocky and desert places, remain in holes and hiding places during the day and go abroad at night in search of insect food. The best known, perhaps, is the Cape jumping-shrew of South Africa (*Macroscelidus typicus*), which is tawny brown, about five inches in length, has a long, flexible proboscis and a long naked tail.

Jumping Spiders, small spiders of the family *Attidæ*, which dwell in low vegetation, and are exceedingly agile. They are usually short and stout in form, rarely more than a quarter of an inch long, and are often brightly colored, especially in the case of the males, which take curious attitudes in order to display their ornaments to the females. Consult Emerton. 'Common Spiders of the United States' (1902).

Jun'co, a genus of slate-colored and white sparrows, present in the United States mostly in winter. See SNOWBIRDS.

Junction City, Kan., city and county-seat of Geary County, at the junction of the Republican and Smoky Hill rivers, 135 miles west of Kansas City; and on the Missouri, K. & T. and the Union P. R.R.'s. The two rivers here form the Kansas River, and make an important shipping point for grain, flour and limestone. A government military post, Fort Riley, is located three miles east of the city. It was settled in 1858 and under a charter of 1870 is governed by a mayor and city council.

JUNE — JUNGLE BOOKS

The city owns the waterworks. Pop. (1890) 4,502; (1900) 4,695.

June, Jennie. See CROLY, JANE G.

June, the 6th month in the calendar. The etymology is uncertain. Vossius gives three etymologies of the name—one from Juno; another from *jungo* (to join), referring to the union between the Romans and Sabines under Romulus and Titus Tatius; a third from *juniores* (the young men), Romulus having been said to have assigned the month of May to the elders, and that of June to the young men, when he divided the people into these two great classes, the former to serve in counsel, the latter in war. The name has also been traced to Junius Brutus, the first consul. It consisted originally of 26 days, to which it is said Romulus added four, and Numa took away one. Julius Cæsar again lengthened it to 30 days, and it has ever since remained unaltered.

June Beetle, or **Fig-eater**, a green and brown beetle (*Allorrhina nitida*) of the family *Scarabæidæ* common in the central and southern United States. The adults often eat figs, peaches, small fruits, corn, etc. The larvæ are white grubs which resemble their northern relatives (see **MAY BEETLE**), but are far less injurious since they normally feed upon decaying vegetable matter in the soil and not on living roots of plants. The adults may be decoyed away from ripe fruit by placing little piles of decaying fruit within their reach; but since they are probably beneficial they should not be destroyed.

June Berry. See AMELANCHIER.

June Bug. See MAY BEETLE.

June Grass. See BLUE GRASS; GRASSES IN THE UNITED STATES.

Juneau, joo-nō', Laurent Solomon, American pioneer: b. L'Assumption parish, near Montreal, Canada, 9 Aug. 1793; d. Shawano, Wis., 14 Nov. 1856. He emigrated to Green Bay, Wis., and thence in 1818 to Milwaukee, where he was active in trade with the Indians. He was not, as has been sometimes stated, the first white settler on the site of Milwaukee. A grant of considerable land had there been made by the Indians to one Mirandeau, a previous resident, and of this grant, Juneau, on Mirandeau's death, secured possession. Juneau made the first survey of Milwaukee village, was its first postmaster and president, and the first mayor of the subsequent city. On ground presented by him, he helped to build the first court-house in the State. For years he was agent for the American Fur Company. A heroic statue of him was placed in Juneau Park, Milwaukee, in 1884. See MILWAUKEE.

Juneau, Alaska, city in the southern district, on a promontory between the Taku River and Lynn Canal, opposite Douglas Island, about 80 miles north of Sitka. It was settled in 1880, is incorporated, and has been selected by Congress as the capital of Alaska. From its situation in the mining region it has become a centre of trade in outfitters' articles and general supplies; while its exports, including gold, furs, and other products of Alaska, have grown to a considerable commerce. Among the manufac-

tories are iron-works, breweries, sawmills, cigar factories, etc. In the vicinity are the Treadwell gold mine and the Silver Bow mines. Villages of the Auk and Taku Indians in the neighborhood are of interest to tourists. At Juneau is the United States land office for Alaska. Its public schools are well conducted, and its water-works, electric-light system, and other public improvements give it all the essential conveniences of a modern American city. Cable service is established here. Pop. (1890) 1,253; (1900) 1,864.

Jung-Stilling, Johann Heinrich, yō'han hin'riх yoong stil'ling, German mystical author: b. Grund, Hesse Nassau, Germany, 12 Sept. 1740; d. Carlsruhe, Baden, 2 April 1817. In the early part of his career he was by turns, a charcoal burner, school master, and tailor, and in 1771 went to Strasburg to study medicine. Here he became acquainted with Goethe, who has sketched him in 'Aus meinem Leben.' He was professor of political economy in the Universities of Marburg and Heidelberg, 1787-1806, and the remainder of his life was passed at the court of the Grand Duke of Baden. His writings, which include several romances as well as distinctly religious works, are more or less mystical in tone. Among them are 'Geschichte des Herrn von Morgenstern' (1770); 'Geschichte Florentins von Fahlendorf' (1783); 'Theobald' (1784-5, an English version of which appeared in New York 1846); 'Das Heimweh'; 'Theorie der Geisterkunde' (1808, in English 1834); 'Scenen aus dem Geisterreiche' (1797-1801), and his famous autobiography 'Heinrich Stillings Leben' (1806). In the publication of this he was aided by Goethe. The work was completed in 'Heinrich Stillings Alter' (1817).

Jungfrau, yoong'frow (Ger. "virgin," or "maiden"), a mountain of Switzerland, in the Bernese or Helvetic Alps, on the frontiers between the cantons of Bern and Valais, 12 miles southeast of Interlaken. It is one of the most magnificent mountains in Switzerland and the loftiest calcareous mountain in Europe; height 13,670 feet. It was first ascended in 1811.

Junghaus, yoong'hows, Sophie, German novelist: b. Cassel, 3 Dec. 1845. She became well known by the publication of 'Kathe, the Story of a Modern Maid' (1876). Later works of hers are: 'The House of Eckberg,' a study of life during the Thirty Years' War (1878); 'Die Erbin wider Willen' (1881); 'Die Gäste der Madame Santines' (1884); 'Der Bergrat' (1888); 'Zwei Bruder' (1889); 'Zu rechter Zeit' (1892); 'Um das Glück' (1896); 'Junge Leiden' (1900).

Jungle, an Indian term applied to a desert and uncultivated region whether covered with wood and dense vegetation or not, but in English it is applied to land covered with forest trees, thick impenetrable brushwood, or any coarse rank vegetation.

Jungle Books, The (1895), by Rudyard Kipling. The central figure in these books is the boy Mowgli, who, straying from his village home when an infant, had been lost in the forest, and there sheltered and nursed with her own cubs by a mother-wolf, and the hairy Orson. Joined to this element of human interest, and with the coloring of high romance, these

JUNGLE-CAT — JUNIPER

stories picture the personal characteristics and social and political life of the gaunt wolf-family in their cave and the free republic of wolves. Unlike the talking beasts in *Æsop's fables*, those of the 'Jungle Books' are not men in hides and on all fours discussing human problems. Kipling's genius represents them thinking and behaving each according to his own peculiar beastly habit and experience, with great dramatic skill.

Jungle-cat, or *Chaus*, the common wildcat of India (*Felis chaus*). It is 26 inches long in head and body, has a short tail, reaching only to the heel, and is yellowish gray, more or less dark and unspotted, tinged with reddish on the sides, marked by a dark stripe from the eyes to the muzzle, and with reddish black ears slightly tufted. Another Indian "jungle-cat" is the handsome *F. ornata*, which is profusely spotted; it dwells in the desert regions of the Northwestern provinces. Both these cats are said to interbreed with domestic cats, and thus no doubt long ago influenced the varieties of the tamed stock.

Jungle-fever, a severe variety of remittent fever, prevalent in the East Indies and other tropical regions. It is characterized by the recurrence of paroxysms and of cold and hot stages. The remissions occur usually in the morning and last from 8 to 12 hours, the fever being mostly typically developed at night.

Jungle-fowl, the English book-name of a genus of pheasants, the source of domestic fowls, characterized by a fleshy frontal comb and wattles, and the peculiarly laterally compressed tail with its long, drooping, curved feathers. This genus (*Gallus*) is represented by several species in southern Asia, especially India, and the Malay and Philippine Islands. The common jungle-fowl (*Gallus gallus* or *bantiva*) is especially noteworthy as the original stock of our barnyard fowls. The wild birds, which are quite common in cultivated parts of central India and about the bases of the Himalayas up to an elevation of 5,000 feet, closely resemble some of the varieties of game cocks and hens. The sexes differ as in the domestic birds in size, character of tail feathers, combs, wattles, spurs and color. Although naturally living in flocks in the jungles and forests, these haunts are often forsaken for the purpose of feeding upon grain in the cultivated fields. They run with great speed, are tolerably good flyers and roost in trees. The cock crows and the hen clucks and cackles much as domestic fowls do. In the wild state the jungle-fowl is said to be monogamous; eggs to the number of 10 or 12 are laid in a simple depression in the ground lined with leaves and grass. Consult Darwin, 'Animals and Plants under Domestication'; Tegetmeier, 'Ibis' (1891); and Blanford, 'Fauna of British India.'

In Australia this name is often given to the mound-birds.

Juniata, joo-ni-ä'ta, a river of Pennsylvania formed at Petersburg, about six miles northeast of Huntingdon, near the centre of the State, by two streams rising in the Alleghany Mountains — the Little Juniata and the Franks-town Branch. Its course is winding, but it flows in a generally eastern direction for about 150 miles, entering the Susquehanna at Dun-

cannon, 14 miles above Harrisburg. Along the greater part of its course the scenery is picturesque, often marked by grandeur where the river breaks through the mountains that rise in parallel ridges across its path. The Juniata is not a navigable stream, but from its source to its mouth its banks are followed by the Pennsylvania Canal and the Pennsylvania Railroad, the latter crossing the river several times.

Juniata College, a coeducational institution, located at Huntingdon, Pa.; established in 1876 under the auspices of the German Baptist Brethren. Special attention is given to the religious education of the students; one of its principal courses is the history and literature of the Bible. It has art, music, normal, and commercial departments, also a preparatory school. The courses lead to the degrees of bachelor of arts, and of English and sacred literature. In 1903 there were in attendance 350 students, and 21 professors and instructors were connected with the school. There were about 21,000 bound volumes and over 4,000 pamphlets in the library.

Junin, hoo-nēn, Peru, department in the interior; has an area of 23,347 square miles. It is located in the wildest parts of the Cordilleras. Agriculture is neglected and large deposits of silver remain unworked. A railroad connects the southern part with Lima on the coast. The capital city is Cerro de Pasco. Pop. of the department 394,393.

Junior Order of United American Mechanics. See UNITED AMERICAN MECHANICS, JUNIOR ORDER OF.

Ju'niper, a genus (*Juniperus*) of ornamental evergreen trees and shrubs of the order *Coniferae*, consisting of about 35 species distributed mainly throughout the cooler parts of the northern hemisphere, but also in America extending to Mexico and the West Indies. The species have branches which spread in all directions from the main trunk and limbs, small, rigid, needle-like or scale-like opposite leaves; unisexual flowers, the two sexes usually upon separate plants, the staminate, yellow and in catkins, the greenish pistillate ones followed by fleshy, berry-like cones containing from one to six, sometimes 12 seeds, which may not attain maturity until the second or third year. The best known species in the United States is probably the Virginian juniper, red cedar or savin (*Juniperus virginiana*), to be found everywhere east of the Rocky Mountains, upon rocky and sandy soils, mountain sides, etc. It often attains 100 feet in height, its upright or spreading branches forming a handsome conical head. Its numerous attractive horticultural varieties are largely planted in parks and cemeteries. The trunks are highly prized for fence posts, being exceedingly durable; the handsome, red, heart-wood is valued for turning, cabinet work, cooperage, and especially for lead-pencils; but the tree is looked upon with disfavor by the orchardist, because it is one of the hosts of apple rust. See APPLE, paragraph *Diseases*.

The common juniper (*J. communis*) is a smaller species, rarely reaching 50 feet in height and usually less than 25 feet tall, and many of its numerous varieties less than 10 feet. It is

JUNIPERO — JUNOT

widely distributed throughout the northern hemisphere, especially in the colder latitudes and altitudes. Like the preceding species its wood is valued, when of sufficient size, for posts, veneers, pencils, and for turning. The tree itself is also used for ornamental planting. Its bark is sometimes twisted into ropes and its long, tough, fibrous roots are used for making baskets. Its blue-black fruit, which it yields profusely, is used for flavoring certain liquors, as is also the oil obtained from them and from the twigs by distillation with water. This oil has been used in medicine as a stimulant, but is less popular than formerly. The Bermuda cedar (*J. bermudiana*) resembles the Virginian juniper, but is of stouter build, though it rarely exceeds 40 feet in height. Its wood is rather more fragrant than that of the preceding species, like which it is used. Formerly it was employed in the ships built in the Bermudas, but the forests which supplied this industry were mismanaged and the industry perished. Several other species are of more or less economic importance; for instance, the Spanish juniper (*J. oxycedrus*), a shrub which attains a height of about 12 feet, whose fruits yield a disagreeable smelling oil (oil of cade), used in veterinary medicine; and African juniper (*J. procera*), a useful timber species and probably the largest of the genus, often attaining heights of 150 feet in the mountains of eastern Africa, where it is native.

Junipers succeed best in moderately moist, sandy loam in open, sunny situations. They make excellent windbreaks and shelter belts, especially where the soil is too dry, rocky or gravelly for other trees. They may be propagated by seeds which, however, usually require two, sometimes three, years to germinate. Cuttings of almost mature wood are taken in the autumn from the needle-leaved kinds and grown under glass or in the open; species with scale-like leaves are generally side-grafted in the greenhouse during winter. Some of the shrubby species are propagated by layers.

Junipero, Miguel José Serra, mē-gēl' hō-sā' sér'rā hoo-nē-pā-rō, Spanish missionary in America: b. island of Majorca 24 Nov. 1713; d. Monterey, Cal., 28 Aug. 1784. He became a member of the Franciscan order in 1729, in 1750 arrived in Mexico City as a missionary, and in 1750-69 was active among the native tribes. In 1769 he went to the site of San Diego Cal., where he founded a mission. He gathered about him a band of sixteen of his order, and these missionaries converted over 3,000 Indians, of whom Junipero himself is said to have baptized more than 1,000. Junipero instructed the natives in the arts of civilization, and the colonies which assembled about the mission stations constituted the first settlements in California. His headquarters were at Monterey, but he founded several other missions. Bret Harte incorrectly gives his name as Serro.

Ju'nius Letters, The. During the period between November 1768 and 21 Jan. 1772, there appeared in the London *Daily Advertiser* a series of mysterious letters aimed at the British ministry of that day, and signed by various pen-names—the most remarkable of them by that of one "Junius." During the century ensuing,

the authorship of these epistles has been assigned with some degree of probability. The merits of the 'Letters' have been sufficient to give them a life all the more vigorous, perhaps, because they have been conjecturally assigned to Sir Philip Francis. The author was a man thoroughly cognizant of British politics; a vehement opponent of the government, and a fiery pleader for popular liberty. The dominant message is sounded in these words from the first letter of the series: "The admission of a free people to the executive authority of government is no more than compliance with laws which they themselves have enacted." Much constitutional knowledge is shown in these trenchant attacks, which continually refer to the British Constitution as the bulwark of the people's rights. In manner, the letters are vigorous, bold, and among the finest specimens of impassioned invective and irony in English literature.

Junkers, yoong'kérz, a name given to the younger members of the nobility of Prussia and the adjoining states. "Junkerthum" was a term of reproach used in the 19th century to designate the party of reaction in Prussia, which found its most strenuous supporters among the nobility.

Junk'in, George, American Presbyterian clergyman: b. near Carlisle, Pa., 1790; d. 1868. He was graduated from Jefferson College (Pa.) in 1813 and entered the Presbyterian ministry in which he became prominent as a leader of the party known as Old School Presbyterians. He founded Lafayette College at Easton, Pa., in 1832, and was its president till 1841, returning thither in 1845, after three years spent as president of Miami College at Oxford, Ohio. In 1848 he became president of Washington College (now Washington and Lee). He was an outspoken upholder of slavery, but was opposed to secession, and on account of his Union sentiments resigned the presidency of the college in 1861. Consult: 'Life' by D. X. Junkin (1871).

Junks, large flat-bottomed vessels, from 100 to 150 tons burden, used by the Chinese. They have three masts, and a short bowsprit placed on the starboard bow. The masts are supported by two or three shrouds, which, at times, are all carried on the windward side. On the fore and main mast is a sort of lug-sail, of cane or bamboo.

Ju'no, the most exalted divinity of the Latin races in Italy next to Jupiter, of whom she was the sister and wife; the equivalent of the Greek Hera. She was the queen of heaven, and under the name of Regina (queen) was worshiped in Italy at an early period. She bore the same relation to women that Jupiter did to men. She was regarded as the special protectress of whatever was connected with marriage. She was also the guardian of the national finances, and a temple, which contained the mint, was erected to her under the name of Juno Moneta on the Capitoline.

Junot, Andoche, än-dōsh zhü-nō, DUKE OF ABRANTES, French marshal: b. Bussy-le-Grand 23 Oct. 1771; d. Montbard 22 July 1813. He was intended for the bar, but on the outbreak of the revolution joined a volunteer battalion,

JUNTA—JUPITER

and soon attracted notice. At the siege of Toulon, in 1793, he became secretary to Napoleon, and went with him into Italy and Egypt in the capacity of aide-de-camp. In Egypt he was advanced to the rank of general of brigade. In 1800 he was made commandant of Paris, and he particularly distinguished himself at the battle of Austerlitz in 1805. In 1807 he was sent with an army into Portugal, and made his entry without opposition into Lisbon, his success being rewarded with the title of Duke of Abrantes. On the arrival of the British he was defeated at Vimeira, and was then obliged to submit to the humiliating convention of Cintra. Although he subsequently took part in the campaigns (1809) against Austria, (1810) against Spain, and (1812) against Russia, he failed to retrieve his reputation. In 1813 he became insane, and lost his life by leaping from a window.

Junta, a high council of state; a term common in all Spanish-speaking countries. It was originally applied to an irregularly summoned assembly of the states, as distinguished from the cortes or parliament regularly called together by the authority of the king. In Cuba the term was adopted by the insurgents before the Spanish-American war, to designate the general legation of the Cuban republic abroad. This legation or junta was first appointed 19 Sept. 1895, by the Constituent Assembly that formed the insurgent Cuban government, which at the same time made T. Estrada Palma head of the junta and chief Cuban representative abroad, with authority to appoint ministers to all governments and to have control of Cuba's diplomatic relations and representatives throughout the world. The junta established its headquarters in New York, and was the organization through which the insurgents' friends outside of the island communicated with the Cuban soldiers in the field during the Spanish-American war. See CUBA.

Junto, *The*, a club formed in Philadelphia by Benjamin Franklin for mutual improvement. Morals, politics, and natural philosophy, as well as the social well-being of man, were the main subjects discussed. It continued for about 30 years. The name was also applied to an English Whig ministry in the reign of William III., the chief members of which were Admiral Russell, Somers, Lord Wharton, and Montague, the great financier. This was the first ministry ever made of one and the same party politics. It was the suggestion of Robert, earl of Sunderland, to William III., who shrewdly said, if all the ministers were of one party they would pull together.

Jupati, *joo'pä-té*, a palm (*Raphia taedigera*) of the tide-flooded lands of the lower Amazon and Pará rivers, remarkable for its leaves, probably the largest in the vegetable kingdom. The trunk is only 6 or 8 feet high, and 1 foot in diameter. The leaves rise nearly vertically from the trunk, bending out on every side in graceful curves, forming a magnificent plume 70 feet in height and 40 in diameter. Leaves have been measured 50 feet long, and the leaf-stalk is often 12 or 15 feet long below the first segments of the leaf, and 4 or 5 inches in diameter, perfectly straight and cylindrical, and when dried light and strong as the quill of a bird. The Indians split it into laths for a variety of purposes — window-

shutters, boxes, bird-cages, partitions, and even entire houses being constructed of it, with the addition of a few supporting posts at the angles. The fruit, a large oblong drupe, has a bitter oily flesh.

Jupiter, *joo'pl-tér*, or *Juppiter*, the supreme deity of the Latin races in ancient Italy, the same as the Greek Zeus. As the supreme deity Jupiter received from the Romans the title of *optimus maximus* (best greatest), and as the deity presiding over the sky he was considered as the originator of all the changes that took place in the sky. From him accordingly proceeded rain, hail, and the thunderbolt, and he it was that restored serenity to the sky after it had been obscured by clouds. Hence the epithets of *Pluvius* (rainy), *Tonans* (thundering), etc., were applied to him. The most celebrated of his temples was that on the Capitoline Hill dedicated to him as *Jupiter Optimus Maximus*, jointly with Juno and Minerva. He was represented with a sceptre as symbolical of his supreme authority. He was the guardian of all property; and every Roman was believed to be under his protection, and that of his consort Juno, the queen of heaven. White animals were offered up to him in sacrifice, his priests wore white caps, and his chariot was represented as drawn by four white horses. See JUNO.

Jupiter, the largest planet of the solar system, and the fifth (excluding the asteroids) in order of distance from the sun. Its mean diameter is about 85,000 miles; polar diameter about 82,000; its mean distance from the sun 475,692,000 miles; its period of revolution round it 11 years 10 $\frac{1}{3}$ months; its orbit is inclined to the ecliptic at the angle 1° 18' 40.3". The inclination of its axis is 3° 5' 30", so that changes in the seasons must be almost unknown; its volume is 1,400 times that of the earth, but its mass is only 300.857 times. Jupiter has five moons, the last was discovered by Barnard, at Lick Observatory in 1892. The other four were discovered by Galileo in 1610 and are visible through an ordinary telescope. They are at average distances of from 267,380 to 1,192,820 miles from the planet; they appear to make one revolution on their axis while passing once round the planet. Europa, the smallest, has a diameter of 2,099 miles, somewhat less than that of our moon; Ganymede, the largest, has a diameter of 3,436 miles. The planes of their orbits are nearly the same as the ecliptic and the orbit of Jupiter. The disk of Jupiter is crossed in a direction parallel with the equator by three or four vividly marked bands or belts; other of these belts vary in density and distinctness. Spots also appear and remain for some time on its surface. In particular, a large red spot of varying dimensions has been observed from time to time. Professor George Washington Hough sums up the results of his 23 years of observations of Jupiter somewhat as follows: First, its equatorial belt changes both in size and position slowly and gradually. Second, the fainter belts also vary. Third, the circular white spots are very permanent in latitude, but are not fixed in position one with another. Fourth, the dark spots of the same size as the circular white spots are not so stable as they, and probably lie at the level of the equatorial belt. Fifth,

JURA — JURISDICTION

the large, irregular white spots near the equator make one rotation in 9 hours 50 minutes. As to the constitution of the planet, Prof. Hough concludes that the matter at the visible boundary of Jupiter has a density about half that of water (the average density of the planet is 1.37 times that of water). The medium at the boundary is in the nature of a liquid. In it the great red spot and the circular white spots are located. In such a medium all motions would be slow and gradual and the shape and size of an object would be very permanent. The equatorial and polar belts may be located on the surface or at a higher level than the red spot. In middle latitudes within 20° of the equator the higher atmosphere carries a layer of dark matter. In this envelope are formed the openings that we call white spots, and by unequal distribution black spots. The belts may be assumed to be some sort of vapor of considerable density. The planet is at a high temperature, but not self-luminous.

Jura, joo'rā, a chain of mountains in central Europe, partly belonging to France, partly to Switzerland, between which they form a sort of natural barrier, extending from southwest to northeast, and exhibiting a number of parallel ridges. The greatest length is nearly 200 miles, from Belley in France, department of Ain, to the banks of the Rhine; and the greatest breadth about 60 miles, between the Lake of Geneva and the banks of the Doubs. The principal geological formation is the Jura limestone, with greensand, belonging to the lower cretaceous series. Stalactite caves are numerous. The two chief rivers having their source in the chain—the Ain and the Doubs—are both French. They descend from its western slopes, and belong to the basin of the Rhone. The highest peaks of the Jura are Crêt de la Niège, Reculet, Mont Tendre, and Dôle, all over 5,500 feet.

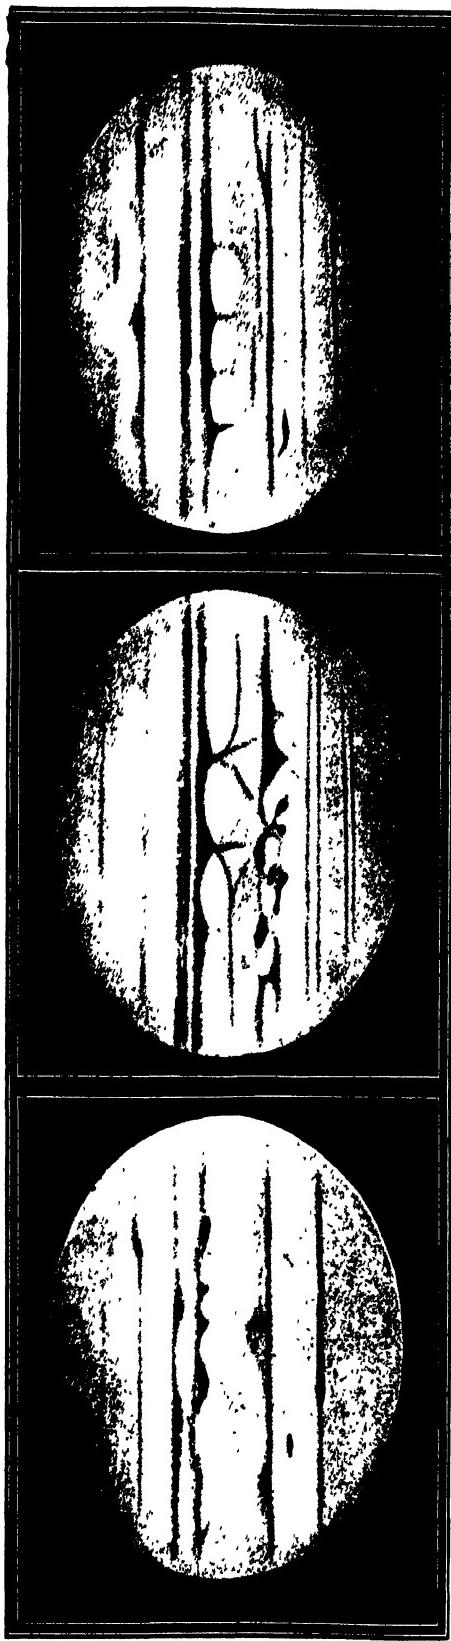

Juras'ic, a system or series of formations with like characteristics, and containing fossil remains indicating a time occupying the first half of the Mesozoic period, and characterized by many changes in the distribution of sea and land, especially in the northern hemisphere, where the present continental areas were apparently represented by archipelagoes. The formations of this period take their name from their prominent exposure in the Jura Mountains; but are known in Great Britain as the Oolites because there made up of granular (oolitic) limestones below the Cretaceous and above the Lias, from the latter of which the series is separated by no very definite boundary. In America synchronous formations are, indeed, called "Juratrias" and represent the transition from the Permian to the Cretaceous. The Jurassic is represented somewhat in South America and in the western United States, as in the highly fossiliferous "Como stage" beds of Wyoming, and the auriferous state of California, but most strikingly in the brown "bird-track" sandstones of the Connecticut Valley, in Nova Scotia, and in the red rocks that crop out along the eastern foot of the Alleghanies from New Jersey to South Carolina. During this period most of the globe now dry land was covered with shallow seas which were the abode of a great variety of

lowly fishes and reptiles. On land it was the height of the age of reptiles, and especially of dinosaurs (q.v.) and pterodactyls. Toward its close the progenitors of birds appeared in the shape of *Archæopteryx* (q.v.), and traces of mammals are found. Consult authorities mentioned under GEOLOGY.

Jurel, joo'rēl, or **Xurel**, a fish of the genus *Caranx*, especially *C. cryos*, more widely known as the yellow mackerel and hard tail. Unlike most members of this tropical genus, the jurel is common as far north as Cape Cod. In Florida and the Gulf States it is an important food-fish, caught in seines during the spring and summer when in shallow water for the purpose of spawning. It is migratory, and like most wandering fishes carnivorous and voracious.

Jurisdiction includes both the right to exercise authority (*imperium*) and the field within which such authority may properly be exercised (*dominium*), whether its limits be territorial or personal. In early law, jurisdiction in the second sense was rather personal than territorial, and the same must be true wherever distinct races occupy together the same territory. While the tendency is to gradually work out a system of law applicable to all inhabitants, the state must of necessity recognize the fact that its subjects of different races will consent to be governed only by separate and often contrasting systems. Such is the case, for example, in British India to-day. So, too, jurisdiction was divided according to the subject matter, and the Church secured and jealously maintained authority over all matters of conscience, and managed to extend the jurisdiction of the ecclesiastical courts to very important questions, including marriage, legitimacy, wills, and administrations, and to actions affecting the personal rights of the clergy.

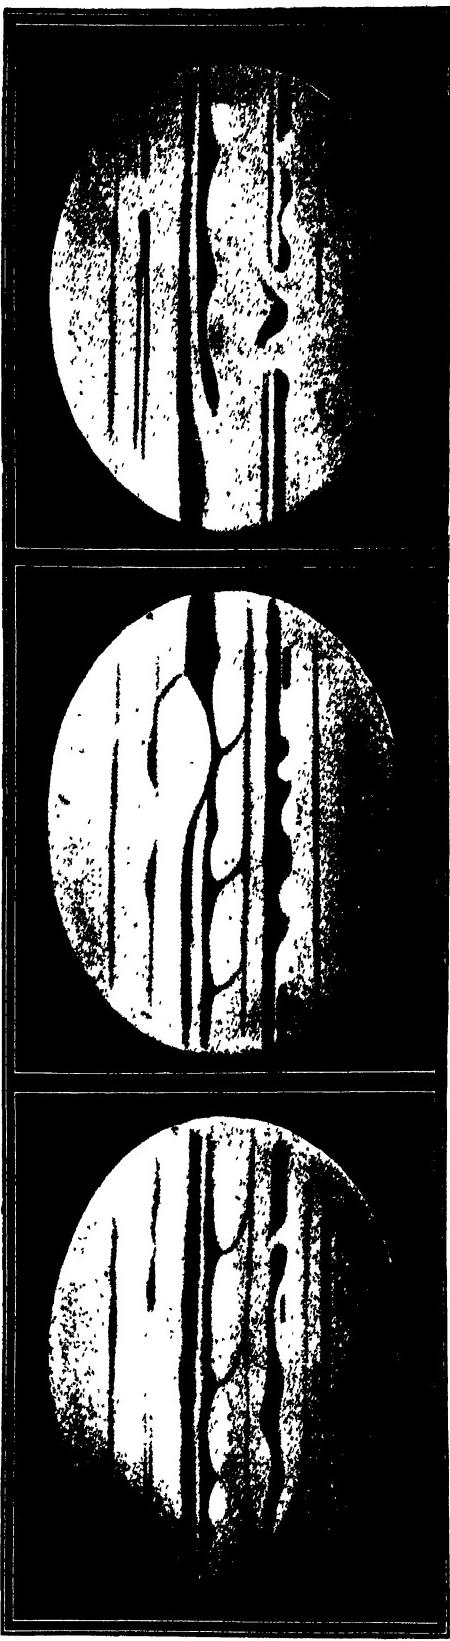

The Constitution of the United States discriminates clearly and sharply between the executive, the legislative, and the judicial powers of government, and its provision that the Constitution and the laws of the United States made in pursuance thereof shall be the supreme law of the land, taken in connection with the provision that the judicial power shall extend to all cases arising under the Constitution, forms the basis of a jurisdiction which, at least in the extent to which it has been carried, is without precedent outside of the United States. It is by virtue of these provisions that the Federal courts exercise the power of declaring void acts of Congress or of the State legislatures which conflict with the Constitution of the United States. To this power and the energy and ability of the Supreme Court in its exercise, are due the vigor and efficiency of the Federal government, and the establishment of its supremacy within the field of its jurisdiction. This feature has been imitated in the several State constitutions with results unquestionably beneficial as a whole, and so important that the courts have come to be spoken of as the guardians of the constitution. But one result not so fortunate is that the legislative branch of the government, though in theory as much bound by constitutional restrictions as though there were no authority to which an appeal against the validity of its enactments can be taken, is manifesting a disposition to disregard them altogether, leaving the whole question of con-

CHANGES IN THE ASPECT OF THE PLANET JUPITER OBSERVED AT VARIOUS TIMES.

JURISPRUDENCE — JURY

stitutionality to the courts. As our system of government provides no method by which the question can be raised, except in the course of a litigation in which one party relies upon the right conferred by such a statute, there are possibly many unconstitutional acts in force in the various States. A more important consideration is that a disposition on the part of the judiciary to interfere with matters properly legislative may thus be created, and lead to forced constructions by which any law which the judges believe to be bad is held obnoxious to the constitution — resulting in illogical and inconsistent decisions, and a weakening of the authority of the courts.

The Constitution provides that the judicial power of the United States shall extend to controversies "between citizens of different States." The purpose was to open the way for legislation which would provide a tribunal in which the right of a citizen of any State to pursue his legal remedies could not be denied; probably, too, to afford him a tribunal less likely to be affected by local prejudice than a State tribunal of first instance, probably a county court. It is not contended that anything further was designed, but upon this clause depends the most extensive and, except for the provision as to constitutional interpretation which we have just considered, the most important, body of Federal decisions. The tendency of the Supreme Court was at first to hold that the Federal court should administer the law of the State in which it was sitting and that while a citizen of Pennsylvania, for example, having a claim against a citizen of New York, might, if he saw fit, bring his action in the Federal, rather than in the State, court — the law to be applied would be the law of the State of New York. But this rule has been departed from in the later decisions, and while the Federal courts still hold themselves bound to follow the interpretation put upon State statutes by the State courts (unless, of course such statutes are attacked as in conflict with the Constitution of the United States), they hold themselves free to disregard the interpretation of the common law by the State courts, and the system of law built up within the State by the adjudications of its courts, and to adopt their own interpretation, and follow their own judgment. That the Federal courts are popular is shown by the fact that the most important litigation, estimated on the basis of the amount at stake is, where possible, usually brought before them, notably proceedings against corporations and especially the foreclosure of corporation mortgages where it is quite common for the trustee for the bondholders to be a corporation or individual of an other State, or where a committee of bondholders, or even a single bondholder, residing outside the State which is the domicile of the debtor corporation, is the plaintiff. This is sufficient to give jurisdiction to the Federal court.

We have therefore a most interesting condition of concurrent jurisdictions applying to every inhabitant of the United States. The Federal courts are courts of limited jurisdiction — limited to authority expressly conferred by the Constitution and laws of the United States, but once jurisdiction is established, unlimited in the scope of its exercise. Congress has prescribed that the jurisdiction shall only exist when the

matter in controversy has a pecuniary value exceeding \$2,000, and that actions shall be brought only in the district within which the plaintiff or the defendant resides, and has made provision for the removal from the State courts of causes which might originally have been brought in the Federal courts. Some of the States have attempted to prevent this increasing jurisdiction of the Federal courts; for example, by the passage of acts providing as a condition of a license to a foreign corporation to do business within the State, that such corporation, if sued, would not remove the cause into the Federal court. Such acts are manifestly unconstitutional, and have been so declared.

JOHN DOUGLASS BROWN,
Philadelphia.

Jurisprudence. See LAW.

Jury, twelve impartial men legally competent to act, who, under the sanction of their oaths, determine by their unanimous verdict the innocence or guilt of the accused in a criminal trial, or decide the issues of fact which are contested between plaintiff and defendant in a civil trial.

The jury is the characteristic feature of English or Common law, distinguishing it from the systems of Continental Europe derived from the law of the Roman Empire. It is peculiar in itself and incidentally it has produced characteristic developments of our law not found in the Roman or Civil law systems, of which perhaps the most noteworthy is our law of Evidence. The history of the jury system has been most thoroughly and ably investigated, especially in recent years.

Its function has completely changed. Originally those persons from the vicinity who had knowledge of the subject matter were summoned to court to state, upon their solemn oaths, what the common opinion of the neighborhood was as to those facts which formed the basis of the criminal charge to be tried, or the basis of the right to possession or enjoyment of land which was at issue, which were the typical cases of early days. It seems to have been soon established that 12 substantial men were a sufficient number to determine this question. As the judicial system developed, courts came to have more extended territorial jurisdiction, and litigation grew more extensive. Attendance of 12 persons acquainted with the facts of each cause to be tried would impose an intolerable burden upon the community, and our forefathers worked out the plan of submitting their legal controversies to the decision of an impartial jury sworn to determine the facts in issue upon testimony given under oath by witnesses summoned by the parties.

Students of English and American history would probably unanimously agree that as a part of our system of civil government the jury has been a valuable institution. There can be no doubt of its educational value, and of its importance in making each freholder who served on a jury feel that he was individually performing an important public duty. Juries played a conspicuous part in defense of popular rights against attempts at tyrannical exercise of authority by the executive government. In the libel cases of the 18th century the contest was bitterly fought, the judges, under the lead of Lord Mansfield, maintaining that whether a document

JURY

was libellous or not libellous was a question of law for the court (that is, for the judge) to determine, the jury being limited to finding affirmatively or negatively the fact of publication; while the juries, on the other hand, contended for their right to find general verdicts ("guilty" or "not guilty"). The contest was settled by Fox's Libel Act in favor of the right of the jury to determine the guilt or innocence of the accused.

Students of law differ as to the merits of the jury system. Arguments drawn from the supposed mental inferiority of juries need not be considered, since this is not an inherent defect, and there is no more reason why a community should have inferior jurymen than inferior officials of any other class. But weighty objections of an essential character have been suggested. The chief is as to the requirement of an unanimous verdict, which, it is argued, must constantly produce a disagreement and failure to reach a conclusion, or the sacrifice of opinions conscientiously held by some of the jurors. There is no doubt that this requirement is an essential feature of the jury system as known to English law; it has been expressly so decided by the Supreme Court of the United States which, in interpreting the clause of the Federal Constitution which provides that in civil suits in the Federal courts "the right of trial by jury shall be preserved," has held that this requires the unanimous verdict of 12 men. A small number of the States have modified the system by providing for juries of less than 12, or of verdicts rendered by a vote less than unanimous. When such legislation is not in conflict with the State constitution it is lawful, as is doubtless the provision authorizing the service of women on juries.

Another objection is the doubt as to whether the jury is the best means of arriving at determinations of fact. This controversy has been bitterly fought, one side maintaining that the jury is not fitted, either by training or capacity, to decide fairly and intelligently doubtful questions of fact, and that one of its most important functions, that of assessing damages, is not properly performed, especially where the requirement of unanimity necessarily leads to compromise verdicts. On the other hand it is argued that the jury, if properly drawn, represents the average intelligence of the community, and that when it does so, no fairer tribunal can be discovered, and not, perhaps, very consistently, that in civil matters control of the case is really in the judge, who by careful instructions can usually so direct the jury as to bring about an intelligent verdict, or, as a last resort, can set aside one which is clearly wrong, and award a new trial.

A verdict of acquittal in a criminal proceeding finally disposes of the charge against the defendant both by the common law and, in this country, by the provisions of the Federal Constitution (and of most, if not all, of the State constitutions) that no person shall "be subject for the same offense to be twice put in jeopardy of life or limb." Doubtless from this arose the doctrine that in criminal cases the jury are judges both of law and fact, which caught the popular fancy, is not without the weight of respectable judicial authority to sustain it, from the time of Junius, who upheld it in opposition to Lord Mansfield, has been a favorite doctrine of popular leaders, and only in recent years may

be regarded as finally disposed of. The doctrine was discussed by Chief Justice Mitchell, of Pennsylvania, in a capital case in 1801, and pronounced by him to be "unsound in every point of view, historical, logical, or technical," and in 1805 the Supreme Court of the United States (speaking by Mr. Justice Harlan) reached the same conclusion and held that in the courts of the United States it is the duty of the jury in criminal cases to receive the law from the court, and to apply it as given by the court, subject to the condition that by a general verdict a jury of necessity determines both law and fact as compounded in the issue submitted to them in the particular case. Mr. Justice Gray filed a long and able dissenting opinion concurred in by Mr. Justice Shiras, and in this case, reported in 156 United States Reports (page 51), all the arguments on both sides can be found.

The grand jury is, historically, a sort of representative committee of the people of the district throughout which the jurisdiction of the court extends, charged with the duty of reporting to the court offenses which have been committed which they consider should be inquired into, and persons whom they believe to have committed criminal acts for which they should be punished. Its development into the modern grand jury is not well understood. The highest authorities on our early legal history say of it, "The details of this process will never be known until large piles of records have been systematically perused. This task we must leave for the historian of the 14th century."

The grand jury as an existing institution consists of a number of persons drawn from the same class as the ordinary or petit jurors. At the common law the number summoned was 23. They are sworn to the faithful discharge of their duties, and the court then delivers a charge to them, calling their attention to the duties they are to perform, either generally or with reference to any matters of special public interest falling within their jurisdiction to which the court thinks proper to direct their attention, and they can then proceed to business. All indictments are submitted to them and, according as they determine, after hearing the prosecutor's evidence, whether they are well founded or not, they indorse them "true bill" or "ignoramus" (or equivalent words). In the former case the accused is held for trial, in the latter discharged. It is the custom for them to make report to the court on such matters as seem to them of public interest and importance, and to make such recommendations as seem good to them. The report made by them of any offense from their own knowledge or observation, without a bill of indictment laid before them, is called a Presentment.

For the history of the origin and development of the jury, consult: Pollock and Maitland, "History of English Law"; Thayer, "Preliminary Treatise on Evidence at the Common Law" (chapters ii.-iv.); Stephen, "Commentaries on the Laws of England" (Bk. V., ch. xiv.); Stubbs, "Constitutional History of England"; Cooley, "Constitutional Limitations." For a discussion of the merits of the institution under modern conditions which is generally accepted as full and impartial, consult "The System of Trial by Jury," by the late Mr. Justice Samuel F. Miller (21 Amer. Law Review, 859). For the origin of the grand jury: Pollock and

JUSSERAND — JUSTIN

Maitland, 'History of English Law' (Bk. II., ch. ix., § 4). JOHN DOUGLASS BROWN,
Attorney at Law, Philadelphia.

Jusserand, Jean Adrien Antoine Jules, zhōn à drē àn àn-twān zhū zhū-sé-rān, French diplomat and author: b. Lyons 18 Feb. 1855. He was educated at the Faculté de Lyon, in 1878 entered the French ministry of foreign affairs as consul at London; subsequently held other posts in the ministry, among them that of chief of the bureau of Tunisian affairs, and that of associate sub-director of the protectorate; in 1887-90 was councillor of the French embassy in London. In 1890 he became minister to Denmark, and in 1902 ambassador to the United States. His best known work is his 'Les Anglais au Moyen Age: La Vie Nomade et les Routes d'Angleterre au 14me Siècle' (1884; trans. by Smith as 'English Wayfaring Life in the Middle Ages' 1892), which was crowned by the Académie. Of his further writings, the following have appeared in English: 'The English Novel in the Time of Shakespeare' (1890); 'A French Ambassador at the Court of Charles II.' (1892); 'Piers Plowman' (1894); 'English Essays from a French Pen' (1895); 'A Literary History of the English People' vol. I. (1895); 'Shakespeare in France under the Ancient Régime' (1899).

Justice, Department of, in the United States, an executive branch of the government. The department dates only from 1870. The supreme head of this department, the attorney-general, is appointed by the President and confirmed by the Senate. He is a member of the cabinet, and his salary is \$8,000 a year. The establishment of this department brought under his control all United States district attorneys and marshals, and secured uniformity in the trial and prosecution of cases. The attorney-general rarely argues cases, this work being done by his subordinates. The solicitor-general takes the place of the attorney-general in the latter's absence. He has charge of the conduct of cases in the courts at Washington. The office of attorney-general was established almost at the beginning of the government, and not until 1870, as stated, was the Department of Justice organized and placed under his charge. See ATTORNEY-GENERAL.

Justice, Lord, a person invested with royal authority in England for a short time, during the absence of the monarch. Queen Victoria and her successor Edward VII. have never appointed lord justices in their absence; George IV. was the last king of England to do so. The powers of lord justices have been confined to pardoning or reprieving convicts, summoning or proroguing parliament, disposing of treasury funds, and making church preferments. In the absence of the viceroy from Ireland lord justices have sometimes been appointed to perform his functions.

Justice of the Peace. See COURT.

Justifica'tion, theologically, the rendering a man just, or the imputing to him of righteousness. The Roman Catholic doctrine of justification was formulated by the Council of Trent in 1547. According to the Council the first step in justification is the calling of the sinner to repentance through the working in his heart of

divine grace, and the assistance of his will, whereby he is enabled to turn to God. This grace is based on no merit in the sinner, but arises entirely from God's love and mercy. "This disposition or preparation," the decree continues, "is followed by justification itself, which justification consists, not in the mere remission of sins, but in the sanctification and renewal of the inner man by the voluntary reception of God's grace and gifts, whence a man becomes just instead of unjust." The Lutherans regard the preliminary operation of divine grace as not due to any merit in the sinner, but they rejected the view that man could contribute anything toward his own conversion. According to the Augsburg Confession men "are justified freely for Christ's sake through faith," and "this faith doth God impute for righteousness before him"; and Calvin declares justification to consist "in the remission of sins and the imputation of the righteousness of Christ." Thus, according to these theologians justification denotes not a rendering just, but a reputing and declaring just. The Roman Catholics believe that justification consists essentially in a process of sanctification and renewal of the moral nature in which the will of the sinner operates toward his own salvation. Luther and Calvin conceived that the merits of Christ were imputed to the believer, though they also taught that sanctification necessarily followed on real justification, of which it is the only external proof. Their doctrine is based mainly on the Epistle to the Romans (see especially iii. 28 and iv. 5). The Roman Catholic view of justification is based on such passages as Luke xviii. 14; 1 Cor. vi. 11; James ii. 24. The Church of England and Protestant Episcopal Church in the United States define justification in their XI. article as follows: "We are accounted righteous before God, only for the merit of our Lord and Saviour Jesus Christ by faith, and not for own works or deserving: Wherefore, that we are justified by faith only is a most wholesome doctrine, and very full of comfort."

Jus'tin I., Byzantine emperor: b. 450; d. 1 Aug. 527. He was a peasant of Dacia and rose from the rank of a common soldier to be commander of the imperial guard, and on the death of Anastasius I. in 518 became emperor. He relegated the civil administration to the quæstor Proclus, and between them the empire was governed with a fair amount of success. Consult Bury, 'Later Roman Empire' (1889).

Justin II., Byzantine emperor: d. 5 Aug. 578. He succeeded his uncle Justinian I. in 565. Beset with enemies outside the empire and harassed with internal discord, he in 574 solved his difficulties by abdicating in favor of Tiberius, captain of the guard. During his reign northern Italy was conquered by the Lombards, and the Persians took possession of several Asiatic provinces of the empire.

Justin (MARCUS JUSTINIANUS JUSTINUS), a Latin historian, who probably lived at Rome in the 2d or 3d century A.D. He made an epitome of the general history of antiquity by Trogus Pompeius, a native of Gaul, who lived in the time of Augustus, and whose work is no longer extant. This epitome, although incorrect in detail, is valuable for its compressed reproduction of the old histories. The first English version, by Goldingé, appeared in 1574.

JUSTIN MARTYR—JUTE

Justin Martyr (JUSTINUS MARTYR), a Christian apologist and martyr: b. Flavia Neapolis, Shechem, Palestine, 100 A.D.; d. Rome 165. He began active life as a professor of Platonic philosophy, and subsequently embraced Christianity without abandoning Platonism. He was a staunch adherent of the Christian party in the empire, a keen confuter of Gnosticism, and an unwearied defender of the Christian doctrine of the Logos. In every department of Christian dogmas he stood foremost as a teacher. Eventually he went to Rome (150 A.D.) and during ten years of activity he wrote his 'Apology,' with a supplement known as the 'Second Apology,' addressed to the Emperor Marcus Aurelius. He afterward had a controversy with a Jew, an account of which is embodied in his 'Dialogue with Trypho the Jew.' He was put to death for his faith, and his day on the Church calendar is 31 April. Consult: Migne, 'Patrologia'; Semisch, 'Justinus der Märtyrer'; Aubé, 'Justin, Philosophe et Martyr' (1874).

Justinian I. (FLAVIUS ANICIUS JUSTINIANUS), surnamed the GREAT, emperor of the East: b. of Gothic peasant parentage at Tauresium, Illyricum, probably 11 May 483 A.D.; d. 14 Nov. 565. Patronized by his uncle, Justin I., who, from a Thracian peasant, had become emperor, he so flattered the senate and dazzled the people that he was made consul, and took the title of *Nobilissimus*. On the death of his uncle, with whom he had latterly shared the imperial power, he was proclaimed emperor, and married an actress named Theodora. During his reign the party disputes of the Greens and the Blues became so violent, that in his attempt to quell the tumults the emperor's own life was in jeopardy, and a great part of Constantinople was destroyed by fire. Aided by his generals, he was able subsequently to restore to the Roman empire a part of its former possessions, as when Belisarius in 523 and 529 defeated the Persians, and achieved victories in Africa, and when Narses put an end to the Ostrogoth rule in Italy. Turning his attention to the laws, Justinian commissioned ten learned civilians to draw up a new code, and the result was the 'Corpus Juris Civilis,' or body of civil law. He took great interest in building cities, fortifications, and churches; among the latter he rebuilt the church of St. Sophia at Constantinople. To maintain his public munificence he oppressed the people with taxes. Consult Finlay 'History of Greece' (1880); Hodgkin, 'Italy and her Invaders,' Vol. IV. (1880); Bury, 'Later Roman Empire' (1889); Hutton, 'The Church in the Sixth Century' (1897); Gibbon, 'Decline and Fall of the Roman Empire' (ed. by Bury 1896-1900).

Justinian II., surnamed RHINOTMETUS, Byzantine emperor: b. 669; d. December 711. He succeeded his father, Constantine IV., in 685, and was deposed and banished for his cruelty, by his general, Leontius in 695. He regained his throne ten years afterward, and was overthrown by Philippicus Bardens and killed.

Jute. Two species of plants yield the jute of commerce, *Cochchorus capsularis* and *C. olitorius*. They are tall shrubs, 8 to 15 feet high, the fibre being produced in the bark, and known as bast fibre. Supposed to be indigenous to India, where the species grows wild, cultivated to a limited extent by other Eastern people, as

the Chinese and Malays, *C. olitorius* is naturalized in all parts of the tropics to the shores of the Mediterranean. Jute was introduced into the United States by the Department of Agriculture in 1870 (see various articles in Monthly Reports of this department 1870-5), and was found to be adapted to cultivation along the line of Gulf States from Texas to South Carolina. It should be noted that the China jute of commerce is not jute at all, but a similar bast fibre derived from *Abutilon avicinæ*. This plant was experimented with in New Jersey 25 years ago, though unsuccessfully, the fibre being wrongly called American jute. In India many kinds of jute are recognized, all being known under local trade names, which are unimportant here. The value of jute as a textile lies wholly in its fineness, silkiness and adaptability to spinning, low cost of the raw material being another advantage. Several American fibre plants classed as weeds yield a better, whiter, and stronger fibre, though they cannot be utilized for economic reasons. (See special report on bast fibres, No. 6, Office of Fibre Investigations of the Department of Agriculture.) The fibre of jute, compared with other textiles, is quite inferior, the bleached filasse soon losing its whiteness and becoming a dingy, dirty brown, while its strength rapidly deteriorates. Nevertheless it may be regarded as one of our most useful fibres — too useful in certain directions, as its fineness and lustre, as well as cheapness, adapt it most readily to purposes of adulteration, and as it takes colors easily it can be stained or dyed to imitate many of the other fibres, though such frauds can be readily detected. The uses of the fibre are many, and it enters into all classes of textiles from woven fabrics of great beauty to coarse ropes and bagging. In the manufacture of fabrics it goes into curtains, chair coverings, and other forms of upholstery, carpets, webbing, burlap and bagging (especially cotton bagging), and it has been employed for imitation silk fabrics, although for this purpose the fibre requires a special treatment in order to subdivide it more finely and render it more glossy. The fibre is also made into all kinds of cordage, either honestly, as jute, or as an adulterant, considerable quantities having been used in past time for the manufacture of binding twine. It is largely employed for fine and coarse twines, small rope, sash cords, etc., and where cheapness is a desideration it fills the demand. During the fiscal year ending 30 June 1902 we consumed 131,192 tons of jute and jute butts, costing \$4,480,000. The jute was worth \$48, and the jute butts \$24 per ton. The commercial use of jute dates back less than a century, the first exports in noticeable quantity (about 18 tons) having been made, to England, in 1828. By 1850 the exports had reached 30,000 tons; in 1871, 310,000 tons. Now some 800,000 acres are cultivated in jute, more than half of this area comprising nine districts of northern Bengal. Both high and low lands are employed for this culture, although the larger part of the crop is produced upon the "churs" or lands of recent alluvial formation along the rivers. In this country the "river bottoms" would be favorable for the culture, in localities of the South, where the requisite conditions of heat and moisture prevail.

Twelve to fifteen pounds of seed is the average quantity sown per acre, though Spon gives nearly double this amount. In India the yield is

JUTIAPA — JUXON

about 400 pounds of fibre per acre. Little or no cultivation is given the crop save thinning out where overcrowded. The plants mature in three months and the crop is harvested with a bill hook or sickle at the time when the flowers have begun to show and the seed has not yet appeared. If the plants are allowed to seed, the fibre will be stronger and heavier, but harsher. In some districts, after harvesting the stalks are stacked in the field until the leaves drop off, while in other localities stacking is not practised. The stalks are sorted as to length into three sizes, and made into bundles that one man can carry. The extraction of the fibre is accomplished by steeping the bundles in stagnant water, covering them with jungle plants, clods of earth or cow dung. When the setting is completed the ryots go into the water waist deep, and by thrashing the surface of the water with the stalks, assisting the loosening of the bark with the fingers, the fibre is separated from the wood. Afterward it is wrung out and hung upon lines to dry. Little may be said regarding jute culture in this country. Machinery would need to be used for stripping the fibre, and there are no practical machines; furthermore at the low prices which prevail for the imported jute, it is doubtful if it could be made a paying crop. The plant is adapted to cultivation in the United States and produces a superb fibre, but it would not be able to compete with India jute at $1\frac{1}{2}$ to $2\frac{1}{2}$ cents per pound. See Special Report (No. 8) office of Fibre Investigations of the Department of Agriculture; 'Dictionary of the Economic Products of India' and various Bulletins of the Royal Gardens, Kew, England. See CORDAGE; CORDAGE INDUSTRIES; FIBRE; INDIA.

CHAS. RICHARDS DODGE,
Commercial Fibre Expert, Washington, D. C.

Jutiapa, hoo-te-á-pá, Guatemala, a department bounded on the north by Jalapa and Chiquimula; on the south by the Pacific Ocean; on the southeast by Salvador; on the west by Santa Rosa. It has an area of 1,563 square miles. The principal industries of the department are cattle-raising and the cultivation of coffee. Sugar, tobacco, and fruits are also grown. Capital, Jutiapa. Pop. about 50,000.

Jut'land, the peninsular portion of Denmark (q.v.).

Juvenal, joo've-nál (DECIMUS JUNIUS JUVENALIS), Latin satirical poet: b. Aquinum, Volscian territory, 50 A.D.; d. 130 A.D. He was the son of a prosperous freedman, and studied rhetoric at Rome, where he took pupils in his professional studies. He is traditionally said to have been despatched with a military command to some remote province, Britain or Egypt, for satirizing Paris, an actor who was Domitian's favorite. His works consist of 16 satires, highly rhetorical, and full of life and fire. There is reason to think, however, that in describing Roman society, he, like Tacitus, has exaggerated the real condition of things. He writes like a scolding schoolmaster with the special pleading of a bitterly disappointed man, railing against classes and circles from which most probably he was excluded. He takes up one after another the common topics of the moral enthusiast, the power of wealth to do wrong, the corruption of senators, the vices of

women, the contempt under which poverty and simplicity are crushed, and the utter vanity of mundane things. Where Horace smiles with a good-natured sally of wit, Juvenal foams and shrieks, but his invective is skilful, epigrammatic and launched with all the point and power of a professional rhetorician. Gifford has translated these satires with remarkable skill, and Samuel Johnson made his first hit as a literary man by his imitation of the third and tenth, which he published under the titles 'London' and the 'Vanity of Human Wishes' respectively. Consult: Jahn, 'Juvenalis' (1850); and the notable English commentary of F. E. B. Mayor (1889).

Juvenile Offenders. In the United States the law with regard to juvenile offenders varies in the different States. The number of reform schools reported in 1900 was 82; instructors employed, 578; pupils attending school, 22,692, and 14,673 in industrial departments. The total number of inmates was 24,925. The value of grounds and buildings was \$18,873,587. The expenditures on buildings and grounds amounted to \$605,010; for salaries and other expenses, \$2,800,281, making a total expenditure of \$3,405,291. The number of assistants, not including instructors in school departments, was 1,788. There were 16,609 white inmates and 2,784 colored inmates; 8,514 were of native parents, and 4,122 of foreign-born parents. Those that could only read when admitted were 2,207, and 1,595 could neither read nor write. The number committed to the institutions during the year was 11,676, and the number discharged 11,990. When discharged from the schools many of the pupils possessed a trade and were provided with good homes; all could read and write; the majority had received the equivalent of a common school education.

In Great Britain, in the eye of the law persons are considered capable of committing crime at the age of 7, and are punishable like other persons. But in England and Ireland, whenever a person under the age of 16 is convicted and sentenced to be imprisoned, the court or magistrates may also sentence him to be sent to a reformatory school for not less than two or more than five years. Such sentence, however, cannot be passed on an offender under 10 years of age, unless his offense is by law punishable with penal servitude or imprisonment, or unless the sentence come from a superior court, such as a court of assize or of quarter sessions. Children who have not yet committed crime, but are in a vagrant and neglected state, may also be sent to an industrial school.

Jux'on, William, English prelate, archbishop of Canterbury: b. Chichester, Sussex, 1582; d. London 4 June 1663. He was educated at Oxford, took orders and after holding church livings (in 1609 at Oxford, and then in 1614 at Somerton), in 1621 succeeded Laud as president of St. John's College. In 1627 he was appointed vice-chancellor of the university, and about the same time chaplain in ordinary to Charles I., who gave him the deanery of Worcester, and then the bishopric of London (1633). He attended the king on the scaffold. His fidelity cost him his bishopric, but at the Restoration he was made archbishop of Canterbury.

K

K the eleventh letter in the English and other alphabets of the modern languages of western Europe.

The character is derived, through the Greek, from the alphabet of the early Phœnicians, where its form is that of K reversed, γ. The k represents the sound produced when the back of the tongue is brought into contact with the palate and the breath expelled. The sound-value of k is the same in all languages; but k is not employed in the modern Latin languages save in spelling foreign words or names. Nor does it occur in Latin save as an abbreviation (K or Kal.) for Kalendæ, K for the name Cæso, or for Cartago, etc.

In English the c of the Latin orthography of words from the Greek is always retained, even when it represents the sound of k, for example, sceptic, pronounced skeptic; and we are beginning to pronounce ceramic keramic. We even substitute c for k in Greek words and names, though in reading Greek we give to the k always its hard guttural sound: hence for us Alkibiades is (in sound) alsibiades, and even Kimon is simon.

The k in Greek names suffers a similar change in the modern Latin languages; but in German speech the true k sound in such names is retained: Ankyra, not ansyra, Korkyra, not corsyra; Kephalos, not sephalos.

In Anglo-Saxon and in Gaelic the k is always represented by c.

The guttural sound of k seems to have stood unchanged in ancient Greek and Latin, whether represented by that letter or by c; but in the modern languages derived from the Latin the k sound underwent great changes, becoming a sibilant equal to s, as "sezar" for Cæsar, or being "palatalized" into the sound tsh, for example, Gr. kyriake, Ger. kirche, Scotch kirk, Eng. church; to produce this change the middle of the tongue, instead of the back of it, is brought into contact with the palate; in French pronunciation the k-sound of c in Latin words, as camera, carbo, carnalis, is changed to sh, and the words are written chambre, charbon, charnel.

Kaaba, kā'bā, or kā'ā-bā. See CAABA.

Kabbala, kāb'ā-lā. See CABALA.

Kabul, kā-boot', or **Cabool**, Afghanistan, capital of the country and of the province of Kabul, situated at the west extremity of a spacious plain, in an angle formed by the approach of two ranges of hills, and (with the exception of a suburb) on the right bank of the Kabul River, which is spanned, in or near the city, by several bridges. It stands at the height of about 6,000 feet above the sea-level, and has a delightful climate in summer, but the winter is severe. The houses are in general slightly built of mud

and unburnt bricks, and there are no public buildings of any importance, though many of the mosques are spacious and commodious. There are hardly any proper streets in the city except those formed by the bazaars, which are extensive and well supplied with goods. A portion of one of the bazaars consists of four handsome covered arcades, separated by open squares and adorned with paintings. Kabul is now becoming an important centre of trade with India and central Asia, and its population is greatly increased in the summer season by the influx of traders and others. The improvements of Western civilization have recently been introduced in new industries and public utilities. The citadel of Kabul is the Bala Hissar or Upper Fort, situated on a spur of the adjacent hills. In it the Amirs used to reside, but the present Amir has his residence in the city itself. Estimated pop. 75,000.

Kabul River, a river of northeastern Afghanistan, rising in a spur of the Indian Caucasus, at a height of 8,400 feet above the sea-level. It flows for about 270 miles in an easterly course, breaking through the Khyber Mountains, crosses the district of Peshawar in British India, and enters the Indus at Attock in the Punjab.

Kabyles, kā-bilz'. See BERBERS.

Kadi, kā'dī or kā'dī. See CADI.

Kadiak, kād-yāk', an island of Alaska, situated southeast of the peninsula of that Territory. It is about 100 miles long and 60 miles wide, has a rocky mountainous surface, and an irregular, deeply indented coast, with some good harbors. Near the coast the soil is somewhat fertile, but little of it is profitable for agricultural purposes. The interior is mostly covered with low forests of pine and other trees. Bears and foxes are common, but other fur-bearing animals have become comparatively rare. The salmon-fisheries afford the inhabitants their chief occupation. Pop. about 2,000.

Kadiak Bears. See BEARS.

Kaffa, kaf'fa. See FEODOSIA.

Kaffraria, kāf-frā'riā, the country of the Kafirs in South Africa; a name formerly used by the Portuguese for all the African continent south from Sofala. It has gone almost out of use, its general substitute being the Transkeian Territories, forming part of Cape Colony.

Kafir-bread, kāf'er-brēd, the edible spongy pith of the stems and cones of any of several species of cycads (q.v.) growing in South Africa, especially *Encephalartos caffer*. This substance resembles sago in its farinaceous character.

KAFIR-CORN — KAI-FUNG

Kafir-corn, Indian millet (*Sorghum vulgare*) extensively cultivated by the half-civilized negroes of south-central Africa. It is called kao-hang by the Chinese. See GRASSES; MILLET.

Kafiristan, kā-fē-ris-tān' (Persian, "land of the infidels"), a region of central Asia northeast of Afghanistan, on the south slope of the Hindu Kush, and having as its southern boundary the Kabul River. Formerly the name was vaguely given to a much greater territory; it is now restricted to a country with an area of about 5,000 square miles, nominally under the government of the Amir of Afghanistan, but virtually belonging to an independent people. In the northern portion, which is mountainous, the surface is rugged and broken; in the south the land is mostly level or moderately undulating. Much of the soil has a high degree of fertility, and is adapted, especially in the valleys, to the cultivation of fruits and cereals of various kinds. Grapes are largely produced, from which is made an excellent wine. The number of the inhabitants is estimated at 200,000. They are said to be skilful workers in wood and metals, but their main pursuits are agricultural and those pertaining to the herding of cattle, sheep, and goats. In many of their traits—in features, complexion, beliefs, manners, and customs—they differ much from neighboring tribes, appearing to be of Aryan extraction, and they claim descent from soldiers of Alexander the Great. They are not without dissensions in the various tribal divisions in which they exist, but their isolation in a region of natural strength has enabled them to maintain a kind of political unity despite internal discords, as well as to preserve their independence against the invasions of other tribes. They have no literature, and in their language appear mingled traits of the Indo-Iranian dialects in their Iranian and Indian divisions. In religion they have largely withheld Mohammedan influences and preserved many of their tribal forms. Consult: Biddulph, 'Tribes of the Hindu Kush' (1880); Leitner, 'Kafiristan' (1881); McNair, 'A Visit to Kafiristan' (Proc. Royal Geog. Soc. 1884); Robertson, 'Kafirs of the Hindu Kush' (1890).

Kafirs, kaférz, **Kaffirs**, **Kaffres**, or **Caffres** (from Arabic *Kāfir*, infidel or unbeliever), the principal race inhabiting southeastern Africa, a branch of the great Bantu family. The name is now chiefly restricted to the tribes occupying the coast districts between Cape Colony and Delagoa Bay. They differ from the negroes in the shape of the head, it being more like that of Europeans; in the high nose, frizzled hair, and brown complexion, which becomes lighter in shade in the tribes of the more southern districts. They are a tall, muscular race, the average height being from 5 feet 9 inches to 5 feet 11 inches, and frugal and simple in their habits. Their chief occupation is raising and tending cattle, and hunting; garden and field work is mainly performed by women. They are of a peaceful disposition, but in times of war they display considerable bravery, tactical skill, and dexterity in the handling of their assagais or spears, shields, and clubs, as has been shown in their engagements with the British forces. There are several distinct branches or families of Kafirs, but the tribes which recent events have specially brought to the front are the Pondoos, the Fingoes, the Zulus, and the Swazi.

Kafirs, especially of the Zulu tribe, are distributed in large numbers over Natal and Cape Colony, and have become to some extent civilized. Frequent hostilities have taken place between the British and one or other of the Kafir tribes, beginning almost with the first acquisition by Britain of the Cape Colony.

Kagoshima, Japan, a city in the island of Kiushiu, capital of Satsuma province, and of the prefectural ken of the same name, on the northwest shore of Kagoshima Bay. The town is well built and is an important industrial centre with a considerable export trade. The celebrated Satsuma porcelain is manufactured in suburban Tanoura. Kagoshima was the feudal seat of the powerful Shimadzu daimios, and in 1863 was bombarded and destroyed by the British owing to the murder of an Englishman; the reigning daimio refusing satisfaction. Here in 1877 Saigo (q.v.) set up the standard of rebellion, and here also he was overwhelmingly defeated a few months later. Pop. (1898) 53,481.

Kagu, kā'gōo, the native name of the remarkable bird (*Rhinochetus jubatus*) peculiar to New Caledonia, where it was discovered only in 1860, and is now rapidly disappearing. It is the only species of a distinct family most nearly related to the sun-bitterns. The kagu is about the size of a domestic fowl, with short wings, rather long legs, a ralliform beak, and a long crest. When the wings are folded, the colors are mottled gray, the wings and tail barred with a darker shade; but when they are spread, the wings are seen to be barred and spotted with white and black arranged in a conspicuous pattern. The kagu is noteworthy for the extraordinary dances and antics which it performs.

Kaguan, kā-goo-ān'. See COLUGO.

Kahn, Julius, American politician: b. Kuppenheim, Baden, 28 Feb. 1861. Removing with his parents to California in 1866, he was educated in the public schools of San Francisco, and for ten years followed the theatrical profession. It failed to satisfy his ambition, however, and in 1890 he returned to San Francisco, where he studied law. In 1892 he was elected to the legislature of California, being admitted to the bar in 1894. He was elected to the 56th and re-elected to the 57th Congress as representative from the 4th district of California. He has championed with much energy the anti-Chinese bill and is regarded as one of the leaders of the movement to prohibit Chinese immigration to the United States.

Kahoka, kā-hō'ka, Mo., city and county-seat of Clark County, on the Keokuk & W. railroad, 20 miles west of Keokuk, Iowa. It is an important shipping point for a large farming and stock-raising region and there are numerous grain elevators, besides flour-mills, brick yards, and fruit canning establishments. The city is governed by a mayor and council elected biennially. Pop. (1890) 1,425; (1900) 1,818.

Kai-fung, ki-fūng', or **K'ai-Feng-Fu**, China, a walled city, capital of the province of Ho-nan, 450 miles southwest of Peking, and 11 miles distant from the Ho-ang-ho, or Yellow River. It was the capital city of China from 960 to 1129 and was then known as Pien-liang. The city has been visited 14 times by flood, 9 times by earthquake, and 6 times by fire. Kai-fung is a station on the New Hankow-Peking

KAI-PING — KALAHARI DESERT

railway. It has a large commercial trade with the interior. Pop. about 150,000.

Kai-ping, kī-ping', China, town in the province of Pe-chi-li, 80 miles north of Tien-Tsin. It is the centre of a large coal field, over 9,000 persons being employed in the mines. The output is over 800,000 tons annually. A branch railroad connects Kai-ping with the Trans-Siberian Railway.

Kaietur (kā-e-toor') Fall, a famous waterfall in British Guiana, on the Potaro River, a tributary of the Essequibo. It was discovered in 1870. Its total height is over 800 feet, and the sheer descent of the water 741 feet, the width of the hard rock over which it plunges being 370 feet. The water has worn a great cavern in the softer underlying layers, and against the dark background thus formed the whiteness of the spray is contrasted with magical effects. The scenery about this great waterfall enhances its beauty and grandeur.

Kailas, ki'lās, the highest summit of the Gangri Mountains in Tibet, between the sources of the Indus and the Brahmaputra, having an altitude of over 20,000 feet. It is a sacred mountain of the Hindus, who formerly regarded it as the abode of their gods.

Kain, kān, John Joseph, American Roman Catholic archbishop: b. Martinsburg, W. Va., 31 May 1841; d. Baltimore 13 Oct. 1903. Educated at St. Mary's Seminary he was ordained priest in 1860 and was for several years stationed at Harper's Ferry, W. Va. In 1875 he was consecrated bishop of Wheeling, and in 1893 he was appointed titular archbishop of Oxyrrychia as coadjutor to Archbishop Kenrick of St. Louis, succeeding to the archbishopric of St. Louis on the death of Archbishop Kenrick in 1895. Owing to failing health Bishop Glennon of Kansas City was made coadjutor in 1902, and succeeded him.

Kainite, ki'nit (from Greek καῦς, new), a complex substance, first discovered in 1865, found in the Stassfurt deposits of Germany and elsewhere, containing sulphates of potash and magnesium and chloride of magnesium. It is used in its natural state as a fertilizer, but much of it is employed in manufacturing potassium sulphate and double potassium-magnesium sulphate.

Kairwan, kir-wān', Tunis, a town 80 miles southeast of Tunis the capital, situated in a barren, sandy plain, and surrounded by a wall; founded about 670. It is connected by rail with Tunis and with the port of Susa, 30 miles distant. It ranks next to Tunis in population and trade, and is one of the holy Mohammedan towns; it was formerly almost inaccessible to Christians. Under the administration of the French, by whom it was taken in 1881, many modern improvements have been made, among which not the least important is a good water-supply. It has a variety of useful manufactures, including morocco, carpets, copper utensils, saltpeter, etc. Kairwan was the first seat of Saracenic empire in Barbary, and still has many fine relics of its ancient grandeur in the fragments of beautiful architecture which abound there, besides a number of interesting mosques, one of them being of great magnificence. Pop. (1900) about 27,000.

Kaiser, kī-zér, a title, the German equivalent for emperor. The Romans added the name of Caesar to their own kings in honor of the "divine Julius," and this passed to Kaiser in the 10th century. When the Holy Roman Empire was dissolved the imperial title was retained by the House of Hapsburg, the head of which since 1804 has borne the title of Emperor (Kaiser) of Austria.

Kaiser-Franzensbad. See FRANZENSBAD.

Kaiser Wilhelm Land. See NEW GUINEA.

Ka'ka, a large, slow-flying, brownish parrot (*Nestor meridionalis*) of New Zealand, which inhabits forests, where it goes about in noisy flocks, and nests in hollows of trees. Its food is miscellaneous, but consists principally of nectarous flowers and of the grubs hiding under bark, which it tears away by its powerful hawk-like beak. A near relative is the Kea (q.v.); and other species on New Zealand, Norfolk and neighboring islands have become wholly extinct since the occupation of those islands.

Kakabek'a Falls, a cataract of the Kaminiatiquia River, Ontario, Canada, 14 miles west of Port Arthur. The falls, which are noted for their picturesqueness, have a height of 130 feet, and their width is about 450 feet.

Kakapo, the Maori name of a large ground-keeping, owl-like parrot (*Strigops habroptilus*), which is now nearly extinct, owing to its inability to withstand the dogs, cats, rats, etc., introduced by civilization, in addition to which its flesh is good to eat. Its terrestrial habits have led to such a reduction of the wing-muscles that the keel has nearly disappeared from the sternum and the bird is practically flightless.

Kak'ar, a sportsman's name for a muntjac (q.v.).

Kakarali, kāk-a-rālī, a South American tree (*Lecythis ollaria*), whose timber is much used in British Guiana for piling and structures exposed to salt water, since it endures well, and resists the boring of shipworms and the attacks of barnacles. The Indians beat its bark until it separates into thin layers convenient for use as wrappings.

Kakke, kāk'kā, a summer disease common in Japan and not unlike the beri-beri of the Malay Peninsula. The disease which in 1850 was confined to a few localities is now almost a national scourge. It begins with a swelling of the legs, and general debility.

Kalafat, kā-lā-fat', Rumania, town in Wallachia, on the left bank of the Danube. Its natural position and extensive fortifications make it command the approach of the Danube at this point. Severe battles were fought here between the Russians and the Turks in 1839, 1854, and 1877. Pop. 2,500.

Kalahari (kā-lā-hā'rē) Desert, a region of South Africa, extending from the Orange River to Lake Ngami, and from Lon. 26° E. nearly to the west coast; partly in British, partly in German territory; called a desert because it contains little water; but besides grass and creeping plants there are large growths of bushes, and also trees; great herds of antelopes roam over its plains; and on the game thus provided, as well as on the vegetable products, particularly water-melons and large tubers, a great number

KALAKAUA—KALEEGE

of Bushmen and Bakalahari subsist. The Kala-hari is remarkably flat, and is intersected in different parts by the beds of ancient rivers. The soil is in general a light-colored soft sand, but in the ancient river-beds there is a good deal of alluvium, which, when baked hard, is so retentive that in some cases pools formed by the rain contain water for several months.

Recent studies have brought to light very interesting facts regarding the limestone basins of this region, peculiar formations, in which can be traced the influence of higher animal life on the shape of the earth's surface. These crater-like depressions served as watering-places for the large wild animals, and the crowding of great herds to these places, to drink and bathe, changed them from simple depressions to the walled basins which they now are, elephants and other animals, by rolling in the mud and rubbing against the walls, giving to the hollows their depth—sometimes 20 to 30 feet—and a diameter commonly of several hundred yards. The water in these basins contained lime carbonate in solution, and with the water drunk by the animals this carbonate disappeared, and the fresh spring-water absorbed another supply from the rock, thus deepening the depression. Scientists estimate that 600 to 800 years may have passed before the natural water-pools became basins. It is surmised that similar depressions in calcareous districts of the American prairies are due, in the same way, to the enormous herds of bisons which formerly inhabited them.

Kalakaua (käl-a-kow'a) I., David, king of Hawaii: b. 16 Nov. 1836; d. San Francisco, Cal., 30 Jan. 1891. He was the son of Kepaakea and Keohokalole, the niece of Kamehameha I., and was elected, 12 Feb. 1874, to succeed Lunalilo, and reigned till his death. In 1887 he was compelled to grant a new constitution, which very greatly restricted the royal authority.

Kalamazoo, käl-a-mä-zoo', Mich., city, county-seat of Kalamazoo County; on the Kalamazoo River, and on the Michigan C., the Lake Shore & M. S., the Kalamazoo & S. H., the Grand Rapids & I., and the Chicago, K. & S. R.R.'s; about 60 miles southwest of Lansing and 45 miles south of Grand Rapids. It was settled in 1829 by Titus Bronson, was incorporated in 1831, and chartered as a city in 1884. It is in a rich agricultural region, the chief products of which are celery, fruits and grains. The chief manufactures of the city are paper, patent medicines, women's clothing, playing cards, wagons and carriages, machinery, caskets, coffins, foundry products, windmills, furniture, and flour. The nine paper mills (1903) employ 2,000 workers; the card factory, 900; the regalia and clothing factories, 1,000; and there are 3,000 engaged in celery growing. The principal trade is in manufactured articles, and celery and other farm products. Some of the prominent public institutions are the Kalamazoo College, opened in 1855 under the auspices of the Baptist Church; the Michigan Female Seminary, founded in 1866 under the auspices of the Presbyterian Church; Nazareth Academy (R.C.), one normal school, Borgess and Queen City hospitals, Saint Anthony's School for feeble-minded children, Michigan asylum for the insane, Academy of Music, and the public library. Other prominent buildings are the Y. M. C. A.,

the city-hall, several churches, and the high school. The city has eight banks with a combined capital of \$6,500,000 (1903). The government is vested in a mayor, public commissioners, and a council of nine members, elected annually. The school board is chosen by popular election. The electric-light plant and water-works are owned and operated by the city. About 2,000 inhabitants are from Holland. Pop. (1890) 17,853; (1900) 24,404.

ELTON R. EATON,
Editor of 'Gazette-News.'

Kalamazoo, a river which has its rise in the northwestern part of Hillsdale County, Mich., and flows west and northwest into Lake Michigan. From the source to the city of Kalamazoo it makes three southward curves, but from Kalamazoo the course is generally northwest. Its whole length is about 200 miles, only 50 of which are navigable. At the mouth is a good harbor for vessels of about 100 tons. The water-power is extensive, and has been of great value in the development of the southwestern part of Michigan. Allegan, Kalamazoo, Battle Creek, and Marshall are on this river.

Kalb, Johann, yō'hän kälb, BARON DE, officer in the American Revolution: b. Hütten-dorf, Bavaria, 29 July 1721; d. Camden, S. C., 19 Aug. 1780. After serving in the French army as lieutenant he became a brigadier-general in 1761. He came with Lafayette to America in 1777, and offering his services to Congress was appointed a major-general in September of that year. After serving under Washington in Pennsylvania and New Jersey till the spring of 1780, he was appointed second in command in the Southern army under Gates. He fell mortally wounded at the battle of Camden, S. C., in the following August, dying three days after. In 1886, on the 106th anniversary of the battle, a bronze statue of the baron was unveiled at Annapolis, Md. Consult Kapp, 'Leben des amerikanischen Generals, Joh. Kalb' (Stuttgart 1862; New York 1870).

Kale, or **Borecole**, a cruciferous plant (*Brassica oleracea*, var. *acephala*), differing from cabbage most strikingly in the non-formation of heads, the leaves being loose and free. It is largely cultivated as a pot-herb, especially in the South, where it generally withstands the winter. It is rather coarse in texture and flavor, but frosts modify both somewhat. In some sections it is extensively used for cattle-feeding. One of the largest producing regions is that in the vicinity of Norfolk, Va., which ships about 200,000 barrels to the markets each year. The varieties cultivated in America are nearly all treated as annuals, being grown from seed much like late cabbage. Some varieties however, are perennial and may be propagated by cuttings, etc. For cultivation see CABBAGE.

Kaleege, ka-léj', or **Kalij**, **Pheasants**, a sportsmen's name in India for the pheasants of the genus *Genus*, which range along the foot-hills of the Himalayan range and eastward to the China and down the Malay Peninsula to Java. They are of medium size, richly dressed, with flattened crests, naked cheeks and spurs on the male. White is conspicuous in the plumage of most, so that they are sometimes called silver pheasants, especially the Chinese species (*G. nycthemerus*), frequently seen in parks and

KALEIDOSCOPE — KALPI

menageries. All are attractive as game birds, especially the Himalayan white-crested and black-crested.

Kaleidoscope, kā-lī'dō-skōp, an optical instrument invented by Sir David Brewster in 1817. It consists of a tube through the length of which pass two mirrors or reflecting planes, which are hinged together along one edge, and make with each other an angle of 180 degrees; while the one end is fitted up with an eye-glass, and the other is closed by two glasses, at a small distance from each other, between which are placed little fragments of glass or other colored objects. The eye looking into the tube perceives these objects multiplied, and the slightest moving of the instrument produces new figures.

Kalends. See CALENDAR.

Kaler, James Otis, "JAMES OTIS," American writer for young people: b. Winterport, Maine, 19 March 1848. His most popular juvenile tale is "Toby Tyler" (1880). Among his other very numerous books may be named: "Raising the Pearl"; "Tom and Tip"; "When Israel Putnam Served the King"; "The Wreck of the Circus."

Kalevala, kā-lē-vä'lä, **The**, the great Finnish epic. It is composed of ancient popular songs, orally transmitted until the early 19th century, when they first began to be collected for literary purposes. Scattered portions were published in 1822 by Zacharias Topelius. But the present form of the poem is due to Elias Lonnrot of Helsingfors, who traveled among the peasantry, and recorded the material exactly as he heard it. His first edition (1835) contains 12,078 lines in 32 runes (cantos); a second edition (1849) 22,793 lines in 50 runes. Lonnrot was the first to arrange the runic verses as a systematic whole. The poem is in eight-syllabled trochaic verse, alliterative but unrimed. An idea of its style may be obtained from the "Hiawatha" of Longfellow, largely an imitation. There is a complete English rendering by J. M. Crawford (1888).

Kali, kā'lē, a Hindu goddess represented with four arms, wearing a necklace of skulls, and the hands of slaughtered giants round her waist as a girdle. Her eyebrows and breast appear streaming with the blood of monsters she has slain and devoured. One hand holds a sword, another a human head. She is the goddess of death and destruction, and goats and other animals are sacrificed on her altars.

Kalidasa, kā-lī-dā'sā, the greatest poet and dramatist of India. Native tradition assigns him to the 1st century B.C., but western scholars place him as late as the 6th century A.D. He was one of the nine "gems," or poets, at the court of King Vikramaditya, but the fact that several monarchs were so named makes his date no more definite. His most famous work is the drama "Sakuntalā," translated by Sir William Jones in 1789, and highly praised by Goethe. This translation helped to call the attention of the Occidental world to Sanskrit studies. Kalidasa wrote two other plays, the "Vikramorvāśi" and "Mālavikā and Agnimitra," and considerable lyric verse. Many doubtful works have also been attributed to him with various degrees of probability. His literary value has long been conceded. The most re-

cent English version of the "Sakuntalā" is that of Edgren (1894).

Kalisch, kā'lish, **Isidor**, American rabbi and author: b. Krotoschin, Prussia, 15 Nov. 1816; d. Newark, N. J., 11 Nov. 1886. Educated at the universities of Berlin, Breslau, and Prague, on the outbreak of the revolution of 1848, he left Germany, and after a brief stay in London came to New York in 1849. For some years he officiated as rabbi in Cleveland, Cincinnati, Milwaukee, Indianapolis, Detroit, and Leavenworth, Kan. In 1868 he established a school in New York, which did not succeed. In 1870 he was called to Newark, N. J., as rabbi, and two years later to Nashville, Tenn. In 1875 he returned to Newark, where he devoted himself until his death mainly to literary work. He was a versatile author, and his works cover a wide field, from a volume of German poems and a translation of Lessing's "Nathan the Wise" to a decipherment of a Phoenician inscription found near Sidon, a sketch of the "Sefer Yetzira," a Kabbalistic work. He took an active part in the American Jewish reform movement and was a frequent contributor to the Jewish press.

Kal'ium, another name for the metal potassium, whence its symbol K is derived.

Kalmar, kāl'mär, or **Calmar**, Sweden, city, the capital of Kalmar Lan (county); on Kalmar Sound, at a place where the distance to the island of Oland is not more than five miles. Kalmar is about 190 miles, in direct line, southwest of Stockholm. A part of the city is on the mainland, and a part on three small islands. The town, which was formerly strongly fortified, though the fortifications are now in great part leveled, has a good harbor, a handsome cathedral, and a fine castle, in which, on 20 July 1397, the "Union of Kalmar" was signed, which settled the succession to the three northern kingdoms upon Margaret of Denmark and her heirs. The commerce of the town is considerable, and it has manufactures of matches, chicory, and tobacco, and some ship-building Pop. (1902) 12,847.

Kal'mia. See MOUNTAIN-LAUREL.

Kalmucks, a nomadic, warlike Mongol race, inhabiting parts of the Chinese empire, Siberia and European Russia. They have been great warriors from very early times, fought many bloody battles with the Tartars, with the Chinese, and among themselves, and made predatory expeditions as far west as Asia Minor. They are intrepid soldiers, splendid horsemen, and troops of them are attached to almost every Cossack regiment. Physically the Kalmucks are small of stature. They number altogether perhaps 700,000.

Kalong'. See FLYING-FOX.

Kal'pa, in Hindu chronology, a day, or a day and night of Brahma, or a period of 4,320,000 or 8,640,000 solar-sidereal years. A great kalpa comprises the life of Brahma.

Kalpi, kāl'pē, or **Calpee**, British India, a town in Jalaun district, Northwest Provinces, on the right bank of the Jumna, about 45 miles south-southwest of Cawnpore. The original town stood on the plain, remote from the river; but repeated Mahratta incursions induced the inhabitants to remove it to its present position

KAMA — KAMEHAMEHA

among extensive ravines, where there is a small fort, which commands the navigation of the Jumna. It carries on a considerable trade, principally in cotton, and is noted for its manufactures of paper and refined sugar, the latter said to be the finest in the world, but too highly priced to be in general demand. During the Sepoy mutiny Kalpi became a principal rendezvous of the revolted Gwalior contingent, which was signally defeated, first by Sir Colin Campbell, in the vicinity of Cawnpore, on which it had previously made an unsuccessful attack, and afterward at Kalpi itself by Sir Hugh Rose, 26 May 1858. Pop. (1901) 15,124.

Kama, kā'mā, the largest tributary of the Volga, rises in the Ural Mountains, on the eastern frontiers of the Government of Vyatka, in Russia; flows first north, then northeast into the Government of Perm, then circuitously south-southeast to the town of Perm, then southwest into the Government of Kasan, and about 40 miles below the town of that name, after a course of about 1,200 miles, joins the left bank of the Volga, almost doubling its volume. It is navigable almost throughout its whole course, and a canal connecting it with a tributary of the Dwina, gives water communication between the Caspian Sea and the Arctic Ocean.

Kama, or **Kâmâdiva**, in Hindu mythology, the god of love and marriage. The accounts of his origin vary in the sacred writings of India. According to one authority he sprang from Brahma's heart. His wife is Rati or "Pleasure."

Kamakura, kā-mā-koo'rā, Japan, village, about 11 miles south of Yokohama. It is said to have been founded in the 7th century. From about 1190, for 400 years it was the political centre of Japan, the residence of many of the powerful men, and frequently the battle-ground for supremacy and power. It is no longer visited as a ruling city, but as a beautiful place, with many interesting relics of antiquity. See DAIB TSU.

Kamala, a plant and drug known, under various names, to Indian and Arab physicians, as a specific against the tapeworm. It occurs as a brick-red powder, adherent to the fruit of the euphorbiaceous plant *Rottlera tinctoria*, formed by minute roundish, semi-transparent granules, mixed with stellate hairs. The active principle of the powder lies in the 80 per cent of resin it contains, which also supplies the coloring matter, called rotllerin, used as a silk dye.

Kamas'si, a South African tree related to the oleander (family *Apocynaceæ*), the wood of which is extremely hard and durable, and is used in wagon-building, for tool-handles and similar purposes. The tree bears fragrant flowers.

Kambodja, kām-bō'ja, a Burmese tree (*Plumeria acutifolia*) related to the oleander, which is commonly used as a shade-tree in the villages of that country.

Kamchatka, kām-chät'kā, or **Kamtchatka**, Siberia, a large peninsula of the Russian empire, 850 miles long from north to south, and of irregular breadth, the maximum being about 250 miles. It has an area of 100,000 square miles. The coasts are dangerous of approach on account of outlying reefs. A lofty range of volcanic mountains traverses the country in a southwesterly direction, with many peaks be-

tween 7,000 and 16,000 feet high. The snow line, in lat. 56° 40', is at an elevation of 5,260 feet. Dittmar, a Russian traveler, devoted three years to the exploration of the geology of Kamchatka. He traced five successive formations, and found 17 volcanoes in active operation. Numerous rivers have their rise in the heights. The Kamchatka, with its affluent the Yelovka, is navigable for 150 miles. The most fertile portion of the peninsula for agricultural purposes lies along the valley of this river. The Russian settlers here raise oats, barley, rye, potatoes, and garden vegetables, but the rest of the country is little adapted for culture. The climate is very severe; the winter lasts nine months, and frost is common at all seasons. The mean annual temperature at Petropavlovsk on the east coast is 28.5°, while at Tigil on the west it is 43°. The average temperature of summer at the former place is 55.5°, and that of winter 19°, but the thermometer has been known to fall as low as -25°. Earthquakes are frequent and violent. Animal life is very abundant, and fish swarm in the seas and rivers. The wild animals, yet abundant in the more sequestered localities, are bears, wolves, reindeer, argalis or wild sheep, black, red, and gray foxes, ermines, sables, and otters. Wild fowl are very numerous. The principal varieties of fish are herrings, cod, and salmon. Whales are numerous in the adjacent seas. The mountains are covered with forests of birch, larch, pine, and cedar, of considerable size in the south, but diminishing northward until the northernmost portion of the territory is covered only with reindeer moss.

The Kamchadales, the principal native tribe, are of diminutive stature, but stout, with flat features, small eyes, thin lips, lank black hair, and scarcely any beard. They are a peaceable, honest, lazy, and intemperate race. In winter they reside in a sunken hut, in summer in one elevated on poles some 13 feet from the ground. Their dress is equally adapted to the changes of temperature, being of fur in winter and nankin in summer. They are nominally governed by their own chiefs, under the jurisdiction of the Russian *ispravnik*, or chief judge, and the most of them are Greek Catholics. Dog trains are used as the means of transport. The other principal tribe are the Koryaks, who live north of lat. 58°. While the Kamchadales are hunters and fishermen, with fixed habitations, the Koryaks are a wandering tribe, subsisting on the produce of the reindeer, and differing from them in language and mode of life. The commerce of Kamchatka is chiefly with Okhotsk. Its exports are furs, skins, oil, etc. Its imports are flour, sugar, dry goods, whiskey, rice, and coffee, almost all passing through the port of Petropavlovsk, the capital, on Avatska Bay. Pop. of capital, 8,000.

Kamehameha, kā-mä'hä-mä'hä or kā-më-hä'më-hä, the name of five kings of the Sandwich or Hawaiian Islands. **KAMEHAMEHA I.**, surnamed the "GREAT": b. 1753; d. Kailua, Hawaii, 8 May 1817. Becoming head chief of part of the island of Hawaii in 1781 he presently subdued the entire group of islands, becoming ruler of the whole in 1811. He was progressive in his views and encouraged intercourse with Europeans. He was succeeded by his eldest son, **KAMEHAMEHA II**. (LIHOLIHO):

KAMEHAMEHA—KAMPEN

b. Hawaii 1797; d. London 14 July 1824. He was intemperate but treated the missionaries kindly, professed Christianity, and recommended his subjects to do likewise. Anxious to secure the friendship of England he went thither with his queen, Kamamalu, but both died soon after arriving in London. He was succeeded by his brother KAMEHAMEHA III. (KAVIKEAOU), surnamed the "Good": b. 7 March 1814; d. Honolulu 15 Dec. 1854. He came to the throne in 1833, the islands having been ruled by a regency since 1824. He introduced a constitutional form of government in 1840, and the independence of the islands was acknowledged by the United States in 1842 and by Belgium, Great Britain, and France in 1844. The more important public offices in his reign were filled by foreigners. He was succeeded by his adopted nephew KAMEHAMEHA IV. (ALEXANDER LIHOLIHO): b. 9 Feb. 1834; d. Honolulu 30 Nov. 1863. He married in 1856 Emma, adopted daughter of Dr. Cooke. In 1860 he founded the Queen's Hospital in Honolulu, personally soliciting subscriptions for this object, in which he took the deepest interest. His elder brother, Lot Kamehameha, succeeded him as KAMEHAMEHA V.: b. 11 Dec. 1830; d. Honolulu 11 Dec. 1872. He proclaimed a new constitution (less democratic than its predecessor), in 1864, satisfactory to the majority of the Hawaiians but distasteful to the foreign population. He never married and left no heir to the throne.

Kamehameha, Order of, an Hawaiian secret society founded in Honolulu in 1864 by Kamehameha II., the then reigning king of the Sandwich Islands. The order is divided into three classes. The badge of the order is a white enameled cross with gold rays surrounded by a crown.

Kamerun, kā-mē-roon'. See CAMEROONS.

Kames, Lord. See HOME, HENRY.

Kamila, kā-mē'lā, or **Kamala**, the glandular hairs of a small euphorbiaceous tree (*Mallotus philippensis*), widely distributed in eastern Asia and Australia. They are ground into a resinous powder which imparts a deep brick-red color to alkaline liquids, alcohol, ether and chloroform, and forms a rich dye especially applicable and extensively used for silk. The same name variously spelled is given to the tree.

Kaministiquia, ka-mī-nīs-ti-kē'a, a river in Canada which has its rise near Lake Nipigon in the province of Ontario, and flows south into Thunder Bay, an inlet of Lake Superior. The town where the Canadian Pacific railroad crosses this river is named after the river. Along the course are several expansions of the river or lakes. Before the railroad entered this section this river and its tributaries formed important routes of travel. Its advantages for transportation were of great importance to the government at the time of the Riel Rebellion (q.v.) in 1870.

Kaminski, kā-mēn'skē, **Stephan**, American Polish Catholic Independent bishop: b. German Poland, 26 Dec. 1859. He was educated in Poland, came to the United States in 1884; was ordained priest in 1893; was rector of various parishes; from 1897 edited and published the "Warta," a Polish weekly; and in 1898 was

consecrated bishop. He was a leader in the independent church movement.

Kammat'ograph, **The**, a photographic camera in which a circular glass plate takes the place of the celluloid film for moving the pictures. The plate can be made to rotate rapidly by means of a multiplying gear, and at the same time to traverse laterally. A small lens forms an image upon the plate, and when the plate is put in motion these images are multiplied into a series of pictures arranged in a spiral. The plate is developed in the same way as an ordinary negative, and a positive is then taken from it. To display the pictures it is only necessary to place the positive in the camera and to arrange it so that the beam from the lantern close to it can pass through the lens. The plate is then rotated as before, the succession of pictures projected upon the screen reproducing the original movement. About 600 pictures can be photographed during the motion of a single plate at the rate of 12 or 14 a second.

Kamloops, Canada, city in the province of British Columbia; on the Thompson River at the junction of the north and south branches, and on the Canadian Pacific railroad; about 255 miles northwest of Rossland and 260 miles northeast of Vancouver. The place where the city now stands was once used as a trading post by the Hudson's Bay Company, but a permanent settlement was made in 1820. Its growth was slow until mining began in the vicinity, and in 1892 it was incorporated. It has several manufacturing establishments, the chief of which are lumber-mills, mining-implement works, wagon factories, tanneries, and a woolen mill. The waterworks and the electric-light plant are owned by the city. The government seat for the Yale District is Kamloops, and the Dominion and Provincial governments have here land and registry offices. It has a mild climate, and in the vicinity in the river valley are many fine farms. Nearby are mountains and small lakes noted for the beauty of their scenery. Pop. (1902) 1,671.

Kampen, kām'pēn, or **Campen**, Jacob de, Dutch Anabaptist leader. When he and his followers were driven out of Upper Germany, they attempted to diffuse their dogmas over the Low Countries. In 1534 John of Leyden nominated him bishop of Amsterdam, but on attempting to take possession of his see, he met with a cruel death at the hands of the people.

Kampen, or **Campen**, Jan van (so called from the town of Kampen), Dutch scholar: b. Kampen, Holland, about 1490; d. Freiburg 1538. He was professor of Hebrew at Louvain 1519-31. He wrote a Latin paraphrase of the Psalms, which has been translated into the chief European languages.

Kampen, Nikolaas Godfried van, Dutch historian: b. Haarlem 15 May 1776; d. Amsterdam 15 March 1839. He became professor of English and German in the University of Leyden in 1815. Among his historical and literary works, many of which were translated into German, are: 'History of the Literature of the Netherlands' (1812); 'History of French Domination in Europe' (1815-23); 'History of the Influences of the Netherlands Outside of Europe'

KAMPEN—KANE

(1831-3). Consult: 'Life,' by S. R. Van Campen (1887).

Kampen, or **Campen**, Holland, a town and port in the province of Overijssel, 45 miles east-northeast of Amsterdam, on the Yessel near its influx into the Zuyder Zee, and where it is crossed by a bridge. Its principal buildings are a church of the 14th century, an elegant town-house, built in an antique style, and a custom-house. A theological school is located here. Anciently it was one of the most flourishing of the Hanse towns; and its commerce after a period of decline has again to some extent revived. Its manufactures also suffered, but it still produces machinery, steam-engines, hosiery, cigars, etc. It has also ship-building yards. Several canals intersect it, and a railway line from Germany through Zwolle terminates here. Pop. (communal) 20,000.

Kamphausen, Adolf Hermann Heinrich, à'dôlf hér'man hin'rih kamp'how-zén, German theologian: b. Solingen 10 Sept. 1829. He was educated at Bonn, in 1855 became secretary of Karl Josias Bunsen, whom he assisted in the latter's 'Bibelwerke,' and in 1863 was appointed professor of theology at Bonn. In 1871-90 he was active as a member of the theological commission for the revision of Luther's translation of the Old Testament. He resigned all professorial duties in 1901. His publications include: 'Das Lied Moses' (1862); 'Die Hagiographen des Alten Bundes nach den überlieferten Grundtexten übersetzt' (1868); 'Das Buch Daniel' (1893); 'Das Verhältnis des Menschenopfers zur israelitischen Religion' (1896). He also edited Daniel (1896) for Haupt's 'Polychrome Bible.'

Kan-Su, kán-soo', an inland province of China, in the northwestern part; area, about 125,380 square miles. At one time Shan-Si, on the east, was a part of Kan-Su, and until 1865 its jurisdiction extended over a much greater extent of territory than at present. The capital is Lan-Chau. The province is rich in minerals and hunting for the sake of the fur is one of the chief occupations. Tobacco of a superior quality is raised in this province. Pop. about 10,000,000.

Kanakas, ká-nak'az, a popular name given the natives of Hawaii, New Caledonia, New Hebrides, and other islands in the South Seas.

Kananur, ká-ná-noor', or **Cananore**, British India, a seaport town in the district of Malabar, presidency of Madras, 44 miles northwest of Calicut. It forms a municipality, and contains various public offices, jail, dispensary, schools, custom-house, etc. There are Anglican, German, and Roman Catholic missions here, and a number of mosques. It has a small trade by sea, but its chief importance is as a military station and the headquarters of the Malabar and Kananur force, being garrisoned by one European and one native regiment. There is a fort of triangular area, built by the Dutch and occupied by them till 1766. Pop. 27,418.

Kana'ri, or **Canari**, a tree of the genus *Canarium* (q.v.), many species of which flourish from India to Australia and the Philippines. The foliage is abundant and handsome, and the wood is hard, heavy and suitable for cabinet-

work, house-trimming, etc. The fruit is a drupe with a hard oily kernel, which forms the particular food of the great cockatoos of the region. The kernel of *C. commune*, known as Java almond, is eaten by the natives either fresh or roasted; and the Amboynese dry it, grind it and bake the flour. Some other species also furnish edible kernels; and from all an oil may be pressed, said to be better than cocoanut oil, both for cooking and for use in lamps. An oil is obtained from the bark resembling balsam copaiba (see COPAIBA). These trees also yield the medical resin elemi, and a gum called black damar.

Kanawha River. See **GREAT KANAWHA RIVER**.

Kan'chil, the smallest species of chevrotain (q.v.). It inhabits Java and neighboring islands, is less than a foot tall, and is proverbially quick and clever in its movements and hiding in the forest. Its scientific name is *Tragulus javanicus*.

Kandahar, kän-dä-här', or **Candahar**, Afghanistan, one of the largest cities of the principality, on a fertile and well-cultivated plain, 3,484 feet above the sea, 200 miles southwest of Kabul. It is enclosed by a mud wall 27 feet high, with a large tower at each of the four corners, 54 semi-cylindrical bastions, and a broad and deep ditch in front, capable of being filled with water from the river. There are six gates, each protected by double bastions. The circumference of the city is nearly four miles. One of the most imposing buildings is the octagonal, domed structure containing the tomb of Ahmed Shah. It is claimed that this city was founded by Alexander the Great. Kandahar is chiefly supported by the transit trade, but it has important manufactures of felt and silk. It was held by the British in 1839-42, and again in 1879-81. Pop. variously estimated at from 25,000 to 100,000.

Kandy, kän'dé, or **Candy**, Ceylon, one of the chief towns on the island, is situated near the centre, 72 miles northeast of Colombo, at the height of about 2,000 feet. "Kandy is uniquely beautiful—the most charming little town in the world," travelers usually describe it. It is situated in a valley surrounded by hills, and boasts an artificial lake, Buddhist and Hindu temples, including the Daladá Máligáwa, the most sacred Buddhist temple in the world. This contains the so-called relic of Buddha's tooth, and also many ancient manuscripts written in Pali and Sanskrit. "The Pavilion," or official residence of the governor, is one of the finest structures in Ceylon. Kandy is connected by railroad with Colombo. The botanic gardens of Peradenia are three miles from Kandy. Kandy was the capital of the ancient kings of Ceylon. Pop. (1901) 26,915.

Kane, Elisha Kent, American Arctic voyager: b. Philadelphia 20 Feb. 1820; d. Havana, Cuba, 16 Feb. 1857. He was graduated as M.D. in the University of Pennsylvania in 1842, and shortly afterward became surgeon to the American embassy to China. After extended travels in India, Egypt, and the continent of Europe he returned to America in 1846, and was employed in the government survey of the Gulf of Mexico. In 1850 he obtained the appointment of senior medical officer to the expedition of two vessels, the Advance and the Rescue, which sailed from

KANE — KANGAROO

New York on the 22d of May in that year in search of Sir John Franklin. On the return of the expedition Dr. Kane published 'The United States Grinnell Expedition in Search of Sir John Franklin—a Personal Narrative.' On the 31st of May 1853, the Advance alone, under Dr. Kane's command, sailed again from New York to resume the search, and proceeding up Baffin's Bay and through Smith's Strait, reached lat. 78° 43' N. Here the Advance remained frozen up for 21 months, and was finally abandoned because provisions were becoming scarce and scurvy and other diseases had made their appearance. The object now was to reach the Danish settlements in Greenland, about 1,300 miles distant. This long and perilous journey, partly in boats and partly in sledges, was accomplished, after 10 weeks of severe privation, with the loss of only one man, and that by an accident. In 1856 Dr. Kane published: 'The Second Grinnell Expedition,' and was awarded gold medals from Congress, the New York legislature and the Royal Geographical Society. Consult: Elder, 'Biography of Elisha Kent Kane' (1857); Greely, 'American Explorers' (1894).

Kane, John Kintzing, American jurist: b. Albany, N. Y., 16 May 1795; d. Philadelphia, Pa., 21 Feb. 1858. He was graduated from Yale in 1814, was admitted to the bar in 1817, entered practice in Philadelphia, was elected to the Pennsylvania legislature as a Federalist in 1823, later became a Democrat, and supported Jackson in the canvass of 1828. In 1845 he became attorney-general of Pennsylvania, in 1846 United States district judge for Pennsylvania, in 1856 president of the American Philosophical Society. He won distinction by his legal attainments and his decisions in patent and admiralty law, but his commitment of Passmore Williamson for contempt of court in an action under the Fugitive Slave law was attacked by the Abolitionists.

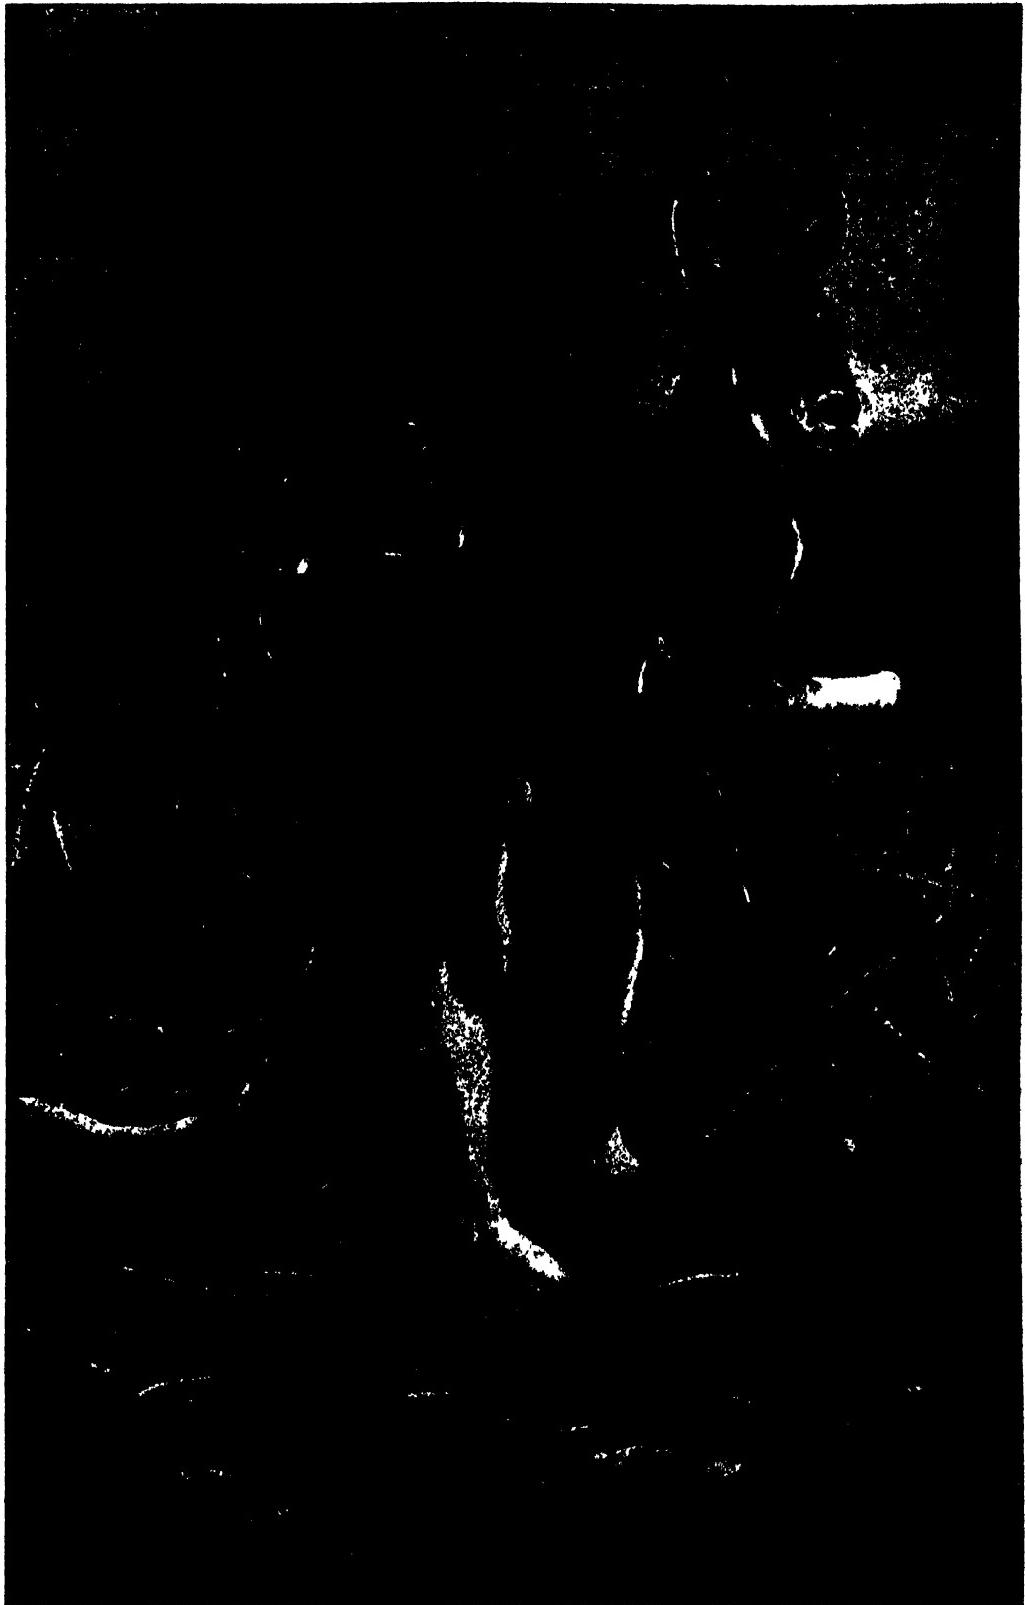

Kane, Sir Robert John, Irish chemist: b. Dublin, Ireland, 24 Sept. 1809; d. there 16 Feb. 1890. He was educated for the medical profession and in 1832 became a member of the Royal Irish Academy. In the same year he founded the 'Dublin Journal of Medical Science' and was its editor for two years. From 1834 to 1837 he was professor of natural philosophy to the Royal Dublin Society; in 1846 originated the Museum of Industry in Ireland. He was knighted the same year, was president of Queen's College, Cork, for several years prior to his resignation in 1873, and in 1876 was elected president of the Royal Irish Academy. He wrote: 'Elements of Chemistry' (1842); 'Industrial Resources of Ireland' (1884); etc.

Kane, Pa., borough in McKean County, on the Baltimore & O., the Philadelphia & E., the Pennsylvania, and the Pittsburg & W. R.R.'s, 95 miles southeast of Erie, 175 miles north of Pittsburg and 122 miles from Buffalo. There are here several of the largest window glass factories in the world, plate glass and bottle factories, lumber-mills, wooden-ware factories and other flourishing industries. There are extensive natural gas and oil wells and deposits of silica in the surrounding country which are of great commercial benefit to the town. On account of its elevation of 2,000 feet, Kane is an attractive summer resort, with good hunting and fishing

grounds in the vicinity. It was first settled in 1859 and became a borough in 1887. The government is vested in a burgess and a council of 9 members elected every three years. Pop. (1890) 2,944; (1900) 5,296.

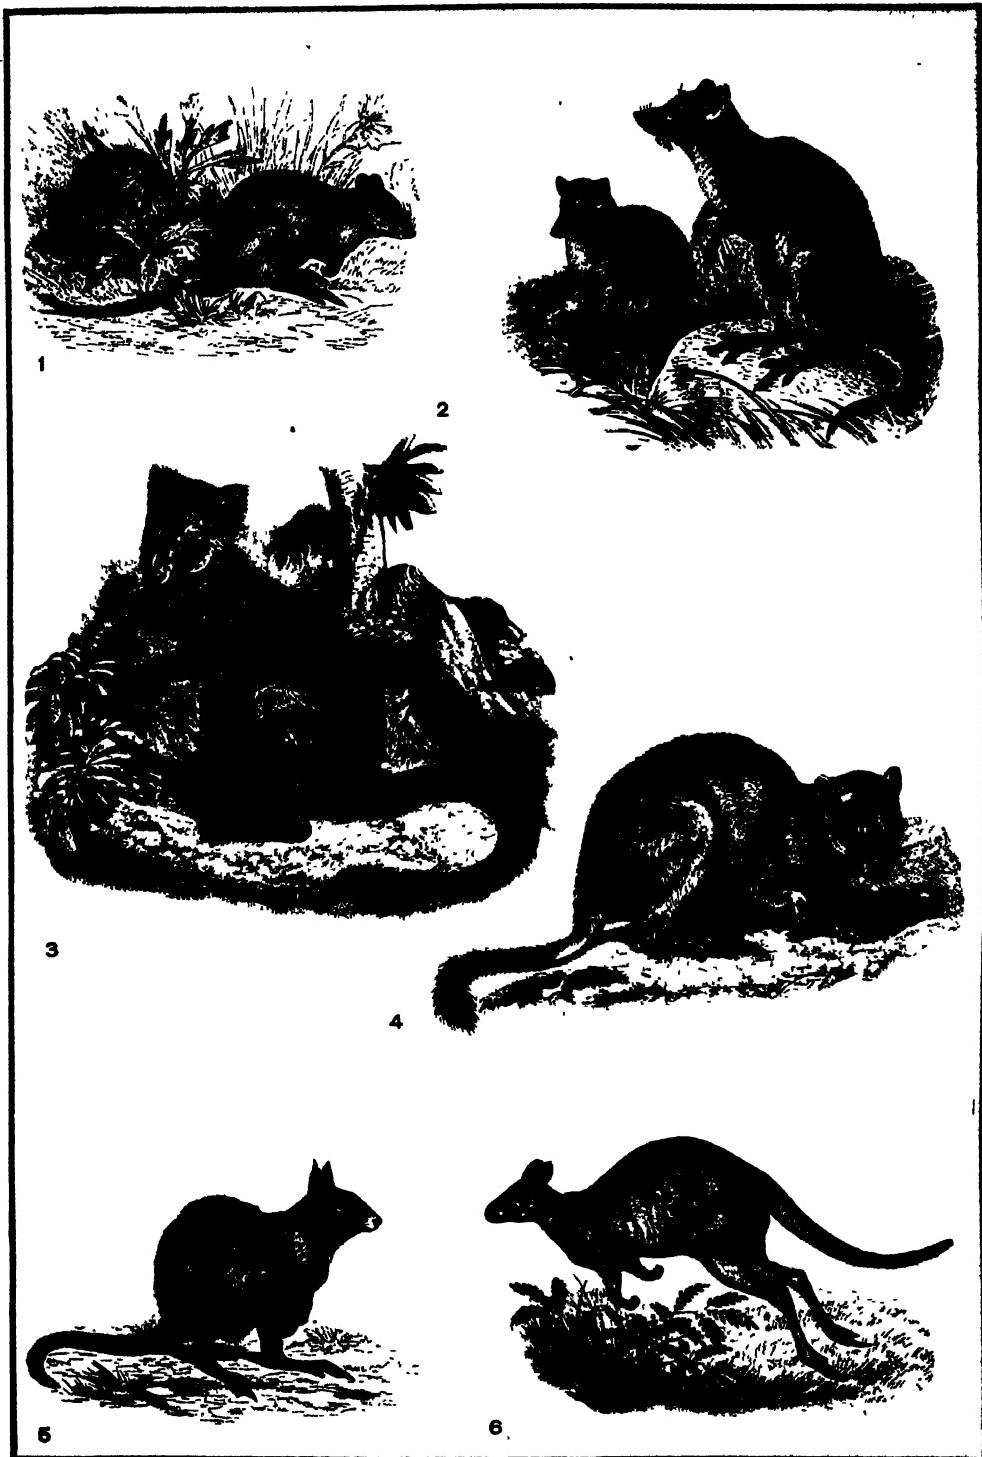

Kang-Hi, kāng-hē', or **K'ang-Hai**, emperor of China: b. 1655; d. 1722. He succeeded his father, Shun-Chih, founder of the Manchu dynasty, in 1661, but until he was 14 the government was administered by a regency. Kang-Hi not only greatly strengthened his empire, but extended it and governed with vigor and wisdom. He was favorably inclined toward the progress of Christianity; manifested great interest in the arts and sciences of the Europeans, and liberally patronized the missionaries. During his reign many important books were published under his oversight, such as the 'Imperial Dictionary'; a literary concordance in 110 volumes styled 'Pei-Wen-Yun-Foo,' and two large encyclopædias.

Kangaroo', an Australian marsupial of the family *Macropodidae*. The word is derived from a native name of the giant kangaroo. The *Macropodidae* are readily distinguished from other marsupials by their shape. The head is small, with large mule-like ears; the neck slender, the trunk narrow before and very massive behind; the fore limbs small and weak with five toes and used chiefly as hands; the hind limbs long, extremely powerful, four-toed, and serving as the chief organs of locomotion; and the tail thick, heavy, and muscular, serving to support the body, in combination with the hind legs, as on a tripod. The dentition is noteworthy, having a somewhat rodent-like appearance. There are three pairs of incisors above, presenting a sharp cutting edge which the single pair of lower incisors passes like the blade of a shears. Canines are reduced to one in the upper jaw. The premolars are two on each side of each jaw. The four pairs of molars are flat-crowned and more or less cross-ridged, as well as tuberculate. The kangaroos are strictly vegetarian, and in Australia represent the deer, antelopes and hares of other regions. About 50 species belonging to 12 or 15 genera have been described from Australia and the neighboring islands. The giant kangaroo (*Macropus giganteus*), the largest, is frequently exhibited in zoological gardens. This, the first of the kangaroos known to white men, was discovered by Capt. Cook during his exploring voyage in 1770, and was described under the name *Didelphys gigantea* from specimens brought home by him. When standing erect in the attitude of scenting danger it is nearly as tall as a man, and when in full flight propels itself by bounds of 12 to 15 feet. On account of its destructiveness to herbage on the sheep-ranges, as well as for sport, it is much hunted by the colonists, a favorite method being coursing. When brought to bay by the hounds it proves no mean antagonist, and frequently kills a dog by seizing it in its arms and ripping it open with the great hind toe. As in other kangaroos the hind feet have a peculiar structure; the fourth toe is enormously developed and furnishes almost the sole support; the fifth is of moderate size; in sharp contrast the second and third toes are minute, slender, and bound together so that only their sharp claws project from the skin, their only function being to comb and cleanse the fur.

GIANT KANGAROO (*Macropus rufus*).

KANGAROOS.

1. Kangaroo Rat.
2. Hypsiprymnodon.
3. Tree Kangaroo.

4. Rock Kangaroo.
5. Hare Wallaby.
6. Pademelon Wallaby.

KANGAROO-RAT — KANSAS

The one or two young are born in an exceedingly helpless state, and after being placed in the pouch of the female remain attached by their mouths to the nipples for several weeks or months; at first they are quite incapable of sucking, and the milk is injected into their mouths by the periodical contraction of the muscles of the mammary glands. Even after they are able to run about, they return to the mother's pouch for temporary rest and shelter. Closely related are the red kangaroo (*M. rufus*) and other species inhabiting the mountains, and the numerous species of large and small wallabies or brush-kangaroos, some of which inhabit New Britain and New Guinea, as well as Australia. The rat-kangaroos (*Potorous* and related genera) are a small group of species somewhat resembling rats and rabbits in size and habits. They are nocturnal and obtain their food largely by digging roots. The genus *Dendrolagus* includes the arboreal tree-kangaroos. Fossil forms are exhumed from the Pleistocene rocks of Australia very similar to modern genera, but some of the older ones were much larger than any existing species. Consult: Thomas, 'Catalogue of Marsupialia, and Monotremata in the British Museum'; Gould, 'Monograph of the Macro-podidae,' and 'Mammals of Australia,' and Aflalo, 'Natural History of Australia.'

Kangaroo-rat, a small and pretty jerboa-like rodent of the southwestern United States. It has very long and strong hind legs, and runs by a series of leaps with great swiftness. It inhabits arid regions, dwells in extensive burrows of its own digging, and feeds mainly upon sun-flower-seeds, great quantities of which are stored up for winter use, when the burrows are warmly furnished with grass. It belongs to the pocket-mouse family (*Heteromyidae*) and is named *Perodipus ordi* by systematists. Consult: Stone and Cram, 'American Animals' (1902).

Kangaroo-mice are smaller American rodents of the genus *Perognathus*. See POCKET-MICE.

Kankakee, kän-ka-kē', Ill., city, county-seat of Kankakee County; on the Kankakee River, and on the Illinois C. and the Cleveland, C. C. & St. L. R.R.'s; about 133 miles northeast of Springfield and 56 miles south of Chicago. It was settled in 1850 and incorporated as a city in 1854. The water-power of the Kankakee River is extensive at Kankakee, and as a result the city is largely engaged in manufacturing. It is situated in an excellent agricultural region, and its good railroad facilities make it an important commercial centre for a large extent of country. The chief industrial establishments (1903) are agricultural implement works, in which are employed 600 men; piano factories, 250 men; furniture factories, 500; knitting works, 250; sewing machines, 300; and stone quarries, 250. Some of the other manufactures are starch, flour, wagons, bricks, tiles, nails, foundry products, mattresses, cigars, some dairy products. The churches are two Methodist Episcopal, one Presbyterian, four Roman Catholic, one Lutheran, one German Methodist, one Reformed Lutheran, one Seventh Day Adventist, and one Christian Science. The educational institutions are the public and parish schools, Saint Joseph's Seminary, a Conservatory of Music, and in Bourbons Grove, a suburb of the city, Saint Viateur's College, and Notre Dame Academy. It

has the Illinois Eastern Hospital for Insane and the Emergency Hospital, a public library, the Y. M. C. A. building, and the city buildings. There are two national banks and two savings banks with a combined capital of \$300,000. The government is vested in a mayor, who holds office two years, and a council of 10 members, one half of whom are elected each year. The council elects the administrative officials and the health and local improvement boards. Pop. (1890) 9,025; (1900) 13,595.

Kankakee, a river of northern Illinois, which has its rise in the northern part of Indiana, flows west and southwest and enters Kankakee County in Illinois. From where it receives the waters of the Iroquois from the south, the course changes to the northwest until it enters Grundy County, where it unites with the Des Plaines River and forms the Illinois.

Kano, kä-nō', in the province of Sokoto, in West Africa, the chief town of the extensive Sudanese sultanate annexed by Great Britain in 1903. Kano is the point of convergence of many caravan routes and is the principal market and centre of trade in the interior of Africa. Leather and cotton goods are extensively manufactured and dyeing is carried on. On account of its industries Kano has been called the Manchester and Birmingham combined of the Dark Continent. The annual attendance of the market at Kano exceeds 1,000,000 persons from all parts of Africa; Morrell estimates the attendance as twice as large. The market is held daily throughout the year and is believed to have existed at this place for over 1,000 years. Sign language is largely used by the heterogeneous crowd in making bargains. In addition to native wares and produce, such as ivory and ostrich feathers, European merchandise and ammunition are on sale. The objectionable feature of the market is the trade in slaves, a characteristic that will doubtless disappear under British rule. The wall surrounding Kano is reported to be 16 miles in circumference. The houses are chiefly of adobe and the streets are wide and clean. Kano was captured by the British in 1903. Pop. (estimated 1892) 120,000. See also SOKOTO.

Kansas, one of the great States of the Middle West, the 21st to be admitted into the Union, and a centre of human activity and achievement from its beginning. In less than 50 years a vast commonwealth has been erected, exceeding in population and resources many of the older States. The historian, George Bancroft, designated Kansas as "the miracle of the age." The name is derived from the Indian word "Kanza," having the dual significance of "wind" and "swift." In popular nomenclature Kansas is known as "the Sunflower State." Its State motto is *Ad Astra per Aspera* — "through difficulties to the stars." The State is situated in lat. 37° to 40° N., lon. 94° 40' to 102° W.; bounded on the north by Nebraska, on the northeast and east by Missouri, on the south by Oklahoma and Indian Territories, and on the west by Colorado.

Early History.—The territory forming the present State of Kansas was a part of the Louisiana Purchase of 1803, except a fraction in the southwest corner acquired from Texas in 1850. It is claimed that Coronado visited the country as early as 1541, and there are evidences

KANSAS

of French and Spanish expeditions in later years. The Lewis and Clark Expedition, planned by President Jefferson, reached Kansas in June 1804, and, two years later, the expedition commanded by Zebulon Montgomery Pike, who gave his name to "Pike's Peak," crossed the territory from the Missouri River to the Rocky Mountains. The expedition of Major Stephen H. Long was made in 1819, and in 1824 was established the "Santa Fe Trail," the famous highway of Kansas, extending 400 miles directly across the Territory, and from Independence, Mo., to Santa Fe, a distance of 780 miles.

This was the beginning of the development and growth of Kansas. The outposts of civilization were being extended westward from the Mississippi River. The Indians of Missouri and other Mississippi Valley States were concentrated with the tribes already occupying the country west of the Missouri River. These included the Osage, Shawnee, Pawnee, Delaware, Kickapoo, and Kansas tribes, to which were added the Cherokee and other tribes from the States of the south, the Ottawas, Pottawatomies, Wyandottes and others from Ohio, Michigan and Indiana. Kansas became Indian Territory, and remained such from 1830 to 1854. Occupation of the country by white settlers was fraught with peril and hardship, and only accomplished by marvelous heroism, perseverance and endurance. To aid in the work of civilization missions were established on the frontier, and military posts located at Fort Leavenworth, Fort Scott and Fort Riley.

Territorial Days.—The admission of Kansas as an organized Territory dates from 30 May 1854, when President Pierce signed the Kansas-Nebraska Act. This brought on what may be termed the political troubles of Kansas, and later, as a result of the slavery agitation, precipitated the great armed conflict between the North and the South in 1861-5. It was on Kansas soil that the first battle was fought for the freedom of the negro, and it was Kansas that developed the heroic figure of John Brown. From the time Congress took the first step for the admission of Kansas, with or without slavery, the Territory became the scene of contention, pillage and bloodshed. The pro-slavery men of Missouri endeavored to gain control of the Territory in 1854, and established the first city, Leavenworth. Soon afterward an anti-slavery colony from Massachusetts settled at Lawrence. No more hostile factions ever struggled for supremacy on this continent.

Andrew H. Reeder, of Pennsylvania, was appointed to be the first governor of the Territory. At the first contest for territorial delegate to Congress the slavery men of Missouri crossed the river and participated in the election, the candidate of the pro-slavery party being successful by reason of these illegal votes. The Free-soilers protested and held indignation meetings at Lawrence and other points. The Missourians repeated the same tactics at the election in the spring of 1855 for representatives to the legislature. When the legislature met at Pawnee the pro-slavery members were in the majority, and controlled the proceedings, even to the extent of driving out the Free-soil members and changing the seat of government.

The Free-soil party repudiated the acts of the legislature and refused to abide by them.

Governor Reeder was removed from office and succeeded by Wilson Shannon, of Ohio. John W. Whitfield was elected delegate to Congress by the pro-slavery party, and Ex-Governor Reeder chosen to the same position by the opposition, but Congress refused to give either delegate a seat. A Free-soil constitution was adopted in December 1855, under which Charles Robinson was elected governor, but the election was repudiated by President Pierce, who had recognized the "bogus" legislature. The Free-soil legislature ignored the action of President Pierce, and, to meet this and other menacing circumstances, the military forces of the United States government were placed in command of Governor Shannon. Governor Robinson and Congressman-elect Reeder were indicted for high treason. The pro-slavery party received large accessions from Georgia, Alabama and South Carolina. In the troubles resulting from this conflict of authority the Emigrant Aid Society Hotel and the "Herald of Freedom" and "Kansas Free State" printing offices at Lawrence were destroyed, and the town of Osawatomie—the home of John Brown—was sacked and burned.

Struggles for Statehood.—A bill for the admission of Kansas as a State was passed by the lower house of Congress in June 1856, but was defeated in the Senate on account of the recognition it gave to the Free-soil constitution. A meeting of the Free-soil legislature in Topeka was dispersed by United States troops acting under orders from President Pierce. By this time the interest in the Kansas struggle became general throughout the United States. The suppression of slavery became a national instead of a state issue. While Congress debated and legislated, the pro-slavery and free-state factions continued to war against each other for possession of the Territory and control of the law-making machinery. Conflicting constitutions were adopted, rival legislatures elected, and civil government overthrown. Public meetings were held in all parts of the North to lend encouragement to the movement for making Kansas a free State. Similar sympathy and help came to the pro-slavery party from the States of the South. Horace Greeley and Abraham Lincoln visited the Territory, and made speeches in opposition to the further extension of slavery on American soil. Governor Shannon was removed from office, and the several governors appointed to succeed him found the duties of the position so onerous that they resigned in rapid succession.

After numerous battles, elections and vicissitudes, a constitutional convention was called to meet at Wyandotte 5 July 1859. It was composed of 35 Free-state and 17 pro-slavery delegates, who were now known as Republicans and Democrats, respectively. Under the constitution adopted by this convention slavery was prohibited and Kansas admitted as a State 29 Jan. 1861. The seat of government was located at Topeka. At the election held in December 1859, under the Wyandotte constitution, Charles Robinson was chosen to be the first governor of the State, and Martin F. Conway the first representative in Congress. When the first State legislature assembled at Topeka in March 1861 James H. Lane and Samuel C. Pomeroy were elected the first two United States senators from the new State.

KANSAS

In the civil war which followed the inauguration of President Lincoln in 1861, Kansas showed its loyalty to the Union by furnishing 20,000 trained soldiers out of a total population of but little more than 100,000—a number greatly in excess of her quota, none of them drafted, and in proportion exceeding the enlistments from any other State. A large part of this force was employed in defending the borders of the State from invasion by southern troops, Indians and guerrillas. During one of these border raids a force of 400 men under command of Quantrell invaded Lawrence, burning and pillaging the town and killing 150 defenseless citizens. The war and the troubles with the Indians, together with a visitation of drought in 1860, greatly retarded the growth of Kansas, but when these obstacles were passed an era of progress and development set in which has never since abated. The splendid soil and auspicious climate and the general adaptability of the State to farming and stock-raising purposes have attracted thousands of settlers to the State, and the advancement in all lines has been rapid, substantial and permanent.

Governors—(Territorial) Andrew H. Reeder (1854 to 1855), Wilson Shannon (1855 to 1856), John W. Geary (1856 to 1857), Robert J. Walker (1857), James W. Denver (1858), Samuel Medary (1858 to 1860). (*State*) Charles Robinson (1861-3), Thomas Carney (1863-5), Samuel J. Crawford (1865-8), Nehemiah Green (1868), to fill the unexpired term of Samuel J. Crawford, resigned; James M. Harvey (1860-73), Thomas A. Osborn (1873-7), George T. Anthony (1877-9), John P. St. John (1879-83), George W. Glick (1883-5), John A. Martin (1885-9), Lyman U. Humphrey (1889-93), Lorenzo D. Lewelling (1893-5), Edmund N. Morrill (1895-7), John W. Leedy (1897-9), William E. Stanley (1890-1903), Willis J. Bailey (1903—). During the official interruptions incident to the territorial period the following persons served terms as acting governor: Daniel Woodson, Frederick P. Stanton, James W. Denver, Hugh S. Walsh, George M. Beebe.

United States Senators.—James H. Lane (1861-6), Samuel C. Pomeroy (1861-73), Edmund G. Ross (1866-71), Alexander Caldwell (1871-3), Robert Crozier (1873-4), James M. Harvey (1874-7), John J. Ingalls (1873-91), Preston B. Plumb (1877-91), William A. Peffer (1891-7), Bishop W. Perkins (1892-3), John Martin (1893-5), Lucien Baker (1895-01), William A. Harris (1897-03), Joseph R. Burton (1901), term expires 1907; Chester I. Long (1903), term expires 1909.

Government.—The State legislature consists of 40 senators and 125 representatives. Sessions are held biennially, in odd-numbered years. The legislature of 1903 was divided politically as follows: Senate, 34 Republicans, 6 Democrats and Populists; house, 95 Republicans, 30 Democrats and Populists; Republican majority on joint ballot, 129. The elective State officers include governor, lieutenant-governor, secretary of state, auditor, treasurer, attorney-general, State superintendent of public instruction, commissioner of insurance, 7 justices of the supreme court, and 3 members of the State board of railroad commissioners. Kansas has 8 representatives in the lower house of Congress, of which 7 are chosen by districts and 1

at large. Women have the right of suffrage at municipal, bond and school elections. They have been elected to municipal and school offices, and in some cases to county offices.

Population.—The local census of 1855 gave Kansas a population of 8,501; this increased in 1860 to 107,206; in 1870 to 364,399; in 1880 to 396,069; in 1890 to 1,427,096; in 1900 to 1,470,495. The present population of the State, according to the local census of 1903, is 1,487,847. Population by counties follows:

COUNTY	Pop.	COUNTY	Pop.
Allen	26,468	Linn	15,534
Anderson	13,630	Logan	2,127
Atchison	30,369	Lyon	25,944
Barber	6,698	Marion	21,455

Leavenworth	41,044	Wyandotte	74,267
Lincoln	9,849		

There are 118 cities and towns having a population of 1,000 or more. The 10 largest cities and their population are: Kansas City, 59,919; Topeka, 38,959; Wichita, 31,549; Leavenworth, 22,991; Atchison, 16,617; Fort Scott, 13,707; Pittsburg 13,116; Lawrence, 11,726; Hutchinson, 10,668; Parsons, 10,066.

Topography.—Although a part of the great plains which form the eastern slope of the Rocky Mountains, the physical character of the Kansas country is best described as rolling prairie. There are no mountains, and no marshes. The altitude varies from 750 feet in the eastern to 4,000 feet in the western part of the State. The bulk of the land is tillable, but crops are uncertain in the western third of the State on account of deficient rainfall. In this deficient area the vast stretches of prairie are largely used for grazing purposes. The rivers are the Kansas, Arkansas, Republican, Smoky

KANSAS

Hill, Solomon, Saline, Neosho and Verdigris — none of them navigable. There are numerous smaller streams, giving abundant water and drainage in the eastern two-thirds of the State. The land area comprises 82,080 square miles (52,531,200 acres), extending 408 miles from east to west, and 208 miles from north to south.

Climate.—The climate is mild, the great proportion of the days being fair and sunny. In summer the temperature ranges from 80° to 100°, with cool nights, and dry, pure air. In winter it rarely falls below zero. The violent winds of winter and spring, known to the early settlers, have been greatly mitigated by the cultivation of the soil and the planting of trees.

Agriculture and Stock-raising.—Fully 40 per cent (20,000,000 acres) of the farm land of Kansas is in a high state of cultivation. The cultivated farms have an aggregate value of \$600,000,000. The acreage in field crops in 1902 was exceeded only by Iowa. The following table shows the acreage, quantities and values of farm products for the year 1902:

growth of nursery stock. The number of apple trees in bearing in 1902 was 7,295,415; peach trees, 4,062,463; cherry trees, 852,268; plum trees, 641,977; pear trees, 247,515; number of acres in nurseries, small fruits and vineyards, 13,226.

Manufactures.—The natural material for manufacturing is limited. There are no timber lands of consequence, and no deposits of iron. Manufacturing, therefore, is confined to the conversion of farm products into marketable commodities, such as flour and meat, and these industries are important and extensive. Including the large plants at Kansas City, Kan., the slaughtering and meat packing business of the State for the year 1900 amounted in value to \$77,411,883. The flouring and grist mill products for the same year aggregated a value of \$21,926,768. Other manufacturing interests for the same year amounted to the following sums: Car construction and railroad shop work, \$6,816,816; zinc smelting and refining, \$5,790,144; foundry and machine shop products,

CROPS	Acres	Quantities	Values
Winter wheat	6,254,747	54,323,839	\$28,983,943.60
Spring wheat	46,293	325,397	155,546.57
Corn	6,990,764	201,307,102	78,321,653.26
Oats	1,023,171	32,966,114	9,504,254.35
Rye	338,358	3,728,296	1,584,321.31

The numbers and values of live stock for the same year were: Horses, 811,504 — \$51,130,422; mules and asses, 95,671 — \$6,606,970; milch cows, 791,844 — \$23,755,320; other cattle, 2,555,800 — \$61,339,200; sheep, 136,753 — \$410,259; swine, 1,427,302 — \$11,775,241; total value, \$155,107,412.

Kansas ranks well in the production of fruit and is surpassed by but few States in the

\$3,652,530. The total value of the products enumerated was \$118,402,400, covering the work of 860 establishments and 18,288 employees.

Mineral Resources.—These consist principally of coal, zinc, lead, natural gas, petroleum, cement and gypsum. With the exception of the three last-named commodities the mining industry is chiefly located in the southeast corner of the State, embracing the counties of Cherokee,

KANSAS.

CAPITOL AT TOPEKA.

KANSAS

Crawford, Labette, Bourbon, Montgomery, Chautauqua, Neosho and Allen. Cherokee leads in coal, lead and zinc; Crawford is second in coal, Allen is first in natural gas, and Neosho first in petroleum. Extensive mines of coal are also found in Osage and Leavenworth counties. Reno and Kingman counties have the principal salt mines. Building stone of excellent quality is found in various parts of the State. Underlying the surface of Kansas are the three common formations known as the Carboniferous, Triassic and Cretaceous systems, running from north to south, and dividing the State into three belts of nearly equal extent. In the year 1900 the value of the mineral products of Kansas were: Coal, \$5,516,534; zinc, \$3,000,000; salt, \$1,675,000; clay, \$975,500; stone, \$714,750; natural gas, \$695,000; cement, \$669,685; oil, \$355,118; lead, \$324,859; gypsum, \$267,500; total, \$14,193,946.

Railroads.—The total mileage of railway tracks operated in Kansas is 10,483. The prominent lines and systems are: Atchison, Topeka & Santa Fe; Chicago, Rock Island & Pacific; Union Pacific; Missouri Pacific; Missouri, Kansas & Texas; Saint Louis & San Francisco. The gross earnings of all Kansas railroads for the year 1902 were \$28,000,000.

Banking.—There are 502 State and private banks in Kansas, with a total paid capital of \$8,156,500, and deposits of \$47,690,056.14. The 146 national banks have a paid capital of \$9,936,400, and deposits of \$50,973,729; making a total capital of \$18,092,900, and total deposits of \$98,663,785.14, these figures being for the year 1903. Of the total deposits it is estimated that 68 per cent is owned by farmers and stockmen.

Education.—Kansas spends more than \$5,000,000 annually in the support of public schools. The school population is 500,000, the enrolment 390,000, and the average attendance 265,000. Number of teachers employed, 11,698. The percentage of illiteracy in the State is very low, being less than 3 per cent. The colleges in the State are: Baker University, Baldwin; Bethany, Lindsborg; Campbell University, Holton; Highland University, Highland; Kansas Wesleyan University, Salina; McPherson, McPherson; Midland, Atchison; Ottawa University, Ottawa; Southwest Kansas, Winfield; Saint Benedict's, Atchison; Saint John's, Salina; Saint Mary's, Saint Marys; State Agricultural, Manhattan; State Normal, Emporia; State University, Lawrence; Sisters of Bethany, Topeka; Washburn, Topeka.

Religion.—All of the religious denominations are represented, the Methodist being the largest numerically, followed in order by the Roman Catholic, Baptist, Disciples, Presbyterian, United Brethren, Congregational, Lutheran, Friends, African M. E., and Evangelical Association. The moral standard of the population is very high, Kansas being one of the few States that has adopted an amendment to its constitution prohibiting the manufacture and sale of liquor.

Newspapers and Libraries.—Kansas has 837 newspapers, including 51 dailies, 634 weeklies, 4 semi-weeklies, 116 monthlies, 14 semi-monthlies, 2 bi-monthlies, 11 quarterlies, and 5 occasionals. Of public, college and high school

libraries there are 112, with a total of 525,519 volumes.

Charitable and Penal Institutions.—The institutions of this class, and the numbers of inmates of each, are: Insane asylum, Osawatomie (990); Insane asylum, Topeka (780); Insane asylum, Parsons (430); Blind asylum, Kansas City (93); Imbecile school, Winfield (210); Deaf and Dumb school, Olathe (263); Soldiers' Orphans' home, Atchison (150); Soldiers' home, Dodge City (146); State penitentiary, Lansing (1,020); Industrial reformatory, Hutchinson (260); Industrial school, girls, Beloit (125); Reform school, boys, Topeka (209). The Federal government maintains a military prison and a branch of the national soldiers' home at Leavenworth.

Bibliography.—Andreas, 'History of Kansas' (1893); 'Biennial Reports of the Board of Agriculture of Kansas'; Ewing, 'The Struggle for Freedom in Kansas' (1894); Goss, 'History of the Birds of Kansas' (1891); Hale, 'Kansas and Nebraska' (1854); Hinton, 'John Brown and His Men' (1894); Haworth, 'Geological Survey of Kansas' (1896, et seq.); Hodder, 'The Government of the People of the State of Kansas' (1895); Holloway, 'History of Kansas' (1868); Inman, 'The Old Santa Fe Trail' (1899); Hutchinson, 'Resources and Development of Kansas' (1871); 'Kansas Historical Society Collections' (1881, et seq.); Phillips, 'The Conquest of Kansas' (1856); Prentis, 'History of Kansas' (1899); 'Public Documents of Kansas'; Robinson, 'The Kansas Conflict'; 'Kansas: its Interior and Exterior Life' (1899); Spring, 'Kansas' (1899); Thayer, 'The Kansas Crusade' (1899); Wilder, 'Annals of Kansas' (1886); Wilson, 'Eminent Men of Kansas' (1902).

JANUS L. KING,
Kansas State Librarian.

Kansas, a river in the State of Kansas, formed in Geary County by the junction of the Smoky Hill and Republican rivers. The direction of its course is mainly east; but it makes one gradual curve toward the north between Junction City, at the source, and Topeka. After a course of about 250 miles through a rich agricultural region, the river flows into the Missouri at Kansas City. The largest tributary is the Little Blue River from the north. Several small tributaries enter the Kansas from the south.

Kansas, University of, a State educational institution, situated at Lawrence, Kan. The establishment of a State university was provided for in the State constitution, and an act of the legislature incorporated the university in 1863. In 1865 a preparatory department was opened, and in 1866 one building was erected and the collegiate department established; in 1891 the preparatory department was discontinued. The present organization includes the school of arts, with classical and literary courses leading to the degree of A.B.; the school of engineering conferring the degree of B.S.; the graduate school giving advanced courses in arts and engineering; the school of law; the school of fine arts, offering courses in music, painting and elocution; the school of pharmacy; the school of medicine, offering the first two years of a regular four year medical course; and the summer session of six weeks. The university is the head of the State's public school system, and is in

KANSAS CITY

direct connection with the high schools, admitting those who have completed the high school course, or a similar course, without examination; no tuition is charged to residents of Kansas, and the university is open to both men and women; non-residents pay a small fee. The library in 1903 contained 40,840 volumes and a large number of pamphlets; \$7,000 are annually appropriated for the purchase of books; the natural history museum contains over 250,000 specimens. In 1903 the State appropriated \$50,000 for a building for the law school. Number of students (1903) 1,294; number of professors and instructors, 81.

Kansas City, Kan., city, county-seat of Wyandotte County; on the Kansas and Missouri rivers, and on the Union P., the Missouri P., the Chicago R. I. & P., the Chicago G. W., and the Atchison, T. & S. F. R.R.'s. Branches of other railroads enter the city and the nearby towns are connected by electric-trolley lines. Kansas City, Mo., opposite and east is one with Kansas City, Kan., in commercial development, but each has an independent municipal organization. A large number of bridges connect the two cities. In one part of the city, west of the Kansas River and south of the Missouri, the dividing line between the two cities is a street.

Kansas City is the largest city (1904) in the State. It was formerly known as Wyandotte, later as Kansas City, Kan., then, in 1886 the municipalities of Armourdale, Armstrong, Wyandotte, and Kansas City, united under the name of Kansas City. The area is 10½ square miles. A portion of the city is built on the river bottoms, and many fine public and private buildings are on the high bluffs and extend back on the level land. The city is on both sides of the Kansas River, so the boundary line between the States of Missouri and Kansas is in part the boundary line between the twin cities. It is noted for its live-stock and meat-packing industries; but the second largest live-stock-interest establishments in the country are on the boundary dividing the two cities. Some of its other chief industrial establishments are railroad car shops, machine shops, grain elevators, smelters, iron and steel works, flour mills, soap and candle factories, box and barrel factories, foundries, wholesale grocery houses, slaughter yards, lumber and brick yards. The slaughtering and meat packing industries have a capital of \$15,000,000. In the State, in 1902, the value of the meat packing industries was \$77,411,883, nearly all of which was the output of the Kansas City establishments. The manufacturing products of the city represented, in 1902, about \$85,000,000. The city is the seat of Kansas City University, established in 1896 by the Methodist-Protestants; the State Institution for the Blind; College of Medicine and Surgery; Saint Margaret's and Bethany hospitals; and Carnegie Library. It has fine public parks, a magnificent high school and excellent public and parish schools. In August 1902 the city was visited by a severe storm and over 200 houses were destroyed, and a large number of public and private buildings were injured. Pop. (1890) 38,316; (1900) 51,418.

Kansas City, Mo., the second city in the State of Missouri and the 22d in population in the United States, it is located in the north-western part of Jackson County in the angle

formed by the Kansas River at its junction with the Missouri. At the intersection of 14th and Washington streets, the latitude is 39° north and the longitude is 94° 36' 16.18" west. The name is derived from an Indian tribe that formerly occupied and owned much of this section of the country and their title to which was extinguished in 1808, excepting a narrow strip of land 24 miles wide lying eastward of the State line from Fort Clarke, later known as Fort Osage, and extending southward to the Arkansas River. The Indians relinquished their title to this strip of land in 1825, and in it lies nearly all of Jackson County.

History.—Trading posts had been established at different points along the Missouri River from 1765 to 1799 as far upward as what is now St. Joseph, by the adventurous French trappers and traders who first explored much of this western country. The settlers who had been checked at the eastern limit of the Kansas Indian Reservation made a general rush into the newly acquired purchase. In 1826 a census was taken with the view of forming a county organization which was effected 15 December in the same year. Prior to this date, however, Daniel Morgan Boone, third son of Col. Daniel Boone, the noted pioneer, came from Kentucky in 1787 to St. Louis, where he made his home for 12 years, residing there during the summers, but in winters hunting and trapping beaver chiefly on the Big and Little Blue, in Jackson County, which he declared to be the best beaver country known. However, it was reserved for Lewis and Clarke to give the first distinct account of the country at the mouth of the Kansas River and this record made by them, is dated 26 June 1804. In 1800 Louis Barthelot, known in the early history as Grand Louis, moved from St. Charles, Mo., and settled at the mouth of the Kansas River; his wife being the first white woman to have a home on the present site of Kansas City. In 1821, Francis Chouteau established a camp opposite Randolph Bluffs. A flood in 1826 destroyed his trading post where he had made the first permanent white settlement within the corporate limits of Kansas City. These settlers were trappers, traders, laborers, and voyagers with their families. What is now the busiest part of Kansas City was called at first Westport Landing. The town of Westport was platted in 1833, and lies about four miles south of the landing on the Missouri River. Kansas City proper, that is, 250 acres of land, was laid out in town blocks and lots in 1838, but owing to a disagreement among the stockholders the project was abandoned till 1846, when a new company was formed who advertised and sold 150 lots. The town began to grow and soon had 600 inhabitants. At this time the chief agency in building up the new town was the trade with the Indians and with New Mexico. Within the short space of five years the town enjoyed almost exclusively the entire trade of New Mexico that came east to the Missouri River. This traffic was along what was known as the "Santa Fe Trail" (q.v.), a highway, extending at first from Franklin, Mo., on the Missouri River, to Sante Fe, New Mexico. Outside of these French settlers who had established themselves in the vicinity of what is now Kansas City, was James H. McGee, who came here in 1828, and whose family was prominently identified with the early history and de-

KANSAS CITY

velopment of this part of Missouri. There was not a sufficient infusion of the American spirit, however, for a number of years materially to affect the character of the early French traders who gave their attention to the extensive fur trade with the Indians as far west as the Rocky Mountains. Prior to 1828, the only means of crossing the Missouri River at this point was by canoes, but this year a ferry was established, so that the few settlers could cross the river to take their corn to a horse-mill on the north side of the river.

Topography.—The original site of Kansas City presented a rugged, precipitous and uninviting aspect,—high bluffs composed chiefly of limestone, facing the Kansas River as it sweeps in from the southwest, thence veering west of north till it empties into the Missouri River,—thence continuing along the south bank of the Missouri River four miles to the valley of the Big Blue. Through these high bluffs cut by deep ravines, in some places 200 feet deep, ran streams into the river. These gorges were the channels through which the water that fell on the upland, flowed into the Missouri. Towering upward from the two rivers, stood the precipitous bluffs with but a few hundred feet in width of bottom land on which to begin a city. Just below where the Kansas River empties into the Missouri, the bluffs for a mile or more were composed chiefly of a rich loam which has been shaved down to a moderate grade and the dirt made into brick. Owing to the changable nature of the Missouri River in cutting through the bottom land on either side of it, the town had to be built between the river and the bluffs, along the deep ravines, and on the hills. Persons who see the city as it is now, can scarcely realize the obstructions that had to be removed in grading down streets to a level and in filling cuts. The city is topographically divided into three parts, known locally as the Hills, including all that part of the town on the highlands, extending east and south into level upland which is of great beauty; West Kansas City, including the lowlands lying between the State line on the west and the east bluff of the Kansas River, and the East Bottom which takes in all the lowland lying east of the foot of Grand Avenue where it runs to the Missouri River, were originally covered with dense forests, as indeed was the entire town site, and it was not till after the Civil War that the timber was cut off the West Bottom; since then it has become the busiest part of Kansas City in which are located the stock yards, elevators, the most of the passenger and local freight depots, and a large part of the wholesale business houses of the city. From its earliest history as Westport Landing, Kansas City was noted for its steamboat traffic. It had one of the most permanent landings on the river,—a rocky bank with a deep current in front of it. Here were landed the goods for the Mexican and Indian trade West and Southwest, and in exchange were received the wool, furs, buffalo robes, and other articles for the eastern markets. The location of the city at the most southern bend eastward in the Missouri River, even before the age of continental railroads, was the natural route through which the Santa Fe and the Indian trade of the West and Southwest must pass to be exchanged for the products these people desired.

Commerce.—The men who have contributed so much toward making Kansas City the metropolis of the Missouri Valley turned their attention to the grain and produce market of this vast region thirty years ago. From an insignificant local trade in 1871 of a few hundred thousand bushels of grain handled that year, the business has grown now to 50,000,000 bushels annually. In 1902 there were received 24,018,400 bushels of wheat, 16,092,800 bushels of corn, 8,358,000 bushels of oats, 376,800 bushels of rye, 33,000 bushels of barley, 99,200 bushels of flax-seed, 15,060 tons of bran, and 146,320 tons of hay, while the export of grain was 36,206,400 bushels. In the elevators and mills the storage capacity is 6,320,000 bushels, and the handling capacity,—1,518,000 bushels, while the total mill products aggregate 1,692,854 barrels. The numerous grain elevators enable the railroads to handle and transport grain to other points with facility and despatch. Its title as the “greatest winter wheat market”, is known in foreign countries to which millions of bushels of Kansas, Nebraska, Missouri, and Oklahoma grain are annually shipped by Kansas City exporters. It is not alone as a centre for the accumulation of wheat, corn, and oats that it is famous, but also as a distributing point for cereals to be consumed in the south, east, and in foreign markets. The flour and meal manufactured by the half dozen local mills also go abroad in large quantities, as well as to many parts of the United States. The milling business is one of the rapidly growing industries. Enormous capital is involved in the transaction of the grain business. In elevators alone the investments run into millions of dollars. The growth of this market since its inception in 1871 has been marked by a uniform and rapid progress until it is one of the most important grain markets in the United States. Kansas City's bank clearings are more than \$1,000,000,000 annually, and the deposits exceed \$70,000,000 in 19 different banks, having a paid up capital of \$6,000,000. At present Kansas City occupies the second position in the world as the leading live stock market. The stock yards are the most convenient for the quick and safe handling of stock in the United States. The aggregate value of live stock handled last year was \$126,250,000. The packings houses are eight in number, having a combined capacity for daily slaughter of 12,300 steers, 34,500 hogs, and 14,200 sheep. These products are marketed in every civilized country. The stock yards cover 200 acres, containing 1200 cattle pens, 625 hog pens, and 100 sheep pens. The receipts of cattle at the stock yards in 1902 were 2,279,166; hogs 217,937; sheep 15,4084; horses and mules 768,448; shipped in 730 cars. The cost of the packing plants is estimated at \$12,000,000, and the number of hands employed approximate 1,000; while the annual value of the outputs is over \$150,000,000. In 1902 the wholesale trade of Kansas City exceeded \$100,000,000, and the retail trade \$45,000,000. Seventy firms did a business of \$16,000,000 in agricultural implements. The geographical location of Kansas City with respect to other centres of trade is represented as follows: distance to St. Louis 229 miles, Chicago 612 miles, Cincinnati 660 miles, Omaha 200 miles, St. Joseph 200 miles, St. Paul 500 miles, Minneapolis 200 miles, Albany 1,260 miles, Buffalo 200 miles, Boston

KANSAS CITY

1,459 miles, New York 1,303 miles, Philadelphia 1,213 miles, Washington 1,267 miles, Pittsburg 896 miles, Atlanta 902 miles, Galveston 962 miles, New Orleans 942 miles, Denver 633 miles, Los Angeles 1,805 miles, San Francisco 2,093 miles, Portland, Ore., 2,050 miles.

Railroads.—Twenty different railroad systems enter the city, operating 33 different lines, representing more than 50,000 miles in length. The magnitude of this business may be inferred from the fact that 200 passenger trains arrive and depart daily from the depots, while 350 freight trains come into and go out of the freight yards, thus rendering Kansas City one of the greatest and most important transfer and distributing points on the continent, as well as one of the greatest express centres. Two railroad bridges span the Missouri River and a third is in process of construction. In telegraphic communication Kansas City is only surpassed by New York and Chicago in the number of wires entering the city and in the volume of business transacted.

Manufactures.—It has only been of recent years that manufacturing industries have sprung up along various lines in Kansas City. The energies of the business men were directed for two decades after the close of the Civil War to the live stock and agricultural trade, and in supplying the farmers with agricultural implements. Owing to the great deposits of bituminous coal in this vicinity and the abundance of raw material out of which so many products can be economically and rapidly manufactured, new industries are springing up each year. There are more than 600 factories in operation, employing 30,000 hands, who make \$200,000,000 worth of merchandise annually. The minor manufactures represent an invested capital of \$26,437,307, and output of \$36,527,392, employing more than 16,000 persons.

Government.—At the head of the city government is the mayor, whose term of service is two years, upper house of aldermen, consisting of 14 members, whose term of service is four years, elected at large; lower house councilmen, 14 members, term of service two years; city treasurer, auditor, police judge, and city attorney, elected biennially. The other officers are nominated by the mayor and confirmed by the upper house. The board of park commissioners, the chief of the fire department, engineer, city physician, superintendent of buildings, superintendent of streets, plumbing inspector, superintendent of workhouse, etc., are appointed by the mayor and confirmed by the upper house. The board of police commissioners is composed of three members, the mayor, and two citizens appointed by the governor.

Public Service.—The assessed valuation of property is \$93,260,070, an increase of more than \$30,000,000 since 1893, and this valuation represents about one fourth of the cash value. The municipal indebtedness of the city is \$5,331,900.00, the greater part of which is for the water-works plant. The city is also the owner of much valuable property, including the city hall, hospital, the workhouse grounds, and parks. The comptroller's last report shows the expenditures for operating expenses of the several departments: Officers and employees, \$99,000.00; police department, \$280,000.00; fire and fire patrol, \$249,000.00; hospital and board of health,

\$35,000.00; workhouse, \$17,000.00; printing and stationery, \$18,000.00; board of public works, \$200,000.00; gas and street lighting, \$100,000.00; parks, \$48,000.00; garbage, \$20,000.00; expense, \$56,000.00; water department, \$453,409.00. The city purchased the waterworks in 1895. The water used is obtained from the Missouri River at Quindaro, a pumping station eight miles up the river. During 1902 there were 19 miles, 1,667 feet of water mains laid, and 283 fire hydrants placed. The street railway service, which permeates all parts of the city, connects with suburban trolley lines, reaching Independence, Leavenworth and intermediate stations, and affords a means of rapid transit for a quarter of a million of people at a nominal expense. The revenue to support the municipal government is derived from taxes levied annually on personal and real property, and the annual tax levy is about 12½ miles on the dollar's valuation. The city has an area of 26.3 square miles, with 452 miles of streets, of which 117.55 miles are paved with asphalt, 39.65 miles with vitrified brick, 2.24 miles with stone blocks, and 39.17 miles with macadam.

Population.—The following figures show the steady progress with which year by year Kansas City has advanced to her proud position as the largest and most important city in the Missouri Valley. The population in 1838 was 300. (1846), 700; (1857), 2,000; (1860), 4,418. (1870), 32,200; (1880), 55,785; (1890), 132,710. (1900), 163,750. The death rate is exceedingly low, being 12.84 of every 1,000 inhabitants.

Religion.—In 1825 the Jesuit fathers organized a mission near the mouth of the Kansas River, and built a small log house near the foot of what is now Troost Avenue, just below the bluff, where they worshipped for several years. Father Roux came in 1830 and took charge of the congregation, and five years later he purchased from a Canadian Frenchman a tract of 40 acres upon the hill adjoining the present site of the Roman Catholic cathedral and the bishop's residence. A part of this tract was cleared of the heavy timber, and a log church was erected, and here the congregation, composed chiefly of French-Canadians and half-breeds, scattered over more than 400 square miles, worshipped for 20 years. As soon as the Indian land was purchased settlers poured into it from the settlements east of it. Other religious denominations came till at the present time the number of churches in Kansas City is 180. The following will show the number of religious organizations. Baptist (32), Christians (15), Christian Scientist (3), Congregational (10), Episcopal (8), Evangelical (4), Hebrew (4), Lutheran (4), Methodist Episcopal (25), Methodist Episcopal South (8), Presbyterians (16), Reformed (1), Roman Catholic (20), Universalists (3), Unitarians (1), miscellaneous (23).

Public Schools.—The present public school system was organized 1 Aug. 1867, and in October of that year the schools were formally opened in rented rooms which had been hastily and scantily furnished. Bonds were issued, sites were purchased, and school houses erected. Sixteen teachers were employed during the first year, and about 1,200 pupils were enrolled. From this small beginning the school district has been enlarged till there are 52 different public school buildings, including sites valued at \$3,347,390, with an enrolment of 29,591 pupils,

KANSAS-NEBRASKA BILL

of whom 3,700 are in the four high schools, being the largest per cent of high school pupils in any city in the United States having a population of more than 100,000 inhabitants. There are 718 teachers employed in the public schools. The public library, in which there are 43 persons employed, is also under the control of the board of education. In addition to the public school system, there are 60 other schools of various kinds, including private and parochial schools, medical and dental colleges, commercial schools, a school of oratory, fine arts, and an excellent school of law. Politics has been kept out of the city schools, and this is due largely to the plan suggested in 1876, when Superintendent Greenwood proposed that a non-partisan board composed of three Republicans and three Democrats be elected, and the board has been thus kept ever since. There are 850 persons employed in various capacities in the public schools and the public library, and the cost of operating the schools and public library is \$663,979.52. It is a noteworthy fact that since the organization of the board of education 36 years ago with six men serving all the time, only 29 different men have composed its membership. Two members are elected every two years, and the term of service is six years. Kansas City was the first city in the United States to make its school board non-partisan.

Parks and Cemeteries.—The city has spent nearly \$6,000,000 for its parks, which contain 2,089.9 acres, divided into six park districts: The North Park District, 219.39 acres; South Park District, 148.40 acres; West Park District, 165.07 acres; East Park District, 66.24 acres; Westport District 136.80 acres; Swope Park District, 1,354.00 acres. The system is divided into 19 different parks, nearly all of which are connected by an extensive system of 15 boulevards in connection with parkways, speedways, and pleasure resorts. Located in different parts of the city and easy of access are eight cemeteries, the largest of which are Union, Elmwood, St. Mary's and Forest Hill.

Public Buildings.—Among the public buildings are Convention Hall, which will seat 25,000 persons; city hall, county court-house, post-office, public library, Board of Trade building, New York Life building, Central high school, and the Manual Training high school, four large theatres, and also libraries and reading rooms. The public library, art gallery and museum, located at Ninth and Locust Streets, cost \$250,000, and is under the management of the board of education. There are 90,000 volumes in the library, paintings in the art gallery of the value of \$200,000, and a rare collection of natural history specimens in the museum, especially rich in Indian curios. There are 30 hospitals, asylums and homes. A large per cent of the citizens own their own homes, which adds to the civic pride and the material prosperity of the city.

Bibliography.—Case, 'History of Kansas City' (1888); Miller, 'History of Kansas City' (1881).

J. M. GREENWOOD,
Supt. of City Schools, Kansas City.

Kansas-Nebraska Bill, a bill passed by Congress in 1854; the last of three compromises between the aggressive slavery expansionists of the South and their antislavery opponents in the

North. It is famous because, by its repeal of the first, the Missouri Compromise (q.v.), it precipitated the organization and rapid growth of the Republican party, and especially incited the radical abolition sentiment of the North to aggressive action, thus causing or hastening the secession of the Southern States and the resulting Civil War. Its passage was mainly due to the leadership of Stephen A. Douglas (q.v.), of Illinois. The second compromise occurred when New Mexico and Utah came to be organized as Territories in 1850. The compromise consisted of the provision, which was also one of the two principal features of the Kansas-Nebraska Bill that when these Territories came to be admitted as States they should come in with or without slavery as their constitutions, which would be framed by the people, might prescribe. The strengthening of the fugitive-slave law was the other feature of this compromise. This settlement of 1850 was the first step toward the final compromise, the Kansas-Nebraska Bill.

As early as 1844 Stephen A. Douglas introduced in the House of Representatives a bill "to establish the Territory of Nebraska," and Douglas afterward asserted that he took this method of serving notice on the secretary of war to discontinue using that Territory as the dumping-ground for Indians. In 1848 Douglas, now chairman of the Committee on Territories in the Senate, introduced in that body a bill for the same purpose. In December 1851 Willard P. Hall of Missouri gave notice in the House of a bill for the organization of Nebraska; but none of these bills got beyond the committee stage. On 2 Feb. 1853 William A. Richardson of Illinois, the leading lieutenant of Douglas in the House, introduced still another bill "to organize the Territory of Nebraska." This bill, which, like all of its predecessors in question, made no reference to slavery, passed the House, 10 Feb. 1853; but in spite of the strenuous endeavors of Douglas in its behalf, it failed of consideration in the Senate. The long debate over this bill in the House disclosed clearly that the primary object of members from the Northwest, who were its champions, was to protect and encourage travel over the great upper line to the Pacific coast, and make way for the ultimate construction of the already much talked of Pacific railroad; while members from the South, and especially from the Southwest, were bent on keeping this northern region open for the colonization of their undesirable Indian tribes, with the purpose of securing travel and the railroad to the Pacific coast through their own country.

Early in the session of the next Congress—14 Dec. 1853—Senator Dodge of Iowa, a coadjutor of Douglas in this enterprise, introduced a bill to organize the Territory of Nebraska. This bill also originally contained no reference to slavery; but by amendment it became the famous Kansas-Nebraska Bill, which finally became a law 30 May 1854. On 4 Jan. 1854 the Senate Committee on Territories, through Douglas, reported a substitute for the Dodge bill which contained the compromise provision of the Utah and New Mexico acts; namely, that "the Territory of Nebraska, or any portion of the same, when admitted as a State or States, shall be received into the Union with or without slavery, as their constitutions may prescribe at the time of their admission." In his famous report, accompany-

KANSAS STATE AGRICULTURAL COLLEGE

ing this bill, Douglas points out that "eminent statesmen hold that Congress is invested with no rightful authority to legislate upon the subject of slavery in the Territories, and that therefore the 8th section of the Missouri Compromise is null and void; while the prevailing sentiment in large sections of the Union sustains the doctrine that the Constitution of the United States secures to every citizen the inalienable right to move into any of the Territories with his property of whatever kind or description, and to hold and enjoy the same under the sanction of law." The report pointed out also that under this section it was a disputed point whether slavery was prohibited in the new country by valid enactment, and advised against the undertaking by Congress to decide these disputed questions. The bill was further amended so as to provide that all questions pertaining to slavery in the Territories and the new States to be formed therefrom be left to the decision of the people residing therein; that cases involving title to slaves be left to the courts; and that the provision of the Constitution in respect to fugitive slaves should be carried out in the Territories the same as in the States. On 16 January Senator Dixon of Kentucky offered an amendment, which was accepted by Douglas, expressly repealing the slavery restriction clause of the Missouri Compromise; and the bill passed with these amendments.

The repeal of the Missouri Compromise restriction was hotly denounced by the anti-slavery element, and was seized with alacrity and used with great effect as a political weapon by antislavery agitators and politicians; and Douglas was also savagely denounced for selfish subserviency to the South for the sake of winning the Presidency. But Douglas and his friends ably and plausibly defended the repeal of the Missouri restriction on the ground that it was consistent with and the natural sequence of the popular sovereignty compromise of 1850; that there was danger that it would be held unconstitutional by the courts; that there was ground for fear that Dixon's amendment, as he proposed it, would legislate slavery into the Territories, and that on the whole Douglas, as leader of the dominant party, and having regard to the preservation of the Union as well as to the vexatious slavery question, made the safest and best terms practicable in securing the right of the people to decide the question of slavery for themselves. In the course of the debate on the bill Douglas, as well as Thomas H. Benton, who was opposed to the repeal of the Missouri restriction, insisted that, left to the people, slavery could never be successfully introduced into Kansas or Nebraska.

Impartial consideration of all the facts bearing upon this phase of the question leaves no ground for the charge preferred by leading historians and others that the proposed Nebraska Territory was at last divided into Kansas and Nebraska at the instance of Southern members to gain opportunity to make Kansas a slave State. The "provisional" delegate in Congress at that time from Nebraska, well known by still living contemporary citizens of the Territory as a reliable man, in his published account of his part in the transaction asserts that, before he went to Washington to attend the session of December 1853, it was agreed among the enterprising citi-

zens of western Iowa—there were then no citizens of Nebraska—who were pushing the project for Territorial organization, that division was desirable so that one of the Territories might be directly opposite their State, and that he urged this change upon Douglas, who assented to it. In the debate on this feature of the bill Senator Dodge of antislavery Iowa and Representative Henn of the Iowa district bordering on Nebraska urged the division for the frankly expressed reasons that it would be to their advantage to have the capital of an important commonwealth opposite them, and would aid in securing the route of the Pacific railroad through their part of the country; while the representatives of slaveholding Missouri were indifferent to the question of division. Douglas himself specified the wish of the Iowa members as the basis of his reason for the division of the Territory. It is significant, moreover, that Douglas had always stood for a northern Territory, as shown by his original bills of 1844 and 1848. It is a very significant fact that the northern boundary of the Territory in each of these bills was the 43d parallel, which is identical with the northern boundary of the present State; and that the southern boundary described in the bill of 1848 was also identical with the same boundary of the State, while the southern boundary described in the bill of 1844 was only two degrees farther south. These and other incidents of a like kind show a remarkable prescience and a persistent consistency in interpreting the wishes and interests of those most directly interested in the Territory opposite the State of Iowa and on the line of the great natural highway connecting Chicago, the commercial mart of the Northwest, and the home of Douglas, with the Pacific coast. Mr. Henn in resenting "the unjust charge made on this floor by several that it (the proposed division) was the scheme of Southern men whereby one of the States to be formed out of these Territories was to be a slave State," put the case concisely: "The bill is of more practical importance to the State of Iowa and the people I represent than to any other State or constituency in the Union."

The Kansas-Nebraska Bill was also distinguished by more completely safeguarding the rights of Indian occupants than any previous Territorial organic acts had done; and likewise in being the first Territorial bill of that class which provided for the choice of the members of both houses of the legislature by popular election, to drop the provision requiring the submission of all acts of the legislative assembly to Congress for approval. The Territory organized by this bill comprised all of the unorganized part of the Louisiana Purchase north of the 37th parallel, which comprised all of the Purchase north of that line except the States of Iowa and Missouri, and that part of the Territory of Minnesota between the Mississippi River on the east and the Missouri and White Earth rivers on the south and west.

Editor 'History of Nebraska.'

Kansas State Agricultural College, a co-educational institution, located at Manhattan, Kan.; established in 1863 by the presentation to the State of Bluemont College. The college has excellent opportunities for experimental works as it cultivates 544 acres of land; 323 acres of which is owned by the college, and 221 acres

KANSAS WESLEYAN UNIVERSITY — KAPP

leased. It is not a classical school; the departments, the courses of which lead to the degree of bachelor of science, are agriculture, English, mechanical and electrical engineering, general and domestic science. It has also a preparatory department, a music school, and a trade school. It has several short courses, as: dairying, 12 weeks in winter; agriculture and mechanics, 12 weeks in winter, for two years; horticulture and mechanics, 12 weeks in winter, for two years; and domestic science, 12 weeks in fall, for two years. The faculty numbered in 1902, 59, and the number of pupils in attendance was 1,400. The school has no income from tuitions; but receives from the State \$22,700; from the "Land Grant Fund" of 1862, \$32,300; and by the United States Appropriation Act of 30 Aug. 1890, \$25,000, making a total annual revenue of \$80,000. It received also for the experiment station (United States Act of 2 March 1887) the sum of \$15,000. A weekly periodical, devoted to the interests of the subjects taught in the school, and called the "Industrialist," is published by the faculty. The library has about 25,000 volumes, and the value of the college property is (1903) about \$600,000.

Kansas Wesleyan University, a coeducational institution, founded in 1886 under the auspices of the Methodist Episcopal Church, at Salina, Kan. In 1902 there were connected with the school 34 professors and instructors, and pupils in attendance 985. There were in the library 5,000 volumes.

Kant, kānt, Immanuel, German metaphysician: b. Königsberg, Prussia, 22 April 1724; d. there 12 Feb. 1804. His first education, of a strictly religious character, he received at home, his father, whose family is believed to have been of Scottish origin, being a saddler of limited means. He early showed great application to study, and was sent to the Collegium Fredericianum, and then (in 1740) to the university of his native city. His progress at college and at the university was rapid and brilliant, his studies embracing mathematics and physics, as well as philosophy. Leaving the university after three years, he engaged in tuition, and it was not till 1755 that he took his degree. Soon after this he was appointed one of the teachers in the Königsberg University, and lectured on logic, metaphysics, mathematics, and natural philosophy, to which, at subsequent periods, he added natural law, moral philosophy, natural theology, and physical geography. In 1770 he became a full professor, obtaining the chair of logic and metaphysics, a post that he occupied till 1797. Dissatisfied with the dogmatisms of Wolff and the skepticism of Hume, he set himself to investigate the field of metaphysics for himself, and in the first place proceeded to the examination of the origin, extent, and limits of human knowledge. According to him, part of our knowledge is knowledge *a priori*, or original, transcendental, and independent of experience; part of it is *a posteriori*, or based on experience. What he calls the "pure reason" has to do with the former. His great work, the "Kritik der reinen Vernunft"—Critique of Pure Reason (first edition 1781), contains the foundation for his whole system of philosophy. In the preface to a later work, the "Kritik der Urtheils-kraft"—Critique of the Power of Judgment (1790), he defines "pure reason" thus: "Pure reason is the faculty to understand by *a priori*:

principles; and the discussion of the possibility of these principles, and the delimitation of this faculty, constitutes the critique of pure reason. In the first rank of such ideas as we do not derive from experience are space and time. Kant shows that all our perceptions are submitted to these two forms, hence he concludes that they are within us, and not in the objects; they are necessary and pure intuitions of the internal sense. The three original faculties, through the medium of which we acquire knowledge, are sense, understanding, reason. Sense, a passive and receptive faculty, has, as already stated, for its forms or conditions space and time. Understanding is an active or spontaneous faculty, and consists in the power of forming conceptions according to such categories as unity, plurality, causality, etc., which categories are applied to objects of experience through the medium of the two forms of perception, space and time. Reason is the third or highest degree of mental spontaneity, and consists in the power of forming ideas. As it is the province of the understanding to form the intuitions of sense into conceptions, so it is the business of reason to form conceptions into ideas. Far from rejecting experience, Kant considers the work of all our life but the action of our innate faculties on the conceptions which come to us from without. He proceeds in a similar way with morality; the idea of good and bad is a necessary condition, an original basis of morals, which is supposed in every one of our moral reflections, and not obtained by experience. He treats this part of his philosophy in his "Kritik der praktischen Vernunft"—Critique of Practical Reason (1788). Other important works of his are: "De Mundi sensibilis atque intelligibilis Forma et Principiis" (1770); "Prolegomena zu einer jeden künftigen Metaphysik, die als Wissenschaft wird auftreten können" (1783); "Grundlegung zur Metaphysik der Sitten" (1785); "Metaphysische Anfangsgründe der Naturwissenschaft" (1786); "Die Religion innerhalb der Grenzen der blossen Vernunft" (1793); "Metaphysik der Sitten" (1797). Complete editions of Kant have appeared edited by Rosenkrantz and Schubert (1838-42), Hortenstein (1867-9); and Kirchmann. English translations include those of the "Critique of Pure Reason" by Meiklejohn (1854) and Max Müller (2d ed. 1896); of the "Prolegomena" by Mahaffy and Bernard (2d ed. 1889); Bax (1883); Carus (1903); of the "Critique of Practical Reason" by Abbott (2d ed. 1898); of the "Critique of Judgment" by Bernard (2d ed. 1892); of the "Philosophy of Laws" by Hastie (1887); of the "Principles of Politics" by Hastie (1891); of the "Cosmogony" by Hastie (1900). Consult: E. Caird, "Critical Philosophy of Kant" (1859); Mahaffy, "Kant's Critical Philosophy for English Readers" (1872-74); Watson, "Kant and his English Critics" (1881); Stirling, "Textbook to Kant" (1881); Morris, "Kant's Critique of Pure Reason" (1882); Paulsen, "Immanuel Kant, sein Leben und seine Lehre" (1898, Eng. trans. 1902); Vaihinger, "Commentar zu Kants Kritik der reinen Vernunft" (1881-92).

Kapp, Friedrich, frēd'rīk käp, German biographer and historian: b. in Hamm, West-

KARA — KARR

phalia, 13 April 1824; d. Berlin 27 Oct. 1884. He left Germany at the outbreak of the revolution of 1848, and settling in New York in 1850, took active part in American politics. In 1860 he was a presidential elector and in 1867 commissary of education. Returning to Germany in 1870, he entered the Reichstag in 1872. His works, which mainly refer to the United States, include 'American Soldier Traffic by German Princes' (1864); 'German Emigration to America' (1868); 'History of the German Migration into America' (1867); 'Frederick the Great and the United States' (1871); etc.

Kara (kä'rä) **Sea**, an arm of the Arctic Ocean indenting the north coast of Siberia, between Nova Zembla and Yalma Peninsula. The Yenisei and Ob rivers flow into this sea. Since 1875 when Nordenskjöld made his voyage in the Vega, several navigators have sailed on this sea and found that it is not, as once supposed, ice-locked all the year; but is open in July and August. Consult: Hovgaard, an article in the 'Scottish Geographical Magazine' (January 1890) on a route to the North Pole.

Karadzic, kā-rä'jēch, **Vuk Stefánovic**, Servian author: b. Trschitsch, Servia, 7 Nov. 1787; d. Vienna, 7 Feb. 1864. The two great works of his life were the reformation of the Servian literary language (which, up to his time has been a very debased medium, being either rude Slavonian or a hybrid jumble of Serb and Slavonian), and the publication of the 'Popular Serb Songs' (4 vols. 1814-33; 3d ed. 1841-46). His epoch-making Serbian-German-Latin 'Dictionary' appeared in 1818. The songs attracted widespread attention, and were translated into every European tongue. He was the founder of modern Servian literature.

Karageorgevitch, kā-rä-gä-org'a-véch, PRINCE Peter, king of Servia: b. Belgrade 1846. He was educated at Belgrade, but when his father, Alexander Karageorgevitch, was driven from the throne in 1858, he became a soldier of fortune and pretender. After training in France at the St. Cyr school and the Military staff college, he fought in the foreign legion during the Franco-Prussian war. Later he took part in Herzegovina's struggle for liberty. Upon the assassination of Alexander I. Obrenovitch in 1903, Prince Peter was proclaimed king of Servia by the army. See SERVIA, History.

Ka'raites. See JEWISH SECTS.

Karankawan, kā-rän'ka-wän, an American Indian tribe, now extinct. They formerly lived along the Texas coast in the vicinity of Matagorda Bay, and originally came from Central America. They were first mentioned in 1687, by the French explorer Joutel, and were regarded as cannibals. They were uncompromisingly hostile to the whites. In 1843, fifty survivors of the race removed to Mexico, where in 1858 the last of them were exterminated by Mexican ranchers.

Karaveloff, kā-rä-vä'löf, **Petko (PETER)**, Bulgarian statesman: b. Kalofer 1840; d. Sofia 7 Feb. 1903. He studied in Moscow, in 1878, became vice-governor of Vidin, in 1879 was a founder of the Liberal party, in 1880 was appointed minister of finance, and later in that year assumed the premiership. After the coup d'état of Prince Alexander, he retired to Eastern Rumelia, but on the restoration of the constitu-

tion in 1883 returned, and in 1884-6 was again premier. In 1886 he was appointed to the regency on the abdication of Alexander (7 Sept.), but after the election of Ferdinand (7 July 1887) his power waned; in 1890 he was sentenced to a five-years' imprisonment for conspiracy. Pardoned, however, he was elected to the Sobranye, or national assembly, and from 4 March 1901 to January 1902 he was premier, his resignation being compelled by opposition to his conclusion of a French loan.

Karawala. See CARAWALA.

Karli, kär'lë, a Buddhist cave-temple of India, rich in sculpture, and divided like a church into nave and aisles, with an apse. The temple probably belongs to the 1st century.

Karlowitz, kär'lō-vits, or **Carlovitz**, a town of the Austrian empire, on the frontier of Slavonia. The great vine mountain in the vicinity yields the best and strongest qualities of Hungarian wines. A peace was concluded here in 1699, between Austria, Poland, Russia, Venice, and Turkey. In 1848-9, Karlowitz was the focus of the Servian rebellion against Hungary, and the theatre of collision between the Servians and the Magyars, and at a later period between the Hungarians and the Austrians. The town contains a Greek cathedral and is the seat of the Greek archbishop of the Servian nationality. Pop. (1900) 5,643.

Kar'ma, (1) in Buddhism, the judgment at death which determines the future state of the deceased. It is also the fiat of the Buddhists on actions, pronouncing them to be meritorious, or otherwise. (2) In theosophy, Karma means the unbroken sequence of cause and effect, each effect being in its turn the cause of a subsequent effect. It is a Sanskrit word meaning "action" or "sequence." See BUDDHISM: E.O.; THEOSOPHY.

Karma'thians, a former Mohammedan sect, founded in Irak by Karmath during the 9th century. Missionaries were trained to spread his creed, and one of them, Abu Said, gained a strong hold on the people of the Persian Gulf. The caliph, afraid of the influence of the new sect, sent an army for its suppression, but he was defeated, and Abu Said took possession of the whole country.

Kar'nak. See THEBES.

Karr, Jean Baptiste Alphonse, zhōn báp-tēst äl-fôns kär, French novelist and satirist: b. Paris 24 Nov. 1808; d. Nice, France, 30 Sept. 1890. He was educated at the Collège Bourbon, where he subsequently taught, and began in 1832 to write for the 'Figaro,' becoming its editor-in-chief in 1839. In that year he established 'Les Guêps' (the Wasps), a monthly journal of satire which aroused many enmities. His earliest books were novels, among them: 'Sous les Tilleuls' (1832); 'Vendredi Soir' (1835); 'Geneviève' (1838); 'Clotilde' (1839); among later works may be named: 'Voyage autour de mon Jardin' (1845); 'Gaités ro-

KARROOS — KASSALA

maines' (1870); 'Dieu et Diable: le Credo du Jardinier' (1875). The latter portion of his life was passed at Nice where he was a devoted gardener, several flowers having been named in honor of him.

Karroos, kā-rooz', the Hottentot name, now adopted by physical geographers, for the table-land or extensive plains between the mountain ranges of Cape Colony. They are fertile during the short rainy season, but during the dry season they assume the appearance of parched arid deserts, though even then flocks and herds find a certain amount of food on them. In recent times artificial methods of procuring water for these tracts have been adopted. In some places great reservoirs have been made to impound the water of permanent streams, or streams that exist only in time of rain; many wells have also been sunk, from which water may be pumped by means of windmills if it does not rise of itself. In this way large areas of the Karroos are now occupied as farms on which more or less grain is grown. Kloof, a sort of companion name to karroo, is applied to the longitudinal valleys extending between the ranges of the adjacent hills.

Kars, (1) a province of Russia, in the southwestern part of Transcaucasia; area, 7,188 square miles. It is mountainous, but the chief occupations are agriculture and stock-raising. Pop. estimated, 300,000. (2) Kars, the capital of the province of Kars, is about in the centre of the province, on a high plateau, barren in part but productive in the vicinity of the city. It was formerly a Turkish fortified city, and since it became a Russian possession (1878) the fortifications have been strengthened. The city has some manufactures, carpet-mills, cotton and woolen factories. Pop. about 22,000.

Karun, kā-roon', the only navigable river of Persia, and important as a route to the interior. About 117 miles from the mouth navigation is impeded by the rapids of Ahwaz. Formerly the Karun flowed direct to the sea, but now it traverses an artificial channel leading it into the Shat-el-Arab, which it joins at Mohammerah. It has recently been opened to foreign trade as far as Ahwaz.

Karyokinesis, kar'-yō-kī-nē'sis, the process of development of the ovum under the influence of fertilization. See CELL; EMBRYOLOGY.

Kasan. See KAZAN.

Kasbin, kās-bēn', or **Kazvin** (also spelled CASVEEN, CASBIN, and KAZBIN), Persia, a town in the province of Irak-Ajemi, about 90 miles west-northwest of Teheran. It is built of kiln-burned bricks, and had once a great number of elegant mosques and well-constructed bazaars, but a large proportion of the buildings are now ruined and deserted, partly as the result of repeated earthquakes. The manufactures include tanning, weaving, etc., and there is a considerable transit trade. There are many vineyards and gardens in the neighborhood. Pop. estimated at 40,000.

Kashgar, kāsh-gār'. See CASHGAR.

Kashmir. See CASHMERE.

Kaskas'kia, an American Indian tribe of the Algonquian family, formerly occupying a part of southern Illinois. In 1832, the survivors of the race, with the Peorias, removed to Kansas,

and affiliated with the Weas and Piankishaws. The four tribes removed to Indian Territory in 1867, and in 1903 scarcely 100 members of the four tribes remained. See INDIANS.

Kaskaskia, Ill., a township in Randolph County, on both sides of the Kaskaskia or Okaw River, at its junction with the Mississippi opposite Ste. Genevieve, Mo. A part of it now obliterated was the oldest town in the West, the first permanent white settlement in the Mississippi Valley. Marquette in 1675 had established a mission among the Kaskaskia Indians near the present Utica, Ill., on the Illinois River; the Jesuits Marest and St. Cosme, guided by Tony (q.v.), removed the mission in 1700 to the Mississippi bottoms three miles from the river, near the Kaskaskia. It thrived greatly, and was not only a large Indian market, but sent produce and furs to New Orleans. Fort Chartres was built there in 1720; eminent French officers and adventurers came thither—as Vaudreuil and the commandant Chevalier de Bertel—and with its gay French life it was named "the Paris of the West." A noted Jesuit college and convent were maintained there. It formed one of the chain of posts by which France was to hem in English colonization; but in 1763 it fell into the hands of the English, who made it their capital in that region. On 4 July 1778 George Rogers Clark (q.v.), with a company of 200 Virginia militia, captured it for the United States by a night attack; this enabled us to claim and obtain possession of the Northwest Territory by the peace of 1783, and changed the destiny of this whole region. It remained a leading western town, and was the capital of Illinois as a Territory (1809) and a State (1818); but on removal of the seat of government to Vandalia in 1819, it began to decline. The river steadily encroached on the meadow; and in 1892 united its course with the Okaw, converting a large part of the old site, with most of the ancient buildings, into an island, which in 1899 crumbled into the river after several great floods. North of the junction still remains about a third of the town site, with the foundations of a church and of the capitol building. In 1891 the Illinois legislature appropriated \$50,000 to remove the old cemetery to a point on the bluffs, and a large monument has been erected there. Consult: 'Kaskaskia: A Vanished Capital' (in 'Chautauquan,' Vol. XXX., 1900); 'Kaskaskia and its Parish Records' (in 'Magazine of American History,' Vol. VI., 1880).

Kaskaskia River, rises in Champaign County, Ill., and flows southwest through Moultrie, Shelby, Clinton, Fayette, and St. Clair counties, finally joining the Mississippi in Randolph County. It formerly entered at Chester, but in 1891 (see below) the great river cut away the neck of land at Kaskaskia and joined it there. It is nearly 300 miles long, and navigable to Vandalia, 150 miles. It flows through a fertile rolling country which is part of the Illinois coal field.

Kassai, kā-sī', a tributary of the Kongo, which it enters from the south a short distance above Stanley Pool, pouring into the Kongo a vast volume. It is navigable for hundreds of miles.

Kassala, kā-sā'lā, North Africa, a town at the southeastern extremity of the Egyptian Su-

KASSON—KATIPO

dan, near the border of Abyssinia, formerly belonging to Egypt, and once a commercial centre. Before the Mahdi's uprising it had a population of perhaps 20,000. Italians captured it from the Mahdists in 1894, and in 1897 it was restored to Egypt. Its population is now supposed to be about 10,000.

Kas'son, John Adam, American lawyer and diplomatist: b. Charlotte, Vt., 11 Jan. 1822. He was graduated from the University of Vermont in 1842, studied law at Worcester, Mass.; was admitted to the bar, and in 1857 moved to Iowa and continued the practice of his profession. He became active in the Republican party, was a delegate to the national convention in 1860 and chairman of the State committee in the campaign; was assistant postmaster-general in 1861-2; and commissioner to the International Postal Congress at Paris in 1863. He was elected to Congress in 1863 and served until 1867; in the next year was elected to the Iowa State legislature, and from 1873 to 1877 was again a member of Congress. He was then appointed minister to Austria, which position he held till 1881. In 1881-4 he served again in Congress, and from 1884-5 was minister to Germany; in 1885 he was commissioner to the Kongo International Conference at Berlin, and special envoy to the Samoan International Conference in 1893. In 1897 he was appointed special commissioner plenipotentiary to negotiate reciprocity treaties as provided for by the Dingley Tariff Law, and in 1898 was a member of the American Canadian Joint High Commission. He has written 'History of the Monroe Doctrine' (in the 'North American Review' 1881); 'History of the Formation of the United States Constitution' (1889).

Kästner, kést'nér, Abraham Gotthelf, German mathematician and poet: b. Leipsic 27 Sept. 1719; d. Göttingen 20 June 1800. He received an appointment at Göttingen, where, in accordance with the reformatory spirit which animated that university in the latter part of the 18th century, he exerted a powerful influence in delivering mathematical and natural sciences from the bondage of antiquated text-books. His 'Anfangsgründe der Mathematik' (6th ed. 1800), and his various other writings, inaugurated a more enlightened era of scientific study in Germany. He took a conspicuous part in the formation of the celebrated union of Göttingen poets, and by his assistance the elder Boye succeeded in introducing, through the instrumentality of the 'Musenalmanach,' an entirely new generation of poets to the public. His general popularity was chiefly due to his 'Sinngedichte.' A portion of his epigrammatic poems were included in his 'Miscellaneous Writings' (1783).

Kastner, Johann Georg, yō'hān gā'örg käst'nér, German composer and writer on music: b. Strasburg 9 March 1810; d. Paris 19 Dec. 1867. He studied with Maurer and Romer; in 1832-5 composed four operas, of which 'Die Königin der Sarmaten' (1835) is chief; and then removed to Paris, where he wrote other operas, among them his best work, 'Le dernier Roi de Juda,' presented at the Conservatoire in 1844. From 1837 he also published a series of elementary treatises on music, a once authoritative work on instrumentation being perhaps the best. He was made an associate of the Académie Française.

Katab'olism, otherwise known as destructive metabolism; the chemical changes occurring within an organism and resulting in the formation of simpler products through the decomposition of more complex ones.

Katahdin, ká-tä'din, or **Ktaadn**, the highest mountain in Maine, situated in Piscataquis County and in the central part of the State. The region is difficult of access, the Penobscot River being the only thoroughfare, and its course being interrupted by frequent shoals and falls. The mountain, which has an altitude of 5,385 feet, is entirely of granite, and stands in abrupt walls with acres of surface exposed in naked floors. Its sides which are marked by bare spots caused by sliding rock, present a striking appearance. On its summit are found only lichens and a few dwarfish plants; half-way down, the birch and other forest trees are stunted. Over the granite rocks, even to the summit, are found boulders of trap and of other rocks not belonging to the mountain, and among them pieces of sandstone containing fossil shells. The view of the country from the summit embraces scattered mountains rising in conical granitic peaks, among which are interspersed hundreds of lakes, many of them large, and innumerable streams.

Katatypy, a new method in photography. Over the finished negative is poured a solution of hydro superoxide. This leaves, after evaporation, a uniform layer of peroxide of hydrogen. Soon the silver of the plate works upon this peroxide and produces a catalytic dissolution wherever there is silver, while in the places free from silver the peroxide remains. By this means an invisible picture of hydro superoxide is produced upon the plate. This picture can be printed from the plate directly upon common paper, to which the image is transferred.

Ka'ter, Henry, English physicist: b. Bristol 16 April 1777; d. London 26 April 1835. In 1799 he went to India where he was engaged on the great trigonometrical survey, a work to which he rendered important service. In 1814 he retired on half-pay, and henceforth occupied himself exclusively with scientific studies. He was employed by the emperor of Russia to construct standards for the weights and measures of that country; determined the length of the seconds pendulum (see KATER'S PENDULUM), investigated the diminution of terrestrial gravity from the pole to the equator; and invented the "floating collimator," an instrument of great use to trigonometers. With Dr. Lardner he wrote the 'Treatise on Mechanics' in the 'Cabinet Cyclopaedia.'

Kater's Pendulum, a contrivance for measuring the force of gravity, named from its inventor Henry Kater (q.v.). The principle governing its action is the fact that in the case of a physical (compound) pendulum the centres of oscillation and of suspension are interchangeable. It is a bar pendulum with two sets of knife edges, symmetrical in form, but not in the distribution of masses with reference to the geometrical centre; and, somewhat modified and improved, is now the standard for geodetic work.

Kati'po, the New Zealand name for alleged poisonous spiders of the genus *Latrodectus* (q.v.).

KATIPUNAN—KAUFMAN

Katipunan (kä-tē-poo'nän) Society, a secret society in the Philippines, organized originally to oppose Spanish supremacy. At the adjournment of the Filipino Congress it was decreed that the supreme council of the Katipunan Society should assume control of native affairs. The society organization was purely military, with a chief or colonel assigned to each 100 members. Each member signs an oath written in his own blood, swearing under most revolting penalties to serve and obey the society. The membership in the organization has gradually decreased since the American occupation.

Katsura, käts-wē'a, COUNT, Japanese soldier and statesman: b. Chosiu 1847. He received a military training in Prussia, entered the Japanese army in 1867, fought in the war of the Mikado's restoration, was vice-minister of the army in 1886-91, and in the Chino-Japanese war (1894-5) commanded the 3d division, with which 4 March 1895 he captured New-chwang. In 1896 he was governor-general of Formosa, in 1898-1900 minister of war, and in 1901 became prime minister.

Katte, Walter, American civil engineer: b. London, England, 14 Nov. 1830. Coming to the United States in 1850 he was resident engineer of the Pennsylvania State canals 1857-8, and subsequently held various engineering posts of responsibility. From 1865 to 1875 he was in the employ of the Keystone Bridge Company of Pittsburg, superintending at this time the building of the steel arch bridge at St. Louis. He was chief engineer of the New York elevated railroad 1877-80, and from 1880 to 1898 held similar posts on other important railroads, including the New York Central.

Ka'tydids, large neuropterous insects of the grasshopper family *Locustidae*, remarkable for their loud and shrill call. The katydids belong to several allied genera which have the head obtuse in front, the wings and wing-covers large and leaf-like, and the color bright green. Highly developed stridulating organs are found in the males in the form of transparent drum-like structures at the base of the wing-covers, by the friction of which, one against the other, as the wings are raised and lowered, the well-known call is produced. This is heard only at night (though some species have quite different day calls as well) and is so loud and shrill as to be distinctly audible at a distance of a quarter of a mile. The call of the males is answered by chirps from the females. The characteristic eggs are gummed to twigs in two contiguous over-lapping rows. Katydids are peculiarly American. The common species is *Cystophylus concavus*, known by its very broad coarse-veined wing-covers and long ovipositor. In *Phylloptera oblongifolia* the wing-covers are narrower and the veins finer. Other related genera are *Phaneroptera* and *Microcentrum*.

Katzbach (käts'bāh) River, a small stream in Silesia, Prussia, falling into the Oder at Parchwitz. On its bank 26 Aug. 1813 a battle was fought between the French and the Prussians in which the latter under Blücher won a signal victory. The French lost 12,000, and 18,000 were taken prisoners.

Katz'er, Frederic Xavier, American Roman Catholic archbishop: b. Ebensee, Austria, 7 Feb. 1844; d. Fond du Lac, Wis., 20 July 1903.

He came to this country in 1864, and was ordained to the priesthood in 1866. Until 1875 he was a professor in the Seminary of St. Francis in Milwaukee, when he became pastor of the cathedral at Green Bay and secretary of Bishop Krautbauer. After four years of labor in this capacity, he was appointed vicar-general of the diocese of Green Bay, and on the death of Bishop Krautbauer, in December 1885, became administrator, and in May 1886, bishop of Green Bay. In December 1900 he was chosen archbishop of Milwaukee.

Kauai, kow'i-, one of the Hawaiian Islands, the most northern of the group, in lat. 22° N. and long. 159° 30' W.; area, 590 square miles. It is of volcanic origin, its highest elevation reaching nearly 6,000 feet; but although mountainous in character the island has a soil of great fertility, a considerable portion of which, mainly in the northern part, is under cultivation. Sugar is the chief product, and tropical fruits are also largely grown. There is great extent of forest land, and the island is well supplied with streams, the largest of which is Hanalei. The principal harbors are Hanalei, Koloa, Nawiliwili, and Waimea. Pop. (1900) 20,734.

Kauffmann, kowf'män, Marie Angélique Catherine, commonly known as ANGELICA KAUFFMAN, Swiss painter: b. Coire, Switzerland, 20 Oct. 1741; d. Rome 5 Nov. 1807. She was the pupil of her father, John Joseph Kauffmann, a painter of little note. Her first work of importance was a portrait of the Duke of Modena and his duchess. She then collaborated with her father in the decoration of the parish church and castle of Schwarzenburg, his birthplace, painting many portraits in the meantime. Going to Florence, she was hindered in her artistic career by her passionate devotion to music and singing, but in 1763 finally abandoned all other pursuits for that of painting. She fell under the influence of Winckelmann at Rome, and produced the 'Mother of the Gracchi.' She also did some work in co-operation with the Venetian landscape painter Zucchi, whom she subsequently married. It was at this point in her life that she developed the particular sentimental style of her paintings as seen in 'Anna and Abra'; and 'Samma at the Grave of Benoni,' which created a furore. In London (1765) she became the darling of court and aristocracy, and was loaded with wealth and honor; she was made member of the Royal Academy and was thought to have inspired Sir Joshua Reynolds with tender feelings. She was, however, unfortunate in marrying a Swede who called himself Count Hom, from whom she was later divorced. She eventually married Zucchi, and settled in Rome (1781). While her tenderness borders on mawkishness, and her designs are monotonous, her imaginative figures have an elevated charm which was not without its influence in circles where George Morland was typical of English art. Her personality cast a reflection which enhanced the impression which her pictures made on her contemporaries, and the 'Miss Angel' of Mrs. Thackeray Ritchie exhibits with tact and fidelity this interpretation of her somewhat remarkable career.

Kaufman, David S., American politician: b. Cumberland County, Pa., 1813; d. Washington, D. C., 13 Jan. 1851. A graduate of Princeton

KAUKAUNA — KAVA-KAVA

University, he removed to Natchez, Miss., where he studied law. In 1837 he settled in Nacogdoches, Texas, and the next year was elected to the Texas Congress. He was twice re-elected and twice chosen speaker of the House. In 1843 he entered the Texan Senate, taking an active part in favor of annexation, and being elected one of the first members of the House of Representatives from Texas (1846-51).

Kaukauna, kā-kā'na, Wis., city, in Outagamie County; on the Fox River, and on two divisions of the Chicago and Northwestern railroad; about 21 miles southwest of the city of Green Bay and seven miles northeast of Appleton. At this point the Fox River has a fall of 50 feet within one mile, which gives the city excellent water power. A government ship canal has been built to overcome the obstruction to navigation caused by the rapids. The place was first settled in 1790 by Dominick Ducharme, and was incorporated as a town in 1850. It was chartered as a city 5 April 1885. The city has two banks with a combined capital of \$160,000; and the bookings show a total of business of \$800,000. The chief industrial wealth of the city is derived from railroad shops, employing 450 men; Union Bag and Paper Company works, 300 employees; Pulp and Paper Company works, 225; Outagamie Paper Company works, 175; Kaukauna Fibre Company, 80; Lindane Pulp Company, 80. The city has 10 churches, one high school, two graded public schools, and two graded parish schools. About one half the population are Germans. Pop. (1900) 5,115.

JAMES I. TOWER,
Editor of 'Sun.'

Kaulbach, Wilhelm von, vīl'hēlm fōn kowl'bāh, German painter: b. Arolsen 15 Oct. 1805; d. Munich 7 April 1874. He learned the rudiments of his art from his father who was a goldsmith and engraver on copper. He was a good draftsman when he went to Düsseldorf in 1821 and entered the Art Academy where his chief teacher was Cornelius, already acknowledged as the head of the Düsseldorf school of historic painting. When Cornelius in 1825 removed to Munich, at the invitation of King Ludwig of Bavaria, he followed him and soon became his disciple in the art of ceiling decoration, examples of which are 'Apollo and the Muses' in the great hall of the Odeon, and the allegorical figures of the 'Four Chief Rivers of Bavaria,' and of 'Bavaria' in the portico of the royal palace. His pure and classic power of design is well exhibited in the 16 wall paintings, illustrating the story of 'Cupid and Psyche,' in the palace of Duke Maximilian at Munich. He was at this time attracted to the study of Hogarth's works, the fruit of which appeared in his illustration of books, including the works of Shakespeare, Goethe, and Schiller, and the Reineke Fuchs. He painted many great incidents in the history of Germany, including twelve scenes from Klopstock's 'Hermann's Fight,' and the 'Death of Hermann,' wall paintings in the queen's palace at Kingsbau. But his most ambitious and comprehensive works are those in which he endeavored to represent the progress of the human race by a series of typical historic tableaux. These comprise the 'Tower of Babel'; 'Age of Homer'; 'Destruction of Jerusalem'; 'Battle of the Huns and Romans';

'The Crusaders'; 'The Reformation' (1847-63). The range of his intellectual ideas, his wonderful power of generalization, his mastery of every style of painting from caricature to the sublimity of the Italian cinquecentists, as represented by Michelangelo, have no parallel among modern painters. His coloring may be a little cold, sometimes a little crude, but his sense of form, his loftiness of conception and his genius for harmonious composition have won for him the first place among German artists of the transition period between the idealism of Cornelius and the realism of the modern historic school.

Kauri, kow'rī, the native name of a tree, and of the valuable gum derived from it. It is the most conspicuous species (*A. australis*) of the East Indian and Australian genus *Agathis* (formerly *Dammaria*) of coniferous trees,—a native of New Zealand, where it grows only at the northern extremity of the North Island. It reaches the height of 150-200 feet, and its timber is much valued for building purposes, for making furniture, etc., and still more for masts and ship-building, but it is becoming very rare. The resin of this tree, the kauri gum, forms a valuable export, and is used in making fine varnish, etc. Most of it is obtained in a semi-fossil state, by digging in places where the tree no longer grows. See DAMMAR.

Kautz, kowtz, Albert, American naval officer: b. Georgetown, Ohio, 29 Jan. 1839. He was graduated at the United States Naval Academy in 1859, became a lieutenant in 1861 and rose through gradual promotion to the rank of rear-admiral in 1898. He was flag-lieutenant to Farragut in 1862, and when New Orleans was surrendered he entered the city and raised the national flag over the custom-house. He took command of the Pacific station and in the following March was prominent in the settlement of the Samoan troubles. He was retired in January 1901.

Kautz, August Valentine, American general: b. Ispringen, Germany, 5 Jan. 1828; d. Seattle, Washington, 4 Sept. 1895. He was a brother of Albert Kautz (q.v.), and his parents settling in Ohio in 1832, he was graduated from West Point in 1852. He served through the Civil War in the Federal army, distinguishing himself in several engagements, was promoted colonel in 1874, and brigadier-general in 1891. He published: 'The Company Clerk' (1863); 'Customs of Service for Non-Commissioned Officers and Soldiers' (1864); and 'Customs of Service for Officers' (1866).

Kautzsch, kowch, Emil Friedrich, German Protestant theologian: b. Plauen, Saxony, 4 Sept. 1841. He was educated at the University of Leipsic where he became tutor in Old Testament exegesis in 1869, and professor extraordinary in 1871. From 1872 to 1880 he was professor at Basel, at Tübingen 1880-8, and at Halle from the last named date. With Socin and Zimmerman he founded the Palestine Exploration Society of Germany in 1877, and among important works which he has edited are: the 22d to the 26th editions of Gesenius' 'Hebrew Grammar' (1878-96); and the 10th and 11th editions of Hagenbach's 'Encyklopädie und Methodologie der theologischen Wissenschaften' (1880-4).

Kava-Kava. See AVA.

KAVANAGH—KEAN

Kavanagh, kav'a-nä, Julia, Irish novelist: b. Thurles, Ireland, 7 Jan. 1824; d. Nice, France, 28 Oct. 1877. She wrote a large number of novels, the scenes of which were almost invariably laid in France, where her life was mainly spent until she began a literary career in London in 1844. Among her works are: 'Nathalie' (1851); 'Daisy Burns' (1853); 'Two Lilies' (1877); 'Woman in France During the 18th Century' (1850); 'A Summer and Winter in the Two Sicilies' (1858); 'French Women of Letters' (1861); 'English Women of Letters' (1862). Her novels and other works were popular both in this country and in England.

Kaveri, or Kavery. See CAUVERY.

Kaw (more correctly KANZA), a branch of the Osage division of the Sioux Indian stock, formerly living on the lower Kansas River, and early in the 19th century estimated at 1,300. In 1846 the government removed them to a reservation in the present Oklahoma, west of the Osage River; where they dwindled so rapidly that in 1900 there were only 217, over half of them of mixed blood.

Kay, John, English inventor: b. Walmersley, Lancashire, England, 16 July 1704; d. France, after 1764. In 1733 he invented the fly-shuttle, for which a patent was granted him, and in 1745 a power loom for the weaving of narrow goods, a patent for which was also granted. These inventions, however, so greatly aroused the anger of the working classes, who feared that the machines would entirely supersede hand labor, that they stole Kay's machines, wrecked his home, and obliged him to flee to France, where he died in poverty.

Kaye, Sir John William, English military historian: b. Acton, Middlesex, 1814; d. London 24 July 1876. He was for a number of years an officer in the Bengal artillery, but resigned in 1841. In 1856 he entered the East India Company, and upon the transfer of the government of India to the crown, succeeded John Stuart Mill in the political department of the India office. His works consist of histories and biographies relating to the East, among them being 'A History of Afghanistan' (1851-3); 'History of the Administration of the East India Company' (1853); 'A History of the Sepoy War in India' (1857-8; London 1864-75), a comprehensive narrative of the celebrated Mutiny down to the fall of Delhi; 'Lives of Indian Officers' (1867); 'Essays of an Optimist' (1870).

Kazaks'. See KIRGHIZ.

Kazan, kä-zän', Russia, a fortified city, capital of the government of the same name, on the Kazanka, about four miles above its junction with the Volga, 460 miles east of Moscow. It properly forms three towns—the kremlin or citadel, the middle town, and the lower town. Many Mohammedan Tartars still reside here, engaged in business. It is a bishop's see, and the seat of a small university, founded in 1803. It has also several other schools. Here are large soap-works and tanneries, also manufactures of woolen, cotton, lace, and earthenware. It carries on an extensive trade. The caravans to Bokhara and China pass through Kazan. At a little distance from Kazan is an admiralty establishment, with a navigation school, maga-

zines, and a dock-yard, where vessels are constructed, and sent down the Volga to the Caspian Sea. Pop. about 135,000.

Ke'a, a large olive-green parrot of New Zealand (*Nestor notabilis*) with the hawk-like beak of its race, which in its former wild condition fed chiefly upon insects, but since the introduction of sheep into the South Island (to which it is confined) has become a meat eater. These birds haunt the vicinity of slaughtering pens, and feed with avidity upon offal, sheep-heads and the like. This led them to attack wounded sheep, or those with sores; and finally taught some of these parrots to alight upon the back of a sheep, pull out the wool and even tear away the living flesh. These injuries were usually upon the loins, and the fat about the kidneys seems to be the special attraction. So many keas have been killed by herdsmen that the species is now rare. Compare KAKA; and consult Buller, 'Birds of New Zealand' (1888).

Kean, kēn, Charles John, English actor: b. Waterford, Ireland, 18 Jan. 1811; d. Queensborough Terrace, Chelsea, London, 22 Jan. 1868. He was second son of Edmund Kean (q.v.). He made his first stage appearance 1 Oct. 1827 as Young Norval in 'Douglas.' In 1830 he visited the United States, where he was favorably received before he had made a London reputation. In 1850-9 he managed the Princess Theatre, where he introduced more elaborate machinery and setting than had yet been seen on the English stage, revived Byron's 'Sardanapalus,' and appeared (13 Jan. 1855) in his greatest role, Louis XI., in Boucicault's adaptation of de la Vigne's play of the name. His Hamlet was his chief tragic part, but he was best in melodrama. He withdrew from the stage 28 May 1867. Consult: Cole, 'Life and Theatrical Times of Charles Kean' (1850); Cook, 'Hours with the Players,' Vol. II. (1881).

Kean, Edmund, English tragedian: b. London 4 Nov. 1787; d. Richmond Surrey 15 May 1833. His supposed parents were connected in a low capacity with the theatrical profession. He was early on the stage, and for several years wandered about the provinces, now as reciter and singer, now as tumbler in a circus, and later as a member of itinerant companies. He married Miss Chambers, an actress in his company, in 1808. In 1814 he appeared at Drury Lane as Shylock. His triumph was decided and he at once commanded large salaries. Hazlitt and Lamb eulogized him. Coleridge said: "To see Kean act is like reading Shakespeare by flashes of lightning." At Kemble's retirement in 1817 Kean took the foremost place on the English stage. He appeared in several other tragic roles, among them Richard III., Hamlet, Lear, Sir Giles Overreach, and Othello. In these characters he has perhaps never been equaled. He first came to the United States in 1820, when he was seen with enthusiasm in New York, Boston, and Philadelphia. A second, but much less successful tour in 1825 was extended to Canada, where he was chosen a chief of the Huron Indians. His hold on the public remained uninterrupted until 1825, when he appeared in the character of co-respondent in an action of divorce. He never regained public favor; his dissolute habits also began to tell on him, and he made his last appearance in Othello, in company with his son Charles, in 1833, but

KEAN—KEARNY

broke down during the performance, and his death took place some three months later. The biographies by Barry Cornwall (1835) and F. W. Hawkins (1869), although the best existing, contain much apocryphal material, a good share of it furnished by Kean himself.

Kean, Ellen Tree, English actress: b. 1805; d. London 20 Aug. 1880. Her début was made at Covent Garden Theatre, London, in 1823, and she soon became known as a talented performer in high comedy. She visited this country in 1839 and was very successful. In 1842 she was married to Charles John Kean (q.v.) and with him visited America again in 1846. She retired from the stage after his death in 1868.

Keane, kēn, John, 1st Lord KEANE, Irish soldier: b. 6 Feb. 1781; d. Burton Lodge, Hampshire, 26 Aug. 1844. He entered the army as a captain in 1794, commanded a brigade of the third division in the Peninsular war and became major-general (1814), was in command of the British force landed in December 1814 for an attack on New Orleans, was superseded by Pakenham and Gibbs on their arrival with reinforcements, and led the left column in the action of 8 Jan. 1815. In 1823–30 he was military commander and civil governor in Jamaica, in 1834–9 was commander-in-chief at Bombay, and in 1839 led the "Army of the Indus" in the invasion of Afghanistan, when Ghuznee was taken (23 July). For this service he was made Baron Keane of Ghuzni and Cappoquin. He attained the rank of lieutenant-general (1830).

Keane, John Joseph, American Roman Catholic archbishop: b. Ballyshannon, County Donegal, Ireland, 12 Sept. 1839. In 1846 he was brought by his family to the United States, and was educated at St. Charles' College and St. Mary's Seminary, Baltimore. He was ordained priest in 1866, and was assistant rector of St. Patrick's Church, Washington, D. C., 1866–78. He became bishop of Richmond in 1878, was rector of the Catholic University of America 1886–97, and was installed archbishop of Dubuque in 1900. He has contributed to various periodicals, and was Dudleyian lecturer at Harvard in 1890.

Kearney, kär'nī, Denis, American labor agitator: b. Oakmont, County Cork, Ireland, 1847. He went to sea from 1858 to 1872; and in the latter year settled in San Francisco, becoming foreman of a gang of stevedores and later going into the draying business independently. In 1877 he began an agitation among the workingmen, his attacks being directed mostly against the rights of capital and the importation of Chinese labor. Large mass-meetings were held in the so-called "Sand Lots" near the city, and the movement grew rapidly in power and importance, but dominated entirely by Kearney. Finally he was able to pack a convention which adopted a new State constitution in the interests of his movement, and very detrimental to capital and property interests. In 1878 he visited the Eastern States, speaking in the large cities, but failed to gain an important following; on his return to California he gradually lost his influence and his party sank into obscurity.

Kearney, Neb., city, county-seat of Buffalo County; on the Burlington & M. R., the Union

Pa., and the Kearney & B. H. R.R.'s; about 125 miles west of Lincoln and 175 miles, in direct line, southwest of Omaha. Kearney is midway between the eastern and western coasts of the United States. The first settlement was made in 1871; it was incorporated in 1872, and received its city charter in 1889. It is in the midst of a rich agricultural region noted for wheat and live-stock. The chief industrial establishments are a furniture factory, three cigar factories, and large brick yards. The city is the seat of a State Industrial School for Boys, a State Normal School (1903), a Military Academy under the auspices of the Episcopal Church, a high school, and a public library. It has three banks, the combined capital of which is \$200,000. The government is vested in a mayor who holds office two years, and in a council of eight members, elected annually. Pop. (1900) 5,634; (1904) 7,000.

F. L. WHEDON,

Editor 'The Kearney Democrat.'

Kearns, Thomas, American politician: b. near Woodstock, Ont., 11 April 1862. He attended the public schools until his father's removal to Holt County, Nebraska, in 1872, then worked on the home farm till he was 14. After several years spent as a freighter in Nebraska he removed to Utah in 1883, where he worked at first as a miner, becoming subsequently one of the owners of the Mayflower and Silver King mines. He was a member of the common council of Park City, Utah, in 1895, and was a delegate to the National Republican convention the next year. He was also a delegate to the Philadelphia convention in 1900, and was elected a member of the United States Senate in 1901. He is largely identified with the mining interests of Utah and is one of the owners and projectors of the Salt Lake, San Pedro and Los Angeles railroad which runs from Salt Lake City, Utah, to Los Angeles, Cal.

Kearny, Lawrence, American naval officer: b. Perth Amboy, N. J., 30 Nov. 1789; d. there 29 Nov. 1868. Having entered the navy in 1807, he was active in the defense of the coast of South Carolina and States adjacent during the War of 1812, and in 1826 in command of the Warren effectually put an end to the depredations of the Greek pirates in the Levant. Promoted captain (1832), he was assigned (1841) to the command of the East India squadron, and began the negotiations for a commercial treaty between China and the United States, later concluded by the special envoy, Cushing. On his return voyage to the United States, Kearny stopped at the Hawaiian Islands to protest against the contemplated transfer of the islands to Great Britain. In 1867 he was made commodore on the retired list.

Kearny, Philip, American soldier: b. New York 2 June 1815; d. near Chantilly, Va., 1 Sept. 1862. He was graduated from Columbia in 1833, studied law, but in 1837 entered the United States army as lieutenant of the 1st dragoons, and in 1830–40 was in Europe for the study of the cavalry service of the French army, with which he fought in the Algerine war. In 1841 he was on the staff of Gen. Scott, in 1846 resigned from the army, but soon afterward enlisted for the Mexican War, fought at Contreras and Churubusco, and at the close of the latter engagement charged and pursued into Mexico

KEARNY—KEATS

City the retreating enemy. He again resigned from the army in 1851, in 1859 entered the French service, and participated in the war in Italy, where he fought at Solferino. On 17 May 1861, he was appointed brigadier-general in the Union service, and given command of the 1st New Jersey brigade in the Army of the Potomac. Later he was assigned to the command of the cavalry of that army, and served conspicuously in the Peninsula. He was commissioned major-general of volunteers 7 July 1862, took part in the second Bull Run, and subsequently at Chantilly was shot while reconnoitering. Kearny was a brilliant cavalry leader, termed by Scott "the most perfect soldier" he ever knew. Consult: De Peyster, 'Personal and Military History of Philip Kearny' (1869).

Kearny, Stephen Watts, American general; b. Newark, N. J., 30 Aug. 1794; d. St. Louis, Mo., 31 Oct. 1848. He entered the United States army in 1812 as lieutenant, and distinguished himself in the action at Queenstown Heights in the same year. He served throughout the war, and became, in June 1846, a brigadier-general. At the commencement of the Mexican War he commanded the "Army of the West," which marched from Bent's Fort on the Arkansas westward, and conquered New Mexico. Having established a provisional civil government in Santa Fé, he proceeded to California, and participated with his command in the battle of San Pascual, in December 1846. For his services in this campaign he was appointed brevet major-general, his commission being dated from the battle of San Pascual. He was governor of California from March to June 1847, but subsequently joined the army in Mexico, where he continued until the close of the war. He wrote: 'Manual for the Exercise and Maneuvering of United States Dragoons' (1837); 'Organic Law'; 'Laws for the Government of New Mexico' (1846).

Kearny, N. J., town in Hudson County, on Newark Bay, between the Passaic and Hackensack rivers, and on the Pennsylvania, the Lehigh V., the Erie, and the Delaware, L. & W. R.R.'s; opposite the city of Newark. The first permanent settlement was made in 1765, by Germans, and the place was called New Barbadoes. Later it became a part of Harrison, but in 1871 it was incorporated and named in honor of Gen. Philip Kearny (q.v.) who once lived in the place, and whose residence still stands within the limits of the town. It has several manufacturing establishments, the chief of which are the Nairn Linoleum works with 1,200 employees; the Arlington Company Celluloid works, 1,000 employees; and the Marshall Thread Company, 2,000 employees. Other manufactures are golf balls, metal bedsteads, roofing material, and brass novelties. The town has a State Soldiers' Home, the Sacred Heart Industrial School for Boys, public and parish schools, and nine churches. In Arlington, or the third and fourth wards, there are many fine residences with large and well kept grounds. The government is vested in an alderman-at-large, practically a mayor without veto power, and a council of eight members, elected every two years. Pop. (1900) 10,896.

W. J. KEEGAN,
Editor of West Hudson (Press.)

Kearsarge, kēr'sārj, the name of two mountain peaks of the White Mountains. (1) Mount Kearsarge in Carroll County, N. H., is 3,260 feet in height. The Federal vessel which sank the Confederate cruiser Alabama was named after this mountain. (2) Kearsarge Mount, in Merrimac County, N. H., is 2,943 feet in height. This mountain was once called Kyar-Sarga.

Kearsarge, The, a ship of the United States navy which played a conspicuous part in the only sea-fight of the Civil War. See ALABAMA, THE.

Keary, kē'rī, Annie, English novelist: b. Bitton near Wetherby, Yorkshire, 3 March 1825; d. Eastbourne, Sussex, 3 March 1879. Beginning a literary career with books for children, she made her reputation with stories of Irish life and became very popular, 'Castle Daly' (1875) being her best work. Among other fictions by her are: 'Clemency Franklyn' (1866); and 'A Doubting Heart,' left unfinished at her death and completed by Mrs. Katharine Macquiod. She also published such historical works as 'Early Egyptian History'; and 'The Nations Around.'

Keary, Charles F., English novelist and antiquarian writer. He was educated at Cambridge University and beside the novels 'A Mariage de Convenience' (1889); 'Herbert Vanlennert' (1895); 'High Policy' (1902); etc., has published 'Outlines of Primitive Belief' (1882); 'The Mythology of the Eddas' (1882); 'The Vikings in Western Christendom' (1890); 'Norway and the Norwegians' (1892); 'Riegel: an Autumn Mystery' (1903).

Keasbey, kēz'bē, Lindley Miller, American political economist: b. Newark, N. J., 24 Feb. 1867. He was graduated from Harvard in 1888 and went abroad to study at Strasburg. He was appointed professor of political science at the University of Colorado in 1892, where he remained for two years, and in 1894 became professor in the same department at Bryn Mawr. He has written a number of monographs and magazine articles, also 'The Nicaragua Canal and the Monroe Doctrine' (1896); and has translated 'The Economic Foundations of Society' from Loria.

Keats, kēts, Gwendoline, "ZACK," English novelist: b. Devonshire. She first attracted notice by a series of dialect tales appearing in 'Blackwood's Magazine,' and in 1898 acquired sudden fame by her volume, 'Life is Life,' consisting of 12 stories delineating with skill and vigor the more painful and hopeless side of existence. Later books by her include: 'On Trial' (1899); 'Tales of Dunstable Weir' (1900); 'The White Cottage' (1901).

Keats, John, English poet: b. Moorfields, London, 31 (29?) Oct. 1795; d. Rome, Italy, 23 Feb. 1831. He studied in John Clarke's school at Enfield, was apprenticed (1810) for five years to a surgeon at Edmonton, broke his indentures (1814), continued his surgical studies in the London hospitals of St. Thomas' and Guy's, was appointed dresser at the latter (1816), but soon afterward relinquished his professional work, and turned to literature, aided by Leigh Hunt, who published some of his verse in the 'Examiner.' In 1817 appeared his volume 'Poems, by John Keats,' containing

KEBLE — KEELEY

work of much promise, but quite unrecognized by the public. This he followed in 1818 by 'Endymion,' a volume whose obvious defects explained though they could not justify the bitter critical attacks in 'Blackwood's Magazine' (it is supposed by Lockhart) and the 'Quarterly Review' (by J. W. Croker), whose vulgar abuse was extreme even for those times. Keats continued his poetical work, however; collaborated with Charles Armitage Brown in the tragedy of 'Otho the Great,' and in 1820 published 'Lamia, Isabella, the Eve of St. Agnes, and other Poems,' on which volume his reputation as one of the great English poets is based. Already stricken with consumption, he sailed for Italy September 1820, and there died at Rome, where he was buried in the Protestant cemetery. His best work in its structure and content evinces an ease and a fulness of imagination similar to that of the great Elizabethans; and though he knew no Greek, he seized by intuition the Greek spirit. At times in his earlier experiments he is intricate, fantastic, and unhappy in diction. The best edition of his poems is by H. B. Forman (1889). Consult also: R. M. Milnes, 'Life, Letters and Literary Remains of John Keats' (new ed. 1867); Clarke, 'Recollections of John Keats' in 'Recollections of Writers,' by C. and M. C. Clarke (1878); the 'Life' by W. M. Rossetti (1887); and that by Colvin (1891) in the 'English Men of Letters' series; Goethein, 'John Keats Leben und Werke' (1807); H. C. Shelley, 'Keats and His Circle' (1902).

Keble, kēbl, John, English Anglican clergyman and poet: b. Fairfield, Gloucestershire, 25 April 1792; d. Bournemouth, Hampshire, 29 March 1866. He was educated at Corpus Christi College, Oxford, and took his degree in 1811 with high honors. Going to Oriel as a fellow, he became college tutor and public examiner, and in 1831–41 was professor of poetry. He took priest's orders in 1816 and was his father's curate for some time. He was appointed vicar of Hursley, near Winchester, in 1836, a position which he held until his death. To the world at large he is best known as the author of the famous volume of religious verse, 'The Christian Year' (q.v.). He also wrote the 'Lyra Innocentium,' and, with Newman and others, the 'Lyrica Apostolica.' He was a zealous High Churchman, and wrote several of the celebrated 'Tracts for the Times' (1833). Keble College, Oxford, was founded as a memorial of him. Consult: 'Lives' by J. T. Coleridge (1869), and Lock (1892); Yonge, 'Musings over the Christian Year' and 'Lyra Innocentium'; Shairp, 'Studies in Poetry and Philosophy' (1868); Newman, 'Apologia pro Vita sua' (1864); Yonge, 'John Keble's Two Parishes' (1898).

Keble College, one of the colleges of Oxford University, built by subscription as a memorial of the Rev. John Keble, and incorporated in 1870 by royal charter.

Ked'die, Henrietta, "SARAH TYTLER," Scottish novelist: b. Cupar, Fifeshire, 4 March 1827. From 1848 to 1870 she was joint owner of a girls' school in her native place, and from 1870 to 1884 was engaged in literary work in London. She has since resided in Oxford. Her best work is 'Citoyenne Jacqueline' (1865), a

well-told story of the French Revolution. Among other works of hers are: 'Papers for Thoughtful Girls' (1862); 'St. Mungo's City' (1885); 'Six Royal Ladies of the House of Hanover' (1898); 'Women Must Weep' (1901); 'Three Men of Mark' (1901).

Ked'ney, John Steinfort, American Episcopal clergyman: b. Essex County, N. J., 12 Feb. 1819. He was graduated from Union College in 1838 and from the General Theological Seminary, New York, in 1841. After taking orders in the Episcopal Church he was rector of several churches until 1871, when he became professor of divinity in Seabury Divinity School, Faribault, Minn. He has published: 'Catawba River and Other Poems' (1846); 'The Beautiful and the Sublime' (1884); 'Hegel's Ästhetics' (1886); 'Christian Doctrine Harmonized' (1888); 'Mens Christi' (1890); 'Problems in Ethics' (1899).

Keefer, kē'fér, Samuel, Canadian engineer: b. Thorold, Ontario, 22 Jan. 1811. He is a brother of T. C. Keefer (q.v.). In 1841–53 he was chief engineer of the government board of public works, in 1853 was appointed resident engineer of the Grand Trunk railway, and in 1857–64 was government inspector of railways and deputy commissioner of public works. He completed in 1869 the Niagara Falls suspension bridge, then the longest existing single-span structure. His design and description of the bridge received a gold medal at the Paris exposition of 1878.

Keefer, Thomas Coltrain, Canadian engineer: b. Thorold, Ontario, 4 Nov. 1821. He is a brother of Samuel Keefer (q.v.). He was educated at Upper Canada College (Toronto), began practice as a civil engineer in 1838, and in 1850 was appointed by the government to survey the rapids of the St. Lawrence and explore the region between the headwaters of the St. John and the St. Lawrence. In 1851 he became engineer-in-chief of the Toronto and Kingston section of the Grand Trunk railway, and made surveys at Montreal for the present Victoria bridge across the St. Lawrence. He was chief commissioner for Canada at the Paris exposition of 1878. He wrote: 'The Philosophy of Railways' (1849); and an essay on 'The Influence of the Canals of Canada on her Agriculture' (1850), which won a prize offered by the Earl of Elgin.

Keeler, kē'lér, James Edward, American astronomer: b. La Salle, Ill., 10 Sept. 1857; d. San Francisco, Cal., 12 Aug. 1900. He was graduated from the Johns Hopkins University in 1881, was appointed assistant to Prof. S. P. Langley (q.v.) in the Mount Whitney (Cal.) expedition (1881), was in 1881–3 at the Allegheny Observatory, and after study in Germany (1883–4), was appointed assistant at Lick Observatory (1886), and later astronomer there (1888). In 1891–8 he was active at the Allegheny Observatory as its director and professor of astrophysics in the Western University of Pennsylvania, and from 1898 until his death was director of the Lick Observatory. His spectroscopic work included valuable studies of the nebula in Orion and of Saturn's rings.

Keeley, kē'lí, Leslie E., American physician: b. in 1842; d. Los Angeles, Cal., 21 Feb. 1900. He was graduated at Rush Medical Col-

KEELY — KEEWATIN

lege (Chicago) in 1863, was a surgeon in the Federal army during the Civil War, practised medicine at Dwight, Ill., there opened (1880) a sanitarium for the cure of inebriety and the use of narcotics, and later established branches. His system was based on a secret compound said by him to contain bichloride of gold, and hence called the "gold" cure. He published "The Morphine Eater" (1881).

Keely, John Ernest Worrell, American adventurer: b. Philadelphia, Pa., 3 Sept. 1837; d. there 18 Nov. 1898. In early life he was a carpenter. Prior to 1872 he became interested in music, and afterward claimed that the tuning-fork had suggested to him a new motive power. In 1874 a stock company was formed for the purpose of supplying funds for the perfection and promotion of the alleged discovery. Keely built and destroyed many models, gave exhibitions at which numerous remarkable and unexplained effects were produced, but never attained any important result. Upon his death it was found that the so-called Keely motor was operated by an invisible compressed-air apparatus, and that the entire scheme was fraudulent.

Keely Motor. See KEELY, J. E. W.

Keen, kēn, William Williams, American surgeon: b. Philadelphia 19 Jan. 1837. He was graduated at Brown University in 1859, and from Jefferson Medical College in 1862; and during the Civil War period was an assistant surgeon in the Federal army. He then studied in Europe 1864-6, was at the head of the Philadelphia School of Anatomy 1866-75; and at the same time lecturer on pathological anatomy at Jefferson Medical College. From 1875 to 1890 he was professor of artistic anatomy at the Pennsylvania Academy of Fine Arts and also of surgery at the Women's Medical College 1884-9, and of surgery at Jefferson Medical College. His specialty was the surgery of the nervous system. In 1890 he published experiments with the injection of filtered air for determination of rupture of the bladder and in 1891 proposed relieving spasmodic wryneck by the extsection of the nerves supplying the posterior rotator muscles of the head. He has published: "Keen's Clinical Charts" (1870); "Early History of Practical Anatomy" (1870); etc., and became honorary fellow of the Royal College of Surgeons of England in 1900.

Keenan, kē'nān, Henry Francis, American novelist: b. Rochester, N. Y., 4 May 1850. He served in the Federal army during a portion of the Civil War, and was engaged in journalistic work 1868-82. He has published: "The Money Makers: a Social Problem"; "Trajan"; "The Aliens"; "The Iron Game"; "The Players."

Keene, kēn, James Robert, American stock speculator: b. London, England, 1838. He went to California in 1852, was a miner in that State and Nevada, later was a speculator in mining stock at San Francisco, during the so-called "bonanza" period acquired \$6,000,000, and for a time was president of the San Francisco stock exchange. In 1877 he established himself in New York as a Wall Street operator, soon became known for his energetic manipulations on "Change, and since then has lost and made several fortunes.

Keene, Laura, American actress and manager: b. England 1820; d. Montclair, N. J., 4 Nov. 1873. Her real name was Mary Moss, and as "LAURA KEENE" she had become famous in England in the role of Pauline in "The Lady of Lyons" before coming to the United States in 1852, where she made her home the remainder of her life. She was for a time manager of the Varieties Theatre in New York, and 1855-63 was lessee of the Olympic, at first called "Laura Keene's Theatre." She was married to H. W. Taylor in 1847, and to J. Lutz ten years afterward. The most noted play produced by her was "Our American Cousin," brought out in 1858 with Jefferson and Sothern in the cast. While he was witnessing this play at Ford's Theatre in Washington, President Lincoln was assassinated.

Keene, N. H., city, county-seat of Cheshire County; on the Ashuelot River, and on the Boston & M. and the Fitchburg R.R.'s; about 45 miles southwest of Concord and 43 miles west of Manchester. Mount Monadnock is 10 miles from the city. The city, known as Upper Ashuelot, was settled in 1734 and incorporated in 1753 when it took the name of Keene. It received its city charter in 1874. The chief industrial establishments are the repair-shops of the Boston & Maine railroad, sash, door, and blind factories, furniture, pail and tub, and chair factories, glue works, pottery, woolen-mill and shoe factory. Nearly 2,000 persons are employed in the factories. The annual output of manufactured goods is about \$2,000,000. The products of the fertile farms of the vicinity add to the wealth of the city. Pop. (1890) 7,446; (1900) 9,165.

Keener, kē'nēr, John Christian, American Methodist bishop: b. Baltimore 7 Feb. 1819. After entering the Methodist ministry in 1841 he preached in Alabama till 1848 and was pastor and presiding elder in New Orleans 1848-61. He edited the "New Orleans Christian Advocate" (1865-70), and in the year last named was appointed a bishop of the Methodist Church, South. He has published: "Studies of Bible Truths" (1899); "The Garden of Eden and the Flood" (1900).

Keesoo, or Teeso, the flowers of certain species of *Butea* (q.v.).

Keewatin, kē-wā'tīn, a district of Canada lying west and south of Hudson Bay, and extending from Ontario and Manitoba north to the Arctic Ocean. Its area is 756,000 square miles. The greater part of the surface is hilly and somewhat mountainous, but there are no high peaks or ranges. The northern part of Lake Winnipeg and its outlet, Nelson River, are in Keewatin. There are a large number of small lakes, all of which belong in the basin of Hudson Bay. The Severn, Churchill, and Ferguson rivers cross the district and enter Hudson Bay. There is considerable fertile land, but the climate is too cold for luxuriant vegetation. In the south there are large forests of pine, spruce, and other trees. Some valuable minerals have been found, gold and copper, but the mines have not been developed. Hunting, lumbering, and fishing are the chief occupations. The inhabitants of the north are chiefly Eskimos. York Factory, at the mouth of the Nelson River, Fort Churchill, at the mouth of the

KEIFER—KELLEY

Churchill River, Norway House, on Lake Winnipeg, and a number of other places in Keewatin are trading stations of the Hudson Bay Company and its successors in the fur business of Canada. All are small settlements. The fisheries at Lake Winnipeg attract a colony a part of the year.

The name of the district comes from the Indian word kewatin, which means "northwest wind." The lieutenant-governor of Manitoba is the chief executive of this territory, and has had control since the erection of the district, 12 April 1876.

Keifer, ki'fér, Joseph Warren, American politician: b. Clark County, Ohio, 30 Jan. 1836. He was graduated from Antioch College; and in 1856 went to Springfield, Ohio, where he studied law, being admitted to the bar in 1858. At the outbreak of the Civil War he entered the volunteer service as major and rose to the rank of major-general; he was four times wounded; in 1866 he declined an appointment as lieutenant-colonel in the United States army. He was a member of the Ohio State senate in 1868-9; was delegate to the Republican national convention in 1876, and was elected to Congress in that year, serving till 1885; while from 1881 to 1883 he was speaker of the House. Since 1873 he has been president of the Lagona National Bank in Springfield; he has also been prominent in the Grand Army, being department commander in Ohio (1868-70) and vice-commander-in-chief of the national organization in 1871-2. In 1898 he served as major-general of volunteers in the Spanish War, his command being located near Havana. He has written 'Slavery and Four Years of War' (1900).

Keith, kēth, George, Scottish Quaker: b. probably in Aberdeenshire about 1639; d. Edburton, Sussex, England, 27 March 1716. He was educated at Marischal College, Aberdeen; became a Quaker in 1662, and was several times imprisoned for his preaching. In 1677 he accompanied George Fox and William Penn to Holland on a missionary journey; came to Philadelphia in 1680; and was there accused of heresy and interdicted from preaching in 1692. He then held separate meetings of his followers, known first as Keithites and later as "Christian Quakers," and came to London to defend his views. Disowned by the yearly meeting of 1694, he established a congregation in which the Quaker externals were observed but the Lord's Supper and baptism were administered. In 1700 he conformed to the Anglican Church, in 1702-4 was a missionary in America for the Society for the Propagation of the Gospel, and from 1705 until his death was rector of Edburton, Sussex. Among his writings were: 'The Deism of William Penn and his Brethren' (1699); 'The Standard of the Quakers Examined' (1702); and 'A Journal of Travels' (1706).

Keith, Sir William, English administrator in America: b. near Peterhead, England, 1680; d. London 18 Nov. 1789. He was for a time surveyor-general of the customs for the southern district of North America; in 1717 became lieutenant-governor of Pennsylvania and the three lower colonies (the present Delaware), of which Penn was titular governor; established a high court of chancery abolished in 1735; on Penn's death and the ensuing difficulties took the side of the people; and later was superseded. His

conduct had been treacherous to the proprietary authority, but he had many adherents. He was twice elected to the assembly, but in 1728 went to England and presented to the king 'A Short Discourse on the Present State of the Colonies in America.' He also wrote a 'Colonial History of Virginia' (1738), and a volume of essays (1740).

Keller, kēl'lér, Gerard, Dutch writer: b. Gouda 13 Feb. 1829. His best works are his books of travel, including: 'A Summer in the North' (1861); 'A Summer in the South' (1864); 'Paris Besieged' (1871); 'Murdered Paris' (1872); 'Europe Sketched in All her Glory' (1877-80); 'America in Image and in Writing' (1887). Among his numerous novels may be named: 'Within and Without' (1860); 'From Home' (1867); 'Over-Perfect' (1871); 'The Privy Councillor'; 'In Our Days' (1880); 'Our Minister' (1883); 'Flickering Flames' (1884); 'Nemesis' (1885). He is the author also of books for the young, and several dramas.

Keller, Gottfried, German poet and novelist: b. Zurich 19 July 1819; d. there 16 July 1890. Original in execution, he was a keen observer, genuinely artistic, and with a strong sense of humor, sometimes extravagantly indulged. In his best vein he goes straight to the heart. To romanticism in *motifs*, processes, and characters, he joined realism in execution. Among his works may be cited: 'Der grüne Heinrich' (1854, 16th ed. 1897), his first novel and one of his best; 'Seldwyla Folk,' a collection of short stories (1850); 'Romeo und Julie auf dem Dorfe' (1876); 'Martin Salander' (1886). His collected poems appeared in 1883. By critics Keller is ranked among the best of German novelists. Consult: Brahm, 'Gottfried Keller' (1883); Köster, 'Gottfried Keller' (1900).

Keller, Helen Adams, an American woman famous for intellectual progress in spite of being a blind deaf-mute: b. Tuscumbia, Ala., 1880. Consult autobiography, 'The Story of My Life' (1903); Chamberlain, 'Helen Keller as She Really Is.' See DEFECTIVES, EDUCATION OF.

Kellermann, François Christophe, frānswā krēs-tōf kēl'lér-mān (originally GEORG MICHAEL KELLERMANN), Duke of Valmy, French marshal: b. Wolfsbuchweiler-an-der-Tauber, Bavaria, 28 May 1735; d. 12 Sept. 1820. He entered the Conflans Legion as a hussar in 1752, and engaged in the first campaigns of the Seven Years' War. In 1792 he received the command of the army of the Moselle, formed a junction in September with the main army under Dumouriez, and sustained 20 Sept. 1792 the celebrated attack of the Duke of Brunswick. This "cannonade of Valmy" caused the allies to retreat, and perhaps decided, not merely the whole campaign, but also the fate of Europe, and the supremacy of France, till 1813. In the following wars of France Kellermann received various general commands. He became marshal of France in 1804 and Duke of Valmy in 1809. After the restoration of the Bourbons he was appointed a member of the chamber of peers, where he espoused the Liberal side.

Kelley, kēl'i, Benjamin Franklin, American soldier: b. New Hampton, N. H., 10 April

Copyright 1902, by C. M. Gilbert.

HELEN KELLER, HER INSTRUCTOR AND JOSEPH JEFFERSON.

KELLEY — KELLOGG

1807; d. Oakland, Md., 17 July 1891. In 1861 he recruited and became colonel of the first Virginia regiment enlisted in the Federal service, on 17 May became brigadier-general, captured Romney 26 October and was for a time, until January 1862, commander of the department of Harper's Ferry and Cumberland. In July 1863, he was appointed to command the department of West Virginia, in November 1863 destroyed the Confederate camp near Morefield, Va., and in August 1864 defeated the enemy at Cumberland, Md., and New Creek and Morefield, Va. He was brevetted major-general of volunteers in 1865, and subsequent to the war was from 1876 superintendent of the Hot Springs (Ark.) reservation, and from 1883 an examiner of pensions.

Kelley, Edgar Stillman, American composer: b. Sparta, Wis., 14 April 1857. He was graduated from the Stuttgart Conservatory of Music in 1880, and returning to this country settled in San Francisco, composing there incidental music to 'Macbeth.' He removed later to New York, where he became special instructor in composition in the New York College of Music, and where his opera, 'Puritan,' was produced in 1892. He has also composed an orchestral suite 'Aladdin' symphony; music to 'Prometheus Bound'; music for dramatic production of 'Ben Hur' (1899); etc.

Kelley, James Douglas Jerrold, American naval commander: b. New York 25 Dec. 1847. He was graduated from the United States Naval Academy in 1868; became lieutenant-commander in 1893 and commander in 1899. He has published: 'The Question of Ships'; 'Our Navy'; 'American Men-o'-War'; 'History of the Naval Experimental Battery'; 'The Navy of the United States'; and is the naval editor of the *New York Herald*.

Kelley, William Darragh, American legislator: b. Philadelphia, Pa., 12 April 1814; d. Washington, D. C., 9 Jan. 1890. He was apprenticed first to a jeweler and later to a printer, studied law at Philadelphia and in 1841 was admitted to the bar there, in 1845–6 was attorney-general of Pennsylvania, and in 1846–56 judge of the court of common pleas at Philadelphia. Previously a Democrat, he became a Republican in 1854, and in that year gave at Philadelphia a once well-known address on 'Slavery in the Territories.' In 1860 he was a delegate to the national Republican convention, and from that year until his death was a member of the House of Representatives, where he was chairman of the Committee on the Centennial Exposition and was known as 'Pig-iron Kelley.' For some years he was senior of the House. Among his publications are: 'Letters on Industrial and Financial Questions' (1872); 'Letters from Europe' (1880); 'The New South' (1887).

Kellogg, kĕl'ōg, Amas Monkham, American educator: b. Utica, N. Y., 5 June 1832. He was graduated from the Albany (N. Y.) State Normal School in 1851 and was instructor there 1852–6. Since then he has held other educational posts and has edited the 'School Journal' from 1874. He has published: 'School Management'; 'Life of Pestalozzi' (1891); 'How to be a Successful Teacher' (1901), etc.

Kellogg, Clara Louise, American opera singer: b. Sumterville, S. C., 12 July 1842. She obtained her musical education chiefly in New York, where her first appearance in opera was in 1861 at the Academy of Music, in the role of Gilda in 'Rigoletto.' Henceforward she was one of the most popular of American singers, and was also most cordially received in England, where she sang in opera 1867–8 and again in 1872 with Christine Nilsson. Her voice was a pure and flexible soprano and her execution brilliant. She had an extensive repertoire, including 45 operas. In 1874 she organized an English opera company and with it visited nearly every part of the United States. In 1876 she organized an Italian opera company and later appeared on the concert stage. In 1887 she married her manager, Carl Strakosch, and soon after retired from professional life.

Kellogg, Edgar Romeyn, American soldier: b. New York 25 March 1842. He served through the Civil War in the Federal army, and was distinguished for bravery at Murfreesboro, during the Atlanta campaign, and at Jonesboro. He commanded the 10th United States Infantry at the battle of San Juan Hill, Cuba, 1 July 1898, and was appointed brigadier-general, United States army in the following October.

Kellogg, Elijah, American Congregational minister and writer for the young: b. Portland, Maine, 20 May 1813; d. Harpswell, Maine, 17 March 1901. He was graduated from Bowdoin College in 1840, from the Andover Theological Seminary in 1843, was pastor of the Congregational Church at Harpswell, Maine, in 1844–55, in 1855–65 was chaplain of the Boston (Mass.) Seamen's Friend Society, was later for a time in charge of a congregation at Rockport, Mass., but soon returned to Harpswell, and there devoted himself to literary work. He published over a score of juveniles, including 'The Elm Island Series' (1868–70); 'Pleasant Cove Series' (1870–4), and 'Good Old Times Series' (1877–82). But he is best known for his familiar blank verse addresses, 'Spartacus to the Gladiators,' 'Regulus to the Carthaginians,' and 'Pericles to the People.' Consult Mitchell, 'Elijah Kellogg: the Man and His Work' (1903).

Kellogg, George, American inventor: b. New Hartford, Conn., 19 June 1812; d. there 6 May 1901. Albert Kellogg, the botanist (q.v.), was his brother. He was graduated from Wesleyan University in 1837, in 1841 became a manufacturer in Birmingham, Conn., removed in 1855 to New York, was a United States revenue officer in 1863–6, and later was active in manufacturing and experimentation at Cold Spring, N. Y. Among his inventions were a machine for the manufacture of jack-chain, with a capacity of a yard per minute; a type-distributer; an adding apparatus; and a dovetailing machine.

Kellogg, Martin, American Latinist and educator: b. Vernon, Conn., 15 March 1828; d. San Francisco 26 Aug. 1903. He was graduated from Yale in 1850, from the Union Theological Seminary in 1854; having removed to California about 1855 there held a pastorate at Grass Valley, Nevada County; was professor of Latin and mathematics in the College of California (1860–9); and when the college was merged into

KELLOGG — KELLY

the university held the chair of Latin and Greek in the latter institution in 1869–76. In 1876–94 he was professor of Latin language and literature, in 1890–3 acting president, and in 1893–9 president of the university. He resumed his professional duties in 1900. He published: ‘*Ars Oratoria*,’ an edition of selections from Cicero and Quintilian (1872), and ‘*The Brutus of Cicero*’ (1889).

Kellogg, Samuel Henry, American Presbyterian missionary and scholar: b. Quogue, Long Island, N. Y., 6 Sept. 1839; d. Landour, India, 2 May 1899. He was graduated at Princeton College in 1861 and at the Theological Seminary in 1864, and after being ordained to the Presbyterian ministry, went as a missionary to India, where he remained till 1877. He was professor of systematic theology in Western Theological Seminary 1877–86, and pastor of St. James’ Square Presbyterian Church, Toronto, 1886–92. He returned to India in 1892 and remained there till his death. His publications include ‘*A Grammar of the Hindi Language*’ (1876); ‘*The Jews: or, Prediction and Fulfilment*’ (1883); ‘*The Light of Asia and the Light of the World*’ (1885); ‘*The Genesis and Growth of Religion*’ (1892); ‘*From Death to Resurrection*’ (1885); etc.

Kellogg, William Pitt, American lawyer and politician: b. Orwell, Vt., 8 Dec. 1831. He was educated at the Norwich Military Institute and removed to Illinois, where he studied law. Being admitted to the bar in 1852 he began his practice at Canton. He became active in the Republican party, was a delegate to the national convention in 1860, and one of the presidential electors in the same year, voting for Lincoln. In 1861 the President appointed him chief justice of the Territory of Nebraska, but later granted him leave of absence that he might raise a regiment of cavalry in Illinois, of which he became colonel. He remained in the army two years, serving in the Missouri campaign with Pope, but was compelled to resign on account of ill health. He was collector of the port at New Orleans (1865–8); was elected senator from Louisiana in 1868; was then elected governor of the State in 1873, serving till 1876, when he was again elected senator. At the expiration of his term as senator he was elected to the House of Representatives, where he remained till 1885. He has been a delegate to every Republican national convention from 1860 to 1896.

Kel'ly, Edmond, American municipal reformer: b. Toulouse, France, 28 May 1852. He was educated in early years in England and after graduation at Columbia Law School in 1877, was called to the bar. In 1884 he was admitted to the French bar and practised in Paris till 1890, and was counsel for the American legation at Paris. He has been conspicuous in recent efforts to improve the municipal administration of New York. He is the author of ‘*Evolution and Effort, and their Relation to Religion and Politics*’ (1898); and ‘*Government; or, Human Evolution*’ (1901).

Kelly, James Edward, American sculptor: b. 30 July 1855. He studied at the National Academy of Design, and up to 1881 was known as an illustrator of books and magazines. Since that time he has successfully devoted himself to sculpture, and chosen subjects from

American history for treatment by his patriotic chisel; so great has been his success that he has won the title of ‘Sculptor of American History.’ His well known works include ‘Sheridan’s Ride’ (1878); ‘Paul Revere,’ a statuette (1882); ‘Monmouth Battle Monument,’ with five illustrative panels (1883–5); groups for the ‘Saratoga Monument’ (1887); ‘Grant at Fort Donelson’ (1886); ‘General Devens’ and the ‘Sixth New York Cavalry Monument’ at Gettysburg (1890); ‘Call to Arms’; colossal figure for the Troy ‘Soldiers’ Monument’ (1891); ‘Buford Monument’ at Gettysburg (1895); ‘Battle of Harlem Heights’ (executed for the Sons of the Revolution at Columbia University, 1897); and a colossal monument to commemorate the defense of New Haven. A remarkable series of military portraits has also been produced by him. Forty generals of the Civil War, including Grant, Sherman and Sheridan, gave sittings for the sculptor. A series illustrating the leading generals and admirals of the Spanish-American War has followed, witnessing to his skill and industry as a portrait sculptor. Wheeler, Dewey, and Sampson are included in this latter gallery of busts.

Kelly, John, American politician: b. New York 21 April 1821; d. there 1 June 1886. After a public school education, he was apprenticed to the mason’s trade, in 1845 established a successful business of his own, was elected alderman in 1854, in 1855–9 was a Democratic representative from New York in the 34th and 35th Congresses, and in 1859–62 and 1865–7 was sheriff of New York County. In 1868 he was the candidate of the Democratic Union for mayor, but was defeated by Oakey Hall; and in 1871 assisted Charles O’Conor, Samuel J. Tilden and others in the reorganization of Tammany Hall which followed the Tweed “ring” troubles. He became comptroller of New York in 1876, but was removed in 1879 by Mayor Cooper. In 1878 he caused the city delegates to bolt the Democratic State convention of that year, and was himself nominated for governor by the bolters on an independent ticket in opposition to Robinson, the regular candidate. He received 77,566 votes, and thus caused the election of Alonzo B. Cornell, Republican. In 1885 and 1886 he was chairman of the Tammany Hall general committee. See TAMMANY HALL.

Kelly, William, American inventor: b. Pittsburgh, Pa., 22 Aug. 1811; d. Louisville, Ky., 11 Feb. 1888. He early turned his attention to invention, engaged in the forwarding and commission business at Pittsburgh, Pa., and from 1846 in the iron business in Kentucky. In 1851 he finally perfected his process in decarbonizing iron by means of a current of air, and thus by a converter directly transforming pig-iron into steel. This method, “Kelly’s air-boiling process,” was the same as that patented by Sir Henry Bessemer in England in 1856 (or 1857), and Kelly asserted that Bessemer had gained knowledge of it through American workmen. Bessemer’s application in the United States was refused, and the patent awarded to Kelly. Kelly’s interests were safeguarded by a syndicate, and steel was first manufactured under his patents in the foundry at Wyandotte, Mich. He is said to have introduced Chinese labor into the United States.

KELLY'S FORD — KEMBLE

Kelly's Ford, Engagements at. This point on the Rappahannock River six miles above its junction with the Rapidan and about five miles below Rappahannock Station, was the scene of several engagements between the Federals and Confederates during the Civil War. In August 1862, the Union cavalry of the Army of Virginia had a spirited encounter with the Confederate cavalry, and 17 March 1863 Gen. Averell with 2,100 Union cavalry and a battery of six guns, crossed at the ford, after a sharp engagement, and moved on Culpeper Court House, under orders to rout and destroy Fitzhugh Lee's cavalry brigade, reported at that place. Lee was found in his immediate front with five regiments and a battery, and when about noon Averell advanced, a hard fight ensued, during which Lee was gradually forced back over a mile; then Averell was checked, finally driven back, and recrossed the river at dark. It was the first purely cavalry battle of the War, and was closely contested on both sides. The Union loss was 65 killed and wounded and 22 missing; the Confederate loss, 90 killed and wounded and 34 missing. Among the Confederate killed was Captain John Pelham, a young artillerist of much promise. A portion of Pleasonton's cavalry division crossed the ford and took part in the battle of Fleetwood (q.v.) 9 June 1863. When Gen. Meade began his Mine Run campaign (see MINE RUN) two corps of the Army of the Potomac under Gen. Sedgwick forced the passage of the Rappahannock at the railroad crossing, 7 Nov. 1863, while Gen. French, with two corps, forced the passage at Kelly's Ford, five miles below. The advance of the Third corps crossed with a loss of 36 killed and wounded, the Confederate loss being 64 killed and wounded and 205 captured, and the Army of the Potomac was united at Brandy Station. Preceding and following these engagements the ford was the scene of many stirring events.

E. A. CARMAN

Kelp, any of several large broad-leaved fucoid seaweeds (q.v.), which are burned for making ash and used for other purposes. The ash is known as "kelp" (or in France as *varec*), and was formerly produced in large quantities by slowly charring several tons of the weed in a shallow pit. The yield in ash was about 5 per cent of the weight of the mass burned. This crude ash contains several salts, especially carbonates and sulphates of sodium and potassium, with other substances in smaller proportions. It used to be the principal source of soda and iodine, but these substances are now otherwise obtained, and the making of kelp-ash has ceased to be profitable.

Kelp-crab, a large squarish edible crab (*Epialtus productus*), numerous in rocky weed-covered places along the Pacific coast from Monterey to Puget Sound.

Kelp-fish, a large blenny (*Heterostichus rostratus*) of the Californian coast, which is sold for food in the local markets. It is reddish brown, much streaked and mottled, so that it is practically invisible among the sea-weeds (kelp) where it usually lurks. Many other more or less similar fishes are called kelp-fishes in other parts of the world.

Kel'tie, John Scott, Scottish geographer: b. Dundee, Scotland, 29 March 1840. He has

been editor of the 'Statesman's Year Book' from 1880, is editor of the 'Geographical Journal,' and has written extensively on geographical and scientific topics in newspapers and periodicals. He has published 'History of Scottish Highlands and Clans' (1874); 'Report on Geographical Education' (1886); 'Applied Geography' (1890); 'The Partition of Africa' (1894). He is a member of geographical societies all over the world.

Kel'ton, John Cunningham, American soldier: b. Delaware County, Pa., 1828. He was graduated at West Point in 1851, received the commission of lieutenant in the infantry and served for six years in the frontier garrisons of Minnesota, Kansas, and Dakota. At the conclusion of that period he was ordered to West Point as instructor in the use of small arms. During the Civil War he returned to active service and in 1861 became purchasing agent for the Western Department. The same year he was put in command of the 9th Missouri volunteers, with the commission of colonel. In 1862 he was appointed to the staff of Major-General Halleck, as assistant adjutant-general, and in 1865 brevetted brigadier-general in the regular army. He was appointed after the war a staff colonel and assistant adjutant-general at Washington; and invented improvements in military firearms which met with the acceptance of the Ordnance Department. Among his works on military subjects may be mentioned a 'Manual of the Bayonet' (1861).

Kelts. See CELTS.

Kel'vein, Lord. See THOMSON, SIR WILLIAM.

Kem'ble, Adelaide. See SARTORIS, ADELAIDE KEMBLE.

Kemble, Charles, English actor, 11th child of Roger Kemble (q.v.), and younger brother of John Philip Kemble (q.v.): b. Brecon, South Wales, 25 Nov. 1775; d. London 12 Nov. 1854. He was educated at the English Roman Catholic College at Douay, France, and in 1794 made his first appearance at Drury Lane as Malcolm to his brother's Macbeth. In 1800 he produced at the Haymarket Theatre his adaptation of Mercier's 'Deserteur,' under the title of 'The Point of Honor,' which achieved considerable success. In 1807 his play of 'The Wanderer,' adapted from Kotzebue, and in 1808 his farce of 'Plot and Counterplot' were both successfully brought on the stage. As an actor he gained special celebrity by the performance of such characters as Falconbridge, Edgar, Romeo, Charles Surface, Cassio, Don Felix, and Benedick. His impersonations were greatly heightened by the physical advantages which he possessed of a fine voice, handsome features, and a tall athletic figure. About 1840 he was appointed to the office of examiner of plays, and shortly afterward made his last appearance on the stage. He subsequently gave occasionally public readings from Shakespeare. He was the father of John Mitchell Kemble (q.v.), the philologist, and of Fanny and Adelaide Kemble (q.v.). Consult Fitzgerald, 'The Kembles' (1871).

Kemble, Elizabeth. See WHITLOCK, ELIZABETH KEMBLE.

KEMBLE — KEMEYS

Kemble, Frances Anne, English actress and author, daughter of Charles Kemble (q.v.): b. London 27 Nov. 1809; d. there 16 Jan. 1893. She manifested no special predilection for the stage, but made her début at Covent Garden, then under the management of her father, in October 1829. On this occasion she played Juliet, her father taking the part of Romeo, and her mother that of the nurse, with complete success. For the three succeeding years she performed leading parts in tragedy and comedy with great applause, distinguishing herself particularly in *Juliet*, *Portia*, *Bianca* in Milman's *'Fazio'*, *Julia* in the *'Hunchback'* (the latter being originally personated by her), *Belvidera*, *Isabella*, *Lady Teazle*, and *Louise de Savoy*, in her own play of *'Francis the First'*, written when she was 17, and received with approbation. In 1832 she accompanied her father to the United States, and met with an enthusiastic reception in the chief cities. In 1834 she was married to Pierce Butler, a Georgia planter, and retired from the stage. The union proving unhappy, a separation took place at the end of a few years, and Mrs. Butler fixed her residence in Lenox, Mass. In 1849 she secured a divorce and resumed the name of Kemble. Her first work in prose, *'A Journal of a Residence in America'* (1835) was chiefly devoted to a description of her tour through the United States. It was followed in 1837 by a drama, *'The Star of Seville'*, acted with success; and in 1844 appeared a collection of her poems. Later works were *'A Year of Consolation'* (1847); *'Residence on a Georgia Plantation'* (1863); *'Record of a Girlhood'* (1878-9); *'Records of Later Life'* (1882); *'Notes upon Some of Shakespeare's Plays'* (1882); *'Poems'* (1883); *'Far Away and Long Ago,'* a story (1889); *'Further Records'* (1891). In the winter of 1848-9 she commenced in Boston a series of Shakespearian readings which drew crowded audiences, and during the next two years repeated the course in some of the principal American cities. In 1851 she returned to England, reappeared for a brief period on the stage, and gave readings in London and other parts of the United Kingdom. In 1856 she returned to the United States, and continued for several years at intervals to give readings in Boston and elsewhere. Her grandson, Owen Wister (q.v.) is a well known American writer.

Kemble, George Stephen, English actor: b. Kington, Herefordshire, 3 May 1758; d. 5 June 1822. He was a son of Roger Kemble (q.v.) and in 1783 made his début in London at Covent Garden Theatre as Othello. In the latter part of his career his increasing bulk enabled him to play the part of Falstaff without resort to padding. He was at various times theatrical manager in London, Edinburgh, and Glasgow.

Kemble, John Mitchell, English Anglo-Saxon scholar: b. London 2 April 1807; d. Dublin 26 March 1857. He was educated at Trinity College, Cambridge, and having early directed his attention to Anglo-Saxon language and history, employed himself in the ancient MSS. in the libraries of the university. The first fruits of his researches appeared in 1833, in the publication of the Anglo-Saxon poem *'Beowulf'*, in 1834, and issued a pamphlet on the *'History of the English Language, First or Anglo-Saxon Period.'* He edited in seven octavo volumes,

for the English Historical Society, a collection of all the known charters of the Anglo-Saxon period, under the title of *'Codex Diplomaticus Ävi Saxonici'*, and in 1849 appeared his most valuable and best known work, *'The Saxons in England.'* Kemble was for many years editor of the *'British and Foreign Review'*, and in 1840 succeeded his father, Charles Kemble (q.v.), as censor of plays, which office he occupied till his death.

Kemble, John Philip, English tragedian, eldest son of Roger Kemble (q.v.): b. Prescott, Lancashire, 1 Feb. 1757; d. Lausanne, Switzerland, 26 Feb. 1823. He was educated at the Roman Catholic seminary of Sedgley Park, Staffordshire, and the College of Douay, France, where he early distinguished himself by his proficiency in elocution. On his return to England he entered immediately upon the profession of an actor, and appeared for the first time in London at Drury Lane, 30 Sept. 1783, in the part of Hamlet, and was received with great applause. It was not, however, till 1788 that he took a decided lead in tragedy. He afterward obtained the management of Drury Lane Theatre, where his sister, Mrs. Siddons (q.v.), was the leading actress. In 1794 he brought out a musical entertainment of his own, entitled *'Lodiska'*, which had a great run. In 1802 he became manager of the Covent Garden Theatre, where he continued his career with great success till the destruction of the theatre by fire in 1808. In the autumn of 1809 the new edifice which had been constructed opened with an increase of prices, which, with certain obnoxious arrangements in regard to the private boxes, created for a series of nights the disturbances known by the name of the O. P. riots. Kemble retired from the stage 23 June 1817. As an actor he was distinguished for dignity, precision, and studious preparation. His merits were differently appreciated, but by all he was regarded as a highly gifted actor, and the impressions made in characters more immediately adapted to his style of excellence, such as Cato, Coriolanus, Hamlet, John, Jaques, Penruddock, was very great. See Boaden, *'Memoirs of the Life of John Philip Kemble'* (1825).

Kemble, Roger, English actor and theatrical manager: b. Hereford 1 March 1721; d. 6 Dec. 1802. John Philip Kemble (q.v.) and Mrs. Siddons (q.v.) were his children. He organized in 1753 a traveling company in which many members of his family appeared. In 1788 he appeared at the Haymarket as Falstaff and the Miller in *'The Miller of Mansfield'*, when, although rated as a mediocre actor, he is said to have played "with very superior effect."

Kemeys, Edward, American sculptor: b. Savannah, Ga., 31 Jan. 1843. He was educated in New York and served in the Civil War as captain in the artillery. He resigned in 1866 and went west, where he saw something of Indian life, and became familiar with the habits and forms of big game. He returned to New York and worked as a civil engineer in the laying out of Central Park, but did not seriously choose the profession of art until 1870, when he resolved to become a sculptor. He went abroad in 1877 and his exhibits in Paris and London attracted attention, especially his *'Fight between a Buffalo and Wolves'* in the Salon of 1878. He has made American wild animals his spe-

KEMNITZ — KEN

cialty. He is in short the American Barye; his 'Panther and Deer,' his 'Coyote and Raven,' are noteworthy for their fidelity to nature and life-like expression, and he is also remarkably successful in his figures of the North American Indian.

Kem'nitz, Martin. See CHEMNITZ, MARTIN.

Kempe, Charles Eamer, English worker in stained glass: b. Ovingdeane, Sussex, 29 June 1837. He received his early education at Rugby, and was graduated at Oxford University. His principal works have been in stained glass of the 13th century style in which the color, drawing and expression are of a unique excellence. He is distinctly a religious painter, who choosing as his medium the most difficult and intractable of methods and materials, has achieved supreme artistic and devotional success. His principal production in this country is the remarkable Jesse window in the Church of the Advent, Boston, which bears comparison with the more famous Jesse window of Troyes, France. He has designed and executed many fine windows for the cathedrals of Lichfield and Durham, and the 'Jane Austen' window recently set up in Winchester Cathedral is one of his latest creations.

Kem'per, James Lawson, American soldier and politician: b. Madison County, Va., 11 June 1823; d. Orange County, Va., 7 April 1895. Graduated from Washington College (Lexington, Va.) in 1842, he studied law at Charles-town (Va.), served in the Mexican War as captain of volunteers, and for ten years was a representative in the Virginia legislature, during two of which he was speaker of the house. In 1861 he was appointed colonel of the 7th Virginia, C. S. A.; in 1862 fought at Fair Oaks (31 May—1 June), where he was commissioned brigadier-general; and later also at Frayser's Farm (30 June), South Mountain (14 September), Antietam (16–17 September); and Fredericksburg (13 December). He was severely wounded at Gettysburg, was subsequently detailed to command the forces in and about Richmond, and 1 March 1864 was promoted major-general. After the war he practised law in Madison County, was Democratic governor of the State in 1874–8 and at the close of his term became a planter in Orange County. He published a collection of messages to the State legislature (1876).

Kemper, Reuben, American soldier: b. Fauquier County, Va., 1770; d. Natchez, Miss., 10 Oct. 1826. He emigrated to Ohio in 1800, and subsequently removed with two of his brothers to the Territory of Mississippi, where they were leaders in the movement to rid West Florida of Spanish rule. The Spanish authorities caused the Kempers to be kidnapped, but they were rescued by the commander of the American fort at Point Coupee. The Kempers pursued with great ferocity all who were engaged in this wrong upon them, and Reuben devoted himself to the task of driving the Spaniards from the American continent. He was engaged in an attempt to capture Mobile, which failed; and on the fitting out of the formidable expedition of Gutierrez and Toledo, in 1812, against the Spanish authority in Mexico, was assigned the rank of major, and afterward chosen colonel of the force, which co-operated

with the Mexican insurgents. The expedition advanced into Texas, fought several bloody battles, in which Kemper and his Americans performed extraordinary feats of valor, and won brilliant victories. Kemper was subsequently engaged under General Jackson in the defense of New Orleans, and added greatly to his reputation as a soldier by his activity and efficiency. At the conclusion of the war he became a planter in Mississippi.

Kempff, Louis, American rear-admiral: b. Belleville, Ill., 11 Oct. 1841. He was graduated at the United States Naval Academy in 1861 and served with distinction throughout the Civil War. He was promoted captain in 1891, and became rear-admiral in 1899. When the Boxer troubles began in China in 1900 he was placed in command of the United States naval forces in Chinese waters. On 29 May he sent 108 marines ashore, who co-operated with the men landed from the other foreign warships in the harbor at Taku. When the Chinese forts were shortly after bombarded by the allied naval forces he declined to participate in the attack, on the ground that his government was not at war with China. For the judgment displayed on that occasion a joint resolution was pending in the 57th Congress conferring on him the thanks of Congress. He was retired from active service in October 1903.

Kem'pis, Thomas à, German devotional writer: b. Kempen, near Cologne, 1380; d. Mount Saint Agnes, near Zwolle, Netherlands, 26 July 1417. He was educated at Deventer by the Brethren of the Common Life, a religious order of men who passed a contemplative existence in transcribing manuscripts, compiling and writing religious books of various sorts, and religious exercises. In 1399 he entered the monastery of Mount St. Agnes, near Zwolle, of which his brother was prior, took the monastic vows in 1406, was ordained priest six years afterward, and in 1425 was elected sub-prior. He excelled as a copyist, and delighted to transcribe the Scriptures, the church fathers, and works of ascetic piety, while the fame of his eloquence and zeal was widely extended. He owes his present renown to his treatise 'De Imitatione Christi,' which has been translated into every language in Christendom. It has been wrongly but somewhat naturally attributed to the renowned theologian Gerson, chancellor of the University of Paris, and the question was debated with a view to national honor and the interests of ecclesiastical orders. The evidence in favor of the authorship of à Kempis is overwhelming. Three writers nearly his contemporaries mention him as author. Moreover several copies written in his own hand are extant, and in one ancient copy he is expressly named as the author. Both the literary style and the tone of refined piety which characterize this work are also distinguishing features of the devotional works of which he is certainly the author. Consult Kettlewell, 'Thomas à Kempis and the Brothers of the Common Life' (1884); Wolfsgruber, 'Giovanni Gerson, sein Leben und sein Werk De Imitatione Christi' (1880).

Ken, or Kenn, Thomas, English bishop and hymnologist: b. Little Berkhamstead, Hertfordshire, 1 July 1637; d. Longleat, Wiltshire, 19 March 1711. He was educated at Winchester School, graduated from New College, Oxford,

KENAI—KENDALL

and became successively domestic chaplain to Bishop Morley (1665); rector of Brightstone, Isle of Wight (1667); and prebend of Winchester (1669). He spent five years traveling on the continent with his nephew Izaak Walton, living principally at Rome (1675–80), and accompanied Mary, Princess of Orange, to Holland, as domestic chaplain. In 1680 he was appointed chaplain to Charles II., attended him in his last illness, and was nominated by him to the bishopric of Bath and Wells (1684). He suffered deprivation with other non-jurors (q.v.) on the accession of William of Orange, for maintaining allegiance to James II. (1691). He was one of the lights of the English Church in one of the darkest periods of English social life, and by his zeal and devotion did much to maintain the standard of Christian conduct, his personal example of goodness being backed by learning, taste, and breadth of sympathy. His theological and devotional writings are principally valuable for the personality with which they are connected, but his immortal 'Morning and Evening Hymns' have won for him imperishable fame as the guide and inspirer of Christian devotion. Consult: Plumptre, 'Life of Bishop Ken' (1888).

Kenai, kē-nī', a peninsula in the southern part of Alaska, with William Sound on the east, Gulf of Alaska east and south, and Cook Inlet on the west. It is about 160 miles long and 110 miles across the widest part. It has good harbors, valuable coal fields, and some gold has been discovered.

Ken'dal, Margaret Brunton Robertson (GRIMSTON), English actress: b. Great Grimbsy 15 March 1849. She was a sister of T. W. Robertson, the dramatist (q.v.); was known on the stage as "MADGE ROBERTSON" and made her first appearance in London, as Ophelia, in 1865. She soon gained a reputation as an excellent actress of high comedy. On her marriage to W. H. Grimston (q.v.) in 1869 she assumed with him the stage name of Kendal. The Kendals made several visits to America after 1889 and secured favorable notice wherever they were seen.

Kendal, William Hunter (WILLIAM HUNTER GRIMSTON), English actor: b. London 16 Dec. 1843. After his marriage to Madge Robertson (see KENDAL, M. B. R.) in 1869, he played leading parts with her. He commenced his career on the stage at Glasgow in 1862, where he remained till 1866, supporting such stars as Mr. and Mrs. Charles Kean, Helen Faucit, G. O. Brooks, etc.; made his first appearance in London at the Haymarket Theatre in 1866, in 'A Dangerous Friend,' played there such parts as Charles Surface, Captain Absolute, Romeo, Orlando, Pygmalion, and in 1879–88 was lessor and manager with John Hare of the St. James Theatre, where were produced 'The Queen's Shilling'; 'The Squire'; 'Impulse'; 'The Ironmaster'; 'A Scrap of Paper'; 'Lady of Lyons'; and 'As You Like It.' He toured with Mrs. Kendal in the United States and Canada in 1889–95.

Ken'dall, Amos, American journalist and statesman: b. Dunstable, Mass., 16 Aug. 1789; d. Washington, D. C., 11 Nov. 1869. He was graduated from Dartmouth in 1811, studied law at Groton, Mass., in 1811–14, was admitted to the bar at Frankfort, Ky., in 1814, was post-

master and editor of the 'Patriot' at Georgetown, Ky., in 1815–6, and in 1816–29 co-editor and part owner of the 'Argus of Western America' at Frankfort. In 1829 he was appointed fourth auditor of the United States treasury, and during the Jackson administration he was extremely influential. He aided in the formation of the President's anti-bank policy (see JACKSON, ANDREW), was a special treasury agent to conduct negotiations with State banks, and is thought to have written several of Jackson's state papers. Appointed postmaster-general by Jackson in 1835, he was retained by Van Buren, but in 1840 resigned because of ill health. He cleared the post-office department of debt, and introduced numerous reforms. He established 'Kendall's Expositor,' bi-weekly, in 1841, and the 'Union Democrat,' weekly, in 1842, but both journals shortly ceased publication. In 1845 he became associated with S. F. B. Morse (q.v.) in the ownership and management of the Morse electric telegraph patents, and by his able direction ensured their commercial success and a fortune for himself. He gave largely in Washington for philanthropic purposes. Though calling himself a Jackson Democrat, he strongly opposed secession. He wrote an incomplete 'Life of Andrew Jackson, Private, Military, and Civil' (1843); 'Full Exposure of Dr. C. T. Jackson's Pretensions to the Invention of the Electromagnetic Telegraph' (1867), and an 'Autobiography,' posthumously published (1872).

Kendall, George Wilkins, American journalist: b. Amherst (now Mount Vernon), N. H., 1809; d. Oak Springs, Texas, 22 Oct. 1867. Settling in New Orleans in 1835, he was one of the founders of the New Orleans *Picayune* in 1837, which became under his direction one of the leading journals of the South. He wrote 'Narrative of the Texas Santa Fe Expedition' (1844), an expedition in which he took part; and 'The War Between the United States and Mexico' (1851).

Kendall, Henry Clarence, Australian poet: b. Ulladalla district, New South Wales, 18 April 1841; d. Redfern, near Sydney, 1 Aug. 1882. He became a lawyer's clerk at Sydney in 1860, in 1863 a clerk in the lands department of the New South Wales public service; later was in the colonial secretary's office; in 1869–73 was active as a journalist at Melbourne; and for some time previous to his death was an inspector of forests. His chief volumes are: 'Leaves from an Australian Forest' (1869), and 'Songs from the Mountains' (1880). He has been called the "poet of the bush" because of his skilful delineation of the character of Australian landscape. In 1886 appeared a collected edition of his verse, with a memoir.

Kendall, William Sergeant, American painter: b. Spuyten Duyvil, N. Y., 20 Jan. 1869. He began as a member of the Art Students' League of New York, and subsequently was a pupil of Thomas Eakins of Philadelphia. He went to France and attended the Ecole des Beaux Arts, and also studied under Olivier Messon. He is equally successful in figure, portrait, and landscape, and has received several honors in acknowledgment of his merit as a fine colorist and powerful draftsman. One of his best pictures is 'The End of the Day,' in which tender sentiment is united with workmanship of excellence.

KENDRICK—KENNAN

Ken'drick, Asahel Clark, American Baptist clergyman and scholar: b. Poultney, Vt., 7 Dec. 1809; d. Rochester, N. Y., 21 Oct. 1885. He was graduated from Hamilton College, Clinton, N. Y., in 1831, and was professor of Greek at Madison (now Colgate) University, Hamilton, N. Y., 1831–50; and held a similar post in the University of Rochester from 1850. Besides translations and several text-books, and revising and editing Olshausen's 'Old Testament Commentary' and Meyer's 'Commentary on John,' he published 'Our Poetical Favorites' (1880); 'The Moral Conflict of Humanity' (1894); etc. He was one of the American committee of New Testament revisers.

Kendrick, John, American navigator: b. Boston about 1745; d. Hawaii 1800. During the Revolution he sailed a privateer, and in 1787, while in command of the Columbia and the Washington, explored the northwestern coast of America and various Pacific islands. In 1791 he voyaged to the South Seas, and established the Chinese trade in sandalwood, which for a long time he successfully carried on. He was among the earliest American sailors to attempt voyages for discovery.

Kendrick, John Mills, American Protestant Episcopal bishop: b. Gambier, Ohio. He was educated in the university of his native town, and was ordained deacon 1864, and priest in the following year. After several years' experience as rector and missionary, in 1889 he was consecrated bishop of Arizona, a post he still occupies, with Phoenix, Arizona, as his see city.

Kenealy, kē-nēlē, Arabella, English novelist: b. Sussex. She is a daughter of Dr. Kenealy, the famous advocate of the Tichborne "Claimant," and after pursuing medical studies practised as a physician in London and at Watford 1886–94. She has published 'Dr. Janet of Harley Street' (1893); 'Such Men Are Such Gentlemen' (1894); 'Woman and the Shadow' (1898); 'A Semi-Detached Marriage' (1899); 'Charming Renée' (1900); etc.

Kenesaw (kēn-ē-sā') Mountain, a mountain in Georgia 25 miles northwest of Atlanta. It is famous as the scene of a battle in the Civil War between the Union troops under Sherman, and the Confederates under Johnston.

Kenesaw Mountain, Battle of. On the night of 18 June 1864 Gen. J. E. Johnston fell back before Gen. Sherman's persistent advance and took a new line with Kenesaw Mountain as its salient, his right wing thrown back so as to cover Marietta, and his left covering the railroad back to the Chattahoochee. Sherman worked to the right, threatening the railroad, and was attacked by Hood's corps at Kolb's Farm (q.v.), 22 June. After much study of the ground, Sherman concluded that he had no alternative but to assault Johnston's line or turn his position. Either course had its difficulties and dangers, but as the enemy and his own officers had settled down to the conviction that he would not assault fortified lines, but would execute flanking movements only, he considered that a successful assault would have a good moral effect and show that he could move against an enemy behind breastworks; so he resolved to attack the left centre of Johnston's position, and orders were given on the 24th that on the 27th McPherson should assault near Little

Kenesaw and that Thomas should assault about a mile further south. Kenesaw was strongly entrenched and held by Loring's and Hardee's corps, Loring on the right, opposite McPherson, Hardee on the left, opposite Thomas. About 9 A.M. of the 27th the troops moved to the assault, and all along the lines for ten miles a furious fire of artillery and musketry was kept up. A part of Logan's Fifteenth corps, formed in two lines, fought its way up the slope of Little Kenesaw, carried the Confederate skirmish-pits, and tried to go further, but was checked by the rough nature of the ground and the fire of artillery and musketry delivered at short range from behind breastworks. Logan's assault failed, with a loss of 600 men, and his troops were withdrawn to the captured skirmish-pits. About a mile to the right Thomas assaulted with Newton's and Davis' divisions. The troops charged up the face of the mountain, drove in the skirmish-line, and reached the main works, but were unable to carry them under the heavy fire of canister and musketry at short range; after heroic effort and the loss of Gens. C. G. Harker and Daniel McCook, commanding brigades, and 1,580 killed, wounded, and missing, fell back and intrenched 75 yards from the enemy's works. The assault was over by 11.30 A.M., and was a failure. It was the most serious reverse sustained by Sherman in the campaign. The entire Union loss was nearly 2,500; Johnston admits a Confederate loss of 808 killed and wounded. Consult: 'Official Records,' Vol. XXXVIII.; Cox, 'Atlanta'; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Sherman, 'Personal Memoirs,' Vol. II.; Johnston, 'Narrative'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Kenia, kā'ne-ä, Mount, an isolated extinct volcano situated in British East Africa, a few miles south of the equator. Its summit is covered with perpetual snow, and for this reason it is known as Doenyo Ebor or White Mountain. Its height is from 18,000 to 19,000 feet. It was discovered by Krapf in 1849, and its summit was first reached (by Kolb) in 1895.

Kenilworth, kēn'l-wērth, a novel by Sir Walter Scott, published in 1819, when its author had long been distinguished both as poet and novelist. It was the second of his great romances drawn from English history; the central figure is that of Queen Elizabeth, surrounded by the brilliant and famous characters of the period—Burleigh, Edmund Spenser, Sir Walter Raleigh; and also by a host of petty sycophants.

Ken'ly, John Reese, American soldier: b. Baltimore 1822. He served in the American army during the Mexican War, attaining the rank of major, and during the Civil War commanded the 1st Maryland regiment, which was captured by Stonewall Jackson at the battle of Front Royal, 23 May 1862. He subsequently commanded a brigade and was brevetted major-general of volunteers at the close of the War. His experiences during the Mexican War are recounted in his 'Memoirs of a Maryland Volunteer' (1873).

Ken'nan, George, American traveler, author, and lecturer: b. Norwalk, Ohio, 16 Feb. 1845. He received a secondary education, became a telegraph operator, in 1865 went to north-

KENNEBEC RIVER — KENNEY

eastern Siberia as an explorer and telegraph engineer, and in 1866-8 superintended the construction of the middle division of the Russo-American telegraph line. In 1870-1 he explored the mountain region of eastern Caucasus and Daghestan, upon his return to America was active as lecturer and journalist, and in 1877-85 was night manager of the Associated Press at Washington, D. C. In 1885-6, with G. A. Frost, an artist, he accomplished a journey of 15,000 miles through Russia and Siberia in investigation of the Russian exile system. He visited all the mines and prisons between the Ural Mountains and the headwaters of the Amur, and published an account of his observations in 'Siberia and the Exile System' (1891), first printed in the 'Century Magazine' (1889-90). From 1886 he lectured in Great Britain and the United States on his Siberian experiences. In 1898, during the Spanish-American war, he visited Cuba with the Red Cross Society and as special commissioner of the 'Outlook' of New York, to which he contributed valuable articles. In 1902 in company with American scientists he explored Mt. Pelée, Martinique, and the scene of the St. Pierre disaster. He further published in book form: 'Tent Life in Siberia' (1870), and 'Campaigning in Cuba' (1890).

Kennebec (kĕn-e-bĕk') **River**, a river in Maine, next to the Penobscot the most important in the State. Its principal source is Moosehead Lake, on the boundary line between Somerset and Piscataquia counties. After a course of 20 miles it receives Dead River from the right. It enters the Atlantic in Sagadahoc County through Sheepscott Bay, an irregular indentation of the coast studded with many islands. The largest tributary of the Kennebec is the Androscoggin, which joins it 18 miles from the ocean at Merrymeeting Bay. The outlets of a number of small ponds, and Sebasticook and Sandy rivers, also flow into it. The most important towns on its banks are Bath, Richmond, Gardiner, Hallowell, Augusta, and Waterville. It has falls at Waterville and at three points above, which afford excellent motive power. Its whole length is about 150 miles, in which it has a descent of 1,000 feet. The influence of the tide extends to Augusta, 42 miles from the sea. A dam with locks was constructed at Augusta for the purpose of improving the navigation above that point, and increasing the water power. The structure is 584 feet long and 15 feet above ordinary high water mark, and cost \$300,000. It forms a pond 16½ miles in extent, with an average depth of 16 feet. The river is closed by ice at Hallowell from the middle of December to about 1 April; below Bath it is open at all seasons except during winters of unusual severity.

Kennebunk, kĕn-e-bĕnk', Maine, town in York County, on the Kennebunk and Mousam rivers and the Boston & Maine railroad, 24 miles southwest of Portland. The ample water-power here is utilized for various manufacturing industries, among the articles produced being leatheroid, sample-cases, shoe-stiffenings, fibre-board, and lumber. The town has a free circulating library containing several thousand volumes. It is one of the old towns of Maine, its settlement dating from about 1650. Until 1820, the year in which Maine became a separate State, Kennebunk was a part of Wells. Pop. (1890), 3,172; (1900), 3,228.

Kennebunkport', Maine, town in York County, 25 miles southwest of Portland, on the Atlantic Ocean, at the mouth of the Kennebunk River, and on the Boston & Maine railroad. It is situated on a good harbor, has an excellent beach, fine boating facilities on the river, and is a favorite summer resort with superior hotel and boarding-house accommodations. Besides Talbot's Library, the town has public and circulating libraries. Its industries include the manufacture of lumber and the building of boats and canoes. The town was settled in 1629, and incorporated as Cape Porpoise in 1653. Having been nearly destroyed by Indians in 1703, it was reincorporated in 1717 as Arundel, and in 1821 took its present name. Pop. (1890), 2,196; (1900), 2,123.

Ken'ney, John Pendleton, American novelist: b. Baltimore, Md., 25 Oct. 1793; d. Newport, R. I., 18 Aug. 1870. He was graduated at Baltimore College in 1812, and in 1814 served as a volunteer in the ranks, taking part in the battles of Bladensburg and North Point. In 1816 he was admitted to the practice of the law, which he followed successfully for 20 years. In 1818 he commenced authorship, by the publication, in connection with his friend Peter Hoffman Cruse, of the 'Red Book,' a serial of light character in prose and verse issued about once a fortnight, and continuing two years. In 1820 he was elected to the Maryland house of delegates, and re-chosen the two next years. In 1832 he published his first novel, 'Swallow Barn, or a Sojourn in the Old Dominion,' descriptive of the plantation life of Virginia. In 1835 appeared 'Horseshoe Robinson, a Tale of the Tory Ascendancy,' the most successful of his writings. In 1838 he published 'Rob of the Bowl, a Legend of St. Inigoes,' relating to the Maryland province in the days of Cecilius Calvert, second Lord Baltimore. Kennedy was a member of Congress 1839-45, and was prominent among the Whig members. In 1849 appeared his 'Life of William Wirt, Attorney-General of the United States,' and in 1852 he became secretary of the navy. His works not previously named include: 'Annals of Quodlibet' (1840); 'Mr. Ambrose's Letters on the Rebellion' (1865). He was a friend of Thackeray, and wrote or sketched in outline the fourth chapter of the second volume of 'The Virginians.' Consult 'Life' by Tuckerman.

Ken'net River, a tributary of the Thames, in England. It rises in Wiltshire, flowing east through Berkshire, emptying into the Thames at Reading, after a course of 46 miles. It is a part of the waterway connecting the North Sea with Saint George's Channel.

Kenney, kĕn'i, Richard Rolland, American politician: b. Little Creek Hundred, Sussex County, Del., 9 Sept. 1856. He was graduated at State librarian, 1879-83. In January 1887, was admitted to the Delaware bar in 1881, and was State librarian, 1879-83. In January, 1887, he was elected to the United States Senate as a Democrat and became a popular leader. His term expired in March 1901, and a deadlock occurring in the Delaware legislature, which was Republican, a successor to Kenney was not elected and Delaware is now (1903) unrepresented in the National Senate.

KENNY — KENT

Ken'ny, Sir Edward, Canadian statesman: b. County Kerry, Ireland, 1800; d. Halifax, N. S., 16 May 1891. He removed to Halifax in 1824, where he engaged in business, and was mayor at one time. He was member for 26 years of the legislative council of Nova Scotia, during 11 of which he was president; served as receiver-general of Canada 1869-79; president of the privy council 1869-70; and senator 1867-70; being knighted in the year last named.

Kenosha, kē-nō'shā, Wis., city, county-seat of Kenosha County; on Lake Michigan, and on the Chicago & N. railroad; about 35 miles south of Milwaukee. It has steamer communication with many of the ports on the Great Lakes. It is a trade centre for quite an extent of country. Its chief manufactures are leather, typewriters, furniture, wagons, lamps, machinery, iron bedsteads, and flour. It is the seat of Kemper Hall School (P. E.). The Simmons Memorial Library contains about 6,000 volumes. The city owns and operates the water-works; the water is obtained from the lake and artesian wells. Pop. (1890) 6,532; (1900), 11,666.

Ken'rick, Francis Patrick, American Roman Catholic bishop: b. Dublin, Ireland, 3 Dec. 1797; d. Baltimore 6 July 1863. After studying in Rome 1815-21, he was ordained priest in the latter year and sent to this country to take charge of a seminary at Bardstown, Ky. He remained at Bardstown nine years till his appointment as coadjutor bishop of Philadelphia in 1830. Twelve years later he became bishop of Philadelphia and there founded the seminary of St. Charles Borromeo. In 1851 he was installed archbishop of Baltimore and the next year presided over the first plenary council of American Roman Catholic prelates. He became honorary primate of the United States in 1859. He was prominent as a controversialist and a Biblical scholar, and published 'Dogmatic Theology' (1839-40); 'Moral Theology' (1841-3); a revision of the Douai English Bible, with notes, etc.

Kenrick, Peter Richard, American Roman Catholic archbishop: b. Dublin, Ireland, 17 Aug. 1806; d. St. Louis, Mo., 4 March 1896. After studying at Maynooth he was ordained priest in 1830, and came to the United States in 1833. He was professor of dogmatics in the seminary of the diocese of Philadelphia and subsequently became vicar-general. In 1841 he was appointed coadjutor to Bishop Rosati, of St. Louis, succeeded to that bishopric in 1843, and was created first archbishop of St. Louis in 1847. He opposed the dogma of papal infallibility but acquiesced in its final decree. He published 'The Holy House of Loretto'; 'Anglican Ordinations'; 'Vaticana'; etc. He was a brother of F. P. Kenrick (q.v.).

Kenrick, William, English miscellaneous writer: b. about 1725; d. London 10 June 1779. He believed himself a genius, and was for years active as a libeler of successful authors and actors. Among those whom he attacked were Goldsmith, Garrick, Johnson, Colman, and Fielding. He lectured, too, on subjects ranging "from Shakespeare to the perpetual motion, which he thought he had discovered."

Kenrick, William, American nurseryman: b. 1795; d. 1872. He was the son of a nursery-

man, whose gardens occupied the locality where John Eliot first preached to the Indians, and at 28 he became a partner with his father. He is remembered as having introduced into America the culture of the mulberry tree in order to establish a native silk industry, his book, 'The American Silk Growers' Guide,' in reality a work on mulberry culture, being issued in 1835. Among other novelties he introduced into America was the Lombardy poplar.

Ken'sett, John Frederick, American painter: b. Cheshire, Conn., 22 March 1818; d. New York 14 Dec. 1872. His uncle, Alfred Daggett, an engraver, gave him his first lessons in art, but in 1840 he went abroad and for seven years traveled in England, Switzerland and Italy. The fruit of this student-ramble was a large number of sketches and paintings, out of which he exhibited in 1845 in the Royal Academy. On returning to America he lived chiefly in New York and in 1849 was elected a National academician. His landscapes are more remarkable for sweetness than for strength, but he maintains a uniform standard of merit in all of them. His technique is delicate and refined, especially in his small canvases. He delights in the scenery of the Hudson, and of the sea-coast, and some of his effects are exquisitely charming. Among his landscapes the most interesting are 'Sunset on the Coast' (1858); 'October Afternoon' (1864); 'Noon on the Sea-Shore,' which has been engraved by Hunt. Several of his pictures are in the Metropolitan Museum of Art, New York, the finest of them being 'White Mountains,' a masterpiece of its class. He was for some years a member of the national art commission appointed to direct the decoration of the National Capitol.

Kensington Gardens, a celebrated public park in London four miles west of Saint Paul's, and well known for its royal palace. In former times Kensington Palace was a favorite royal residence; and King William III., Queen Mary, Queen Anne, and George II. died here. Kensington Gardens and Hyde Park are much frequented in summer, and form a great ornament to the metropolis. They cover about 350 acres, and contain the Albert Memorial. In South Kensington the chief attractions are the South Kensington or Victoria and Albert Museum, the Indian Museum, the Natural History Museum, and the Imperial Institute.

Kensington Palace. See KENSINGTON GARDENS.

Kensit, John, English anti-ritualist: b. London about 1852; d. Liverpool 8 Oct. 1902. He kept a small bookshop in Paternoster Row, London, but in 1896 began an attack upon the Roman Catholic Church and the ritualistic party in the Church of England. He organized bands of preachers, called *Wycliffites*, that disturbed public worship and frequently caused riots. At the public ceremony of the confirmation of Canon Gore as bishop of Worcester (22 Jan. 1902) he objected, and then and at the subsequent consecration disturbances occurred. Since his death the movement has had no prominence.

Kent, Charles Foster, American Biblical scholar: b. Palmyra, N. Y., 13 Aug. 1867. He was graduated at the universities of Yale (1889) and Berlin (1892), and the following year became an instructor in the University of Chicago.

KENT — KENTON

In 1895 he was elected professor of Biblical literature and history at Brown University, a position which he held until 1901. He is at present Woolsey professor of Biblical literature at Yale University. Among his writings are: 'Outlines of Hebrew History' (1895); 'The Wise Men of Ancient Israel and Their Proverbs' (1895); 'History of the Hebrew People, the United Kingdom' (1896); 'History of the Hebrew People, the Divided Kingdom' (1899); 'Messages of the Earlier Prophets' (1899); 'Messages of the Later Prophets' (1900).

Kent, Jacob Ford, American general: b. Philadelphia, Pa., 14 Sept. 1835. He entered the army as 2d lieutenant 6 May 1861, became captain in January 1864; and was brevetted colonel of volunteers in October 1864, for faithful and meritorious services in the field during the campaign before Richmond. At the opening of the war with Spain he was colonel of the 24th infantry. He was made major-general of volunteers 8 July 1898, and served with distinction in Cuba, and afterward in the Philippines. He was retired in October 1898.

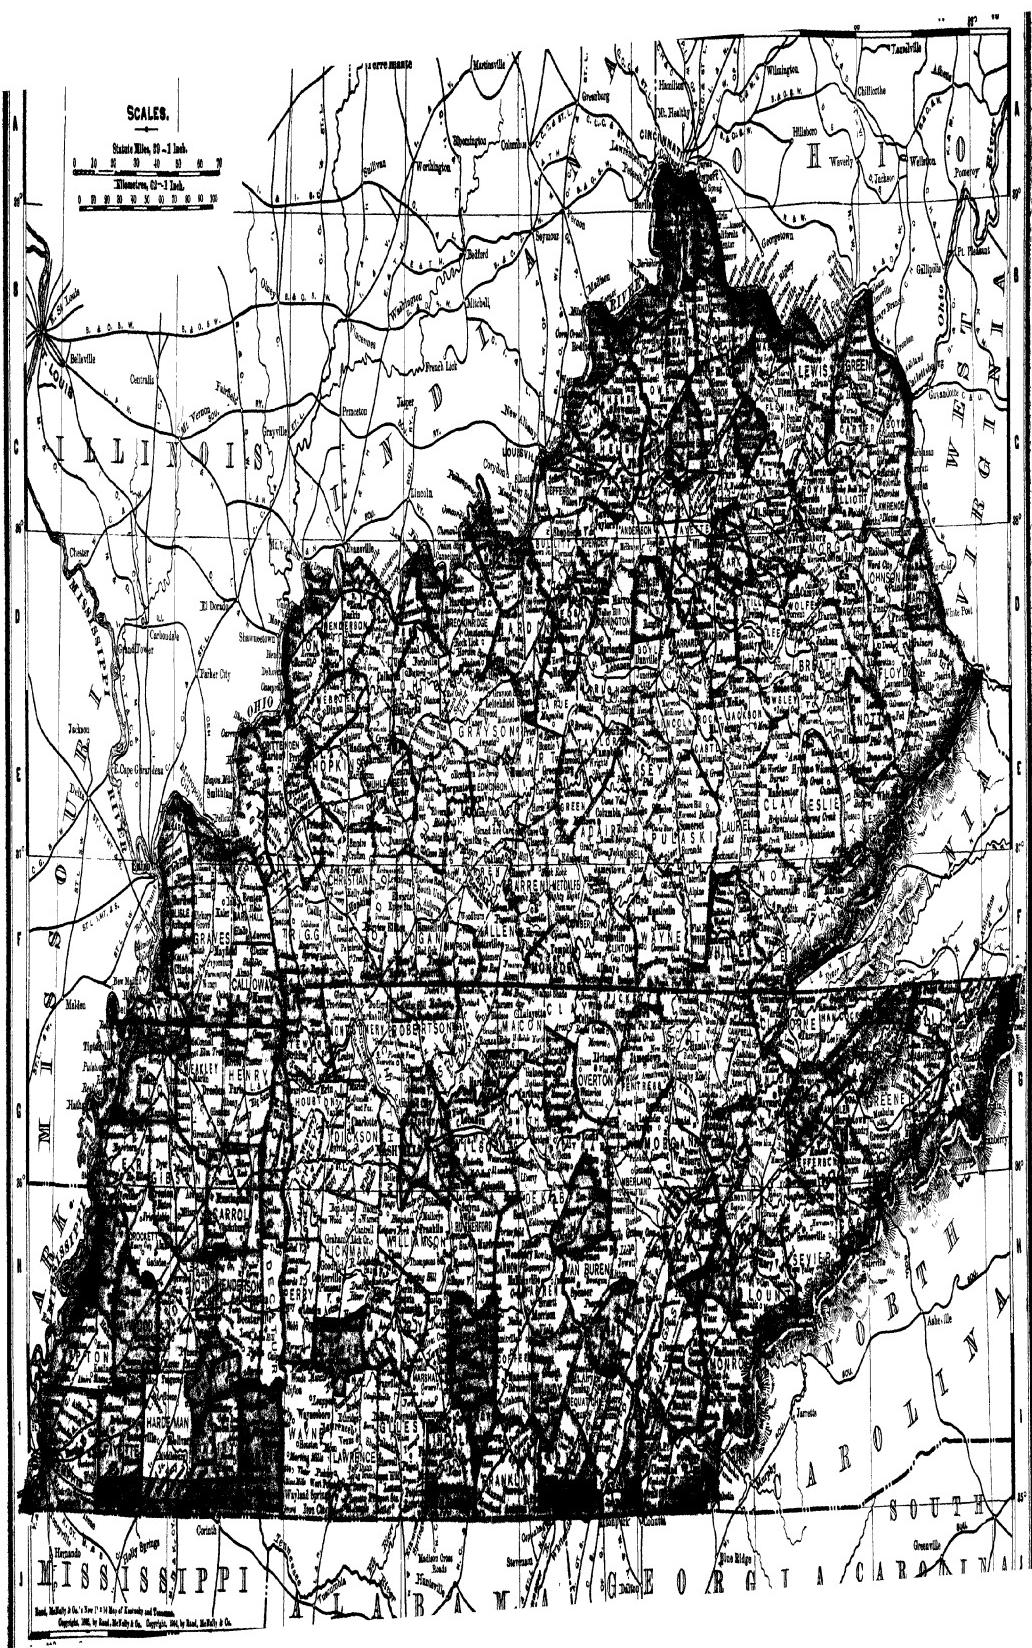

Kent, James, American jurist: b. Philippi, Putnam County, N. Y., 31 July 1763; d. New York 12 Dec. 1847. Kent was graduated at Yale College in 1781, studied law, was admitted in 1785 as an attorney, and in 1787 as a counsellor, and commenced the practice of his profession in Poughkeepsie. He soon became remarkable among his contemporaries for his legal learning and literary attainments. He was elected successively in 1790 and 1792 a member of the legislature for Dutchess County. Kent became an active and leading Federalist, attracting the notice and confidence of Hamilton and Jay. It was by Hamilton's counsel that the reading of the young lawyer was directed to the doctrines of the civil law, and the treatises of the jurists of continental Europe. In 1793 Kent removed to New York, was appointed one of the two masters in chancery for the city of New York. In 1796 he became a member of the legislature. He was also elected professor of law in Columbia College. The body of his lectures at Columbia formed in after years, in some degree, the basis of his celebrated 'Commentaries.' In 1797 he was appointed recorder of the city, and in 1798 judge of the supreme court. He continued a member of this tribunal till 1814, having been from 1804 chief justice. The supreme court at that time differed widely from the court as at present constituted. It was formed after the model of the English king's bench, being composed of five judges, who rode the circuits to try jury cases, and convened during the year at four appointed terms to decide reserved questions of law. There were no American law books, and no reports of American decisions, except those of Dallas, just commenced. The proceedings of the court were languid and dilatory; and resort was had for rules of procedure and principles of law almost exclusively to English precedents and decisions. The accession to the bench of a young, energetic, and able judge, produced a striking change. It was the task of the court to expound the principles of the common law, as applicable to American institutions; to define and limit our new constitutional provisions; to construe recent statutes; to bring the principles of commercial law to bear upon

transactions of trade and commerce; to devise rules of practice; and in short to adapt to a young and rising nation a complicated yet practical code of laws. By the constitution of New York as it then existed an important political duty was imposed on the judiciary of the State. The judges of the supreme court and the chancellor formed with the governor a council of revision with a qualified veto on legislative acts. This council was abolished in 1822. In 1814 Kent became chancellor and the seven volumes of Johnson's 'Chancery Reports,' which contain Chancellor Kent's decisions, afford a profound exposition of the system of equity law. His term of office as chancellor expired in 1823, and returning to New York he resumed his professorship at Columbia and his lectures there were given to the world, in his 'Commentaries on American Law' (1826-30). This work has since passed through 14 editions, and acquired a world-wide celebrity. It has assumed in the United States the position which Blackstone in his own country has long filled by his 'Commentaries on the Laws of England.' It embraces not merely the jurisprudence of the Federal Union, but the municipal law, written and unwritten, of the several States. Consult William Kent, 'Memoirs and Letters of Chancellor Kent' (1898).

Kent, William, English artist, architect and landscape gardener: b. Yorkshire 1684; d. London 12 April 1748. He was apprenticed to a coachmaker in 1698, went to London in 1703, and there made some attempts at painting, and to Rome, where he was a pupil of the Cavalier Luti, and whence he was brought to England by the Earl of Burlington, his patron for the rest of his life. He was employed in portrait-painting and the decoration of walls and ceilings; but Hogarth said that "neither England nor Italy ever produced a more contemptible dauber." However, he did invent a less formal method of gardening and planting, and excelled as an architect. The Horse Guards and treasury buildings, and Devonshire House, Piccadilly, are his work. He published the 'Designs of Inigo Jones' (1727).

Kent Island, the largest island in Chesapeake Bay, Md., some 15 miles long, and situated 7 miles east of Annapolis. It was here the first settlement in Maryland was made by William Claiborne (q.v.) in 1631. Pop. (1900) 2,525.

Kenton, Simon, American pioneer: b. Fauquier County, Va., 3 April 1755; d. Logan County, Ohio, in 1830. At 16 he had an affray with a young man, and believing he had killed his adversary, fled beyond the Alleghanies and became a companion of Boone and the other early pioneers of Kentucky. For a time he acted as a spy of Governor Dunmore, and subsequently participated in the warfare waged against the British and the Indians west of the Alleghanies, showing remarkable courage, sagacity, and endurance. In 1782, learning that his former opponent was living, he returned to his native place, and soon after removed with his father's family to Kentucky. He was frequently engaged in Indian warfare, until the expedition under Wayne in 1793-4 restored tranquillity to the western frontier. As the country began to fill up with settlers, his lands, to which, in consequence of his ignorance of or

KENTUCKY

cannel. Beds of high-grade iron ore are also found in the coal fields, and elsewhere to the extent of 32 counties in all; 71,562 tons of pig iron were turned out in 1900. Building and other stones are extensively quarried: limestone products (including Kentucky River marble), as well for fertilizers and charged waters as for building, were valued at \$176,861 in 1900; sandstones, \$130,557, besides \$20,191 worth of clays. Extensive mining of fluor-spar is carried on in Crittenden and Livingston counties; valuable salt and other mineral springs are utilized; petroleum is found in the counties along the Cumberland and its affluents, formerly distilled from shales and now drilled for, its discovery in several counties in 1902 having caused considerable excitement. Its accompaniment, natural gas, is found in Meade County.

Climate and Rainfall.—The Mississippi bottom lowlands are malarious, but most of the State is mild and notably salubrious, the death rate being low and the army statistics placing Kentuckians at the very top in physical characteristics. The lowest recently recorded temperature is 8° F., and the summer heats are less than in the States to the north and west. The State is ideally watered for agriculture, the mean rainfall is about 47 inches per year, and there are no years of excessive drought.

Forests.—Over a third of the surface of the State is forested. The bottom lands are thick with densely timbered swamps; the western part is a heavily wooded region once open prairie ("the Barrens," where the Indians burnt off the undergrowth to make pasture for the wild game, and the more tenacious roots grew under the soil); and in the east along the Alleghany slopes there is a great quantity of fine timber, most of it being hardwood of astonishing variety. Oaks of many different sorts—white, red, black, post, overcup, chestnut, and black-jack,—hickory, black walnut, blue and black ash, maple, elm, beech, chestnut, poplar, sweet gum, box-elder, wild cherry, yellow pine, cypress, sycamore, and hackberry, are only a portion of its wealth, still largely virgin, though now being rapidly opened up. The poplar and black walnut which are accessible have been already largely harvested.

Soil.—The soils are locally divided into three main grades—first, second, and third rate. The first is the deep alluvium of the river bottoms, estimated at 1,000 square miles. The second (such only by comparison with the first, being one of the finest farming soils known) is the upland Blue Grass soil, covering over 10,000 square miles in 32 counties self fertilized by the decomposition of limestones and phosphatic shales so that farms a century old show no signs of exhaustion, and with decent management need no artificial fertilizer. The third are the shaly lands with insufficient drainage. Besides these there are about 1,500 square miles in swamps and barrens and some thousands where the mineral wealth is worth more than the surface would be for farming land.

Agriculture.—Though Kentucky and Tennessee are apparently artificial divisions from the same body of land, the slight difference in latitude and soils works a complete change in the characteristic products of the two. Tennessee is preeminently a cotton State, raising in 1899 234,592 bales, valued at over \$8,000,000; while Kentucky raised but 1,369 bales, in a few

counties near the Mississippi bottoms. But the immense fertility and water supply of Kentucky have made it one of our leading agricultural States; the value of its crops in 1899 was \$123,266,785, and its live stock was valued at \$73,737,106. The leading farm products are corn, tobacco, wheat and hay; and it raises nearly all the hemp produced in the United States. Vegetable and orchard fruits are grown in large quantities in the region along the Ohio, between and near the two great cities of Cincinnati (with its Kentucky suburbs Covington and Newport) and Louisville, which furnish large markets. In 1900 85.9 per cent of the land surface was in farms, and of this 62.5 per cent was improved against 35.2 per cent in 1850. The number of farms had more than trebled in the meantime, it had increased 30.9 per cent since 1890. The average size of farms decreased in the decade, under intensive cultivation, from 119.4 acres to 93.7; the size being smallest in the northeast, the region of tobacco and corn, and largest in the stock-raising counties, but in most counties the size keeps near the average. The difference in proportion of colored population from the States where cotton is a leading crop is strikingly shown by the statistics of farm ownership and tenure. Out of 234,667 farms only 11,238 were operated by colored farmers; and as their farms averaged only 39.9 acres, they farmed only two per cent. of the land. The most conspicuous change in the decade was that of tenure, the number of cash tenants remained about the same, that of share tenants doubled. But the owned farms were over two thirds of the whole.

The great specialty of Kentucky, and its principal sale crop (most of the cereals being used in the State), is tobacco. In 1900 it not only produced two and a half times the amount of any other State,—314,288,050 pounds, valued at \$18,541,982, against 127,000,000 and 122,000,000 for North Carolina and Virginia respectively—but 36 per cent of the entire product of the United States. This was an increase of 41.6 per cent over 1890, and the largest crop ever reported. The yield averaged 816.7 pounds per acre, and the price 5.9 cents per pound. The preeminence of Kentucky in this is due not only to the favorable constituents of the soil for the plant's growth, but to the sunny equable climate, free from those violent extremes which are death to the delicate plant. The leading section is the west: Christian and Daviess counties head the list. Hemp is a famous product as being almost peculiar to Kentucky; but other fibres have driven it out of the market very largely, and it is of minor practical importance, having steadily declined since 1850. In that year it reached its climax, 78,818,000 pounds; in 1899 it was only 10,303,560, valued at \$68,454, a decrease of about 86.93 per cent since 1850; and was grown by 937 farmers in 17 counties, the chief being Fayette (Lexington), and the rest mainly to the south of it. The largest crop in value was corn, which has long been the great staple, not only for human food, but even more for provender and as a basis of the great distillery interest. Its acreage in 1900 was over half the total for all crops together, and more than double that for the next largest, wheat, and the crop was valued at nearly \$30,000,000. Wheat, for a long time dropping off, gained nearly 60 per cent. in the decade,

KENTUCKY

with a total of 14,264,500 bushels, valued at \$8,923,760. Hay and forage from grasses of several different kinds on the superb pasture of the State, came next, with a total of 776,534 tons, valued at \$6,100,647; grass seed also had considerable importance. Oats and potatoes each came to the total of nearly a million and a quarter dollars; orchard fruits, nearly \$2,000,000; sweet potatoes, onions and miscellaneous vegetables, nearly \$5,000,000. Floriculture is an important industry, the receipts amounting to over \$100,000.

Stock-raising.—The mild winter climate, in which cattle can remain out all winter with little feed, the superb pasture afforded by blue grass, which forms a thick fine turf, and grows to perfection in the shade of the forests, and the abundant and excellent water, have given Kentucky unsurpassed natural advantages for rearing live stock. But these would not have availed but for a succession of breeders of rare intelligence and perseverance, who have made it the centre of the Union for high-grade blooded stock. Especially is this the case with horses. The old Virginia stock, bred from choice imported English animals, themselves bred to combine speed and endurance, were taken by the Kentucky breeders, the strains carefully kept pure except to mix with equally good fresh blood; and they have developed the finest road horses in the country. Kentucky horses it has been estimated have made three fourths of all the winnings on the American turf. There were in the State in 1900 over 450,000 horses valued at about \$23,500,000 besides some 200,000 mules and asses. Dairy products were also of high importance, furnishing nearly \$10,000,000 of product, from 364,025 cows. There were nearly 2,000,000 swine and 1,300,000 sheep, but both have been falling off for many years. The animals sold live and dead, came to about \$25,000,000; the poultry and eggs to nearly \$8,500,000.

Manufactures.—Kentucky has great natural facilities for manufacturing; her immense hard-wood forests, her large coal fields, and plentiful natural waterways, for half a century and more after her admission to the Union kept her abreast of her western neighbors. But since then, there has been a relative falling off. In part it is due to the change in distribution of industries; the development of steam navigation threw Lexington, for instance, which in 1810 had 114 manufactures, into the shade to build up the river towns. But other causes—tardiness in extending railroad facilities to the forests and coal fields is held partially accountable, but this was itself due to general business conditions, and has been mostly remedied—have retarded it relatively, though not absolutely. In 1850 the number of wage-earners was 21,476, in 1900 62,962, but the former was 2.2 per cent of the total population against Ohio's 2.6, the latter 2.9 against Ohio's 8.5. The largest growth was in the decade 1880-90, the wage-earners increasing over 50 per cent. Tobacco is the foremost manufacturing industry, as it is the foremost agricultural product, and steadily growing. In 1900 the 337 establishments employed nearly one ninth of all hands, and turned out one seventh of all the product of the State's manufactories, to a value of \$21,922,111, nearly double that for 1890. Over two thirds of this was chewing and

smoking tobacco and snuff; the cigar manufacture, though the chief early one, having declined relatively. The industry dates from the 18th century, when tobacco was legal-tender currency; every town in the State had its small cigar factories, and many of the farms worked up their own product. Louisville has been for many years a principal leaf-tobacco market of the world, from its great facilities for distribution by river and rail; and tobacco industries of other kinds have therefore tended to concentrate themselves there, though Owensboro and Henderson have extensive establishments which prepare leaf for shipment. Flouring and grist-milling rank next with a product in 1900 of \$14,515,161, an increase of 50 per cent. since 1890. Louisville has large flouring mills with a considerable export trade. Cottonseed oil and cake are important,—\$4,683,000 in 1900. One of the great specialties of Kentucky for over a century has been corn whiskey, known as "Bourbon" from the county of Kentucky to which a number of western Pennsylvania "moonshiners" removed after the suppression of the Whiskey Insurrection (q.v.) in 1794; but the manufacture had been already established at Louisville in 1783, in three other towns soon after, and a Maryland colony in 1787 set up a number of distilleries along Salt River. For the management of the stills, see Internal Revenue System. Since the Civil War the old farm and village distilleries, producing one or two barrels a day, have mostly given way to mammoth establishments. But the total product is heavily declining, having dropped from \$15,159,648 in 1890 to \$9,786,527 in 1900. The manufacture of malt liquors, on the contrary, increased about one fourth; and is mostly concentrated in Louisville. In May 1902 there were 339 distilleries. The internal revenue receipts from the State in that year, mostly from liquors and tobacco, were \$21,096,013.

Pork packing was an early industry in Kentucky, and from the first centred in Louisville. Louisville and Cincinnati were long the rival heads of the slaughtering and meat packing business in the United States; but the great northwestern grain fields have taken it from the Ohio Valley. The use of artificial ice, permitting summer packing, has caused a great revival of it in Louisville. The fortunes of packing and of mere slaughtering, however, are singularly in reverse; the former dropped in the decade from \$2,966,227 to \$635,685; the latter increased from \$405,784 to \$5,081,482. From the hides of these cattle was made leather to the value of \$3,757,016. The chief agent is the bark of the chestnut oak, which is not only excellent for tanning, but has the great advantage over hemlock that cutting down the tree does not necessarily kill it as it does the latter; shoots spring from the stump, if the tree is not too old, and in about 20 years are fit for another stripping. The first large custom tannery was started at Louisville in 1848; that city now has a number, and is the centre of the manufacture, the establishments outside having mostly been abandoned. Sole leather and harness leather are the principal products, although some sheepskins are tanned for the manufacture of shoes and saddles. The industry has declined somewhat since 1883, its climax, but is still one of the leading specialties.

The exploitation of the rich forests now

KENTUCKY

going on its shown by the increase of lumber and timber products, from \$7,904,428 in 1890 to \$13,774,911 in 1900. Logging is an extensive industry on the upper waters of the Cumberland, Kentucky, and Licking Rivers; and the government improvements in the Kentucky, Green, and other rivers enable logs to be floated almost from their original home to the Ohio.

Of iron and steel, there were in 1900 eight establishments, employing 2,402 hands and turning out \$6,676,093 worth of goods, an increase in the decade of over 150 per cent. The early furnaces were abandoned for lack of transportation facilities; in 1846 others were built at Eddyville on the lower Cumberland by William Kelly; and in 1851, five years before Bessemer patented his pneumatic process, Kelly began his "air-boiling" process, essentially the same, for turning iron into steel. During these years steamboats built at Cincinnati were using boiler plate practically the same as the Bessemer, but made by the Kelly process; and the latter finally secured a royalty.

Louisville is also one of the great centres of the manufacture of jeans clothing, from cloth made largely in the State mills; but of late years this has been partly replaced by the cassettes. Louisville produces over half the total manufacturing product of the State, and its relative share is increasing.

Transportation.—Kentucky has 813 miles of navigable water on its boundary alone,—the Ohio 643 miles, the Mississippi west 50 miles, the Big Sandy east 120 miles. The Cumberland and Tennessee are navigated their entire course in the State; the Kentucky, Licking, Salt, and Green are more or less navigable for considerable portions of their lower courses, and some improvements have been made by dams and locks, but are little used. The great canal around the falls of the Ohio at Louisville has largely increased the value of that channel, which with the strip of the Mississippi is the creator of the State's commerce. The railroad system of the State has been greatly hampered by the difficulty of approach from the southeast over the mountains: several thousand square miles of this section, in a solid block, have not a mile of railroad track. This mountain district is a part of Appalachian America (q.v.) and presents, along with interesting Saxon survivals, grave problems in education and the enforcement of law. As the great transcontinental lines run mostly north of it, moreover, it has not been developed as other sections. The State has now about 3,300 miles of railroad in operation; the chief systems are the Louisville & Nashville, the Queen & Crescent, the Illinois Central, and the Chesapeake & Ohio.

Banks.—For the establishment of the banking system, see *History*. The great landmarks are the establishment of the Bank of Kentucky at Frankfort in 1806, and that of the Louisville clearing-house in 1875, which has more than once saved the more solid banks of the State from catastrophe. In 1902 there were 95 national banks in operation, with capital of \$13,334,000, surplus of \$4,015,000, cash and other items, \$3,904,000, loans \$37,976,000, deposits \$30,577,000; 229 State banks, with \$9,264,000 capital, \$2,110,000 surplus, \$3,805,000 cash, etc., \$29,999,000 loans, \$32,045,000 deposits; and 22 private banks, with \$606,000 capital, \$163,000 surplus, \$297,000 cash, etc., \$2,513,000 loans,

\$3,233,000 deposits. The exchanges of the United States clearing-house at Louisville and Lexington for the year ending 30 Sept. 1901 aggregated \$480,595,304.

Education.—In 1901 there were 7,900 white and 1,157 colored teachers in the State, the males slightly in excess among the white teachers, females considerably so among the colored; average monthly salary of whites \$40.00, of colored \$29.95; of men \$44.03, of women \$37.18. The average length of school term was 115 days; this, however, does less than justice to the cities and much more than justice to the rural districts. Entering the Union at an early date, Kentucky failed to receive the land grants which have given rise to large school funds in some other States; and the sentiment for universal education could not become prevalent until after the abolition of slavery. In the cities and among the wealthy, private schools absorbed the interest of the people, so that public education languished until recent years. At present many of the cities and larger towns, as Louisville and Ashland, have very creditable public high schools. The condition of the rural schools is unsatisfactory. The unpaid local trustees prove inefficient, and the erection of school-houses is hindered by legal difficulties over the raising of taxes. School legislation has been wisely adapted to meet the conditions in which the State is placed. The local teachers are paid from a general State fund, so that the richer portions of the commonwealth assist the poorer parts. The election of a superintendent of public instruction in each county is an arrangement contributing to progress. The public instruction provided for the colored people is in separate schools under colored teachers. The difficulties of maintaining schools in the mountain counties, and the impossibility of at once bringing under instruction the negro population, formerly enslaved, gives the State a poor showing in the matter of illiteracy. However, Kentucky is in better condition than most southern commonwealths and shows gratifying evidences of progress: 139 per cent. of its white voters are illiterate, and 49.5 per cent. of its negro voters. The expenditures for school purposes in 1900 were \$2,650,100.

For higher education there were in 1900, 69 public high schools, 82 private secondary schools, 6 public and 8 private normal schools, 13 colleges for men, or coeducational, and 11 colleges for women alone. The Kentucky University, which has had a long and varied history, is now controlled by the Disciple denomination. Center College at Danville (Presbyterian) has been the Alma Mater of many distinguished men, and recently, in combining with Central University, has taken that name. Other schools under religious auspices are, Georgetown College (Baptist) at Georgetown; and Wesleyan College (Methodist, South) at Winchester; Berea College (religious but not sectarian) at Berea, was founded by the anti-slavery element which existed in Kentucky before the War, and has in addition to the ordinary college courses, large normal and industrial departments with special adaptations to the needs of the mountain region. Receiving "all young people of good moral character" it has an attendance of colored students comprising about one seventh of the whole number. The "State College" at Lexington occupies the position of a State uni-

KENTUCKY

versity, enjoying the funds provided by the United States government for "instruction in Agriculture and the Mechanic Arts," and affording special opportunities for the study of the natural sciences. The medical schools of Louisville are attaining reputation and importance. And that city is also the seat of a Baptist and a Presbyterian Theological Seminary.

Churches.—No religious census has been taken since 1890; but no considerable changes have taken place since that date, when the Baptists were far in the ascendant, though divided into "missionary," "predestinarian," and other varieties. Methodist Episcopal South is next in size; then came in order the Disciples of Christ, the Methodist Episcopal, the Colored Baptist, the Roman Catholic, the Cumberland Presbyterian, the African M. E., the African M. E. Zion, and the Protestant Episcopal.

Charitable and Penal Institutions.—There are insane asylums at Lexington, Hopkinsville, and Anchorage; a notable institution for the education of the blind at Louisville; a State school for deaf-mutes at Danville; and an institution for feeble-minded children at Frankfort, which, however, restricts the ages to the period of six to 18, and requires that they shall not be too feeble-minded for training. The State penitentiaries are at Frankfort and Eddyville.

Government.—The State officers are elected for four years, on the November preceding the Presidential election; they cannot be re-elected. The governor has a veto by items, but a majority vote overrides it. If he dies in the first two years of his term, a new election is held; if later, the lieutenant-governor and the president of the senate succeed in order. The legislature consists of 38 senators chosen for four years, and 100 representatives for two years. Sessions are biennial, and limited to 60 days (legislative days). Provisions concerning revenue bills and impeachments follow the model of Congress. Women (by a law of 1902) can hold office on school boards. No State, county, city, or town officers except members of city legislative boards can be elected in the year of a Presidential election. The judiciary is headed by a Court of Appeals, consisting of not over seven or under five elective judges, with terms of eight years. There are no townships, only "magisterial districts," and the county, as in old Virginia is the political unit. Each county is entitled to three sittings of a circuit court each year. The circuit judges are elected for six years, in districts. There is a county judge, and a monthly court day. County officers are elected for four years, except a circuit court clerk for two years, and the sheriff is ineligible to re-election except in alternate terms. Counties must have a minimum area of 400 square miles, and the county-seat must be at least ten miles from the boundary. There are 11 representatives in Congress.

Finance.—The State's assessed valuation in 1902 was \$667,056,375; the bonded debt, \$1,171,394. The tax rate was \$5 per \$1,000. The State revenues are divided into "funds," for different departments; the "general expenditure" fund is unfortunately fixed too low and entirely inadequate to the needful expenses, so that the State expends about double the amount of the fund, giving an appearance of a large deficit which is not correct as to the resources or in-

come as a whole. The financial world, however, takes note of this fact, and Kentucky has perfectly good credit.

Population.—The population of the State at the various censuses has been as follows: 1790, 73,677; 1800, 220,955; 1810, 406,511; 1820, 564,135; 1830, 687,917; 1840, 779,828; 1850, 982,405; 1860, 1,155,684, including 10,684 free negroes, and 210,981 slaves; 1870, 1,648,690; 1880, 1,858,635; 1900, 2,147,174. The foreign-born were but 50,249; considerably more than half Germans, about 10,000 Irish. The colored population was 284,865, not so large as in 10 other States, and not so large a percentage as in 17 others; nor are the colored people increasing so fast as the whites, there having been a relative decrease for the past two decades. The agricultural characteristics of the State have prevented the over-development of specially slave industries, and the mountain districts of course have very few. There seems also to have been some tendency among the negroes to emigrate, and a large emigration of whites is continually going on, so that natives of Kentucky form a notable element in Ohio, Indiana, Missouri and the West.

The one great independent city of Kentucky is Louisville (204,731) at the falls of the Ohio, the third in size on the river, excelled only by Cincinnati and Pittsburg. Covington (42,938), Newport (28,301), Bellevue (6,332) and Dayton (6,104) are virtually suburbs of Cincinnati, the first-named west of the Licking, the last three east of it. Other cities on the Ohio, which monopolizes much the greater part of the urban development and manufacturing of the State, are in the west, Paducah (19,446) at the mouth of the Tennessee, Owensboro (13,189) and Henderson (10,272); in the northeast, Maysville (6,423); on the east, Ashland (6,800), now the head of a rapidly growing iron district. Lexington (26,369), formerly the capital, once called "Athens of the West," is the head of the Blue Grass region. Frankfort (9,487), the capital, on a magnificent gorge of the Kentucky River; Bowling Green (8,226), the head of navigation on the Barren River, a tributary of the Green; Hopkinsville (7,280) in the southwest; and Winchester (5,964) in the north centre, are the only other places of over 5,000.

History.—The earliest explorers found this territory, though formerly inhabited by mound-building, agricultural Indians and presenting every advantage to such tribes, practically deserted, save at two points on the Mississippi and Ohio. It was a ground contested by powerful tribes, who slaughtered any others attempting to hunt there. Kentucky was originally a part of Fincastle County, Virginia, explored by Boone and his companions, as well as previous travelers, soon after 1760. The first settlement was at Harrodsburg in 1774. Boonesborough was founded the following year. With the exception of French settlements, these two towns are the oldest in the West. In the former year the victory at Point Pleasant forced the northwestern Indians to give up their claims, and the "Transylvania Company" (Richard Henderson and associates) bought about 2,500 square miles west of the Kentucky River, from the Cherokees, whose chief told Henderson he "had bought a fine territory but might have some little difficulty in occupying it"; in fact, the settlement was harassed by bloody Indian wars, and

KEPPLER — KERNSTOWN

the North American squadron in Hampton Roads. He was placed in command of the Channel fleet in 1778, and in July of that year engaged the French fleet off Ushant. Having become partly disabled he signaled for his van and rear divisions, but Palliser in command of the rear ignored the signal until too late. Palliser accused him of incapacity and cowardice, but Keppel was honorably acquitted. In 1782 he was raised to the peerage under the title of Viscount Keppel and Baron Eldon. He was first lord of the admiralty 1782-3.

Keppeler, Joseph, American caricaturist: b. Vienna, Austria, 1 Feb. 1838; d. New York 19 Feb. 1894. He early made his reputation as a satiric artist and the leading periodicals of his native city were publishing his witty sketches, almost before he had left the Academy of Fine Arts. But art was not then a serious business to him, and he took to the stage as a comedian and opera singer, and actually began to study medicine at St. Louis, Mo., where he made his residence in 1868. But it was in St. Louis that he found his real vocation. There he established the German 'Puck,' which, while it failed as a commercial enterprise, made his reputation. It was seen at once that a caricaturist of rare skill as a draftsman, of mental fertility and freshness, of witty and incisive satire, had appeared. He was engaged from 1872 to 1877 as caricaturist for 'Frank Leslie's Illustrated Newspaper' in New York, to which city he had removed, and in 1875 he started a New York German 'Puck' in association with Adolph Schwartzman. This was followed in 1877 by the English 'Puck.' He was the first to use colored cartoons in caricature, and drew upon a vast store of classical and historical incidents for adaptation in criticising modern social and political life.

Ker'atin (from Gr. *keras*, a horn), a substance obtained from claws, feathers, hair, horn, nails, wool, and other epidermal appendages. This tissue or substance is distinguished from gelatinous tissue by becoming soft when acted on by water for some time, but no glue is produced. It is insoluble in alcohol and in ether.

Kerguelen (kér'gél-lén) Land, or Desolation Island, an island in the Indian Ocean, intersected by lat. 49° 3' S., lon. 68° 18' E.; length about 100 miles; greatest breadth about 50 miles. It has a remarkably barren and desolate appearance, due to the fact that it consists of lofty masses of basalt and other volcanic rocks. These rise to the height of 2,500 feet, presenting numerous bold headlands and ranges of precipitous cliffs, and possessing a very scanty vegetation. Sea-fowl are numerous, but no land animals are known to exist on it. Its indentations furnish several bays and inlets affording good harbors. It was annexed by France in 1893, and some settlers have made their abode there. Of the flora, which is arctic, the most noteworthy species is the Kerguelen cabbage (*Pringlea antiscorbutica*), a large edible plant, in many ways resembling common garden cabbage, and which has been valued on account of its antiscorbutic properties.

Kermes, kér'méz, dried female scale insects (*Coccus ilicis*) found in many parts of Asia and South Europe on the leaves of an oak (*Quercus coccifera*), supplying a durable

red and scarlet dye. They have been utilized for dyeing purposes in the East from very ancient times, but since the introduction of cochineal (q.v.) their use is confined to the Eastern countries and Spain, where the collection of these insects still gives employment to a number of people, but is diminishing under the competition of the aniline dyes.

Kermes Mineral, a name given to amorphous antimony trisulphide. The native antimony trisulphide occurs in well-developed orthorhombic prisms. When this compound is fused for some time, and suddenly thrown into cold water, its crystalline structure is entirely destroyed. Kermes is a brown-red powder, becoming blackish-gray when washed with boiling water. By fusion it may be obtained as a solid mass, but it is totally devoid of crystalline structure. See ANTIMONY.

Kermess, kér'méz, **Kirmess**, or **Kermis**, formerly a church festival held by the Dutch and in Flanders, and later in other parts of Europe, on the feast-day of the principal saint of a place or church. In the United States the word has come into general use for entertainments given for charitable purposes.

Kern (kérn) Lake, a body of water in Kern County, in the southern part of California; one of a small group of basins in the midst of an almost arid part of the State. Part of the year there is no apparent outlet, but at the period of high water the lake overflows into Kern River. The country around this lake and in the vicinity is noted for its large amount of game.

Kern River, a stream in the southern part of California; almost its whole course is among the mountains of the southeast. The country in the vicinity is noted for game, and at one time valuable mining interests. In the western part of Kern County, the slough of the Kern River occupies an area of about 80 square miles. It flows into Tulare Lake. The Edison Company of Los Angeles are using the valuable water power of this river for their electric-power plant established on this river.

Kernahan, kér'ná-an, **Coulson**, English novelist: b. Ilfracombe, Devonshire, 1 Aug. 1858. He was educated at St. Albans, and afterward privately by his father, a scientist and Biblical scholar. He has contributed to most of the principal English and American periodicals, and has written: 'A Dead Man's Diary'; 'A Book of Strange Sins'; 'Sorrow and Song'; 'God and the Ant'; 'The Child, the Wise Man and the Devil'; 'A Literary Gent'; etc. He has been for many years literary adviser to Ward, Lock, and Company.

Kernstown, Battle of. Gen. "Stonewall" Jackson abandoned Winchester, Va., 11 March 1862 and retreated up the Shenandoah Valley, followed by Shields' Union division beyond Strasburg. Shields was recalled to Winchester on the 20th, and Jackson followed him, his advance cavalry under Turner Ashby engaging Shields on the afternoon of the 22d, near Kernstown, in which Shields received a severe shell-wound. Jackson came up on the afternoon of the 23d and, being informed that Williams' division of Banks' corps had left Winchester and was moving through the Blue Ridge for Manassas Junction, and that Shields had but four regi-

KERNSTOWN—KERR

ments in his front, determined to crush these and thus recall Williams and detain him in the valley. Shields had nearly 8,000 infantry and cavalry and 24 guns, two of his brigades on a ridge covering the road half a mile north of Kernstown, both under command of Col. N. Kimball. Jackson had about 3,000 infantry and 27 guns. Kimball was too well posted to be attacked in front, so leaving Ashby with the cavalry and a small brigade of infantry to hold the road and threaten Kimball's centre and left, Jackson seized a low ridge on Kimball's right, and placed on it his artillery and infantry. Tyler's brigade, which had been held in reserve, was brought up and made unsuccessful efforts to dislodge him, upon which Kimball, drawing from his left and centre, formed a column of seven regiments and, under a terrific fire of artillery and musketry, led it forward, came up on Tyler's left and after a fierce combat broke Jackson's line. Kimball pressed his advantage, and as night closed in, Jackson was in full retreat, leaving his dead and wounded and two guns on the field of his first defeat. He said that he considered the engagement "a fiercer fight during its continuance than any portion of the battle of Manassas." The Union loss was 118 killed, 450 wounded, and 22 missing; the Confederate loss, 80 killed, 375 wounded, and 263 missing. Consult: "Official Records," Vol. XII.; Allan, "Jackson's Valley Campaign"; The Century Company's "Battles and Leaders of the Civil War," Vol. II.

E. A. CARMAN.

Kernstown (Winchester), Second Battle of. On 22 July 1864 Gen. Crook, with four small divisions of infantry and cavalry, joined Gen. Averell's cavalry division at Winchester, Va., Crook assuming chief command of the united force of 11,000 men. On the 23d Crook advanced four miles south to Kernstown and skirmished with Confederate cavalry, and on the 24th went into position on the same ground held by the Union troops in the battle of 23 March 1862. The infantry divisions of Cols. Thoburn, Duval, and Mulligan covered the valley pike, with the cavalry of Duffié and Averell on either flank. Upon the approach of the enemy Averell was sent down the Front Royal road to turn his right. Gen. Early, who, after his raid on Washington, had recrossed the Potomac and taken position beyond Cedar Creek on the 21st, hearing of Crook's advance, put all his army in motion on the morning of the 24th to attack him. At Bartonsville Ramsour's division moved by a road to get around Crook's right, while the divisions of Gordon, Rodes, Breckinridge, and Wharton moved along the valley pike and on either side of it. The cavalry was divided and moved in two columns, one on the right along the Front Royal and Winchester road, the other on the left and west of Winchester, the two to unite in rear of Winchester and cut off Crook's retreat. At 10 A.M. Crook's skirmishers were driven in, and it was discovered that his left extended through Kernstown, and that Averell having left, that flank was exposed; whereupon Wharton's division was moved under cover of some ravines on the right to attack it. The movement was promptly executed, and Wharton struck the left flank and rear of Col. Rutherford B. Hayes' command as it was advancing and threw its left

into some confusion. Hayes changed front and, forming behind a stone fence, held Wharton in temporary check. Almost simultaneously with Wharton's flank attack, Rodes, Gordon, and Ramseur advanced on Crook's centre and right, and the entire line gave way and retreated through Winchester, followed by Early's infantry and artillery beyond Winchester, and by Rodes' division as far as Stephenson's Depot. The retreat was continued on the 25th through Martinsburg to the Potomac, Crook crossing at Williamsport and marching down the north side of the river to Maryland Heights and Harper's Ferry. Early occupied Martinsburg and began the destruction of the Baltimore & Ohio railroad. The Union loss, 23–26 July, was 100 killed, 606 wounded, and 479 missing. Among the mortally wounded was Col. Mulligan, commanding division. The Confederate loss is not accurately known, but it was comparatively light. Consult: "Official Records," Vol. XXXVII.; Pond, "The Shenandoah Valley in 1864"; The Century Company's "Battles and Leaders of the Civil War," Vol. IV.

E. A. CARMAN.

Ker'osene, an illuminating oil; the principal product of the distillation of petroleum, the crude domestic oil yielding 70 per cent. of its weight. The oil is colorless, possessing a characteristic taste and smell; insoluble in water, moderately soluble in alcohol, but very soluble in ether, chloroform, and benzene. It dissolves camphor, iodine, phosphorus, sulphur, fats, wax, and many resins. The flashing point of a safe kerosene should not be less than 34°, and the igniting point 43°. The finest quality of illuminating oil is produced from distillates ranging in specific gravity from 0.775 to 0.780. It has a high flashing point, 48° to 60°, and contains none of the lighter parts of the crude oil. A good illuminating oil should neither be too viscous nor too volatile, and it should not take fire when a light is applied to it. See Oil; PETROLEUM.

Kerr, kér, Michael Crawford, American politician: b. Titusville, Pa., 15 March 1827; d. Rockbridge, Alum Springs, Va., 19 Aug. 1876. He was graduated from the law school of Louisville University in 1851. The next year he moved to New Albany, Ind., and began the practice of his profession; in 1854 he was city attorney, and in 1855 prosecuting attorney for the county. In 1856 he was elected to the State legislature; in 1862 he was reporter for the supreme court of Indiana, and published five volumes of reports of unusual value. In 1864 he was elected to Congress as a War Democrat, and served till 1872. In that year he refused the nomination from his own district, but ran as congressman-at-large, and was defeated by a very small majority; in 1874 he was re-elected to Congress in spite of much opposition, and was made speaker on the organization of the House. He served however only during the first session of that Congress (the 44th), as he died four days after its adjournment. While a member of the House he served on several important committees, including the committee of ways and means; he opposed the reconstruction policy of the Republican party and was an advocate of free trade. He was also a close student of financial problems, favored the resumption of specie payment, and was strongly

KERR — KEW OBSERVATORY

against the Greenback movement in regard to which he opposed a large part of his constituency and many of the politicians of his State.

Kerr, Orpheus C. See NEWELL, ROBERT HENRY.

Ker'ril, a sea-snake (*Distira cyanocincta*), olive with blue-black bands, numerous along the coasts from Persia to Japan, and considered one of the most venomous of its race. See SEA-SNAKE.

Kerrville, kér'vil, Texas, town, county-seat of Kerr County; on the Guadalupe River, and on a branch of the San Antonio & A. P. railroad. It is situated in an excellent agricultural region in which cotton cultivation and sheep raising are the principal occupations. The altitude of the town is about 1,800 feet, which accounts for its agreeable climate. The chief industrial establishments are stock-yards, flour-mills, cotton gins and, in the vicinity, stone quarries. The town has considerable trade in lumber, and is one of the principal wool markets of the State. Pop. (1900) 1,423.

Kersey, kér'zí, a kind of woolen cloth, differing from broadcloth by being woven as a twill. A very thin fine variety of kersey is called cassimere.

Ker'shaw, Joseph Brevard, American soldier: b. Camden, S. C., 5 Jan. 1822; d. there 13 April 1894. He entered the Confederate army at the outbreak of the Civil War, and as brigadier-general commanded a brigade in the Peninsular campaign of 1862. He took part in the capture of Harper's Ferry, 15 Sept. 1862, and was active at Antietam, Fredericksburg, Chancellorsville, Gettysburg, and Chickamauga. After the War he became president of the South Carolina Senate, and was judge of the 5th circuit of South Carolina, 1877-93.

Kes'trel, one of the smaller of the European falcons (*Tinnunculus alaudarius*), resembling the sparrow-hawk, and formerly much used in falconry by the peasantry. The American sparrow-hawk and sharpshin (qq.v.) may be called kestrels.

Ketch, a vessel equipped with two masts, namely, the mainmast and the mizzenmast, and usually from 100 to 250 tons burden. Ketches were principally used in former times as yachts for conveying princes of the blood, ambassadors, or other great personages from one place to another. Ketches in use at the present day are chiefly coasters.

Ketones, két'ōnz. See ACETONE.

Ketteler, két'tél-ér, Clemens August, BARON von, German diplomat: b. Potsdam 1853; d. Peking 20 June 1900. He served for a time in the army, but entered the diplomatic service, in 1882 as attaché at Peking drew up the first treaty between Germany and Korea, in 1883 was appointed acting consul at Canton, in 1892 became secretary of the German legation at Washington, and when in 1893 the legation was made an embassy was appointed first secretary to the embassy and counsellor of state. In 1896 he became minister to Mexico, in 1899 minister to China. In 1900, at the time of the "Boxer" disturbance in northern China, he was selected, owing to his familiarity with the Chinese language, to represent the foreign diplomats in their communications with the govern-

ment. While on such a mission he was shot in the street. Prince Chun, brother of the emperor, was sent to Germany to apologize for the murder, and 18 Jan. 1903 a memorial arch, set up at the expense of the Chinese government, was dedicated at Peking.

Kettle Drum, a musical instrument, formed of thin copper, and has a head of parchment or vellum. Kettle drums are used in pairs, slung on each side of the withers of a cavalry horse. One drum is tuned to the key note, and the other to the fifth of the key in which the piece in which they are to be used is written. The tuning is by a hoop and screws. Also a name for a tea party held by fashionable people in the afternoon before dinner.

Ketu'pa, the generic and vernacular name of a group of large owls of the East Indies, specifically the Javan one (*K. javanensis*), which subsist mainly on fish, crabs, and the like, which they are expert in catching along the shores of sea and rivers. Their legs and talons are long and not feathered.

Keuka (ké-u'ka) Lake, or Crooked Lake, a body of water in New York State extending from Steuben County to Yates County, a distance of 20 miles. It is about 2 miles wide and of irregular form. It has a depth of 200 feet and lies 718 feet above the sea. Steamboats navigate the lake in summer between Hammondsport and Penn Yan.

Keuka, College, N. Y., a college at Keuka Park; founded in 1892 under the auspices of the Free Baptists. It had in 1901: Professors and instructors, 15; students, 176; volumes in the library, 3,000; productive funds, \$150,000; income, \$11,000.

Kew, kū, England, a small village in the county of Surrey, on the right bank of the Thames, opposite Brentford, with which it is connected by a bridge. The royal botanic gardens and the connected pleasure-grounds, the former covering about 75 acres, the latter 250, are the chief attraction of visitors to Kew. They contain the finest collection of plants in the world, and are decorated with various ornamental buildings, including a Chinese pagoda 163 feet high. The botanical constructions here are really magnificent, and have been much augmented in recent years; they include a great conservatory for palms, tree-ferns, and other tropical plants, 362 feet long altogether, the centre portion being 137 feet 6 inches long, 100 feet wide, and 69 feet high, the wings 50 feet wide and 33 feet high; a house for succulent plants, such as cactuses, euphorbias, etc., 200 feet long and 30 wide; a great "temperate house" for trees and shrubs of temperate climates that require protection during the winter; a large orangery, hothouses, greenhouses, etc., of great size. The gardens are open to the public on Sundays as well as week days.

Kew Observatory, a celebrated astronomical structure in Richmond Park, between Kew and Richmond, Surrey, England. It was built by George III. as a private enterprise for the observation of the transit of Venus in 1769 and was then called the King's Observatory. It was transferred to the British Association as a physical observatory in 1841, and given its present name. In 1871 it was placed under the control of the Royal Society.

KEWANEE — KEY WEST

Kewanee, ke-wā'nē, Ill., city in Henry County; on the Chicago, B. & Q. railroad; about 100 miles north by west of Springfield and 122 miles southwest of Chicago. It is situated in an agricultural region, and coal-fields are in the vicinity. The chief manufactures are agricultural implements, boilers, pumps, steam-heating machinery, gloves, mittens, and carriages and wagons. The tube and boiler works employ about 3,520 men. The public library has about 10,000 volumes. The city owns and operates the waterworks. Pop. (1890) 4,569; (1900) 8,382.

Kewa'tin. See KEEWATIN.

Kewaunee, ke-wā'nē, Wis., city, county-seat of Kewaunee County; on Lake Michigan at the mouth of the Kewaunee River, and on the Kewaunee, G. B. & W. railroad. The first permanent settlement was made in 1850, and the city received its charter in 1882. Its chief industrial establishments are foundries, machine-shops, pea-canning works and coffin factory. Pop. (1900) 1,773.

Keweenaw (kē'wē-nā) Bay, an arm of Lake Superior, north of Michigan. It is 8 miles long, by 2 to 6 miles in length. The town of Baraga lies at the head of the bay.

Keweenaw Point, a peninsula in northern Michigan, projecting into Lake Superior. It is rich in copper mines, the maximum thickness of the strata here being 40,000 feet. The peninsula is as large as the State of Delaware, and includes Houghton and Keweenaw counties. Among the towns on the peninsula are Calumet, Houghton, Eagle Harbor, and Copper Harbor.

Keweenawan (kē'wē-nā-an) Series, a great series of rocks, believed to be of Pre-Cambrian age, typically developed on Keweenaw Point, Mich., but found over a large area in Michigan, Wisconsin, and Minnesota. Rocks of the same age occur also in Canada, and possibly in the Adirondack Mountains in New York. The series on Keweenaw Point and southward has a maximum thickness of perhaps 50,000 feet; the lower part consists mostly of thick sheets of lava and intrusive rocks with some sandstone and conglomerate; the upper part is a mass of sedimentary rocks. In the series occur the famous Lake Superior copper deposits. The Keweenawan series is included in the Algongkian or Eozoic system.

Key, David McKendree, American jurist and cabinet officer: b. Greene County, Tenn., 1824; d. Chattanooga, Tenn., 3 Feb. 1900. After studying law he was admitted to the bar in 1849, and in 1853 took up his residence in Tennessee, establishing a successful law practice at Chattanooga. After vainly attempting to prevent the secession of Tennessee, when once that step was taken he joined the Confederate army and served through the War, but at its close joined the Republican party, succeeded Andrew Johnson in the United States Senate (1875); in 1877 was made postmaster-general; and in 1880 was appointed United States district judge for the Eastern and Middle Districts of Tennessee, a position he held till his death.

Key, Francis Scott, American lawyer and song writer: b. Frederick County, Md., 1 Aug. 1779; d. Baltimore 11 Jan. 1843. He was educated at St. John's College, Annapolis, and com-

menced the practice of the law in Frederic City. Subsequently he removed to Washington, where he was for many years district attorney of the District of Columbia. As a song writer he is chiefly known by his 'Star-Spangled Banner,' a popular national lyric, suggested and partially written while the author was detained in the British fleet during the bombardment of Fort McHenry, near Baltimore, of which he was an anxious and interested witness. A posthumous collection of his miscellaneous poems was published in 1856.

Key, in music: (1) A mechanical contrivance for closing or opening ventages, as in flutes, clarinets, ophicleides, etc. By means of keys on such instruments, apertures too remote to be reached by the outstretched fingers are brought under control of the player. (2) A lever which brings the pallets of an organ under the control of the hand or foot of an organist. (3) A lever which controls the striking apparatus of a key-stringed instrument. In the harpsichord it acted on the jack; in the pianoforte it acts on the hammer. (4) The wrest or key used for tuning instruments having metal pegs. Its end is hollowed out so as to fit over the four-sided end of the peg, and the cross-bar with which it is surmounted gives leverage to the hand of the tuner, so that he is enabled to tighten or loosen a string, or (in the case of a drum) slacken or strain a parchment. (5) The sign placed at the commencement of the musical stave which shows the pitch of the notes, was originally called a clavis or key. This sign is called in modern music a clef. (6) Key, in its modern sense, is the starting point of the definite series of sounds which form the recognized scale. Different starting points require the relative proportion of the steps of the scale to be maintained by means of sharps or flats in the signature. The key of C major requires no flats or sharps for this purpose, hence it is called the normal key.

Also a metallic instrument for shooting the lock-bolt of a door; an instrument formed with cavities or interstices corresponding to the wards of a lock, by which the bolt is moved backward or forward.

Key West, Fla., city, port of entry, county-seat of Monroe County; about 60 miles southwest of Cape Sable and nearly 100 miles north by east of Havana, Cuba. The city is on Key West Island, one of a group of coral islands, called Florida Keys. It is the farthest south of any city in the United States. The first permanent settlement was made in 1822 and the city received its charter in 1832. Key West Island is covered by only a thin layer of soil upon which vegetation grows luxuriantly. The island averages about 11 feet above the sea. The harbor is excellent; at the main entrance, on an artificial island, is located Fort Taylor. The city has regular steamer communication with the large cities on the Atlantic and Gulf coasts and with the West Indies and Central America. It is a United States naval station, and during the war with Spain, it was the rendezvous of the United States navy. The chief industries are manufacturing of cigars, gathering sponges, and fishing. There is a large trade in fish, fruit, vegetables, turtles, turtle-shell ornaments, salt, tobacco, both raw and manufactured. In connection with the naval

KEYES—KHARGEH

station there are barracks, machine-shops, marine hospital, docks, etc. Some of the chief public buildings are the government buildings, post-office and custom-house, county court-house, city-hall, and the Martello towers. The principal educational institutions are a Methodist Seminary and the Holy Name Academy. The convent of the Holy Name was used as a hospital for soldiers during the Spanish war. The free public library and the public and parish schools are excellent. There are two banks with a combined capital of \$150,000. The government has erected two light-houses in the harbor and others among the islands; but still many wrecks occur each year. The city owns and operates the waterworks. Pop. (1900) 17,114.

Keyes, kēz, Edward Laurence, American surgeon: b. Charleston, S. C., 28 Aug. 1843. He is a son of Erasmus Keyes (q.v.) and was graduated from Yale in 1863 and from the medical department of the University of New York in 1866. He has practised his profession in New York from 1867, and is now (1903) consulting surgeon to Bellevue Hospital. He has published: 'The Venereal Diseases' (1880); 'Treatise on Surgical Diseases of the Genito-Urinary Organs' (1881); etc.

Keyes, Emerson Willard, American educator and financial writer: b. Jamestown, N. Y., 30 June 1828; d. 13 Oct. 1897. He graduated from the State Normal School, was deputy superintendent of public instruction in New York 1857-65, and acting superintendent 1861-2. In the latter year he was admitted to the bar, became deputy superintendent of the banking department of New York State in 1865, and was appointed bank examiner five years later. In 1882 he was appointed chief clerk of the Brooklyn (N. Y.) Board of Education, a position which he filled until his death. He published: 'New York Court of Appeals Reports' (1867-9); 'History of Savings Banks in the United States' (1878); 'New York Code of Public Instruction' (1879); etc.

Keyes, Erasmus Darwin, American general: b. Brimfield, Mass., 29 May 1810; d. Nice, France, 11 Oct. 1895. He was graduated from West Point in 1832, and served in Charleston in 1832-3. He was later placed on frontier duty in the Northwest during the Civil War, and won distinction at Fair Oaks and elsewhere. He was promoted major-general of volunteers 5 May 1862, and on 31 May of that year was brevetted brigadier-general United States army. He resigned in 1864 and settled in California. He published 'Fifty Years' Observation of Men and Events' (1884).

Keyes, the name given to coral and other reefs or slightly sunken rocks off the shores of Florida, Central America and the West India Islands. The term is derived from the Spanish *cayo* (an islet, rock).

Keyser, ki'zér, Ephraim, American sculptor: b. Baltimore, Md., 6 Oct. 1850. On the completion of his academic course in his native city, he studied art at the Royal Academies in Munich and Berlin, where his success was marked. He has had studios in Rome, Italy, New York, and Baltimore, where he now resides, in charge of the sculpture and modeling classes at the Maryland Institute School of Art.

His most important public works are the De Kalb statue at Annapolis, Md., and President Arthur's tomb at the Rural Cemetery, Albany, N. Y. He has made numerous portrait busts, among others those of Cardinal Gibbons, Daniel Coit Gilman, and Sidney Lanier. While abroad he received the Michael Beer scholarship.

Keyser, Leander Sylvester, American Lutheran clergyman and ornithologist: b. Tuscarawas County, Ohio, 13 March 1856. After graduation from Wittenberg Divinity School he filled various Lutheran pastorates in Indiana and Ohio, and has been pastor of Midland College Church, Atchison, Kan., from 1897. He has published: 'The Only Way Out' (1888); 'Birddom' (1892); 'In Bird Land' (1894); 'Birds of the Rockies' (1902).

Keystone State, a name given to Pennsylvania, because it was the seventh, or central of the original 13 States.

Khaki, kā'kī, a kind of light-brown, drab, or dust-colored cloth, originally used for making the uniforms of East Indian regiments. In the South African war of 1899-1901 the British troops wore khaki uniforms for purposes of protective coloration, and khaki was also worn by the United States troops in the Spanish-American war.

Khalifa, kā-lē'fā, The (SAYED ABDULLAH IBU-SAVED MOHAMMED), Arab religious leader: b. Darfur 1846; d. battle of Om-Debrihat, Egypt, November, 1899. He fought against the Egyptian invasion of Darfur, and subsequently, having heard of the troubles of the Mad Mullah (q.v.), Mohammed Ahmed, with the Egyptian authorities, he visited Mohammed, and proclaimed that the latter was the divinely-sent Mahdi, or "director," appointed for the regeneration of Islam. It was by his councils that the Mahdi caused the troubles in Kordofar and Darfur. Ere long he was made "khalifa," or vice-gerent, his acts to be regarded as equivalent to the Mahdi's own. He was named by the Mahdi as successor, and from 1885 ruled over the Sudan and such adjacent districts as he brought within his sway. His capital was situated at Omdurman, near which, on 2 Sept. 1898, his army, though fighting with great bravery, was almost annihilated by the British and Egyptian forces under Sir Horatio (now Lord) Kitchener (q.v.). He escaped northward, but in November 1899 was slain at the combat of Om Debrihat. See also EGYPT—History; SUDAN.

Khammurabi. See HAMMURABI, THE CODE OF.

Khan, kān or kān, or **Caravansary**, in Turkey and other Eastern countries. There are two kinds, those for poor travelers and pilgrims, where a lodging is furnished gratis; and those for traders, which are usually more convenient, a small charge being made for each chamber.

Khandesh, khān-dēsh', or **Candeish**, British India, an inland district in the presidency of Bombay, with an area of 10,907 square miles. The chief town is Dhulia (pop. 21,880). Pop. 1,460,851.

Khargeh, khār'gē, or **Kharga**, Egypt, town, in the oasis of the same name; 100 miles west of Thebes. Here are the ruins of the temple of Ammon. Pop. 4,000.

KHARKOV—KHORASAN

Kharkov, Här-köf', or Charkov, Russia, (1) a southern government bounded north by Kursk and Voronezh; west and southwest by Poltava; south by Ekaterinoslav; east by the Don Cossacks; area, 21,041 square miles. There are forests in a few parts, but the country generally is open, the soil dry and of a mixed loamy and sandy nature, but usually fertile. The climate is mild, though the winter is somewhat severe; the summer is frequently very hot. Agriculture and the rearing of sheep and other domestic animals form the chief employment of the inhabitants. Sugar and tobacco are manufactured. Pop. (1897) 2,509,811. The principal town is (2) Kharkov, the capital, at the confluence of the Kharkovka and Lopanj, 400 miles southwest of Moscow. The houses are mostly of wood, whitewashed, and have a cleanly appearance. The city is the see of an archbishop, contains a cathedral and other churches, a university with a library, a museum and botanical garden, a technological institute and a veterinary institute, several gymnasia, two theatres, etc. The inhabitants carry on a considerable trade in soap, candles, and leather; and among the chief industries are wool-washing and the manufacture of tobacco and cigars. Pop. (1897) 174,841.

Khartum, Har-toom', or Khartoum, capital of the Egyptian Sudan, on the left bank of the Blue Nile, near its junction with the White Nile. Founded under Mchemet Ali in 1823, it rapidly rose to be the chief town of the Egyptian Sudan, but after its conquest by the Mahdi it was abandoned for Omdurman, on the opposite bank of the river. In the latter part of 1898 it was again occupied by British and Egyptian troops, who found it in a ruined and neglected condition. It is a straggling place covering a wide area, with irregular streets, and houses mostly built of sun-dried bricks. The situation of Khartum made it the emporium of a large trade in ivory, gums, ostrich feathers, senna, etc., which is again developing under Anglo-Egyptian rule. It was the scene of Gordon's heroic defense against the insurgent Sudanese, and of his death in January 1885. The Gordon College, established here after the British occupation, was named in honor of him. Pop. 40,000.

Khayyám, Omar, ö'mär khī-yām'. See OMAR KHAYYAM.

Khedive, kē-dēv' (*Khidiv*), a Persian word signifying lord, the title of the Pasha of Egypt, granted him by a firman from the sultan in 1866. In Persia it was at different eras adopted by provincial governors who were independent of the shah. The title, which had fallen into disuse both among Persian and Turkish governors, was revived in order to give additional honor to Ismail Pasha.

Khiva, hē'vā, or Chiva, a vassal state of Russia, in Central Asia. It formerly occupied a large extent of surface on both sides of the Amu-Daria or Oxus, but since the cession to Russia, in 1873, of its territory on the east of the Amu, is now confined to the west side of this river. It is of a triangular shape, each of its three sides—of which Amu forms one—being about 300 miles in length. One of its angles rests on the Sea of Aral. A great part of the surface consists of deserts, thinly inhabited or

uninhabitable; but along the Amu the land is of a very different character, consisting of rich alluvial loam of the greatest natural fertility. Owing to the great dryness of the atmosphere, however, it soon becomes so stiff and hard that it cannot be penetrated by any ordinary implement. For this the obvious remedy is irrigation; and accordingly, from the earliest period, a mode of culture resembling that of Egypt has been practised. Large canals from the river, with numerous minor branches, intersect every part of the surface, supplying moisture where it is wanted, or removing it where it is in excess, and securing the most luxuriant crops of wheat, maize, rice, barley, and legumes. Cotton and madder are also generally cultivated. The vine thrives well, but requires to be defended against the winter cold by a covering of straw and earth; all the ordinary fruits, including apples, plums, cherries, apricots, figs, and pomegranates, are common. Trade is carried on chiefly with Russia. The principal exports are raw and spun cotton, in return for which are received various articles of European manufacture, as metals and ironware, woollen, cotton, and silk goods, etc. From Bokhara also are obtained cotton and silk goods, green tea, raw tobacco, Chinese porcelain, etc. These are sometimes paid for in money, but more frequently in Russian wares. The government of Khiva is an unmitigated despotism. The greater part of the inhabitants are Tajiks and Uzbeks, in nearly equal numbers. After these are Persians, Karakalpaks, Jamshids, and Turcomans. The designs of Russia on Khiva long caused disquietude in Britain, which has always been jealous of Russian advances in Asia, mainly from a dread of interference with her Indian empire. Accordingly Count Schouvaloff was despatched to England in January 1873, to give explanations respecting an intended expedition to Khiva. Its object was represented as simply the suppression of brigandage, the recovery of a few Russian prisoners, and to teach the khan to desist from acts of violence in the future. The emperor, it was said, had given positive instructions that Khiva should not be taken possession of. In spite of these protestations, however, Khiva was taken possession of on 10 June; and later in the year, though the nominal independence of the khan was stipulated for, it was decided to annex to the Russian dominions the Khivan territory on the right bank of the Amu. The khan also renounced all right of making wars or treaties without Russian sanction. The population is estimated at 700,000 to 1,000,000.

Khokand, hō-känd'. See FERGANAH.

Khoozistan'. See ELAM.

Khorasan, ho-rä-sän', Persia, an extensive northeastern province; area, about 140,000 square miles. The surface is to a great extent uninhabitable. The mountainous region of the north has many well watered valleys with a fertile soil. The most valuable mineral is the turquoise. In many parts cotton, hemp, and tobacco grow freely, and aromatic plants and drugs are numerous and valuable. The principal manufactures are silk and woollen stuffs, carpets, firearms, and sword-blades. About two thirds of the inhabitants are Persians; the remainder are Turcomans, Kurds, and other tribes, who lead a nomadic life. The chief town is Meshed. Pop. estimated at 860,000.

KHORSABAD — KIDD

Khorsabad, khōr-sā-bād'. See NINEVER.

Khyber (hī'bér) or **Khaibar Pass**, a mountain pass on the frontiers of India and Afghanistan, leading from Punjab to Jelalabad and Cabul. The pass winds northwest through a range of hills, called by the same name, for a distance of about 33 miles, and forms the bed of two streams, the one flowing northwest, the other south-southeast. It is at one part as narrow as 10 feet in width, and in many places the hills on either side are quite precipitous and inaccessible, rising at one point to the height of 1,300 feet. At 9½ miles distance from the Indian entrance of the pass is the fort of Ali Masjid, which has several times been taken by the British from the Afghans. The highest point of the pass is Lundi Kotal, 3,373 feet above sea-level. The pass forms the northern military route from India to Afghanistan, and is now under British control.

Kiang, kē-āng', **Dziggetai** or **Kulan**, the large wild ass (q.v.) of Tibet and Mongolia, characterized by its large size (11 to 12 hands high), dark reddish color and the narrowness of the black stripe along the spine; some have faintly barred legs. They dwell upon the lofty, sterile plateaus north of the Himalayas, moving about in bands which travel at amazing speed over the stony plains and up and down the steep hillsides, feeding mainly on twigs of woody desert plants, and acquiring great hardiness. They are hunted by the Mongols as game, yet are not shy as a rule, coming close to a traveling party or camp, apparently actuated by extreme curiosity, unless driven away. The voice has been described as like the neigh of a horse; but the general and truer opinion is that it is more nearly the shrieking bray of the ass. The animal is nowhere domesticated, except a few captive specimens in zoological gardens. See ONAGER.

Kiang-Si, kē-āng'sē, or **Kiangse**, one of the 18 provinces of China proper. It is bounded on the north by Hupeh and Ngan-Hui, on the east by Che-Kiang and Fu-Kien, on the south by Kwang-Tung, and on the west by Kwang-Si and Hunan. The area is 72,176 square miles. The province contains the treaty port of Kiukiang on the Yang-tse-Kiang. The Nan-Ling or Southern Mountains traverse the eastern half of Kiang-Si, and in the north is the large inland lake of Po-Yang-Hu. Here are established famous manufactories of porcelain. The principal river aside from the Yang-tse-Kiang, is the Kin-Kiang. The province produces tea and silk, besides porcelain. The English have large railway concessions. There are telegraph lines connecting the treaty port with other centres of commerce.

Kiang-Su, kē-āng'soo, an important maritime province of China proper, bounded north by the province of Shan-Tung; east by the Yellow Sea; south by the province of Che-Kiang, and west by the provinces of Ngan-Hui and Ho-Nan. Kiang-Su has an area of 44,500 square miles (about that of Pennsylvania). The great commercial importance of this province is denoted by its possession of four treaty ports, Shanghai, Nankin, Su-Chau and Chin-Kiang. Kiang-Su was in fact the first province opened to foreign commerce by means of a treaty port. It is traversed almost its whole length by the

Grand Canal, the ancient Chinese system of waterways. The British have valuable railway concessions and the Germans claim mining rights here. Half the foreign population of China is established in this province.

The Yang-tse-Kiang empties into the sea through this province and enables it to control the trade of all southern China. There are large cotton mills. The capital of the province is Nankin, which was formerly the capital of the Chinese empire. The Tai-Ping rebellion of 1853-4 had its headquarters in this province. Kiang-Su is rapidly becoming the centre of Chinese manufacturing industries, especially in textiles. Commercially, the province is controlled by the English, who have invested largely in railways, mills, and government concessions. Pop. (1900) estimated, 28,000,000.

Kianganes, a Philippine tribe. See QUIANGANES.

Kiao-Chau, kē-ā-ō-chow', or **Kiao-Chow**, a Chinese walled city and a protectorate of the German empire, around the shores of Kiao-Chau Bay on the east coast of the province of Shan-tung. The bay is some 15 miles across from east to west and north to south, and has deep-water anchorages suitable for foreign vessels in its southeastern portion. Kiao-Chau was seized by Germany in November 1897, and in March 1898 the town, harbor, and district were transferred to Germany by treaty on a lease for 99 years, the territory, which covers about 200 square miles, being then declared a protectorate of the German empire. It comprises 33 townships, with a population of 60,000. Around the leased territory is a neutral zone of 2,500 square miles in area. The protectorate is administered by the navy department, its governor being a naval officer. The German garrison, about 2,400 strong, consists of marines and marine artillery.

Kibit'ka, a carriage without springs used in Russia; also the name of a tent used by the nomad tribes of Kirghiz Tartars.

Kickapoos, a tribe of Algonquian Indians, formerly occupying a portion of the Ohio Valley. They were a powerful nation in the early history of that region, and were constantly in arms against the whites until in 1819 they concluded the sale of most of their lands and removed to the Osage River Reservation in Kansas. In 1852 a considerable number of them went to Texas and from there to Mexico; some of these returned, however, and settled in the Indian Territory. In 1900 the total number of Kickapoos in the United States and Mexico was estimated at 1,000. See INDIANS.

Kidd, Benjamin, English sociologist: b. 9 Sept. 1858. He entered the inland revenue service of Great Britain in 1877 and rose to sudden fame by the publication of 'Social Evolution' in 1894. The volume was translated into most of the languages of Europe, and gave rise to considerable controversy, President Roosevelt publishing a series of papers in opposition of the views propounded in it. Its main proposition was that high moral and religious development in society was a process that ran exactly contrary to natural evolution and the Darwinian process of survival. He has also published: 'The Control of the Tropics' (1898); and 'Principles of Western Civilization' (1902).

KIDD — KIDNEYS

Kidd, William, American pirate: b. probably Greenock, Scotland, about the middle of the 17th century, executed London 24 May 1701. He appears to have followed the sea from his youth, and about 1695 was known as one of the boldest and most successful shipmasters that sailed from New York. At this time the depredations of pirates upon British commerce had become so extensive that a company was organized in England, in which William III. and several noblemen were shareholders, to fit out an armed vessel for the purpose of suppressing the practice, as well as of deriving a profit from captures. Kidd, who had obtained some experience as captain of a privateer against the French, received a commission signed by the king, and directed to "the trusty and well beloved Captain Kidd, commander of the ship Adventure Galley," a vessel of 30 guns. Sailing from Plymouth, England, in April 1696, he cruised off the American coast for some months, occasionally entering New York, and finally sailed for the East Indies and the east coast of Africa. Upon his way he resolved to turn pirate, and finding his crew not averse to the project, forthwith commenced a career of plunder and outrage among the shipping which frequented the coasts of Malabar and Madagascar, returning in 1698 with a large store of booty to New York. He took the precaution to bury a portion of his treasure on Gardiner's Island at the east end of Long Island, and subsequently went to Boston, where he boldly made his appearance in the streets, not doubting that under his commission he could clear himself from any charge of piracy. Such, however, had been the scandal which the report of Kidd's depredations had caused in England, that the Earl of Bellamont, governor of Massachusetts and New York, and one of the shareholders in the enterprise, caused him promptly to be arrested and conveyed to England for trial. The charge of piracy was difficult to prove; but having been arraigned for killing one of his crew, named Moore, in an altercation, he was convicted after a grossly unfair trial, and hanged at Execution dock. His name and deeds have been interwoven into popular romance, and form the subject of the well-known ballad commencing: "My name is Captain Kidd, as I sailed, as I sailed," many of the incidents of which, however, are apocryphal. The treasures he had left, consisting of 738 ounces of gold, 847 ounces of silver, and several bags of silver ornaments and precious stones, were secured by Bellamont. But according to popular belief this inconsiderable amount constituted but a tithe of all he had collected, and down to the present time the shores of Long Island Sound and various parts of the banks of the Hudson River continue occasionally to be explored in the hope of discovering the abandoned wealth of the great pirate.

Kid'der, Frank Eugene, American architect: b. Bangor, Maine, 3 Nov. 1859. He was graduated from the University of Maine in 1819, studied at the Massachusetts Institute of Technology 1880-1, and has published 'Architects' and Builders' Pocket Book' (1885); 'History of the Kidder Family' (1886); 'Churches and Chapels' (1895); 'Building Construction and Superintendence' (1896).

Kidder, Frederic, American historical writer: b. New Ipswich, N. H., 1804; d. Melrose, Mass., 1885. He gave much attention to

the language and religion of the New England Indians, and published 'The Expeditions of Capt. John Lovewell' (1865); 'History of the First New Hampshire Regiment in the War of the Revolution' (1868); 'History of the Boston Massacre' (1870); etc.

Kid'derminster Carpet, so called from being made in the town of that name in England. Another of its names, ingram, signifies that it is made of wool or worsted dyed in the grain; that is, before manufacture. Its names two-ply or three-ply indicate the number of webs which go to the making of the fabric.

Kidnapped, a romance by Robert Louis Stevenson, published in 1886, when the author was 36. In his own opinion, it was his best novel; and it is generally regarded as one of his finest performances in romantic story-telling. The full title reads: 'Kidnapped: Being Memoirs of the Adventures of David Balfour in the Year 1751'; and the contents of the tale are further indicated on the title-page, thus: "How he was Kidnapped and Cast away; his Sufferings in a Desert Isle; his Journey in the Wild Highlands; his acquaintance with Alan Breck Stewart and other notorious Highland Jacobites; with all that he Suffered at the hands of his Uncle, Ebenezer Balfour of Shaws, falsely so called."

Kid'napping, is not a legal term, but is frequently applied as such in popular language, both in Great Britain and the United States, to the offense of stealing or carrying off by force a child or adult. In its more limited sense, it is applied to the obtaining of slaves or native labor by force, as practised by the Arabs in Africa. This barbarous traffic existed in very recent years in the South Seas, carried on by Europeans, but now happily suppressed by the appointment of government labor agents. In Great Britain this term was formerly also applied to the illegitimate recruiting for the army and navy. See ABDUCTION.

Kid'ney Bean, a bean of the genus *Phaseolus*, of which European species and varieties have been cultivated from a time immemorial (see BEAN). The wild kidney bean of the United States is a high-climbing vine (*P. perennis*), bearing small purple flowers. The so-called "kidney-bean tree" is *wistaria* (q.v.).

Kidney-root, the purple boneset (q.v.).

Kidneys, the principal excreting organs of the body. They are two in number, fixed in position at the back of the abdominal cavity by a thick layer of fat and the peritoneum which passes in front of them; their lower border is slightly below the last ribs; their shape is characteristic; they have an outer, upper, and lower convex margin, and an inner margin deeply indented, allowing the entrance of the renal artery and exit for the veins and ureter. This indentation corresponds to a considerable hollowing of the interior, which is occupied by the funnel-like origin of the ureter (the pelvis). The kidney is surrounded by a firm membrane called the capsule; inside of this is the substance proper, made up of a connective-tissue groundwork in which are embedded the blood-vessels and the secreting glands called the uriniferous tubules. These tubules start in

KIDNEYS

tiny rounded bodies (Malpighian bodies), and after an orderly arrangement of windings a number of the tubules form slightly larger tubules (collecting tubules), so grouped together as to form striated pyramids which have their apices projecting into the pelvis of the kidney. A Malpighian body is made up of a tuft of blood-vessels, a glomerulus, surrounded by a dilated end of the tube (capsule of Bowman), so that the endothelial lining of the capillary and the epithelium of the end of the tubule are in apposition. By a process similar to filtration the excess of water in the blood passes through these walls and out of the body. There is a similar arrangement of the blood-vessels around the winding tubules, but through these the solids in solution in the blood that are of no further use to the body are taken up by the

Vertical Section of Kidney.

epithelium of the tubules and added to the watery element inside the tubes. This mixed fluid, called the urine, is then passed out into the ureter, whence it is conveyed to the bladder and stored until passed. The ureters are about 16 inches long, with the diameter of a goose-quill; they are lined by a mucous membrane, outside of which there are thin muscular and fibrous layers of tissue.

Urine.—The urine is an amber or yellowish fluid containing about 95 per cent of water, having a specific gravity of 1.018 to 1.025, an acid reaction, and rather characteristic ammoniacal odor. The inorganic solids held in solution are the chlorides, phosphates, and sulphates of sodium, magnesium, potassium, calcium, and iron. More important than these is a group of substances elaborated in the body during metabolism (q.v.), some of which may act as poisons if not properly discharged; the principal ones being urea, uric acid, creatinine, hippuric acid, and the xanthine bases. That of most importance is urea, which should in normal

adults be excreted to the amount of 500 grains daily. In kidney disease the deficiency of this substance is taken as an index of the organ's impairment.

Visible Abnormalities of the Urine.—While the average amount of urine passed by a healthy adult in 24 hours is 50 ounces (3 pints), there are constant variations from this rule, depending on the amount of water ingested and the amount lost through the skin and bowels: so also do the amount of solids vary with the diet and amount of exertion. White cloudiness of the urine may be caused by the presence of pus, phosphates, mucus, or bacterial growths. Reddish or "brick-dust" deposit is caused by an excess of urates, a condition ordinarily of no importance and never an indication of kidney disease. There is apt to be a diminution of the amount of urine in nephritis, and a great increase in diabetes.

Albumen in the urine is the serum albumen of the blood. In health the kidneys may allow the passage of faint traces of this substance, but the presence of amounts large enough to be discovered by the "heat and nitric acid" test usually indicates some abnormality of the epithelium of the tubules—congestion of these organs, inflammation of the ureter, bladder, or urethra, or an admixture of blood with the urine. Albumen may appear in the urine after severe exertion without apparent congestion of the kidneys. Certain individuals go on for years showing albumen in the urine at certain times of the day and never develop any further evidence of Bright's disease. In some persons certain articles of food, particularly those rich in albumen, cause a temporary albuminuria. Although these forms are called "functional," there is always a possibility that they may indicate some slight kidney impairment, and it is the custom of the insurance companies to refuse applicants with albuminous urine.

Urinary casts are tiny cylinders or plugs formed in the uriniferous tubules under abnormal conditions. They are formed of coagulated albumen, blood and epithelial cells, granular matter the result of epithelial cell degeneration, and so-called waxy matter. The clear "hyaline casts" may sometimes be found in small numbers in the urine from normal kidneys, but the constant presence of casts indicates a disease of the kidneys. These bodies are entirely invisible to the naked eye.

Uræmia.—This term denotes a group of symptoms that may appear in the course of diseases of the kidneys and during pregnancy. (See PUERPERAL ECLAMPSIA.) Some toxic substance is held in the blood and causes one or more of such symptoms, which may not be characteristic of uræmia but to which, because of the general complex of symptoms and the known condition of the urine, the term uræmic is applied. The various symptoms which it is customary to include in the category are headache and sleeplessness, hemiplegia and aphasia, general convulsions and spasms of groups of muscles, blindness, delirium and coma, vomiting, dyspnoea, and increased arterial tension. This last condition is due to spasm of the smaller arteries and to hypertrophy of the heart.

Diseases of the Kidneys.—Acute congestion may result from sudden obstruction of the

KIDNEYS

veins, certain irritant poisons, exposure to cold, severe surgical operations, overexertion, or from the infectious diseases. Besides the changes seen in the urine, albuminuria and casts, if the congestion be severe there may be fever, abdominal pain, nausea and vomiting, and partial or complete suppression of urine. The treatment consists in the removal of the cause and the relief of congestion by the hot pack over the lower half of the body. In its severe forms the conditions may be fatal.

Chronic Congestion.—This condition results from obstruction to the venous outflow, as seen in disease of the lungs, heart, and liver, and from the pressure of tumors: it leads to actual change of structure.

Acute Nephritis, Acute Bright's Disease.—This is an inflammation of the vital part of the kidney structure, the secreting membrane of the uriniferous tubules and of the structures around them. In such an inflammation there is congestion of the whole organ, degeneration of the epithelial lining of the tubes, exudation of serum from the blood-vessels into the tubes, and consequent disturbance of the function of the organ. The most common causes of this condition are exposure to cold and wet, the poisons of scarlet fever, pregnancy, etc., certain causes being undiscoverable. The condition may also be due to other infectious diseases, to the ingestion of poisons, or to the presence of large burns of the body surface.

Some cases are so mild that the kidneys are not suspected, the patient having a slight fever, headache, loss of appetite, and general malaise. The ordinary cases show considerable diminution of urine, which is loaded with albumen and casts; there is considerable fever; nausea and vomiting are usual; and these are accompanied by more or less of dropsy, headache, and the other manifestations referred to under the name of uræmia, and by a rapidly developing waxy pallor. These various symptoms are not constant, but the picture is sufficient when the condition of the urine is investigated. As a rule, when this condition lasts only a few weeks these cases recover completely, and the kidneys are as good as before, but the cases of longer duration and of great severity may be fatal, or may leave permanent changes in the organ. This last effect is particularly liable to follow when nephritis begins late in the course of scarlet fever, because of the permanent changes of structure induced by some particular poison generated at that time.

The treatment of these conditions consists in absolute rest, diet of the simplest sort, preferably milk, opening of the various emunctories (the bowels and skin), and attending to such symptoms as threaten the life of the patient.

Chronic Bright's, Chronic Nephritis.—This disorder is characterized by a permanent change in the tissue of the kidney, which may follow acute inflammation, or may come on insidiously as a result of poisoning by alcohol, of syphilis, of prolonged nervous strain, with consequent disturbance of digestion and metabolism, of suppurative inflammations in other parts of the body, and of many undiscoverable causes. The changes in the kidneys consist in growth of

connective tissue around the glomeruli and tubules, more or less degeneration of the epithelium lining the tubes, and arteritis. The disease may be very insidious in development, albumen and casts being discovered on routine examination of the urine. Loss of nutrition may be noticed, or a disturbance of the gastro-intestinal tract may first call attention to the disease. The urine may be increased in amount or diminished, but as the disease progresses the specific gravity grows less from the decrease of urea. Dropsy appears around the ankles and spreads usually as the disease advances. Anæmia is fairly constant, but not severe. Sooner or later that general condition of poisoning known as uræmia is apt to develop because of the inability of the kidneys to excrete the toxic substances. Some cases suddenly develop one or more of the various symptoms, either dyspncea, dropsy, failure of the hearts' action, coma, convulsions, or hemiplegia, without the nephritis having occasioned distinct symptoms previously.

Prognosis in Chronic Nephritis.—The prognosis is not necessarily bad, although as a rule the disease progresses and causes the death of the patient. Intercurrent diseases throw extra strain on the kidneys, and may hasten a fatal termination. Many cases live for years in comparative health, and are carried off by another affection. The actual prognosis of a case is determined by the work the kidneys are able to do on a known diet and under stated conditions of work. This is best determined by an estimation of the excretion of urea in a 24-hour collection of urine.

Treatment.—No treatment of the disease, so far as cure is concerned, is possible, but the progress of the affection can be stayed and the patient kept in comparative good health by careful attention to mode of life, diet, and regulation of the bodily functions. At the time of the more acute exacerbations symptoms are relieved as they arise, and the skin and bowels are called upon to assist the kidneys in the work of excretion by diaphoresis (by the hot pack) and catharsis. When the output of urine becomes small, some benefit may result from the administration of diuretics. For the disturbance of the circulation arterial dilators and cardiac stimulants are employed, and sometimes bloodletting, with the greatest benefits.

Renal Calculi or Kidney-Stones.—See CALCULUS.

Tuberculosis of the Kidney.—This malady occurs in the form of tiny miliary tubercles scattered through the kidney, usually as a part of a general tuberculosis, and in the form of a tubercular pyonephrosis due to extension from the bladder; more rarely the process may be primary in the kidney and then extend to the bladder. The symptoms are frequent micturition, pyuria, hematuria, and occasionally the presence of a tumor. The diagnosis is difficult unless there be tuberculosis of the bladder, testes, or seminal vesicles. Although the prognosis is always grave, cases have recovered where the kidney has been inspected but not removed. Nephrectomy is not performed unless the other kidney can be proven sound.

Injuries of the Kidney.—Severe contusions of the abdomen or loins may cause laceration of the kidney substance and the capsule, or the

KIEFFER — KIEL

kidney may be perforated by stab or gunshot wounds. Slight contusions cause pain and transient hematuria, but the more severe contusions and wounds allow the urine to flow out into the surrounding tissue, sometimes with inflammation following. The wound may require sutures, or the kidney may have to be removed.

Suppuration in and around the Kidney.—This condition is due to the infection of the part with micro-organisms, which may reach the part in three ways—through the blood, from the bladder, and through perforating wounds. It is now commonly noticed that persons in health may pass bacteria through their kidneys without resulting suppuration; and it seems that some injury must take place to allow them to grow there and cause actual damage. Such damage may be made by calculi or contusions. Pylitis is an inflammation of the pelvis of the kidney, and this part is first involved when the inflammation travels up from the bladder. Pyelonephritis is an inflammation of both pelvis and kidney structure. Pyonephrosis is the name used to describe the condition of dilatation of the pelvis and the kidneys with pus: the organ may be entirely destroyed. Perinephritis is an inflammation of the cellular tissue and fat around the kidney. In pyæmia there may be many small abscesses in the kidney substance.

The symptoms of these various forms depend on the severity and site of the inflammation: there are the changes in the urine (the presence of pus, blood, and epithelium from the various parts), the local signs (pain, and possibly swelling), and the general signs of poisoning (fever, rigors, septic look, nausea, vomiting, etc.). An abscess in the kidney may burrow through to the surface; it may drain sufficiently through the normal channels and become chronic; or the patient may die of acute sepsis.

In the treatment of the milder forms it may be sufficient to remove the cause; the bladder may be cleansed by irrigation; or if a penetrating wound be the cause it may be enlarged and cleansed. If there be a perinephritis or a severe pyelonephritis, the abscess-cavity must be drained. The kidney is removed (nephrectomy) if destruction has gone too far.

Movable or Floating Kidneys.—By this phrase is meant a condition in which the kidneys leave their fatty bed and travel downward or otherwise through the abdomen. In the milder grades of this condition the kidney is displaced downward during inspiration, but in the more severe grades one or both are constantly low, even down to the pelvis. No symptoms whatever may arise from this condition; but on the other hand the dragging on the vessels and nerves may give rise to pain in the back and sides, minor disturbances of digestion, or nausea and vomiting. The nervous system is so deranged that it is common to have most confusing symptoms. Occasionally the ureter becomes twisted and dams back the urine, causing marked distention of the pelvis of that organ, a condition called hydronephrosis. When such an obstruction persists, the kidney structure is gradually thinned until its function is lost. It is customary to have the sufferer from a

floating kidney wear a support around the abdomen; at times the operation of fixation of the kidney in its normal place may be advisable.

D. D. ROBERTS, M.D.
Brooklyn, N. Y.

Kieffer, kē'fer, **Henry Martyn**, American German Reformed clergyman and author: b. Mifflinburg, Pa., 5 Oct. 1845. He was graduated from Franklin and Marshall College, Lancaster, Pa., 1870, and from the Theological Seminary there in 1873. Enlisting at 16 as a drummer in a Pennsylvania regiment he served three years, his experiences in that capacity appearing in his popular 'Recollections of a Drummer Boy' (1883). He was pastor of a German Reformed Church at Norristown, Pa., 1873-84 and has held a similar pastorate at Easton, Pa., from the date last named. His 'College Chapel Sermons' was issued in 1891.

Kieft, kēft, **Willem**, Dutch administrator in America: b. Holland about 1600; d. off the Welsh coast 1647. He came as the fifth governor of New Netherlands, and arrived in the colony 28 March 1638. He was greedy, choleric, and tyrannous; began his administration by concentrating the executive power; and was soon involved in troubles with the Indians. In 1640 he despatched a force to murder the Raritan tribe. He was not wholly successful; the act was avenged, and when in 1643 he arranged for the destruction of the River tribe, which had sought the protection of the colony against the Mohawks, he deemed it wise to obtain sanction for the proceeding through the signatures of three citizens. A desolating war ensued, almost to the extinction of the colony. Public sentiment was strong against him, and he finally conceded the selection of a "Council of Twelve," who stood for the beginning of representative government in New Netherlands, but practically were figure-heads quite disregarded by the governor. The Puritans at the east and the Swedes at the west were making encroachments upon Dutch territory, and Kieft was finally recalled and succeeded by Peter Stuyvesant. On 16 Aug. 1647 he sailed for Holland with his enemy, Dominie Bogardus, who had denounced his tyranny, and whose services he had revengefully disturbed by having soldiers make noises under the meeting-house windows. The vessel was wrecked on the coast of Wales, and Kieft, Bogardus, and nearly all the rest on board were drowned. Kieft rebuilt Fort Amsterdam, improved the appearance of the settlement, and effected several administrative reforms.

Kiel, kēl, town of Prussia, in Holstein, situated on a deep bay of the Baltic, which presents all the appearance of a lake, and has finely wooded banks, 54 miles north by east from Hamburg, with which it is connected by railway. It was formerly the place of meeting for the Schleswig and Holstein states, and the seat of a superior appeal court for the duchies. It possesses a university, founded in 1665, with an attendance of about 900 students, a library of 200,000 volumes, museums for antiquities and ethnology, and a zoological institute. Kiel is admirably situated for trade, the whole bay on which it stands forming a safe roadstead, and the town being provided with spacious quays. Since the construction of the railway connecting it with Hamburg it has entered into formidable com-

K'ien-lung — Kilian

petition with Lübeck, and as a fortified naval port of Germany, and the station of the greater part of the imperial fleet, is rapidly rising in importance. The Kaiser-Wilhelm Ship Canal from the mouth of the Elbe joins Kiel Bay at Holtenau, somewhat north of Kiel proper. Kiel has works for sugar, soap, machinery; woolen factories, iron foundries, tan-works, tobacco works, ship-building yards, etc. Pop. (1890), 69,172; (1900), 121,824.

K'ien-Lung, kē-ĕn-loong', emperor of China: b. 1710; d. Peking 7 Feb. 1799. He succeeded his father, Yung-Ching, in 1735. He favored the Christian religion in private, but in 1753 interdicted its exercise by a formal order; and the missionaries were, in consequence, obliged to proceed with great caution, although several of them were in the emperor's service, and treated with great respect as men of science and learning. On the suppression of the Jesuits in 1774 China was less visited by scientific persons than formerly, which induced K'ien-Lung to send to Canton and invite artists and learned men of all the European nations, and particularly astronomers. Resolving to immortalize the remembrance of his victories by the graver, he engaged French artists to copy some Chinese paintings in which they were represented; but Louis XV. had them engraved for him at his own expense. The larger Chinese collection on agriculture contains several poems of this monarch on rural occupations and incidents; and he established a library of 600,000 volumes, containing copies of all the most interesting works in China. In 1795 he abdicated in favor of his son.

Kieserite, kē-zér-it, a hydrated magnesium sulphate found at Stassfurt, Germany, and elsewhere, and employed as a source of epsom salts and in the manufacture of manures. Mixed with quicklime and water it hardens into a mass which, after heating, pulverizing, and again mixing with water, becomes of a marble-like consistency, and may be made into ornamental articles, etc.

Kiev, kē'ev, or **Kief**, a government of Russia; length, 210 miles; average breadth, about 170 miles; area, 19,691 square miles. The surface is in general flat or undulating. The Dnieper and its affluent the Pripet are the only navigable streams. There are no lakes of any extent. The climate is remarkably mild and dry. The rivers freeze in December, and are again open in February. In summer the heat is so great and the quantity of rain so small that the channels of many streams become dry. Large crops of all kinds of grain are raised, and much attention is paid, especially in the south, both to the rearing of cattle and the dairy. Sugar, tobacco, spirits, and beer are manufactured, and there is a large export of grain, cattle, honey, wax, and tobacco. Pop. (1897) 3,576,125.

Kilauea, kē-low-ă'a, an active volcano in Hawaii. It has an oval crater, 9 miles in circumference, with a lake of red and boiling lava at the bottom over 1,000 feet below the crater's mouth. The volcano lies 10 miles from the sea, and 30 miles from Hilo, on the eastern slope of Mauna Loa, 4,000 feet above the sea. Kilauea crater forms a great cavity on the side of the mountain, 3 miles long, 2 miles wide and 800 feet deep. At the southwestern end is a small

lake of boiling lava called Halemanman, or House of Everlasting Fire. Great eruptions occurred here in 1789, 1823, 1832, 1840, and 1868.

Kilbourne, kil'bérn, James, American pioneer: b. New Britain, Conn., 19 Oct. 1770; d. Worthington, Ohio, 9 April 1850. He was successively employed as an apprentice, clerk, merchant, and manufacturer, and having secured a competence, presented himself as a candidate for orders in the Protestant Episcopal Church, and was ordained about 1800. In 1801-2 he organized the Scioto Company, under whose auspices a colony of about 100 persons, under the lead of Kilbourne, was in 1803 established in what is now the township of Worthington, Ohio. Having organized here the Episcopal parish of St. John's, as well as others in the neighborhood, and procured the establishment of a western diocese by the general convention of the Protestant Episcopal Church, he retired from the ministry in 1804, and was soon after appointed a civil magistrate, an officer of militia, frontier, and surveyor of a large portion of the public lands. In 1812 he was one of the commissioners to settle the boundary between the public lands and the great Virginia reservation, and also commissioned as a colonel in the frontier regiment; and in the succeeding year he entered Congress, of which he remained a member until 1817. He was the first to propose donations of lands to actual settlers in the northwest territory, and afterward served for some years in the Ohio legislature.

Kildeer. See **KILLDEE**, or **KILLDEER**.

Kilham, kil'am, Alexander, founder of the Kilhamites or New Connection Methodists: b. Epworth, Lincolnshire, 10 July 1762; d. Nottingham 20 Dec. 1798. He professed conversion at 18, became a preacher in 1783 and two years later was enrolled by Wesley as a regular itinerant. He was strongly in favor of complete separation from the Established Church, a step to which Wesley had always been opposed. On the death of the latter this subject came under discussion. He at once urged separation and sought moreover for the distribution of administrative power between the ministry and the lay members. For several offensive passages in his 'Progress of Liberty' (1795) the pamphlet in which these views were expounded, he was tried at a conference held in 1796 and expelled from the denomination, upon which he immediately organized the "New Connection Methodists, or Kilhamites."

Kilian, or **Kuln**, Saint, the apostle of Franconia. He was of noble Scottish extraction and had entered a monastery in Ireland when hearing of the spiritual destitution of German Franconia, he asked and received from the pope a commission to preach the Gospel to the German idolators, and with Colman his priest, and Totnan his deacon was instrumental in converting great numbers at Würzburg, and among them Duke Gosbert. On being rebuked by Kilian for marrying Geilana, his brother's widow, Duke Gosbert promised to put her away, and hearing this, Geilana caused the three missionaries to be secretly assassinated (690) without her husband's knowledge. Kilian is honored as the first bishop of Würzburg, and his festival is 8 July.

KILIMANJARO — KILLIFISH

Kilimanjaro, kil-ē-män-jä'rō (the Great Mountain), a double-peaked, snow-clad mountain of Africa, in German East Africa, about 100 miles inland from the port of Mombasa. The highest peak, estimated at 19,270 feet, is the highest known in the African continent.

Killarney, ki-lär'ni, market town in Ireland, in the county of Kerry, on the Great Southern and Western railway. In summer, Killarney is thronged with visitors to the lakes and the delightful scenery in the neighborhood. Fancy articles of wood, particularly of arbutus, which attains to great perfection in the environs, are made to a considerable extent, and are in great request by tourists. Pop. (1900) 5,500.

Killarney, Lakes of, three connected bodies of water, the lowermost of which is within $1\frac{1}{2}$ miles of the town of Killarney, Ireland. These famous lakes are situated in a basin in the midst of the mountains of Kerry, some of which rise abruptly from the water's edge densely clothed with trees from base to summit. Between the lower and the middle lakes is the fine ruin of Muckross Abbey.

Kill'dee, or Killdeer, the most common and best-known species of American plover (*Ægialitis vocifera*). It is found throughout temperate North America, especially in the western United States, breeding northward to Newfoundland and in winter migrating to South and Central America. It is nine or ten inches long and the sexes are similarly colored—brown above with a chestnut tinge on the rump, around the neck is a white ring bounded in front by a complete, and behind by an incomplete black ring; the lower parts are white and there is a white stripe through the eye; the wing-quills and tail are variegated black and white. The killdeer is distinctively a bird of the interior, spreading over the prairie lands and fields, and frequenting the seashore chiefly during the winter. During the summer it is usually found in pairs, breeding in corn and hay fields or along water courses. The four, clay-colored, spotted, pyriform eggs are deposited in a slight depression in the ground. Though always noisy birds, the cry or whistle, from which their name is derived, is heard in its perfection when the nest is approached, and the frightened hen endeavors by various devices to lead the intruder away. Like that of other plovers, the food is chiefly of an animal nature. In the late summer and early autumn the killdeer is sought by gunners, but much less so than related migratory species of the same genus. Consult: Baird, Brewer and Ridgeway, 'Water-birds of North America'; and Elliot, 'North American Shore Birds.'

Killebrew, kil'i-broo, Joseph Buckner, American railway official: b. Montgomery County, Tenn., 29 May 1831. He was graduated from the University of North Carolina, was Tennessee commissioner of agriculture and mining in 1871-81, acting superintendent of public instruction there in 1871-3, and in 1880 was appointed by Gen. F. A. Walker special expert for the 10th census on the culture of tobacco in the United States, his report (1881) being an acknowledged authority. In 1893 he became a railway official in the South. He was appointed editor-in-chief of the 'Rural Sun,' and published 'The Resources of Tennessee' (with J. M. Saf-

ford, 1874-5); 'Geology of Tennessee' (with Safford, 1876); 'Tobacco Leaf' (with H. Myrick, 1897); and other works.

Killer, a kind of whale, or large porpoise, also called orca or grampus, of the family *Dolphinidæ*, and constituting the genus *Orcinus*. It reaches a length of about 25 feet. The head is rounded and the lower jaw is a little shorter than the upper. The dorsal fin is extraordinarily high in the adult males, like a broadsword, nearly vertical and about six feet in length from base to tip; in the female it is prominent but much lower. The pectoral fins are large, broad, and rounded, and the flukes, or tail-fin, also broad and thick. The color is peculiar, being black above and on the fins, and white below; the margins of the two colors sharply defined. The white of the belly extends forward to the end of the lower jaw, and upward on each side where it forms a large, oblong, white area. Above and somewhat behind the eye is a conspicuous oblong, white spot. In the young the white areas are tinged with yellow. The upper and lower jaws are armed with thick, powerful, somewhat curved teeth, numbering in all from 40 to 56.

The killer is the largest and most powerful representative of the dolphin family. It hunts in packs and is rapacious and exceedingly voracious. Unlike all other cetaceans it feeds upon warm-blooded aquatic animals, and chiefly on young seals, porpoises and whales. It attacks the larger whales without hesitation, biting them on the lips and throat, sometimes in order to force them to surrender their young, which are torn to pieces and devoured. In one instance the stomach of a killer was found to contain the bodies of thirteen porpoises and fourteen seals. The best known species (*Orcinus orca*) inhabits all seas. A second species is found in the South Pacific. Others have been described, but their validity is doubtful.

F. W. TRUE,

Curator of Mammals, U. S. National Museum.

Killiecrankie, kil-i-kräng'ki, a pass of Scotland, in the Grampians of northern Perthshire, on the Highland Railway, three miles southeast of Blair-Athole. A viaduct of ten arches carries the railway over the pass. Here Claverhouse, Viscount Dundee, defeated the forces of William III. under Mackay on 7 July 1689, but was killed in the moment of victory.

Killifish, one of a group of small fishes of the family *Cyprinodontidæ*. They have broad, depressed, scaly heads, large cycloid scales, no lateral line, small very protractile mouths with several rows of pointed teeth, and a well-developed air-bladder which possesses somewhat of a pulmonary function. The common killifish, mud-fish, or mummichog (*Fundulus heteroclitus*) seldom exceeds three inches in length, and is exceedingly abundant in shallow waters along the shores of bays and estuaries, in brackish pools, and tidal rivers from Maine to Mexico. It is extremely hardy and is important economically as food for larger fishes. The sexes differ in color. The large killifish (*F. majalis*) reaches a length of six inches, and is found in shallow salt and brackish bays from Florida to Cape Cod. The males have transverse and the females longitudinal black bars. The species of *Fundulus* are oviparous, but some

KILLINGLY — KIMBALL

genera of the family are viviparous and strongly dimorphic, sexually.

Killingly, *kil'ing-li*, Conn., town, including several villages in Windham County, on the Quinebang and Five Mile rivers, 25 miles northeast of Norwich; on the New England railroad. It has the Danielson Public Library, Danielson High School, churches and town-hall, and manufactures of cotton and woolen goods, boots and shoes, etc. It was settled in 1693, and until 1708 was known as Aspinock. Pop. (1890) 7,027; (1900) 6,835.

Killington (*kil'ing-tōn*) **Peak**, an elevation of the Green Mountains, in the State of Vermont; about 10 miles southeast of Rutland. It is 4,241 feet high, and the view from its summit is most beautiful; a large number of pretty villages and charming valley may be seen on a clear day.

Kiln Pottery. After centuries of gradual development kilns as used in the clay industries have become fixed, so far as may be, in three general types, up-draft, down-draft and muffle kilns. The last named stands alone as its distinctive feature lies not in the method of firing or the direction of the draft but in the fact that the kiln consists of a single laboratory closed to the direct entrance of flame and heated by radiation through the walls. This type of kiln is used in all cases where it is necessary that the contained wares should be protected from dust and smoke but where it is not convenient to enclose them in saggers. Large ware such as porcelain bath-tubs and sinks, heavy pieces of terra-cotta, etc., cannot be set in saggers as pottery is on account of weight and size. They are therefore burned in a muffle kiln being set directly upon the brick floor. Muffle kilns are also used for burning painted wares. These are smaller than the kilns for heavy goods and are burned to a much lower temperature. Such kilns can be set, burned, cooled and drawn in 24 hours, while the large muffles cannot be turned in less than 10 days.

General kilns for pottery burning are of the open type. The wares are enclosed in saggers which are set over one another in tiers (bung). Saggers are cases made of refractory clay and suited as to size to the wares they are to contain. The flames and kiln gases pass freely round the saggers and the whole chamber is uniformly heated.

The usual form of kiln is cylindrical with a slightly domed crown. Outside this is the "hovel" or conical top familiar to the inhabitants of pottery towns. The hovel serves the purpose of a chimney and collects the smoke from a number of apertures in the kiln crown. The fire mouths range in number from six to ten according to the size of the kiln. In the up-draft kiln the gases simply pass up between the bungs of saggers and find a free vent at the top. In the down-draft type the top of the crown is closed and the gases after passing up the walls and under the crown are led down a centre stack and up again through flues arranged for the purpose. The structure of the down-draft kiln is more complicated than the up-draft, but a considerable economy of fuel is effected. The kiln also cools more rapidly.

Kilns for burning brick follow the same general lines but vary in form. For this purpose

the square kiln is among the most popular, being usually operated on the down-draft principle.

Many plans have been devised for the perfect utilization of heat, but none that is entirely satisfactory. One of the best is that of the continuous kiln. This has been applied in Germany to the burning of porcelain, but nothing better than brick has been entrusted to it in America. The continuous kiln is a long low tunnel built in the form of a parallelogram with rounded ends. This is divided into as many chambers as may be necessary, each chamber having an entrance at each side and two fire mouths. Paper partitions are used in order to secure the correct movement of the draft, and as each successive chamber is filled with ware and the proper dampers opened the heat from the burning chambers is drawn through the unburned brick bringing them up to a high temperature without any additional fuel. Meanwhile the chambers in which the firing has been completed are beginning to cool and so the work goes on continuously. The economy of the method is very great, but a considerable output is necessary in order to avoid stoppage. Kilns are, for the most part, burned with coal, both hard and soft coals being used. Those in the gas belt are successfully burned with natural gas and in some places oil is used. The temperatures at which different wares are burned are about as follows:

Roofing tile and paving brick.....	1030°—1070°C
Common brick and drain tile.....	1090°—1170°C
Faience art pottery — glaze.....	1150°C
Faience art pottery — body.....	1230°C
Sewer-pipe and stoneware	1250°—1290°C
Earthenware dishes	1290°—1310°C
Hotel china	1330°C
Bone china	1330°C
Hard porcelain	1390°—1410°C

Kil'owatt. See UNITS; WATT.

Kilpat'rick, *Hugh Judson*, American soldier: b. Deckertown, N. J., 14 Jan. 1836; d. Valparaiso, Chile, 4 Dec. 1881. He was graduated at West Point in 1861, and in the autumn of that year became a lieutenant-colonel of cavalry. He was appointed a brigadier-general of volunteers in May 1863, and in the following March was active in a raid to Richmond for the release of Federal prisoners. He commanded the cavalry of Sherman's army in its march from Atlanta to Savannah, in 1864, and in June 1865 was promoted major-general of volunteers. After the War he was prominent as a lecturer and a Republican political speaker. He was minister to Chile from 1865 to 1870, and was reappointed in 1881. In 1887 his remains were removed from Chile and interred at West Point. Consult: Moore, 'Kilpatrick and our Cavalry' (1865).

Kim'ball, *Hannah Parker*, American poet: b. Boston, Mass., 25 April 1861. She has published: 'Soul and Sense' (1890); 'Victory and Other Verses' (1897).

KIMBALL — KIMCHI

Kimball, Harriet McEwen, American religious poet: b. Portsmouth, N. H. November 1834. Although she has written much verse of a secular nature, it is as a religious poet that she is best known, and several of her lyrics have found an honored place in hymnals. She was the principal founder of the cottage hospital in her native city. Her published works include: 'Hymns'; 'Swallow Flights'; 'The Blessed Company of All Faithful People'; 'Complete Poems' (1889).

Kimball, Heber Chase, American Mormon leader: b. Sheldon, Franklin County, Vt., 14 June 1801; d. Salt Lake City, Utah, 22 June 1868. In 1832 he was baptized into the Church of Latter-Day Saints, in the same year was ordained an elder of the church by Joseph Smith, and in 1835 became one of the 12 Mormon apostles. In 1838 with Brigham Young he led the Mormons from Missouri into Illinois, where they finally settled at Nauvoo, and in 1847 was a pioneer in the exodus to the valley of Great Salt Lake. He was successively chief priest of the order of Melchizidek (1846), a councillor to Young (1847), and chief justice and lieutenant-governor of Deseret.

Kimball, Richard Burleigh, American author: b. Plainfield, N. H., 11 Oct. 1816; d. New York 28 Dec. 1892. He was graduated at Dartmouth College in 1834 and later admitted to the bar; practised his profession at first in Waterford, N. Y., and afterward in New York. He founded the town of Kimball, Texas, and constructed the first railroad in that State, extending from Galveston to and beyond Houston. His publications include: 'Letters from England' (1842); 'Cuba and the Cubans' (1850); 'Saint Leger' (1850); 'Romance of Student Life Abroad' (1853); 'Under-Currents of Wall Street' (1862); 'Henry Powers, Banker' (1868); 'Today in New York' (1870); 'Stories of Exceptional Life' (1887).

Kimball, Sumner Increase, organizer and superintendent of the United States Life Saving Service: b. Lebanon, York County, Maine, 2 Sept. 1834. He was graduated from Bowdoin in 1855; studied law, and was admitted to the bar in 1858. In 1859 he served in the State legislature, and was a member of the committee on judiciary. In 1862 he became a clerk in the second auditor's office in the Treasury Department at Washington, and in 1871 was made chief of the revenue marine service. In that position he had occasion to investigate the condition of the government stations on the New Jersey and Long Island coast where surf boats and other apparatus were stored under the charge of a keeper for use in case of shipwreck; he found the property badly cared for, and the service inefficient. Obtaining an appropriation from Congress he entirely reorganized the service, and so successfully that it was soon extended to Cape Cod and other points on the Atlantic coast. In 1878 the life saving service was organized as a separate bureau and was extended to the Pacific coast and the Great Lakes. He was made the head of the bureau and has introduced many improved methods, including the patrol system, and telephonic connection between adjacent stations; he also obtained the passage of the law, to the effect that inspectors, keepers and crews in the service

should be appointed on a strictly non-partisan basis "with reference solely to their fitness." He has also been acting register, acting comptroller, and acting solicitor of the Treasury; and in 1889 he was the United States delegate to the International Marine Conference. He has written 'Organization and Methods of the United States Life Saving Service' (1880), the most complete monograph on the subject.

Kimberley, kim'bér-li, Lewis Ashfield, American rear-admiral: b. Troy, N. Y., 2 April 1830. He was appointed to the navy in 1846 and was graduated from the Naval Academy in 1852. In the Civil War as executive officer of the Hartford, Farragut's flagship, he took part in the contests at Port Hudson, Grand Gulf, Warrington, and Mobile Bay; and in 1871 accompanied the United States expedition to Korea. In 1880-3 he commanded the navy-yard at New York, in 1884-5 was a member of the examining and retiring board, in 1885-6 was in command of the Boston navy-yard, in 1887 was promoted to rear-admiral, and in 1892 was retired.

Kimberley, Australia, a northern district of Western Australia, brought into notice by the discovery of gold fields in 1886. It contains immense tracts of splendid pasture and much land suitable for cultivation. The chief port for the district is Derby, on the Fitzroy River, near King Sound. The district, which has an area of 144,000 square miles, is divided into East and West Kimberley. It is separated from the more populous parts of the colony by a stretch of sandy desert.

Kimberley, South Africa, town of Cape Colony, the capital of Griqualand West and of the South African diamond fields, is situated at a distance of 647 miles by rail from Cape Town, and close to the western boundary of the Orange River Colony. Kimberley owes its existence and prosperity to the mining of diamonds, an industry that began in 1870. It stands on an open plain, has wide straight streets, good public and other buildings, and receives a supply of water from the Vaal, 17 miles distant. Some of the most important buildings are the High Court of Griqualand West; the public library; the Kimberley Club, rebuilt in 1895 after destruction by fire; the Masonic Temple; a municipal sanatorium; theatres; several churches and a synagogue, etc. The most important diamond mines are those called Kimberley, De Beers, Bultfontein, Du Toit's Pan, and Wesselton. During the South African war Kimberley was invested by the Boers for 123 days, from 15 Oct. 1899, till its relief by General French on 15 Feb. 1900. Diamonds to the value of over £60,000,000 have been obtained here. Pop. 28,718.

Kimchi, kim'kē, David, or Rdak (RABBI DAVID KIMCHI), Hebrew philologist: b. Narbonne 1160; d. 1240. He was the most learned member of a learned family, and maintains to-day his reputation as grammarian, lexicographer, and exegete. Besides his commentary on Genesis, Chronicles, the Prophets, and the Psalms, he wrote a grammar, 'Michlol' (Venice 1545); a Hebrew dictionary, 'Sefer Haschoraschin,' which was practically a list of roots (Naples 1490). He also wrote a tract under the title 'El Sofer,' which treated of the Massora and the Hebrew Accents and was published for the first time in 1864.

KINAH — KINDERGARTEN IN AMERICA

Kinah, ki'nä, The, a Hebrew metrical form, usually employed in dirges and songs of mourning, such as the Lamentations of Jeremiah. Each verse member is divided by a cæsura into two unequal parts, of which the first is the longer. The shorter clause simply enforces the thought expressed in the longer; as in the following example:

"He was unto me as a bear lying in wait ||
a lion in secret places."

"And thou hast removed my soul far off
from peace || I forgot prosperity."

The kinah, with its long drawn out clause, and its short abrupt closing phrase, is still employed in Oriental countries. It has the effect of a cry, followed by a sob. It seems to halt like the metre which in classic times was called the halting iambus, and it might fittingly be styled the Semitic choliambus.

Kindergarten in America. The kindergarten is a form of education for children too young to enter the regular schools. The principles and methods of the kindergarten were worked out by Friedrich Froebel (q.v.). Its ideal is to develop the child's mental and moral powers through a wise direction of the child's natural self-activity or "play." Mental development is attained through a connected series of simple objects, called "gifts," from which the children learn the facts of form, color, size, weight, measure, and general relationship; and through a series of simple occupations in plaiting, weaving, modeling, etc., in which the knowledge gained is used and the powers of observation and attention developed. Games, music and story-telling are also important parts of the work; and much emphasis is laid on the development of the social instincts and sympathies of the children.

The history of the kindergarten in America is the record of four sharply defined movements; the pioneer movement, whose point of departure was the city of Boston; the philanthropic movement, whose initial effort was made in the village of Florence, Mass., and whose greatest triumphs have been achieved in San Francisco; the national movement, which emanated from St. Louis; and the maternal movement which, radiating from Chicago, is now spreading throughout the United States. The first of these movements called public attention to the several most important aspects of the Froebelian ideal; the second demonstrated the efficiency of the new education as a redemptive force; the third is making the kindergarten an integral part of the national school system; the fourth is evolving a more enlightened and consecrated motherhood and thereby strengthening the foundations and elevating the ideals of American family life.

Pioneer Movement.—In 1840 the first kindergarten was established by Friedrich Froebel at Blankenburg, Germany. Nineteen years later Miss Elizabeth Peabody of Boston became interested in Froebel's writings. In 1867 she went to Germany to study the kindergarten system. Returning to America in 1868 she devoted the remainder of her life to the propagation of Froebel's educational principles. Through her labors parents were inspired to seek the help of the kindergarten in the education of their children; philanthropists were incited to establish charity kindergartens; the Boston school board was persuaded to open an experimental

kindergarten in one of its public schools and a periodical devoted to the elucidation and dissemination of Froebelian ideals was founded and sustained for four years. The pioneer movement, therefore, broke paths in the four directions of private, public, philanthropic and literary work. Above all through the contagious power of devout enthusiasm it created the consecrated endeavor without which the kindergarten as Froebel conceived it can have no actual embodiment.

In 1872 an independent pioneer movement was begun in New York by Miss Henrietta Haines who invited Miss Boelte to conduct a kindergarten in her school for young ladies. Miss Boelte had studied three years with Froebel's widow, had won a high reputation in Germany, and later had done efficient work in England. About a year after her arrival in America she married Prof. John Kraus and established an independent kindergarten and normal class. Her normal work still continues and she is to-day the leading representative in America of the Froebel tradition. The power of her work results from her resolute adherence to all the details of the original Froebelian method. By this unswerving conformity she has kept alive, through their practical application, ideas which are of the highest importance to the theoretic development of the kindergarten system.

Philanthropic Movement.—In 1874 Mr. S. H. Hill, of Florence, Mass., contributed funds to open the first charity kindergarten in the United States and later put in trust a sum sufficient to sustain and extend the work. Four years later a philanthropic movement was initiated in Boston by Mrs. Quincy A. Shaw, who for the ensuing 14 years supported free kindergartens for poor children, these beneficent institutions reaching at one time to 30 in number. The influence of her example has doubtless conspired with other causes to create the numerous local associations which are now rendering efficient service to the Froebelian cause in different sections of the United States. Of such philanthropic associations the wealthiest and best organized is the Golden Gate association of San Francisco. At the time of its greatest prosperity this organization supported 41 kindergartens, had given training to more than 30,000 children, and had received contributions amounting to \$500,000; unfortunately the financial depression of 1893 reduced its subscription list, and the number of its kindergartens dwindled to 23; it conducts a training school for kindergartners. Other associations deserving special mention are the New York Kindergarten association, whose aim is to provide for the children against whom the overcrowded public schools still close their doors; the Brooklyn association, under whose auspices many mothers' meetings are conducted; the Pittsburg and Allegheny association; the Cincinnati association; the Free Kindergarten association of Chicago, which has a flourishing normal school; the Chicago Froebel association, which organized the first charity kindergarten in that city; the Louisville association, which has parents, nurses, Sunday school, boarding and normal departments. Kindergarten work has also been taken up by many churches, kindergarten methods being introduced in the Sunday school, and day kindergartens established under church

KINDERGARTEN IN AMERICA

management; All Souls' church of New York city was the first to open a day kindergarten. The total number of private kindergartens in the United States in 1901 was 2,996, with 93,737 children enrolled.

National Movement.—Valuable as is the work accomplished by private kindergartens and kindergarten associations, it is necessarily a restricted work; and had the Froebelian movement developed only upon these lines the kindergarten must have remained forever the privilege of the wealthy few, and the occasional gift of charity to the abject poor. The public kindergarten opened in Boston, though carried on for several years, was finally given up upon the plea that the city could not afford to appropriate funds to extend the system, and a second public kindergarten, which was opened in Brighton, Mass., in January 1873, was abolished when Brighton was annexed to Boston in 1874. Meantime, however, Hon. William T. Harris, who was then superintendent of schools in St. Louis, had called attention to the kindergarten and suggested that experiments be made with a view to introducing into the public school such features of the system as might prove helpful in the education of children between the ages of four and six. The outcome of this suggestion was the opening of an experimental kindergarten in the fall of 1873. The work was approved by the school board; new kindergartens were opened as rapidly as competent directors could be prepared to take charge of them, and when Dr. Harris resigned his position as superintendent in 1880 the St. Louis kindergartens had an enrolment of 7,828 children and the system was so firmly established that it has since that time proved itself impregnable to all attack.

The experiment in St. Louis was a crucial one, and had it failed it would have been difficult to prevail upon other cities to introduce the kindergarten into their public schools. There were many ready arguments against such an innovation: the argument from expense; the argument based on the age of kindergarten children; the argument that kindergartens would spoil the children and fill the primary grade with intractable pupils; the argument that only rarely endowed and, therefore, rarely to be found persons could successfully conduct a kindergarten. These arguments would have acquired irresistible force when confirmed by an abortive experiment. Dr. Harris steered the kindergarten cause through stormy waters to a safe harbor. He proved that the kindergarten could be made an integral part of the public school system. He reduced the annual expense to less than five dollars for each child. He called attention to the fact that the years between four and six were critical ones and that the needs of the child at this period were not provided for either by the family or the school. He convinced himself that children who had attended kindergartens conducted by competent directors did better on entering school than those who had received no such training, and the weight of his authoritative statement gave other educators faith in the possibilities of the system. Finally, he proved that with wise training young women of average ability made satisfactory kindergartners. It was impossible to go on repeating that a thing could not be done

in the face of the fact that it had been done, and with the success of the experiment in St. Louis recognition of the kindergarten as the first stage of all public education became simply a matter of time.

In a report entitled 'Early History of the Kindergarten in St. Louis' Dr. Harris reduced his argument in favor of the kindergarten to a brief statement which no one could dispute and whose force everyone could appreciate; and immediately upon the publication of his report the movement in favor of public kindergartens showed an increased momentum. In the years which have elapsed since the successful experiment in St. Louis the kindergarten has been made part of the public school system in 293 cities; the total number of public kindergartens has increased to 2,111 with 3,611 teachers and 149,710 pupils. The cities which have the most fully developed systems of public kindergartens are Boston, Chicago, St. Louis, Philadelphia, New York, Brooklyn, Newark, Milwaukee, and Los Angeles. Philadelphia, which reports 142 kindergartens, leads in number all the cities of the United States. New York follows with 135 kindergartens, St. Louis with 125, Chicago with 89 and Boston with 78. An estimate, based on the sale of kindergarten material, fixes the total number of kindergartens in New York at over 600, so that, including private work and association work, this city has presumably a more extensive provision of kindergartens than any other in the United States.

The following 10 States have the most extensive provision of kindergartens, public and private. The order of the names indicates the relative extent of the provision:

- | | |
|------------------|---------------|
| 1. New York | 6. New Jersey |
| 2. Pennsylvania | 7. California |
| 3. Massachusetts | 8. Ohio |
| 4. Illinois | 9. Wisconsin |
| 5. Michigan | 10. Missouri |

In the year 1873 the National bureau of education began collecting statistics with regard to the total number of kindergartens in the United States. The results are necessarily imperfect, but they enable us to form an approximate idea of the growth of the system. Taking public and private work together, the advance of the kindergarten is shown in the following table:

	1873	1882	1892	1902
Kindergartens	42	348	1,311	5,107
Teachers	73	814	2,535	9,926
Pupils	1,252	16,916	65,296	243,447

Results of Kindergarten Instruction.—Since the aim of the kindergarten is not instruction, but development, its results cannot be tested by examinations or expressed in statistical tables, but must be gathered from the testimony of experts who have had time and opportunity to study its influence. In other words, kindergarten children must be judged by elementary teachers and principals of schools, and unless, upon entering the primary grade, they show superiority to children coming direct from the home, the kindergarten cannot be said to have justified its adoption into our national system of education. Conversely, if the mental and moral superiority of kindergarten children prove to have converted primary teachers and school principals from enemies into warm friends of the Froebelian method, this fact should be accepted as convincing evidence of the merit of the work.

KINDERGARTEN IN AMERICA

Before presenting the testimony which has been collected, it is necessary to call attention to the fact that, in the kindergarten talking is not forbidden, but, on the contrary, children are encouraged to share with the kindergartner and with each other all their happy experience of effort and success. It is, therefore, natural that pupils promoted from the kindergarten should not at first understand the law of silence imposed by the character of the work in the elementary grades, and hence that, without any bad motive on their own part, they should prove troublesome pupils during the first weeks of school life. The failure to understand this fact has caused some unjust criticism of kindergarten children. It will, however, be apparent to all who read carefully the testimony submitted that the adjustment of the kindergarten child to the school environment is a problem which is at present rapidly progressing toward a happy solution.

The more complete the testimony offered, the more certainly should we expect to find some differences of opinion as to the characteristics of kindergarten children. In any large city there will probably be a few incompetent kindergartners and some unintelligent or reactionary primary teachers. That the kindergarten fails to command itself to teachers who are themselves mere martinets should be accounted a merit rather than a defect. The condemnation of incompetent kindergartners by wise primary teachers is a cause of rejoicing to all true friends of the Froebelian method. The influence of the kindergarten should be determined by the majority report. Variations of opinion should be explained by the occasional defect of the kindergartens and the occasional incapacity or prejudice of the judge.

The most extensive and carefully collected information comes from Boston, and consists of 163 letters from teachers of the first grade in reply to a number of questions sent out by the superintendent of schools.

Of the 163 letters those reporting that less than 10 per cent of the children attending the given primary room had received kindergarten training have been eliminated; also several letters based upon experience with children who had been only a few weeks or months in the kindergarten. The total number of letters omitted was 36. Of the remaining 127 letters 102 are favorable and 25 unfavorable to the kindergarten. Among the letters which are classed as unfavorable one only is unqualified in its disapprobation. All the others admit some distinctive merits in kindergarten children, those most frequently specified being increased power of observation and linguistic expression, greater manual skill, and more general information. The most frequent criticisms are that kindergarten children are talkative and not easily amenable to school discipline. Contrasting the 102 favorable with the 25 unfavorable letters, the first fact which thrusts itself upon the notice of the reader is that the majority of their writers seem to have had little difficulty in solving the problem of discipline. A large proportion of these letters make no direct reference to this question, while the account given of the moral characteristics of kindergarten children precludes the thought that they have been found difficult to control.

Replying to the questions with regard to the relative progress of kindergarten children and the character of their work 38 teachers report both a progress quicker in point of time and improvement in the quality of work; 13 teachers report increased rapidity without change in the character of work, and 28 improvement in the character of work without increased rapidity of progress. Thus 51 report greater rapidity, 66 improvement in quality of work, and 79 a decided gain either in speed or quality or in both. The remaining 23 teachers seem to consider that kindergarten training increases the child's general intelligence but does not noticeably affect the ordinary routine of school work.

To the disciple of Froebel the most interesting paragraphs of the Boston letters are those which answer the question, "What, if anything, have you observed as to the characteristics of kindergarten children as compared with other children?" The specific gains mentioned are clearer ideas of number, form and color; greater knowledge of and interest in nature, improved singing, better expression in reading, improved articulation, more orderly and careful arrangement of material in busy work, and greater manual skill shown especially in writing and drawing. The intellectual characteristics of kindergarten children as compared with others are said to be a greater general activity of mind, quicker comprehension, a more receptive mental attitude, greater logical power, greater concentration, more imagination, greatly increased powers of observation and expression, quicker recognition of likenesses, differences and relations, greater love for the beautiful, and visibly increased originality and creative power. Of their moral characteristics it is said that as compared with others kindergarten children are neater, cleaner, more orderly, more industrious and more persevering. They are also more self-reliant, more painstaking and more self-helpful. They are less self-conscious and more polite. They obey more quickly and are more gentle toward each other. They have a more developed spirit of helpfulness. They are more eager, alert, enthusiastic and responsive. They are interested in a wider range of subjects. They have finer sensibilities, manifest love for and confidence in their teachers, and show special interest in everything pertaining to home and family life.

In regard to the St. Louis kindergartens 13 letters, written by teachers of the first grade, reported the progress of kindergarten children in each of the several districts of the city. Two of the letters were eliminated in condensing the reports, because, while kindly in feeling, they were not precise in statement. Of the remaining 11 letters 9 reported that kindergarten children were proficient in arithmetic, and affirmed the conviction that the training of the kindergarten facilitated progress in learning to write, and was of marked value in learning to read. The other two recognized no difference in these respects between kindergarten children and children who came to school direct from the home. The unanimous verdict was that kindergarten children were superior to others in drawing. All the letters concurred likewise in the statement that kindergarten culture developed the aesthetic sense. The intellectual characteristics specified were accurate observations; correct expression; power to make numerical combina-

KINDERGARTEN IN AMERICA

tions; familiarity with geometric forms; quick recognition of magnitude and relation; a generally increased perceptive power, and signal ability in illustrating poems and stories. With regard to manners and morals 9 teachers recognized the good influence of the kindergarten. Of the remaining two one found "few causes for complaint," and the other referred merely to a possible good effect upon order and punctuality. The moral characteristics which were said to distinguish kindergarten children were order, cleanliness, courtesy, consideration, kindness, a perceptible development of the ideal of social dependence and "a love for the beautiful in character."

Dr. E. Benj. Andrews, when superintendent of schools in Chicago, wrote: "Our best first grade pupils are from the kindergarten, and the influence of kindergarten teaching is more and more felt in all the grades. Its ethical and social value is equal to its intellectual value"; and principals of schools in that city gave equally favorable testimony. Since the kindergarten system has been more highly developed in Boston, Chicago and St. Louis than in other places, testimony from these cities is of the highest importance; similar results are however, showing themselves in many smaller cities and towns.

Dangers of Kindergarten Education.—In view of the attacks so freely and insistently made upon what is called the "sentimentalism" of the kindergarten, it may be well to call attention to the fact that none of the expert witnesses whose testimony has been quoted seem to have detected its existence. Undoubtedly among kindergartners there are some sentimentalists; but that sentimentalism is inherent in the Froebelian ideal or tolerated in the best training schools for kindergartners may be unhesitatingly denied. There is greater danger of its appearance in private than in public work, because any person calling herself a kindergartner may be accepted as such by ignorant or thoughtless parents. In public kindergartens under competent supervision its persistence is impossible.

It is greatly to be desired that all cities establishing kindergartens in connection with their public schools, should insist upon having a specially qualified supervisor. Without watchful and intelligent guidance the kindergarten tends either to relapse into a mere play school or to become too closely conformed to the primary school. The ideal supervisor stands to the individual kindergartner in a relation similar to that which the latter occupies toward her children. She quickens their intellectual and moral aspiration, deepens in them the complementary impulses of self-culture and child-nurture, points out practical errors and suggests the ways and means of overcoming them. She must thoroughly understand the method of the kindergarten, its psychologic implications and its relationship to education as a whole. She must unite intellectual insight with moral earnestness and practical sagacity. Hence only the most gifted and illuminated kindergartners are adequate to the work of supervision.

Two great dangers assail the kindergarten and threaten to impede its progress toward the realization of Froebel's ideal. The first of these dangers is reversion to instinctive games and

traditional toys. In some kindergartens, children are taught to play street games, while it has recently been urged that peg boards, tops, bean bags, kites, dolls, jackstraws, hoops, spool, chalk and wire games and the whole toy world should be added to the Froebelian instrumentalities. Tendencies such as these indicate a complete failure to comprehend what Froebel has done. He recognized in traditional games the deposit of unconscious reason; preserved what was good and omitted what was crude and coarse in these products of instinct; supplied missing links and presented a series of games wherein each is related to all the others and which, by means of dramatic and graphic representation, poetry and music, win for the ideals they embody a controlling power over the imagination. In like manner, from among traditional toys he selected those which possessed most educative value, ordered them into a related series and suggested a method by which they might be consciously used to interpret the child's experiences and develop his creative power. If this transfiguration of traditional games and toys is valueless, then the kindergarten has no *raison d'être*. But if Froebel has translated the hieroglyphic of instinctive play and found means which, without detriment to the child's spontaneity, influence the growth of character and the trend of thought, then the clamor for street games and promiscuous toys is educational atavism.

The second danger which threatens the integrity of the kindergarten is the substitution of exercises which attempt to wind thought around some arbitrarily chosen centre for those Froebelian exercises whose confessed aim is to assist thought to unwind itself. Too many kindergartners have allowed themselves to be betrayed into selecting some object such as a pine tree or a potato, and making all songs, games, stories and gift exercises revolve around it. Between these so-called cores of interest and the exercises clustered around them there is no valid connection. The clustering like the subject depends wholly upon the caprice of the teacher. Could such exercises succeed in their object the pupils of different teachers would have their thoughts set to revolving around different centres and more than this around arbitrary and contingent centres. That such a procedure directly contradicts Froebel's ideal will be apparent to all who have understood his writings. That it likewise contradicts every true ideal of education will be evident to all who understand that the function of education is to substitute objective and universal for subjective and contingent associations. The discovery of related qualities in nature, the disclosure of their causes and the reduction of these causes to a system is the great work of science. The discovery of the related activities of mind and their genetic evolution is the work of psychology. The portrayal of the universal and divine man latent in each individual is the supreme achievement of literature and art. To lead pupils away from what is capricious, arbitrary and accidental, and thus capacitate them to receive and augment their scientific, æsthetic, literary and psychologic inheritance is the great duty of education. The substitution of arbitrary for necessary cores of thought wherever attempted is, therefore, the parody of education.

KINEMATICS

Normal Schools.—The future of the kindergarten in the United States is largely dependent upon the work of the normal schools for kindergartners. The friends of the system must, therefore, view with disapprobation and even with dismay the rapid multiplication of schools with low standards of admission and a low conception of the training they should give. Inexperienced students are attracted to such schools, and the result is that the whole country is flooded with so-called kindergartners who are ignorant of the first principles of true education.

In the early days of the Froebelian movement it was believed that in a single year young girls could be prepared to conduct a kindergarten. In most reputable training schools the course has now been extended to cover two years. The requirements for admission into these schools are, generally, graduation from a high school, or an education equivalent thereto. The courses of study include theory of the kindergarten gifts and occupations, study of the Mother Play, practice in songs and games, physical culture, lessons in singing, drawing, modeling and color, lectures on the art of story telling, and more or less observation of the practical work of the kindergarten. Finally, some trainers insist that their normal pupils shall not only observe but assist in actual work with the children. In addition to this specific training, the best normal schools offer courses in science, literature, psychology, and the history of education.

Besides private normal schools and training schools connected with kindergarten associations, kindergarten departments have been established in several great *quasi-public* institutions. Among the most notable of these are the kindergarten department of Pratt institute, Brooklyn, and of Teachers college, Columbia university, and of Workingman's institute, New York. A number of the public normal schools in the United States provide some kind of kindergarten training, the courses varying in length from about two years to six months. These kindergarten departments are found in the normal schools of the following States: New York, Michigan, Pennsylvania, California, Massachusetts, New Jersey, Connecticut, Wisconsin, Illinois, Colorado, Kansas, Rhode Island, Georgia, Nebraska, Ohio, Minnesota.

Kindergartners are admitted to surpass all other teachers as students of educational literature. They are also distinguishing themselves by zealous and persistent attendance upon post-graduate courses in pedagogics, science, literature, history and psychology. Through the efforts of the Chicago kindergarten college post-graduate work of a high order has become a feature of Froebelian activity in that city; in Boston, during successive winters post-graduate classes have been organized in the study of Mother Play, and the pedagogics of the kindergarten; and courses in literature and psychology have also been given. Similar work has been developed in New York, Baltimore, Washington, and other cities.

Maternal Movement.—The power of the kindergarten over the minds of its students arises from the fact that it connects the ideal of self-culture with the ideal of child-nurture. And the true woman responds with whole heart to the appeal to learn all she can, be all she can,

and devote all she is and all she knows to the service of childhood. Rooted in maternal impulses it would be strange indeed if the kindergarten did not appeal to mothers. That classes for mothers should come into existence was a predestined phase of the Froebelian movement. Whoever has studied the writings of Froebel knows that the education of mothers was one of the most important features of his endeavor. Practically, however, the work in this direction amounted to very little until a mothers' department was established in that unique institution, the Chicago kindergarten college. This institution has consciously attempted the transformation of a girls' college into a school for motherhood; while giving general culture its supreme aim is to fit women for motherhood, and it gives instruction to mothers as well as to young girls; in a single year over 700 women attended its mothers' department; recently the work of this department has been extended by holding convocations for the discussion of all phases of child-nurture. Radiating from the kindergarten college as its centre the maternal movement is spreading throughout the United States. It is the highest reach of the Froebelian ideal and means nothing less than the attempted regeneration of all human life through the regeneration of the family. In connection with this movement mothers' clubs have been formed, whose work is usually done on three main lines: (1) kindergarten classes for the children; (2) training and study classes for mothers; (3) lecture courses in literature, science, music, etc.

Froebel's supreme claim to our grateful remembrance rests upon the fact that consciously repeating the unconscious process of social evolution he set the little child in front of the great army of advancing humanity. Science affirms that the feebleness of infancy created the family and that from the family have been evolved the higher institutions. In his cry, "Come, let us live for the children," Froebel utters in articulate speech the ideal whose unconscious impulse set in motion the drama of human history. The little child was pioneer of the process which created human institutions. We must make him the pioneer of their perfection.

SUSAN E. BLOW.

Kinematics, a branch of mathematics which treats of the motions of bodies independently of the forces which produce these motions; it is usually treated of in the introductory parts

KINETIC THEORY OF GASES — KINETOGRAPH

of works on kinetics (popularly termed dynamics).

Kinet'ic Theory of Gases. On any kinetic theory the molecules of a gas are conceived to be in motion in paths long compared with their own size, the average length of path being called the "mean free path." See MATTER.

Kinetogenesis. The mechanics of evolution (q.v.). This is a term suggested by E. D. Cope, meaning development by motion, or the exercise of parts or organs, and is nearly the equivalent of use (q.v.). The examples given by Cope are the development by use of muscles of any hard parts or bone. He claims that muscular tissue is highly plastic, and since it is directly controlled by nervous or equivalent stimuli, "the effect of the latter in building structure is evident." Another example, overlooked by late students, is the beautiful study on the mechanical genesis of bone structure published by Wyman in 1857. This anatomist shows that the cancellated structure of the bone (see BONE) in the lumbar vertebrae, the thigh-bone, tibia, astragalus, and os calcis of man is peculiar to him, and has "a definite relation to the erect position which is naturally assumed by man alone."

The fibres or cancelli of such bones as assist in supporting the weight "are arranged either in the direction of that weight, or in such a manner as to support and brace those cancelli which are in that direction. In a mechanical point of view they may be regarded in nearly all these bones as a series of studs and braces." Wyman dealing with the individual bones shows in what direction force or weight is applied to them, and the corresponding direction the cancelli assume. On the lumbar vertebrae there is vertical pressure, and the principal bone fibres within are also vertical. On the neck of the thigh bone the weight of the body is applied obliquely to the end of an arm, "within it there is a combination of fibres giving strength with lightness, which forms a frame mechanically adapted for resisting the weight which rests upon it," and so with the astragalus. "A certain direction of fibres in all these instances co-exists with a certain direction, or certain directions, of the transmission of pressure. From this constant association of structures and function the inference seems unavoidable, that they are means and ends."

Comparing the bones in question with those of the gorilla and chimpanzee, only "slight traces of the trusswork described in man exist." As they practically exist in man alone, Wyman maintains that "they relate to the kind of locomotion which he alone of the whole animal series can be said to possess, namely, that of walking erect, and which requires in the passive and resisting organs subservient to it, in order that it may be effected with ease and grace, a nice combination of lightness with strength in the materials. His attitude more than any other, in consequence of the pillars of support being arranged in vertical planes, requires the most effectual means for counteracting shocks."

Cope's contributions to this subject in the way of materials drawn from fossil vertebrates are extensive and weighty. He, and also Ryder, have discussed the molding of the limb-joints as the result of mechanical strains; also the origin of the teeth, through mechanical strains and impacts. Thus the origin of the canine, pseudo-canine and canine-like incisor teeth "is due to

the strains sustained by them on account of their position in the jaws at points which are naturally utilized in the seizing of prey, or the fighting of enemies." For example the greatly increased size of the canine teeth of the walrus is due to the use of these teeth in the breaking of ice, and in climbing from the water upon the edge of the floe ice. It is so, adds Cope, with the straight incisors of the hippopotamus, "use as diggers has straightened them to a horizontal from their primitive vertical direction, a change which is also partially accomplished in the true pigs (*Sus*)."

The molar teeth owe their increased diameters to much more severe direct irritation and impact. The origin of the sectorial or shear-like molar teeth of the cat, lion, and other carnivora is thus explained by Cope: "The specialization of one tooth to the exclusion of others as a sectorial, appears to be due to the following causes: It is to be observed in the first place that when a carnivore devours a carcass, it cuts off masses with its sectorials, using them as shears. In so doing it brings the part to be divided to the angle or canthus of the soft walls of the mouth, which is at the front of the masseter muscle. At this point the greatest amount of force is gained, since the weight is thus brought immediately to the power, which would not be the case were the sectorial situated much in front of the masseter. On the other hand, the sectorial could not be situated farther back, since it would then be inaccessible to a carcass or mass too large to be taken into the mouth."

The great length and chisel-like incisor teeth of the squirrel and other rodents also illustrate this subject. Their progressive lengthening through exercise has been explained by Ryder, who shows that the mechanical action involving backward pressure is precisely the opposite of that which has occurred to the carnivora, where the pressure has always been forward owing to the development of the canines.

The direct evidence in favor of the kinetogenetic mode of evolution is greatly strengthened by the discovery of Ameghino in the Tertiary beds of the Argentine republic of one-toed ungulates with two splint bones, and with teeth strikingly like those of the horse, though the animal belongs to a quite different order. The similarity or divergence in shape of the parts is due to the action of similar mechanical conditions in two quite unrelated groups. The same results of strains involved in digging are seen in the fore legs of the fossorial edentates, in the mole, as well as in the mole cricket. Thus as Cope concludes, "in biologic evolution, as in ordinary mechanics, identical causes produce identical results."

ALPHEUS S. PACKARD,
Professor of Zoology, Brown University.

Kine'tograph, a machine, invented by Thos. A. Edison, for taking pictures of moving objects in their changing positions. By means of peculiar mechanism a series of photographs, about 40 to the second, can be taken. So rapidly does this machine work that every motion of a dancer's feet, every twist or turn of an athlete's wrists and arms are reproduced. The impressions are taken on a long strip of gelatine film with such rapidity and accuracy that not the faintest motion is missed.

KINETOPHONOGRAPH — KING

Kine'topho'nograph, an electro-photographic apparatus combining the principles of the kinetograph, the vitascope, and the phonograph, invented by Thomas A. Edison. It is a combination of electricity and photography. A man can sit in his own parlor and see reproduced on a screen the forms of the players in an opera produced on a distant stage, and, as he sees their movements, he will hear the sound of their voices as they talk or sing or laugh.

Kine'toscope, an apparatus invented by Thomas A. Edison for exhibiting the pictures taken by the kinetograph. The kinetoscope displays the pictures to the eye, one after another, so rapidly that they all seem like one scene, with the figures moving about as they do in actual life. Also an instrument invented by Perigal, for illustrating the result of the combination of circular movements of different radii in the production of curves.

The Smithsonian Institution, in Washington, has afforded an excellent example of accelerated speed in its use of the kinetoscope in studying the growth of a plant. Kinetoscopic pictures were taken steadily and systematically as the plant grew; a delicate piece of work which required several months before the film was complete, and involved the use of an automatic flash-light and other contrivances in order that the hourly growth of the plant could be observed from first to last. When the film was finished, however, it could be run through the kinetoscope as fast as the operator wished. As a result the plant could be seen, in the compass of a few minutes, actually growing from seed to maturity, each stage of growth being in the same proportion to all others as in the original development of the plant itself.

King, Albert Freeman Africanus, American physician: b. England 18 Jan. 1841. He was graduated in medicine from Columbian University in 1861, and from the University of Pennsylvania in 1865, was appointed a professor in the medical department of Columbian and later in that of the University of Vermont, and held various posts in professional organizations. He became best known as an advocate of the theory of the transmission of malaria by the mosquito, now generally accepted by experts. He published a 'Manual of Obstetrics' (1882; 8th ed. 1900).

King, Anna Eichberg. See LANE, ANNA EICHBERG KING.

King, Basil. See KING, WILLIAM BASIL.

King, Charles, American journalist, president of Columbia College: b. New York 16 March 1789; d. Frascati, Italy, 27 Sept. 1867. He was the second son of Rufus King (q.v.), and during the residence of his father as American minister at St. James he was sent with his brother to Harrow school. Upon the breaking out of hostilities with Great Britain, King, though a Federalist, deemed it right that the war should be prosecuted to an honorable and successful result; and as a member of the legislature of his native State in 1813, and as a volunteer in the autumn of 1814, he acted upon those sentiments. In 1823 he became associated with Johnston Verplanck in the publication of the 'New York American,' a conservative newspaper, of much political influence and a high

literary character, until 1827, when Verplanck retired and Mr. King continued sole editor. After its publication was discontinued Mr. King was associated in the conduct of the New York 'Courier and Enquirer' 1845-9, when he was chosen president of Columbia College, which office he occupied until 1864.

King, Charles, American soldier and novelist: b. Albany, N. Y., 12 Oct. 1844. He was graduated from West Point in 1866 and was in active service in the United States army till his resignation in 1879. On the outbreak of the war with Spain he was commissioned a brigadier-general of volunteers and later served in the Philippines under General Lawton. In 1901 he became commandant at Orchard Lake Military Academy. He has published a long series of popular novels treating of army and frontier life and people, among the best of which are: 'The Colonel's Daughter' (1883), describing life in a frontier fort; 'Kitty's Conquest' (1884); 'Captain Close and Sergeant Crocus' (1895); and also 'Campaigning with Crook' (1890); 'Trials of a Staff Officer' (1901); etc.

King, Clarence, American geologist: b. Newport, R. I., 6 Jan. 1842; d. Phoenix, Ariz., 24 Dec. 1901. He was graduated from the Sheffield Scientific School of Yale University in 1862, in 1863-6 was a member of the California geological survey under the direction of Prof. J. D. Whitney (q.v.), discovered Mounts Whitney and Tyndall, the highest group in California, and with J. T. Gardiner executed the first survey of the Yosemite Valley. In 1866 he originated the plan for a survey of the western Cordilleran region at its widest point. This plan was finally sanctioned by the government and under the auspices of the army engineering department and King's direction, was executed as the "survey of the 40th parallel" and completed in 1872. The survey has been characterized as a "signal contribution to the material of science." The volume on 'Systematic Geology' (1878), the first of six constituting the report, was written by King and has been highly esteemed. In 1872 certain swindlers sowed a tract in Arizona broadcast with rough gems; the discovery of valuable diamond fields was announced, and companies were organized for the exploration of the find. The "fields" proved to be within the official limits of the 40th parallel survey, and were thereupon examined by King, who detected and proclaimed the fraud. In 1878 King organized the various surveys then active into the United States Geological Survey under the general direction of the secretary of the interior, and was appointed director of the survey. He resigned in 1881, attained a large practice as a mining expert, and undertook an uncompleted series of experiments to determine the action of the primal constituents of the earth under the conditions assumed as existing at the time of its separation from the sun. Partial results were published by him in Silliman's 'Journal' (January 1893) in an article on 'The Age of the Earth.' He wrote also, 'Mountaineering in the Sierra Nevada' (1871), a description of his explorations, and a work of literary as well as scientific value.

King, Edward (by courtesy VISCOUNT KINGSBOROUGH), Irish archaeologist: b. Cork 16 Nov. 1795; d. Dublin 27 Feb. 1837. He is best

KING

known for his great and important work, 'Antiquities of Mexico, comprising Facsimiles of Ancient Paintings and Hieroglyphics, etc.,' nine volumes and a portion of a tenth being published 1830-48. Its aim is to establish the fact of the original settlement of Mexico by a tribe of the Israelites. The author spent over \$160,000 on his undertaking, and died in a debtor's prison.

King, Edward, American writer: b. Middletown, Mass., 31 July 1848; d. Brooklyn, N. Y., 27 March 1860. He lived in Paris 20 years as correspondent of American journals. Among his works were: 'My Paris, or French Character Sketches' (1868); 'Kentucky's Love, or Roughing It Around Paris' (1872); 'The Great South' (1875); 'The Golden Spike' (1886); 'A Venetian Lover' (1887), a poem; 'The Gentle Savage' (1888), a popular novel.

King, Grace Elizabeth, American writer: b. New Orleans 1852. She was educated in New Orleans, contributed much to periodicals, and published in the 'New Princeton Review' in 1886-8 Creole sketches which won considerable reputation and constitute the story 'Monsieur Motte' (1888). Among her further works are: 'Tales of Time and Place' (1888); 'Earthlings' (1889); 'Chevalier Alain de Triton' (1889); 'Jean Baptiste Lemoine, Founder of New Orleans' (1892); 'Balcony Stories' (1893); 'New Orleans: The Place and the People' (1896); and 'De Soto and his Men in the Land of Florida' (1898).

King, Henry Churchill, American theologian: b. Hillsdale, Mich., 18 Sept. 1858. He was graduated from Oberlin in 1879, from the Oberlin Theological Seminary in 1882, studied also at Harvard and Berlin, was associate professor of mathematics at Oberlin in 1884-90, associate professor of philosophy in 1890-1, and professor of philosophy in 1891-7. In 1897 he was appointed professor of theology. In 1893 he was a member of the National Educational Association's committee of ten. His works are: 'Outline of Erdmann's History of Philosophy' (1892); 'Outline of the Microcosmus of Hermann Lotze' (1895); 'The Appeal of the Child' (1900); and 'Reconstruction of Theology' (1901).

King, Horatio, American statesman: b. Paris, Maine, 21 June 1811; d. Washington, D. C., 20 May 1897. He learned the printer's trade and published 'The Jeffersonian' in his native town, and subsequently in Portland, 1831-8. The next year he was appointed clerk in the post-office department in Washington; became first assistant postmaster-general in 1854; was postmaster-general January-March 1861; and was the first man in public office to deny the power of a State to withdraw from the Union. He published: 'An Oration before the Union Literary Society of Washington' (1841); 'Sketches of Travel; or Twelve Months in Europe' (1878).

King, John Alsop, American politician: b. New York city 1788; d. 1867. He was the son of Rufus King (q.v.); was educated at Harrow, England, then returned to New York to study law, and was admitted to the bar. In 1812 he served as lieutenant of cavalry, was elected to the State assembly in 1810, and several times re-elected till 1823, when he was elected to the Senate. Though an opponent of Clinton, he

strongly favored the building of the Erie Canal. In 1825 he went with his father to England as secretary of the legation, and on his father's return to the United States on account of ill health, he remained as *chargé d'affaires*. In 1838 he was again a member of the New York legislature for several terms; and in 1849 he was elected to Congress as a Whig and there opposed all compromise measures, especially the Fugitive Slave Law. He was one of those active in the founding of the Republican party, presided at the Syracuse convention of 1855; and was a delegate to the Philadelphia convention of 1856. In 1857 he became governor of New York State and in that office gave special attention to educational matters and internal improvements; he declined a renomination in 1860. He was one of the presidential electors in 1860, voting for Lincoln, and in 1861 was a member of the Peace Convention.

King, John Crookshanks, American sculptor: b. Kilwinning, Ayrshire, Scotland, 11 Oct. 1806; d. 18—. He was educated as a practical machinist, and emigrating to the United States in 1829 was employed for several years in Cincinnati and Louisville as superintendent of a factory. In 1834, at the suggestion of Hiram Powers, he made a model in clay of the head of his wife, and the success with which the work was accomplished encouraged him to adopt the profession of a sculptor. From 1837 to 1840 he resided in New Orleans, and modeled a number of busts of public men and made cameo likenesses, but subsequently removed to Boston. He executed several busts of Daniel Webster, also busts of John Quincy Adams, Agassiz, Ralph Waldo Emerson, and other Americans prominent in public life or literature.

King, Preston, American legislator: b. Ogdensburg, N. Y., 14 Oct. 1806; d. Hudson River, near New York, 12 Nov. 1865. He was graduated from Union College in 1827, studied law, entered practice in St. Lawrence County, N. Y., early engaged in politics, and in 1830 established at Ogdensburg and became editor of the 'St. Lawrence Republican' in support of Andrew Jackson. In 1834-7 he was a member of the New York State assembly, in 1843-7 and 1849-53 served in Congress as a Democratic representative, but in 1854 joined the Republican party, whose candidate he was for secretary of state in 1855. He was a Republican member of the Senate in 1857-63, was largely instrumental in obtaining the nomination of Johnson for the vice-presidency at the Republican national convention (Baltimore) of 1864, and when Johnson became President was appointed collector of New York port.

King, Rufus, American statesman: b. Scarborough, Maine, 24 March 1755; d. Jamaica, L. I., 29 April 1827. He was graduated from Harvard in 1777 and admitted to the bar in 1778. In 1782 he entered the Massachusetts legislature and Congress in 1784. He took an active part in convention which framed the Federal Constitution, and removing to New York in 1788 became a senator from that State the next year, serving 1789-96. He was United States minister to Great Britain 1796-1803, and after some years spent in partial retirement was sent for the third time to the Senate in 1813, and won renown as an orator by the brilliant speech he made on the burning of Washington by the

KING

British. In 1819 he was again elected to the Senate, serving till 1825, when he was appointed the second time minister to the court of St. James. He was the Federalist candidate for the vice-presidency in 1804 and 1808. In collaboration with Hamilton, he wrote the 'Camilus Letters.'

King, Rufus, American journalist and soldier: b. New York 26 Jan. 1814; d. there 13 Oct. 1876. He was graduated from West Point in 1833, entered the engineer corps, resigned from the army in 1836, became assistant engineer of the New York & Erie Railway, and was adjutant-general of New York State 1839-43. He was associate editor of the Albany *Evening Journal*, and in 1841-5 editor of the Albany *Advertiser*. Having then removed to Wisconsin, he was editor of the Milwaukee *Sentinel and Gazette* in 1845-61, and in 1847-8 a member of the State constitutional convention. In May 1861 he was commissioned brigadier-general of Wisconsin volunteers. He commanded the 1st division of the 3d army corps in the department of the Rappahannock in March-August 1862, was a member of the court-martial for the trial of Maj.-Gen. Fitz-John Porter (1862-3), resigned 20 Oct. 1863, and was minister at Rome in 1863-7. In 1867-9 he was deputy customs collector of New York port. He was a son of Charles King (q.v. 1789-1867).

King, Stanton Henry, American sailors' missionary: b. Paynes Bay, Barbados, 1 May 1867. He went to sea at 12 years old and in his books 'Dog Watches at Sea' (1900) and 'A Bunch of Rope Yarns' (1902); he has related many of his personal experiences. He became superintendent of the Sailors' Haven, Charlestown, Boston, Mass., in 1898.

King, Thomas Starr, American Unitarian clergyman and lecturer, generally known as Starr King: b. New York 17 Dec. 1824; d. San Francisco 4 March 1864. He was a clerk in a dry goods store at Charlestown, Mass., in 1836-40, a teacher at Boston and Medford in 1840-2, studied theology with Hosea Ballou at Medford, preached for a time to a Universalist congregation of Boston, and in 1846-8 was pastor of the Universalist Church at Charlestown. In 1848-60 he was pastor of the Hollis Street Unitarian Church of Boston, and during this period gained great popularity as a lyceum lecturer in the northern States. Best-known was his 'Substance and Show' but other familiar subjects were 'Goethe,' 'Sight and Insight,' 'The Laws of Disorder,' 'Socrates.' He became pastor of the First Unitarian Society of San Francisco in 1860; was among the first, by newspaper article and lecture, to call attention to the Yosemite Valley; and when, in the presidential campaign of 1860, the idea of the establishment of California as an independent Pacific republic was discussed, denounced the project from the lecture platform and preserved the State to the Union. During the Civil War he was active in obtaining in California large and necessary funds for the Sanitary Commission. His name was at one time associated with the White Mountains, which he thoroughly explored, and which became known chiefly through his writings, particularly 'The White Hills: Their Legends, Landscape, and Poetry' (1859; new ed. 1887). A memorial to him was set up in Golden Gate Park, San Francisco, Cal., in 1889. King was

one of the leading figures of the American lyceum in the most flourishing days of that institution. 'Patriotism, and other Papers' appeared posthumously (1865); as did the sermon 'Christianity and Humanity' (1877), with a memoir by E. P. Whipple, and the collection of lectures, 'Substance and Show' (1877). Consult also: Frothingham, 'A Tribute to Thomas Starr King' (1865).

King, William, American politician, first governor of the State of Maine: b. Scarborough, Maine, 1768; d. Bath, Maine, 17 June 1852. He was, during the greater part of his life, the last 50 years of which were passed in Bath, an active and successful merchant, but is better known by his public services in his native State. At an early period of his career he became a member of the Massachusetts legislature, and in that capacity was distinguished by his efforts in behalf of religious freedom, and of securing to original settlers upon wild lands the benefit of their improvements. He was an early and ardent advocate of the separation of Maine from Massachusetts, and upon the consummation of that act presided over the convention which met in 1819 to frame the constitution of the new State. He was subsequently elected the first governor of Maine, and, after holding office a little more than a year, became one of the United States commissioners for the adjustment of Spanish claims. He also held other offices of importance under the general and State governments, including that of collector of the port of Bath.

King, William Basil, American Episcopal clergyman and novelist: b. Charlottetown, P. E. I., 1857. After taking orders in the Episcopal Church he was for some years rector of St. Luke's Church, Halifax, N. S., and from 1871 to 1899 was rector of Christ Church, Cambridge, Mass. He is the author of 'Griselda' (1899); 'Let Not Man Put Asunder' (1902); etc.

King, William Rufus, American statesman, 13th Vice-President of the United States: b. Sampson County, N. C., 6 April 1786; d. in Dallas County, Ala., 17 April 1853. He entered the University of North Carolina at 12, and was graduated in 1803. He then commenced the study of law and was admitted to the bar in 1806. In 1806 he was elected to the legislature from his native county, and again in 1809. In 1810 he was elected to Congress, and was twice re-elected. In Congress he united himself with Clay, Calhoun, and others, who advocated the war policy of Mr. Madison's administration, and voted for the declaration of war in June 1812. In the spring of 1816 he resigned his seat to become secretary of legation to Naples under William Pinckney. The latter was afterward transferred to St. Petersburg, and was accompanied to that court also by King as secretary. Having removed to Alabama, he was elected in 1819 one of the United States senators from the new State, and was successively re-elected in 1823, 1828, 1834, and 1840. In April 1844, he was appointed minister to France. The proposition for the annexation of Texas was then pending. England was known to be decidedly opposed to the scheme, and there was a general belief that her government was urging France to join in a protest against it. King was an active advocate of the annexation, and upon reaching Paris directed his ef-

KING—KING SALMON

forts to prevent this joint protest, in which he was successful. He returned to the United States in November 1846. In 1848 Senator Arthur P. Bagby was sent as minister to Russia, and King was appointed to fill the vacancy thus created. In 1849, the term for which he was appointed having expired, he was elected for a full term of six years. In 1850, on the accession of Vice-President Fillmore to the presidency, King was unanimously elected president of the Senate. In 1852 he was elected Vice-President of the United States, at the time Franklin Pierce was elected President.

King, a person vested with supreme power in a foreign state, territory or nation. According to feudal usages the king was the source from which all command, honor and authority flowed; and he delegated to his followers the power by which they exercise subordinate rule or authority. There is now no very clearly marked distinction between a king and an emperor. A queen-regent, or a princess who has inherited the sovereign power in countries where female succession to the throne is recognized, possesses all the political rights of a king.

King-at-arms, an officer of great antiquity, whose business it is to direct the heralds, preside at their chapters, and have the jurisdiction of armory. There are three kings-at-arms in England, Garter, Clarencieux and Norroy. The first is called the principal king-at-arms, the other two provincial kings-at-arms.

King Charles Spaniel. See DOG; SPANIEL.

King Conch, the great wing-shells of the genus *Strombus*, especially *S. gigas* of the West Indies and *S. pugilis* of Florida. The large helmet-shells (*Cassis*) of the same region are often called "queen conchs."

King Cotton, a popular name given the cotton plant in the United States. "Cotton is king" was a frequent declaration before the Civil War, when the supremacy of cotton in commerce and politics was strongly asserted by public men, especially in the South.

King-crab. See HORSEFOOT CRAB.

King-crow. See DRONGO.

King-dory, a bird-dealers' name for the Australian parrots of the genus *Aspromictus*.

King Duck, the spectacled eider. See EIDER DUCK.

King George's Sound, an inlet in western Australia; five miles broad; it is an excellent roadstead, and contains two landlocked recesses, Princess Royal and Oyster Harbors. Albany, on Princess Royal Harbor, is a port of call for mail steamers.

King George's War, a war of Great Britain and its American colonies, against France and its Indian allies (1743-8), so named from King George II. See COLONIAL WARS.

King Henry the Fourth, a historical play by Shakespeare in two five-act parts. Part I., published in 1598, stands at the head of all of Shakespeare's historical comedies. Part II. forms a dramatic whole with the preceding. It was published in 1600.

King Henry the Fifth, a historical drama by Shakespeare, first printed in 1600, the

materials being derived from Holinshed and an earlier drama play on the same subject.

King Henry the Sixth, a historical drama by Shakespeare in three five-act parts. Of the eight closely-linked Shakespearian historical plays, these three are the last but one. The eight cover nearly all of the 15th century in this order: 'Richard II.'; 'Henry IV.' parts i. and ii.; 'Henry V.'; 'Henry VI.' (three parts); and 'Richard III.'. The three parts of 'Henry VI.' like 'Richard II.' present a picture of a king too weak-willed to properly defend the dignity of the throne.

King Henry the Eighth, a historical drama by Shakespeare, based on Edward Hall's 'Union of the Families of Lancaster and York,' Holinshed's 'Chronicles,' and Fox's 'Acts and Monuments of the Church.' The action covers a period of sixteen years, from the Field of the Cloth of Gold, in 1520, to the death of Queen Katharine in 1536.

King John, a drama based upon an older play published in 1591. The date of the action is 1200 A.D. John is on the throne of England, but without right; his brother, Richard the Lion-Hearted, had made his nephew Arthur of Bretagne his heir. Arthur, a lad of 14, is the pride of his mother Constance. The maternal affection and the sorrows of this lady form a central feature of the drama. Arthur's father, Geoffrey, has long been dead, but his mother has enlisted in his behalf the kings of Austria and of France. Their forces engage King John's army under the walls of Angiers. While the day is still undecided, peace is made, and a match formed between Lewis, dauphin of France, and John's niece Blanche. The young couple are scarcely married when the pope's legate causes the league to be broken. The armies again clash, and John is victorious, and carries off Prince Arthur to England, where he is confined in a castle and confided to one Hubert. John secretly gives a written warrant to Hubert to put him to death. The scene in which the executioners appear with red-hot irons to put out the boy's eyes, and his innocent prattle with Hubert is one of the most famous and pathetic in all the Shakespearian historical dramas. Hubert relents; but the frightened boy disguises himself as a sailor lad, and leaping down from the walls of the castle, is killed. Many of the powerful lords of England are so infuriated that they join the Dauphin, who has landed to claim England's crown in the name of his wife. King John meets him on the battlefield, but is taken ill, and forced to retire to Swinstead Abbey. He has been poisoned by a monk, and dies in the orchard of the abbey in great agony.

King Lear, by Shakespeare. See LEAR.

King-monkey, a monkey of the African semnopithecine genus *Colobus*, of which there are several species, one of which is the guereza (q.v.).

King-nut, the shag-bark hickory (q.v.).

King Penguin. See PENGUIN.

King Philip's War. See COLONIAL WARS IN AMERICA.

King Rail. See RAIL.

King Salmon or **Quinnat**, the most important of the several species of salmon found

KING SNAKE—KINGFISHER

on the Pacific coast of the United States; called also Chinook or Columbia River salmon (*Oncorhynchus tshawytscha*). It is especially abundant in the Columbia and Sacramento rivers, and its great economic importance is due to the fact that it enters the rivers in large numbers in the spring. See SALMON OF THE PACIFIC.

King Snake, a large colubrine snake of the southern part of the United States (*Ossela doliata*, of which the northern house-snake is a variety), so called on account of the belief in its power and prowess, especially in overcoming rattlesnakes. It is grayish white, marked by a series of black rings in a manner so variable that many color-varieties have been named. It sometimes reaches a length of ten feet, is extremely muscular and swift, and preys upon frogs, toads and upon snakes, including poisonous ones. Hence this serpent is much respected and rarely killed in the less settled parts of the Southern States. Several other species are known, one of which (*O. coccinea*) is red with black bands, and called the red king snake. These snakes are reproduced by eggs buried in sandy soil or loose dust, like that of a rotting stump. The chain-snakes (q.v.) of the allied genus *Ophiobolus* have an equal right to the name "king snake," and frequently receive it. Consult: Holbrook, "North American Herpetology," Vol. III. (142).

King Vulture. See CONDOR.

King William's War, a war waged by Great Britain and its colonies in America against France and its Indian allies in 1689-1697. See COLONIAL WARS.

King of the Herrings, a fanciful name applied to various sea-fishes. One so called is the moonfish (*Lampris luna*). Another is the rare deep-sea ribbon-fish (*Trachipterus arcticus*) of the North Atlantic. A species of the same family (*Trachypteridae*) occurs occasionally on the northwestern American coast, and was called by the Indians about the Straits of Fuca "King of the Salmon," in reference to their belief that the killing of this fish would be followed by a failure of the salmon supply.

King of the Mackerels, a strange oceanic fish of the genus *Ranzania*, allied to the ocean sunfish (*Mola*), various species of which are superstitiously so called in various parts of the world. One kind (*R. truncata*) is now and then taken in the North Atlantic; and a Hawaiian and Japanese species is *R. makua*. Consult Goode and Bean, "Oceanic Ichthyology" (1895).

King of the Mullets. See CARDINAL-FISH.

King of the Salmon. See KING OF THE HERRINGS.

Kingbird, one of the most familiar representatives in the United States of the tyrant flycatchers (*Tyrannidae*). The typical genus is distinguished by the concealed flame-colored crest, attenuate outer primaries and square tail, and contains many species. The eastern kingbird (*Tyrannus carolinensis*) is found throughout the United States, but rarely in the Southwest or west of the Rocky Mountains; it also enters the British provinces and breeds throughout this range; in winter it migrates into Mexico, Central and South America. It is a plain little bird about eight inches long, nearly black above and quite so on the head,

this color there contrasting greatly with the brilliant flame color of the crest, which can be concealed or erected at will; the tail is tipped with white, and the under parts are wholly white. The young lack the highly colored crown. The most distinctive trait of the kingbird is pugnacity, and during the nesting season no bird may come near its home without being attacked and almost invariably routed. Even crows, hawks, and eagles fly before its fearless and vigorous onslaughts. On account of the large gape of the mouth, the spreading bristles at its sides, and the flat, broad bill, the kingbird, in common with related species, is an adept in capturing flying insects, which constitute its almost exclusive food. In some localities it is known as the bee-martin, and has gained a bad reputation as a destroyer of honey-bees, but it destroys a thousand noxious insects for every bee it eats. The nest is a bulky structure saddled in a conspicuous position on a limb or fork usually of an apple-tree, and the eggs are usually rosy white, boldly spotted with brown and lilac. Two additional species of kingbirds are found in the West and two in the South. Consult: Wilson, "American Ornithology" (1834); Baird, Brewer and Ridgway, "History of North American Birds" (1874); Coues, "Birds of the Northwest" (1874).

Kingfish, the name of various fishes of notable power or superior excellence; especially certain "Spanish mackerels" of the genus *Scomberomorus*. One, the cavalla or "King cero" is a favorite game fish in Florida (see CERO). The kingfish of New York waters (*Menticirrhus saxatilis*) is one of the whiting, of the family *Sciaenidae*, closely allied to the drums (see WHITING). It is a moderately large migratory marine fish, "dusky gray above, sometimes blackish, the back and sides with distinct dark oblique cross-bands running down and forward," and a V-shaped blotch on each side of the nape. It is also known as "sea-mink," and is an excellent food-fish, but has become rare, although formerly ascending the Hudson River in schools, in early spring, for 40 miles or so. Other fishes so called are the little roncador (q.v.) of California, and the opah (q.v.). Consult: Jordan and Evermann, "American Food and Game Fishes" (New York, 1902).

Kingfisher, a bird of the family *Alcedinidae*, characterized by the short, compact body and large head, with a large, straight, acute bill; the somewhat usually short, square tail of twelve rectrices, the short rounded wings having ten primary quills; the short, weak legs and nearly unique cohesion of the middle and outer toes. Two sub-families are commonly recognized, the *Dacelonina*, or "Kinghunters," with a broader, depressed, sometimes curved bill and usually insectivorous habits; and the *Alcedinidae*, or true kingfishers, with a compressed, cererated bill, and usually piscivorous. About twenty genera and 125 species have been described, half of which are confined to the Australian region. About five genera and 50 species are distributed between tropical Africa and Asia, one species alone, the brilliantly colored *Alcedo ispida*, is found in Europe; while all of America has only eight species of *Ceryle*, three of which extend their range into the United States. Of these three, two (*Ceryle*

KINGHUNTER—KINGS

torquata and *C. americana*), are really Mexican and Central American, but the third, the belted kingfisher (*C. Alcyon*), is a widely distributed and highly characteristic member of the North American avifauna. Throughout North America, from the shores of the Arctic Ocean to the Gulf of Mexico, and from the Atlantic to the Pacific, is the summer breeding-home of the belted kingfisher, which in winter retreats south of the limit of freezing. The large, crested head, very large bill, and deep blue color, with black and white markings and largely white under parts, give to this bird a very characteristic aspect, which is heightened by its peculiar habits. Each pair selects a hunting-ground somewhere in the vicinity of water, and other pairs seldom intrude upon this preserve. There the kingfisher perches on a tree overhanging the water and watches for the passage of a fish, when it plunges headlong and usually emerges with a small fish held firmly in the beak. As it rises a spasmodic shake dispels the water from its compact oily plumage, and on returning to its perch, the fish is usually tossed into the air and swallowed head first. Sometimes the kingfisher hunts more in the manner of a tern and plunges from a suspended position in mid-air. The only call is a peculiarly loud, harsh, rattling cry. A burrow six to nine feet long, dug horizontally into a bank, serves as a nesting place, in the slightly enlarged end of which the six or eight pure white eggs are laid on a bed of regurgitated fish bones.

The dacelonine kingfishers have very different habits, and might more properly be called king-hunters. They are usually woodland birds, caring little for the neighborhood of water, since their food consists of insects caught mainly on the wing, or else of tree-frogs, lizards and other small reptiles found on the ground or about trees. The jackass kingfisher (q.v.) of Australia is a prominent example. A peculiar group of the Papuan Islands (genus *Tanysiptera*) has long, racket-shaped tail-feathers and other peculiarities of plumage. The small East Indian species of *Ceyx* have only three toes. Those of Africa are inhabitants of deep woods, but when hard pressed for food will resort to streams and pick up small fishes. All these breed in holes in trees and not in earth-burrows.

Consult: Sharpe, 'Monograph of the Alcedinidae'; Evans, 'Birds' (Cambridge Natural History, Vol. IX.); and American and European ornithologies.

Kinghunter, a kingfisher of the sub-family *Daceloninae*; specifically the jackass kingfisher (q.v.).

Kinglake, Alexander William, English historian: b. Taunton, Somerset, 5 Aug. 1809; d. 2 Jan. 1891. He was educated at Eton and Cambridge, was called to the bar in 1837, but ceased to practise in 1856. He represented Bridgewater in the Liberal interest in Parliament from 1857 to 1868, when Bridgewater was disfranchised. His distinction as a writer rests upon two books: 'Eothen, or Traces of Travel Brought Home From the East' (1844); and 'The Invasion of the Crimea,' in eight volumes, (1863-87). The former is marked by truth to nature, poetry, humor, and imagination; the latter (which is partly the result of personal observation) is an equally brilliant performance

in its own way, almost exhaustive in its details, picturesque and telling in description and narrative, but open to the charge of prejudice in some points, his great dislike of Napoleon III. frequently appearing. Consult: Tuckwell, 'Alexander William Kinglake' (1901).

Kinglet, a very small bird of the thrush family dwelling in northern forests and visiting southern Europe and the United States only in winter. These smallest of songsters, hardly more than 4 inches in total length, are olive-green and gray in color, with a half-concealed yellow crest in one of the two species, the gold-crest (*Regulus Satrapa*), and a flame-colored one in the other (*R. calendula*), called ruby-crown. These tiny birds go about in small lively flocks, and have no hesitation in attacking a crow, jay or hawk with the spiteful fury that long ago won them the name "kinglet" among European peasants. Both, especially the ruby-crown, sing sweetly in the spring before going to some mountain-top or northern forest to make their cup-like nests in some evergreen tree. See GOLD-CREST.

King's Bench, Court of. See COURT.

Kings, Books of, I. and II., canonical books of the Old Testament, forming one book in the Hebrew canon. In the Septuagint version there are various omissions, additions, transpositions, and glosses, which do not in general appear to rest on any authentic authority, and sometimes bear evident traces of later invention. Besides their internal unity the books of Kings are closely connected with those which precede them in the canon, I. and II. Samuel, and even Judges and Ruth, so that some authorities suppose the whole of these books to be a single compilation. Taking the books of Kings alone there is internal evidence throughout that their compilation was subsequent to the destruction of the Jewish monarchy, and in the later chapters much to corroborate the Jewish tradition that Jeremiah, with whose book of prophecies they present many points of agreement, was the compiler. By whomsoever they were compiled, these books, as well as Judges, Ruth and Samuel, are evidently taken from a series of contemporary authorities, being, as shown by citation, the official annals as well as the prophetic writers of the successive periods. These authorities are often followed so literally that when a comment is introduced it is uncertain whether it is that of the original writer or of the compiler; thus the expression which frequently occurs in reference to memorials of occurrences that they remain to this day sometimes implies the existence of the monarchy, the temple, or something else known not to exist in the time of the compiler. The books of Kings thus contain authentic accounts of contemporary history during the whole period of the Jewish monarchy. They begin with the close of the reign of King David, and the history is carried down consecutively to a period subsequent to the capture of Jerusalem and the destruction of the temple, embracing, according to the received chronology, a period of upward of 400 years (1015-588 B.C.), and including the history of both the kingdoms of Judah and Israel. The facts recorded in regard to the foreign relations of these kingdoms from the conquest of Rehoboam by Shishak, king of Egypt, to the

KING'S CHAPEL — KINGSLEY

captivity in Babylon, have been remarkably confirmed by modern discoveries. The outline of events recorded in Kings is also frequently supplemented by much fuller details in the prophetic books, particularly Isaiah and Jeremiah. The text of the books of Kings is not considered by critics to be very pure. The chronology is in a very unsatisfactory state, being difficult to reconcile with other authorities, and in many passages inconsistent with itself. The books of Kings differ from the Chronicles in comprising the history of the separate kingdoms of Israel and Judah, while the Chronicles are occupied almost exclusively with that of Judah. It is also to be observed that the Kings contain much fuller notices of the contemporary prophets, while the Chronicles are more full in describing the temple worship and the ceremonials of the Levitical law. This may, perhaps, be regarded as confirming the hypothesis which ascribes the authorship of the former to Jeremiah the prophet, while the reputed author of the Chronicles was Ezra the priest.

King's Chapel, a religious edifice in Tremont Street, Boston, Mass., built in 1745 on the site of an older church. During the War of the Revolution it was for a time forsaken by its loyalist congregation. In the burial ground adjoining which has been in use since 1630, many of the early Puritans, including Gov. Winthrop, are interred.

King's College, a college of Cambridge University, England, founded by Henry VI. in 1441. The college had in 1902 a provost, 46 fellows, 48 scholars, 120 undergraduates. The college chapel is the finest in the world in size, form and decoration. It contains some of the best glass and wood carving examples in England.

King's College, London, a college established by private subscription and incorporated in 1829, its constitution being amended by an act of Parliament in 1882. The buildings are adjacent to those of Somerset House. It was established for the purpose of providing an education in accordance with the principles of the Established Church. Education is imparted in the departments of theology, general literature and science, applied sciences and engineering, and medicine. The department of general literature and science is intended to prepare students for the universities, for the army, and the Indian and home civil service; and there are also special classes for civil service candidates. There is a department for women. The college possesses a library and a museum. It is now a constituent college of London University.

King's Daughters and Sons, International Order of the, an organization of men, women and children of all religious denominations, whose object is to minister to the sick and needy wherever found, and to do good to all with whom they come in contact. The original circle (of women) was formed in New York in 1886, and its members are found in almost every State in the Union. There are also branches in several foreign countries. The badge is a small silver Maltese cross, generally suspended by a purple ribbon and bearing the initials "I. H. N." (In His name). The society publishes a weekly paper, 'The Silver Cross.' The membership in 1903 was over 500,000.

King's (or Queen's) Evidence, the British equivalent of State's evidence. See **INFORMER**.

King's Evil. See **SCROFULA**.

King's Mountain, N. C., a village in York County, 80 miles northeast of Columbia. In the vicinity is a high hill where a battle took place 7 Oct. 1780, between the Americans, under Levier, Shelby, Campbell and William, and the British, under Ferguson. The latter were defeated with a loss of 456 killed and wounded, among whom was the commander, and 648 taken prisoners after an hour's fighting. Ferguson, shouting to his men: "Crush the damned rebels to the earth," prepared for one final charge, and fell at the head of his regulars pierced by seven bullets, dying, according to tradition, by the hand of Col. Williams, who was also slain. His men, disheartened by his fall, surrendered. The Americans lost only 20 men killed, although a large number were wounded. After the battle 10 of the prisoners notorious for their crimes were hanged, having first been regularly tried and condemned by their captors. This was one of the most brilliant victories of the war, and exercised an important influence in precipitating the downfall of British power in the South. The 75th anniversary of the battle was commemorated by a celebration on the ground.

Kings'ford, William, Canadian historian: b. London, England, 12 Dec. 1819; d. Ottawa, Ont., 29 Sept. 1898. He entered the army and came to Canada in an English regiment in 1841. He then took up surveying and engineering, and was at various times employed upon the construction of the Hudson River, Panama, Grand Trunk, and Canadian Pacific railways. He made his home in Canada and published 'The History, Structure, and Statistics of Plank Roads in the United States and Canada' (1851); 'The Canals: Their History and Cost' (1865); and 'The History of Canada' (1880), a well-known work; etc.

Kingsley, kingz'li, Charles, English clergyman, novelist, and poet: b. Holne Vicarage, near Dartmouth, Devonshire, 12 June 1819; d. Eversley, Hampshire, 23 Jan. 1875. He was a pupil of Derwent Coleridge (q.v.) from whose care he passed to King's College, London, and thence to Magdalen College, Cambridge, where he was graduated with high honors in 1842. Soon after graduation he took orders in the Established Church and obtained the curacy of Eversley, and became its rector in 1844. This living he retained till his death, but he also held in succession two canonries, one in the cathedral of Chester 1869-73, and one in the chapter of Westminster from 1873 till his death. From 1860 to 1869 he was professor of modern history at Cambridge. Early in his career as a clergyman of the Church of England he associated himself with F. D. Maurice, Julius Hare, and others, both in their religious views and in their social aims. With them he considered it the peculiar duty of the Church to improve the condition of the working-classes, not only by inspiring them with Christian feeling and Christian principle, but also by encouraging and aiding them in bettering their material position. With the latter object he was a strong advocate of co-operative association. His first literary works of importance, 'Alton Locke, Tailor and Poet' (1850), and 'Yeast, a Problem' (1851), gave expression to his sentiments on social ques-

KINGSLEY—KINGSTON

tions, and both of them, but especially the first, made a great impression when they appeared. The principal of his later novels are '*Hypatia*' (1853), '*Westward Ho!*' (1855), perhaps the most popular of his stories, and '*Hereward the Wake*', '*Last of the English*' (1866). Other works of his are '*Glaucus, or The Wonders of the Shore*'; '*Town Geology*'; '*The Roman and the Teuton*', historical lectures; '*The Water Babies*', a fairy-tale of science; and '*At Last*', a visit to the West Indies. He was also the author of numerous sermons, lectures, and essays, and of various poems, the chief of which are '*The Saint's Tragedy*', and '*Andromeda*', the latter one of the most successful experiments in English hexameter. Consult: '*Letters and Memories of Charles Kingsley*', by his wife (1877).

Kingsley, Elbridge, American artist and engraver: b. Carthage, Ohio, 17 Sept. 1842. He was graduated at Hopkins Academy, Hadley, Mass., and proceeded to New York where he studied art at Cooper Union. He began engraving for the Century Company in 1878, and started the School of Painter Engraving in 1880 with original work. He is one of the artists who have been instrumental in raising the school of American engraving to the high rank in the art world which it now enjoys.

Kingsley, Florence Morse, American novelist: b. Medina, Ohio, 14 July 1859. She was educated at Wellesley College and was married in 1882 to Charles R. Kingsley. She has published '*Titus: a Comrade of the Cross*' (1894); '*Stephen*' (1896); '*Paul*' (1897); '*Prisoners of the Sea*' (1897); '*The Cross Triumphant*' (1899); '*The Transfiguration of Miss Philura*' (1901); '*Through a Needle's Eye*' (1902); '*Wings and Fetters*' (1902).

Kingsley, Henry, English novelist, brother of C. Kingsley (q.v.): b. Barnack, Northamptonshire, 1830; d. 24 May 1876. After being educated at King's College, London, and Worcester College, Oxford, he went to Australia, where he spent five years, returning to England in 1858. He was editor of the *Daily Review*, Edinburgh, 1870-1, was its war correspondent during the Franco-Prussian War, and as such was present at the battle of Sedan. In 1859 he published '*Recollections of Geoffrey Hamlyn*', a vigorous novel of Australian life, and this was succeeded by '*Ravenshoe*' (1861); '*The Hillyars and the Burtons*' (1865); also a study of Australian life; '*Leighton Court*' (1866); '*Silcote of Silcotes*' (1867); '*Stretton*' (1869); '*Hetty*' (1871); '*Ois Margaret*' (1871); etc.

Kingsley, James Luce, American educator: b. Windham, Conn., 27 Aug. 1788; d. New Haven, Conn., 31 Aug. 1852. He was graduated from Yale in 1799 and spent the remainder of his life there, as tutor 1801-05, and professor of Hebrew, Greek and Latin 1805-51. He was noted for the purity of his Latin style. He published a '*History of Yale College*' (1835); '*Life of President Stiles*', and highly prized editions of '*Tacitus*' and '*Cicero de Oratore*'.

Kingsley, John Sterling, American zoologist: b. Cincinnati, N. Y., 7 April 1854. He was graduated from Williams College in 1875, was professor of zoology at the University of

Indiana 1877-9; and at the University of Nebraska 1889-91, and has filled a similar position at Tufts College from 1892. He edited '*The American Naturalist*' (1886-96) and has published '*Elements of Comparative Zoology*'; '*Vertebrate Zoology*'; '*Popular Natural History*' (1890).

Kingsley, Mary Henrietta, English traveler and author: b. London 13 Oct. 1862; d. Simonstown, Cape Colony, 3 June 1900. She was a niece of Charles and Henry Kingsley. She made journeys to West Africa in 1893-4 and 1894-5, visiting Ambriz, the Kongo, and Old Calabar on the former, and ascending Mungo Mah Lobeh (13,700 feet) on the latter. She made important zoological collections, and recounted her experience in the interesting volume '*Travels in West Africa*' (1897). Her other books are: '*West African Studies*' (1899), essays; and '*The Story of West Africa*' (1899), in Marshall's '*Empire*' series.

Kings'mill Group. See GILBERT ISLANDS.

Kingston, king'stōn, William Henry Giles, English novelist: b. London 28 Feb. 1814; d. Willesden, Middlesex, 5 Aug. 1880. His youth was spent in Oporto, Portugal, and having aided in arranging a commercial treaty between England and Portugal he was knighted by the Queen of Portugal in 1842. He wrote almost though not quite exclusively for boys, producing 130 stories in 30 years; mostly of sea voyage and adventure, which were very popular. '*Peter the Whaler*' (1851); '*The Cruise of the Frolic*' (1860), the series beginning with '*The Three Midshipmen*' (1873); '*Joviman*' (1877); etc., won for him thousands of readers, both young and old.

Kingston, Canada, city, port of entry, capital of Frontenac County, in the province of Ontario; at the mouth of the Cataraqui and on the Bay of Quinté, an inlet of Lake Ontario, and where the Saint Lawrence begins. The Rideau Canal connects Kingston with Ottawa. It is on the Grand Trunk, the Canadian P., the Kingston & P. R.R.'s, and is about 160 miles by rail north-northeast of Toronto, and 180 miles southwest of Montreal. The harbor sheltered by Navy and Wolfe islands, is considered one of the best on the Lake. It is a strongly fortified city; its fortifications rank third with that of other cities in Canada; Quebec and Halifax are considered better. Defenses are on Navy Point, Messessaga Point, and Point Henry. The harbor and city are commanded by the fortress at Point Henry. When the early French missionaries visited this locality, they found an Indian village where Kingston now stands. Its hunting and fishing opportunities, the great waterways leading east and west and the routes by smaller streams into the interior, were all appreciated by the Indians. The place was often made the meeting ground when they held councils, and made treaties. In 1673 the French built here a fort and called it Fort Frontenac. In 1758 the British obtained possession, and in 1793 the town began to assume the air of permanency, but it did not lose its military appearance. It was used as naval headquarters by the British in the War of 1812. The United Empire Loyalists changed the name, after the Revolutionary War, from Fort Frontenac to Kingston. In 1838 Kingston was chartered as a city. It was made the capital of Canada, when

KINGSTON — KINO

Upper and Lower Canada (Ontario and Quebec) united in 1841, but in 1845 the capital was changed to Quebec. In ship-building it ranks next to Quebec among the Canadian cities. Some of the chief manufactures are locomotives, foundry products, agricultural implements, nails, axles, engines, rolling-stock, leather, pianos, flour, furniture, and confectionery.

Some of the educational institutions are the University of Queens College, Royal Military College, Mechanics Institute, Kingston's Ladies' College, School of Gunnery, Regiopolis College, Saint Vincent's Academy, conservatory of music, business college, and a collegiate and training institute for teachers. It has a general hospital, the Hotel Dieu Hospital, orphan asylums, House of Providence, and just outside the city limits are the Rockwood lunatic asylums and the provincial penitentiary. The Anglican and Roman Catholic cathedrals, the city and county buildings, and several other edifices are well built and add to the attractions of the city. The bronze statue of Sir John A. Macdonald is at the main entrance to the city park. Pop. (1901) 18,043.

Kingston, Jamaica, the capital of the island. See JAMAICA.

Kingston, N. Y., city, county-seat of Ulster County; on the Hudson River, and on the West Shore, the Wallkill Valley, and the Ulster & Delaware R.R.'s; and is connected by ferry with the main line of the New York Central & Hudson River railroad on the east side of the Hudson; about 100 miles north of the city of New York and 55 miles south of Albany. The Wallkill River and Rondout Creek enter the Hudson at Kingston. The first settlement was made here in 1652 by the Dutch. They named the place Esopus. In 1661 they were granted a charter, but as a dependency of Fort Orange (now Albany), the place was called Wilturick. The British obtained possession in 1664 and in 1669 they changed the name to Kingston. On 19 Feb. 1777 the first State convention of the State of New York adjourned from Fishkill to Kingston, and the first State Constitution was proclaimed in front of the court house, on 22 April 1777. On 9 September of the same year, Chief Justice Jay opened in Kingston the first State court. The State legislature met here in September of the same year, but was dispersed by the approach of the British, who entered the place on 7 October and destroyed nearly the whole town by fire. It was rebuilt, and was incorporated as a village in 1805 and chartered as a city in 1872. The city now comprises the former villages of Kingston, Rondout, and Wilbur. The chief manufactures are bricks, motor-trucks, and Rosendale cement. It is the commercial centre for a large extent of country, and has an extensive trade in farm products, coal, cement, lime, lumber, grain, brick, and bluestone. It has the Kingston and Ulster academies, a business college, Our Lady of Victory's Sanatorium, libraries, an armory, a city hall, court house, and several fine churches. The bridge owned by the West Shore Railroad is about 150 feet above tidewater. The "Senate House," the first home of the New York Legislature, contains a collection of relics connected with the early settlement of the country. Kingston Point Park, about 50 acres in extent, and on the Hudson, is being made more

attractive each year. The large steamers now land at this park. The government of the city is vested in a mayor, who holds office two years, and a council. The executive appoints the subordinate officials, subject to approval by the council, except the city judge and the recorder, who are elected by the people. Pop. (1890) 21,261; (1900) 24,535.

Kingston, Pa., borough in Luzerne County, on the Susquehanna River, opposite Wilkesbarre; on the Lehigh Valley and the Delaware & Lackawanna R.R.'s. Here is the seat of the Wyoming Methodist Seminary. The principal industry is coal mining. The repair shops of the Lackawanna Railroad are located here. Kingston was incorporated as a borough in 1858. In the near vicinity in 1778 occurred the famous Wyoming Massacre. Pop. (1890) 2,381; (1900) 3,846.

Kingwood, a kind of wood from Brazil, called also violet wood and jacaranda. It is obtained from a species of *Dalbergia* (q.v.), and is used for turning and cabinet work, as it is hard, dark-colored, and beautifully variegated with violet streaks.

Kinkajou, king'kā-joo. See Porro.

Kinney, kin'ī, **Coates**, American writer: b. Kinney's Corners, N. Y., 24 Nov. 1826. He studied law, was admitted to the bar in 1856 and subsequently edited several Ohio journals. He served in the Federal army during the Civil War, being mustered out in 1865 with brevet rank of lieutenant colonel, and sat in the Ohio Senate, 1881-2. He has published "Keuka" (1855); "Lyrics" (1888); "Mists of Fire and Some Eclogues" (1899), but is best known by the familiar lyric "Rain Upon the Roof."

Kinnikinnik, kin"ī-ki-nik', or **Killikinick**, any of several plants which were used by the Indians, especially in the Western United States, for pipe-smoking, either with or without mixture with tobacco. The principal one was the widespread red bearberry (*Arctostaphylos uva ursi*, see BEARBERRY) whose leaves were dried and powdered. Equally or perhaps more in use in the Upper Missouri region was the dried bark of the new shoots of the osier-cornel, or dogwood (*Cornus stolonifera*) locally known as "red-willow," and of a related species (*C. amomum*) the silky cornel or swamp dogwood, a shrub whose new shoots are smooth and purple red, with ovate leaves covered on the under side with a silvery pubescence, which also clothes the compact cymes; and as the leaves grow older they often become blotched with purple. All these plants contain chemical principles which affect the nerves pleasantly; and many plainsmen learn to enjoy a mixture of Indian kinnikinnik with their tobacco. In the Southern States the country people make a powerful tonic by steeping cornel bark and adding the decoction to corn-distilled whiskey.

Kino, kē'nō, a kind of gum which exudes from certain trees when an incision is made, and is dried without artificial heat. The East Indian or Malabar kino comes from a leguminous tree (*Pterocarpus marsupium*); Bengal or Palas kino from *Butea frondosa*; and Australian or Botnay Bay kino from *Eucalyptus rosiflora*; West Indian from a third plant (*Coccoloba uvifera*). It consists of dark red angular fragments, rarely larger than a pea, and

KINSOLVING—KIOWA

easily splitting into still smaller pieces. It is very soluble in spirits of wine, and in general behavior closely resembles catechu, and yields by similar treatment the same products. In medicine it is an astringent and tonic.

Kinsol'ving, George Herbert, American Protestant Episcopal bishop: b. Bedford County, Va., 28 April 1849. He was graduated from the Theological Seminary at Alexandria, Va., and was ordained to the priesthood in 1875. He was successively rector of churches in Baltimore, Cincinnati, and Philadelphia, and in 1892 was consecrated bishop of Texas.

Kin'ston, N. C., town, county-seat of Lenoir County; on the Neuse River, and on the Atlantic & North Carolina and the Atlantic Coast Line R.R.'s; about 78 miles southeast of Raleigh and about 60 miles from Pamlico Sound. It is situated in a fertile agricultural region in which tobacco and cotton are the chief productive crops. Kinston is an important trade centre and contains a number of large warehouses. Its chief industrial establishments are stemmeryes, packing houses, cotton-mills, machine-shops, foundry, wagon works, turpentine distillery, box and barrel factories, shingle-mills, and knitting mills. It is the seat of the Rhodes Military Institute. The city owns the electric light plant. Pop. (1890) 1,726; (1900) 4,106.

Kinston, Battle of. On 1 March 1865 Gen. Cox, with three divisions of infantry, pushed forward from Newbern, N. C., toward Goldsboro to open communication with Gen. Sherman, who was marching northward from Savannah, and on the 7th two of his divisions were at Wise's Forks, near Southwest Creek, a tributary of the Neuse River, with one division three miles in rear. A brigade was advanced to a cross-road about midway between the main line and the creek. Gen. Hoke, with his Confederate division, crossed the creek on the night and early morning of the 7th and 8th, flanked, surprised, and routed the advance brigade, taking over 900 prisoners and, pressing on, fell upon the left of Cox's line, but was repulsed. He renewed the attack and was again repulsed. On the 9th there was sharp skirmishing and the Confederates made repeated efforts to turn Cox's right, which were foiled. On the morning of the 10th Hoke and D. H. Hill made vigorous and successive attacks first upon the left and then on the right of Cox's line, but were repulsed, and Gen. Bragg, who was in supreme command, made no further effort, retreated across Neuse River during the night, burning all bridges behind him, left a small guard at Kinston and, with the rest of his command, hastened through Goldsboro to join J. E. Johnston, who was concentrating everything available to oppose Sherman. Gen. Schofield joined Cox with troops from Wilmington, and reached Goldsboro on the 21st, Sherman joining him two days later. The Union loss at Kinston was 65 killed, 319 wounded, and 930 missing; the Confederate loss is not known. D. H. Hill reports a loss in five brigades of 118 killed and wounded and 16 missing. Schofield estimated the entire Confederate loss at 1,500, which is probably excessive. Consult: 'Official Records,' Vol. XLVII.; Cox, 'The March to the Sea,' and 'Military Reminiscences of the Civil War,' Vol. II.

E. A. CARMAN.

Kintyre, kín-tír', a peninsula of Scotland, between the Firth of Clyde and the Atlantic, forming the division of Argyleshire. It is 40 miles long from the Isthmus of Tarbet to the Mull of Cantyre, and has an average breadth of about 7 miles.

Kin'zie, John, American pioneer: b. Quebec, Canada, 1763; d. Chicago, Ill., 6 Jan. 1828. His name was originally McKenzie. For a time he was a jeweler in Quebec, but later became a trader in the western United States, and in 1804 established a post on the site of the present Chicago, of which he was the earliest white settler. He also set up stations on the Illinois, Kankakee, and Rock rivers.

Kiosk', a Turkish word meaning pavilion. It has a tent-shaped roof, open on all sides and is supported by pillars, round the foot of which is a balustrade. It is built of wood, roofed with straw or similar materials, and is chiefly erected to afford a free prospect in the shade, but it also serves to embellish a rural or garden view. This kind of pavilion has been introduced from the Turks and Persians into the English, French, and German gardens.

Kioto, ké-ō'tō, or Kyoto, one of the great cities of Japan, and for over 1,000 years the capital; situated on a flat plain about 26 miles inland from Osaka. A high range of hills to the east separates this plain from Lake Biwa, and on these some of the finest temples connected with the city are built. The city is rectangular in form, the longer streets running north and south parallel to the Kamo River, which flows along the base of the ridge. At the north end are situated in an enclosure the plain wooden buildings where the emperors of Japan dwelt so long in seclusion. The Honganji temples of the Monto sect of Buddhists, fine structures of their kind and the centre of the Buddhist faith in Japan, rise at the south end of the city. The streets, though narrow, are clean and attractive, and the whole city has an air of refinement. The singing girls of Kioto are noted for their graceful dances. The pottery, porcelain, crepes, velvets, and brocades of Kioto are highly esteemed; its embroideries, enamels, and inlaid bronze-works are marvels of skilful handicraft. The capital was not removed from Kioto until 1868, when the Mikado and his court took up residence at Tokio (Yedo). Pop. (1900) 353,139.

Kiowa, ki'o-wā (properly kái-gwū), a considerable Indian tribe now in Oklahoma, whose language forms a distinct stock, who have resisted with unusual virility the physical decay so common among the tribes, and whose pictograph calendar from about 1830 is of scientific interest. In dress and dwellings they are civilized, but otherwise tenacious of their old customs; of which the most prominent were the sun dance, and devotion to a stone image called the Taimé, a sort of guardian deity. They had a military order of six degrees, and were organized in six bands; one of which, inaccurately called the Kiowa-Apache (by themselves "Nadiisháñ-dina"), is an Athapascan tribe immemorially confederated with them. First living (according to their and other tribes' traditions) in the Montana Rockies along the head waters of the Missouri and Columbia, they followed the retreating buffalo herds southward along the plains, allying themselves with the Crows and

KIP—KIRBY

assailed by the Cheyenne and Sioux; halted for a while successively in the Black Hills and along the Platte and Arkansas; at first warring with the Comanches, but since 1790 in confederacy with them, and finally making peace with the Cheyennes and Arapahoes. They became one of the most formidable scourges of the plains, harrying the frontiers of the United States and Mexico. The treaty of Medicine Lodge, Kan., in 1867, enforced (after their disobedience) by Custer's troops during the next winter, placed them, with the Comanches, Cheyennes, and Arapahoes, upon reservations in Oklahoma; they broke loose in 1874, and Mackenzie was obliged to kill their horses and deport their leaders and chief men to Florida. Thenceforth they remained on the reservation. This was thrown open to settlement in 1901, and they accepted American citizenship. Their number, about 1,100, is not very much less than at any time for a century. 'Mooney's Calendar History of the Kiowa Indians'; '17th Report Bureau of American Ethnology' 1898.

Kip, William Ingraham, American Protestant Episcopal bishop: b. New York 3 Oct. 1811; d. San Francisco, Cal., 7 April 1893. He was graduated at Yale College in 1831, entered the General Theological Seminary of the Episcopal Church in New York, and was ordained deacon in 1835. In 1838 he was called to the rectorship of St. Peter's Church, Albany, N. Y., which position he retained until his consecration in 1853 as missionary bishop of California. He published several religious treatises, including 'The Lenten Feast' (1843); 'The Double Witness of the Church' (1844); etc.; and also 'Early Jesuit Missions in North America' (1846); 'Early Conflicts of Christianity' (1850); 'The Catacombs of Rome' (1864); 'Olden Times in New York' (1872); 'Early Days of My Episcopate' (1892).

Kipling, Rudyard (originally JOSEPH RUPYARD), Anglo-Indian author: b. Bombay, India, 30 Dec. 1865. After studying at the United Services College, Westward Ho, North Devon, he returned to India in 1882 as sub-editor of the Lahore 'Civil and Military Gazette,' and was for some time special correspondent on the frontier, in Rajputana, and elsewhere, for that paper and for the Allahabad 'Pioneer.' He left India in 1889 and went to England, after visiting China, Japan, Africa, Australia, and the United States. For several years he resided at Brattleboro, Vt., but later returned to England, and lived at Rottingdean, Sussex. During the second Boer war he visited South Africa as a newspaper correspondent. He first made himself known to a restricted circle of English readers by a volume entitled 'Departmental Ditties' (1886), in which he dealt with the salient features of Anglo-Indian life with directness, insight, and metrical facility. An enlarged edition appeared in 1890. In 'Plain Tales from the Hills' (1887) he gave the public the first collection of the striking and characteristic stories of English life under Indian conditions, on which his reputation chiefly rests. It was followed by 'The Phantom Rickshaw' (1889), including 'The Man Who Would be King'; 'Soldiers Three: Stories of Barrack-Room Life' (1890), "almost a classic in its way," whose heroes are a kind of latter-day "Trois Mousquetaires"; 'The Story of the Gadsbys' (1890);

'In Black and White' (1890), including eight tales; 'Wee Willie Winkie, and Other Stories' (1890), including 'The Drums of the Fore and Aft' and 'Under the Deodars' (1890). 'The Light that Failed' (1891) was his first attempt at sustained fiction. 'Life's Handicap: being Stories of Mine Own People' (1891), contains some of his best short stories, among them 'Without Benefit of Clergy.' His reputation was greatly enhanced by the publication in 1892 of 'Barrack-Room Ballads, and Other Verses,' including such poems as 'Fuzzy-Wuzzy'; 'Gunga Din'; and 'The Road to Mandalay.' To the same year belongs the rather unsuccessful novel 'The Naulakha: a Story of the West and East,' written with Wolcott Balestier. 'Many Inventions,' published in 1893, is a collection of 14 short stories, and the Jungle Book (1894), illustrated by his father and others, is partly in verse, partly in prose. Many regard this volume, with its beast-fables of a primitive India, as Kipling's best work. A 'Second Jungle Book' appeared in 1895, and in 1896 a volume of poems was issued under the title 'The Seven Seas, and Other Verses.' 'Captains Courageous' (1897) is a story of the Newfoundland cod banks, and 'The Day's Work' (1898) is a collection of 12 short stories, including 'The Bridge-Builders.' Among more recent works are 'Kim' (1901), whose hero is an agent in Indian secret service, a book in which "the last word upon native India seems to have been said"; 'The Just-So Stories' (1902), a clever juvenile; and 'The Five Nations' (1903), a collection of somewhat uneven verse. Of Kipling's occasional poems the most famous is 'The Recessional,' written on the occasion of Queen Victoria's Diamond Jubilee (1897). Kipling's best work must always rank high, but he is very unequal, and at times journalistic or mediocre. At his best, however, he is skilful in character-drawing, and his word-pictures are often extremely vivid. Consult: Clemens, 'A Ken of Kipling' (1899); Knowles, 'A Kipling Primer' (1900); Le Gallienne, 'Rudyard Kipling' (1900); Parker, 'The Religion of Kipling'; and many magazine articles.

Kip'per, a kippered herring, that is one preserved by smoking or pickling. Anciently in Scotland the word signified a salmon taken after the spawning season, and split, salted and dried, because of its inutility when fresh.

Kiral'fy, Imré, organizer and manager of spectacular exhibitions: b. Budapest, Hungary, 1 Jan. 1845. He commenced the composition of music at the age of 12; introduced many grand spectacular compositions in the United States 1869-94. His many productions include 'Venice'; 'Paris' (1902); 'Columbus'; 'Nero'; 'India'; 'America' (1893); 'Our Naval Victories' (1898); 'Women of All Nations' (1900); 'China, or the Relief of the Legations' (1901). Some of these tableaux and panoramas have had a success unexampled in the history of such undertakings.

Kirby, kér'bí, William, Canadian author: b. Kingston-upon-Hull, England, 13 Oct. 1817. He removed to Canada in 1832, but was educated in Cincinnati, Ohio. In 1839 he removed to Niagara, Ont., where he was editor and publisher of the 'Mail' for 20 years, and from 1871 to 1895 collector of customs there. He published 'U. E., a Tale of Upper Canada,' a poem

KIRCHBACH — KIRKE

1860); 'Le Chien d'Or,' a novel (1877); 'Pontiac' (1887); 'Annals of Niagara' (1896); etc.

Kirchbach, Wolfgang, völ'gäng kir'bäh, German critic and poet: b. London, England, 18 Sept. 1857. He was the son of a German artist and studied in Dresden and Leipsic. Settling in the former city in 1888 he was editor of the 'Magazin für Litteratur des In und Auslandes,' but from 1896 has lived in Berlin. Among his works may be cited: 'Märchen' (1879); 'Salvator Rosa,' a romance (1880); 'Gedichte' (1883); 'Das Leben auf der Waltz' (1892); 'Die letzten Menschen,' a drama (1892).

Kirghiz, kir-géz', Kirghis, or Kirghiz-Kazaks, a widely-spread nomadic people of Asia, of Turkish-Tartar race, who inhabit the steppes that extend from the lower Volga and the Caspian Sea in the west to the Altai and Thian-Shan Mountains in the east, and from the Sea of Aral in the south to the Tobol on the north. The term Kirghiz, though applied by Europeans to the whole of these peoples, properly belongs only to the Kara-Kirghiz (Black Kirghiz, called also Burúts or Fruts). Those to whom Europeans give the name Kirghiz are called by the Asiatics Kazaks. The Kirghiz-Kazaks speak the Turkish dialect of the Uzbeks. In their physical type they belong to the Mongolian race. They profess the Mohammedan faith, though they do not practise polygamy. They are below the general average of European stature, and are remarkably healthy and vigorous. Their food is chiefly mutton and horse-flesh, with koumiss or fermented mare's milk, from which they extract an intoxicating spirit. Their dwellings consist of a hemispherical tent, the frame of which is of boughs, the covering of felt. Their manufactures are exclusively domestic, and consist of woolen cloths, felt, carpets, hair-ropes, leather, metal ornaments for horse-trappings, knives, etc. They carry on a trade by barter with the Chinese and Russians, exchanging sheep, horses, camels, cattle, wool, skins, etc., for tea, cutlery, silks, and other manufactured goods. A considerable portion of the Kirghiz dwell in Chinese territory, for the most part in Turkestan, but the greater number of them are nominally under Russian dominion. Of those European Russia contains 150,000.

Kirk, kérk, Edward Norris, American Congregational clergyman: b. New York 14 Aug. 1802; d. Boston 27 March 1874. He was graduated at Princeton (then the College of New Jersey), in 1820, studied law in New York, was graduated from the Princeton Theological Seminary in 1824, was agent for the Board of Foreign Missions in the Southern States, was ordained in 1827, in 1828-37 was pastor of the Fourth Presbyterian Church of Albany, N. Y., and there established with N. S. S. Beman a school of theology. From 1842 until his resignation in 1871 he was pastor of the Mount Vernon Congregational Church of Boston. In 1856 at the request of the American and Foreign Christian Union he inaugurated regular worship for American Protestants in Paris. He was president of the American Missionary Association, and published 'Sermons' (1840; 1860); 'Lectures on Christ's Parables' (1856); and other writings.

Kirk, Ellen Warner Olney, American novelist: b. Southington, Conn. 6 Nov. 1842.

She was educated in Stratford, Conn., and was married to John Foster Kirk (q.v.) in 1879. Her novels have been popular, and among them are: 'Lost in Idleness' (1877); 'A Midsummer Madness' (1884); 'The Story of Margaret Kent' (1886); 'Sons and Daughters' (1887); 'A Daughter of Eve' (1889); 'Walford' (1890); 'The Story of Laurence Garthe' (1895); 'Dorothy Deane' (1899).

Kirk, John Foster, American historian: b. Fredericton, N. B., 22 March 1824. He removed to the United States in 1842 and settled in Boston, where he was for 11 years secretary to the historian Prescott, whose complete works he has edited. In 1870 he removed to Philadelphia, where he was editor of 'Lippincott's Magazine' till 1886; and lecturer on history in the University of Pennsylvania, 1885-8. He is the author of 'History of Charles the Bold' (1863-8); and editor of the 'Supplement' to 'Allibone's Dictionary of Authors' (1891).

Kirkbride, Thomas Story, American physician: b. near Morrisville, Bucks County, Pa., 31 July 1809; d. Philadelphia 16 Dec. 1883. He received the degree of M.D. from the University of Pennsylvania in 1832, and was appointed resident physician of the Friends' lunatic asylum at Frankford, Pa. A year later he was elected resident physician of the Pennsylvania hospital, in which he continued two years, when he began general practice in Philadelphia. In January 1841 he became superintendent of the Pennsylvania Hospital for the Insane, then first opened, and continued in that office till his death. He published 'Rules and Regulations of the Pennsylvania Hospital for the Insane' (1850), which has been a text-book and guide in the regulations of new hospitals; and a work 'On the Construction, Organization, and General Management of Hospitals for the Insane' (1854, enlarged 1880). In 1853 he proposed the erection of a new hospital, and the separation of the sexes in two distinct buildings, and was the first superintendent in the United States to carry such an arrangement into effect.

Kirkdale Cave, in Yorkshire, England, 28 miles west of Scarborough, is famous for the numerous remains of Tertiary mammals. It was discovered in 1821, in the cutting back of an oolitic limestone rock in which it is situated. Its greatest length is 245 feet. The fossil bones are contained in a deposit of mud that lies on the floor of the cave. The remains of the following animals have been discovered: hyena, tiger, bear, wolf, weasel, elephant, rhinoceros, hippopotamus, horse, ox, deer, hare, rabbit, water-rat, raven, pigeon, lark, and duck.

Kirke, Sir David, English adventurer: b. Dieppe, France, 1596; d. Ferryland, Newfoundland, 1656. The "merchant adventurers" of London were at the beginning of his life a powerful body of associated privateers, and his father, Gervase Kirke, a dealer in French wine, who had left France to escape from the perils of the religious wars, joined the adventurers and projected with Sir William Alexander a plan for capturing New France and colonizing Nova Scotia. They obtained letters of marque and a monopoly of the fur trade, and David Kirke sailed in 1627 as commodore of three privateers, his brothers, Lewis and Thomas, being each in command of one. Off Quebec, they captured 20

KIRKLAND — KIRKWOOD

French ships with cargoes and passengers. In 1629 he captured another vessel and compelled Champlain to surrender Quebec. In the meantime peace had been made with France, the captured territory was restored, but Kirke was knighted for his services. He seemed doomed to disappointed ambition to the end, for Cromwell's council revoked, after the execution of Charles I., the grant of all Newfoundland made to Kirke by the king, although the adventurer eventually recovered some portion of the lands thus confiscated.

Kirkland, Caroline Matilda Stansbury, American author: b. New York 12 Jan. 1801; d. there 6 April 1864. In 1827 she married William Kirkland, a professor in Hamilton College, Clinton, N. Y., removing with him to Michigan in 1839. She lived for a few years a pioneer life and her experiences furnished the basis of her earlier books published under the pseudonym, "Mary Clavers." These include: "A New Home; Who'll Follow?" her best work (1839); "Forest Life" (1844); and "Western Clearings" (1846). In 1842 she made her home in New York, where she established a boarding school for girls and contributed frequently to periodicals. Among her later works are: "The Helping Hand" (1853); "Memoirs of Washington" (1857); "The Destiny of Our Country" (1864).

Kirkland, James Hampton, American educator: b. Spartanburg, S. C., 9 Sept. 1859. He was graduated from Wofford College (Spartanburg, S. C.) in 1877, was assistant professor of Latin and Greek there in 1881-2, and professor of Latin and German in 1882-3. After European study (1883-6), he was professor of Latin in Vanderbilt University (Nashville, Tenn.) in 1886-93, and in 1893 became chancellor and professor of Latin language and literature. He wrote several monographs, and published a "Study of the Anglo-Saxon Poem called by Grein "Die Höllenfahrt Christi"" (1885), and an edition of the "Satires and Epistles of Horace" (1893).

Kirkland, John Thornton, American Unitarian clergyman and college president: b. Little Falls, N. Y., 1770; d. Boston 26 April 1840. He was the son of Samuel Kirkland (q.v.), was graduated at Harvard College in 1791, and ordained pastor of the Congregational (Unitarian) Church in Summer Street, Boston, in 1794, where he remained till elected president of Harvard College in 1810. He held this office until 1828. His "Life of Fisher Ames" (1800) is perhaps the most valuable of the several biographies of which he was the author, and his "Eulogy of General Washington" was much admired. He exerted a very great influence during his life, by the force of his intellect and character, and during his presidency the college flourished, both in its internal condition and in its external relations.

Kirkland, Joseph, American novelist: b. Geneva, N. Y., 7 Jan. 1830; d. Chicago 1894. He was a son of Caroline Kirkland (q.v.) and made his home in Illinois after 1856. During the Civil War he served in the Federal army, attaining the rank of major, and after engaging in coal mining for a time, practised law in Chicago. He published: "Zury, the Meanest Man in Spring County" (1887), a faithful story of the beginning of pioneer life in Illinois; "The

McVees" (1888); "The Captain of Company K" appeared in 1891; "The Chicago Massacre of 1812" (1893); "The Story of Chicago" (1892-4).

Kirkland, Samuel, American missionary to the Indians: b. Norwich, Conn., 1741; d. 1808. He was graduated at Princeton 1765. He had previously visited the Senecas, for the purpose of studying their language. In 1766 he was ordained, and sent by the Congregational Church to preach to the Indians. After living among the Senecas for a year and a half he went to the Oneidas, whom he considered to be the highest type of the Iroquois. During the Revolution he persuaded the Oneidas and Tuscaroras, who were bent on taking one side or other, to join the Americans, instead of the British. He saw considerable war service as military chaplain, especially with General Sullivan on the Susquehanna, in 1779. In 1793 he founded the Hamilton Oneida Academy for the education of Indian boys. This is now known as Hamilton College. In 1804 the Indians made complaints concerning his administration, and he published a vindication, which with his letters and journals, furnishes a unique picture of life among the Iroquois. Consult: Lothrop, "Life of Samuel Kirkland" (1848).

Kirk'man, Marshall Monroe, American railway official: b. Illinois 10 July 1842. He entered the railway service of the Chicago & Northwestern line in 1856, held various posts in different departments, was comptroller in 1881-9, and in 1889 became second vice-president. His chief works are: "The Science of Railways" (1894); "The Classical Portfolio of Primitive Carriers" (1896); "The Air Brake" (1901); "Building and Repairing Railways" (1901); "The Romance of Gilbert Holmes" (1900).

Kirkpatrick, Sir George Airey, Canadian statesman: b. Kingston, Ontario, 13 Sept. 1841. He was graduated with honors at Trinity College, Dublin, in 1861, studied law and was called to the bar in 1865. He succeeded his father as representative of Frontenac in the Dominion Parliament and sat from 1870 to 1891, when he was made lieutenant-governor of Ontario. He retired from this office in 1897.

Kirksville, kérks'vīl, Mo., city and county-seat of Adair County, on the Omaha, K. C. & E., and the Wabash R.R.'s; 204 miles northwest of Saint Louis. It was first settled in 1840, and under a charter of 1893 is governed by a mayor and city council elected biennially. There is a normal school here, court-house, public library and numerous churches. It lies in the centre of an extensive agricultural district and has manufactures of iron, wagons, carriages, etc. Pop. (1890) 3,510; (1900) 5,960.

Kirkus, William, American Episcopal clergyman: b. Yorkshire, England, 9 May 1830. After 16 years spent in the Congregational ministry in London he came to this country and entered the Episcopal ministry in 1871. He was for many years prior to 1892 rector of St. Michael and All Angels Church, Baltimore. He has published: "Christianity, Theoretical and Practical" (1854); "Miscellaneous Essays, Critical and Theological" (1863); "Orthodoxy, Scripture and Reason" (1865); "Religion: a Revelation and a Rule of Life" (1886).

Kirkwood, kerk'wud, Daniel, American educator: b. Bladensburg, Md., 27 Sept. 1814;

KIRKWOOD — KISSINGEN

d. Riverside, Cal., 11 June 1895. In 1851 he became professor of mathematics in Delaware College, of which he was president in 1854-6; and in 1856-86 was professor of mathematics in Indiana University, save for the interval 1865-7, when he was professor of mathematics and astronomy in Washington and Jefferson College. He contributed largely to scientific journals, and published the volumes: 'Meteoric Astronomy' (1867); 'Comets and Meteors' (1873); and 'The Asteroids or Minor Planets between Mars and Jupiter' (1887).

Kirkwood, Samuel Jordan, American statesman: b. Harford County, Md., 20 Dec. 1813; d. Iowa City, Iowa, 1 Sept. 1894. Having removed to Richland County, Ohio, in 1835, he studied law, was admitted to the bar in 1843, in 1845-9 was prosecuting attorney of the county, and in 1850-1 a member of the State Constitutional convention. In 1855 he established himself in milling and farming in Iowa, the next year was a member of the State senate, and in 1860-4 Republican governor of Iowa. During the Civil War he levied 48 regiments of volunteers and equipped them at \$500,000 less than the usual cost. He was United States Senator in 1865-7 (completing the unexpired term of James Harlan, resigned), was again elected governor of Iowa in 1875, in 1877-81 was a member of the Senate, and from 5 March 1881 to 6 April 1882, when he resigned, was secretary of the interior in Garfield's cabinet. He then withdrew from political life.

Kir'mess. See KERMESS.

Kirtland, kér'tländ, Jared Potter, American physician and educator: b. Wallingford, Conn., 10 Nov. 1793; d. Cleveland, Ohio, 10 Dec. 1877. He studied in the medical department of the University of Pennsylvania and was graduated from that of Yale in 1815; practised at Wallingford (1815-18) and Durham (1818-23), Conn., from 1823 at Poland, Ohio; in 1829-32 and 1834-5 was a member of the Ohio legislature; and was professor of the theory and practice of medicine in the Ohio Medical College (Cincinnati) in 1837-42. In 1843 he assisted in founding the medical department of the Western Reserve University, where he was professor of the theory and practice of medicine in 1843-64. He assisted in founding and became president (1845) of the Cincinnati Academy of Sciences, from 1865 the Kirtland Society of Natural History.

Kiser, Samuel Ellsworth, American journalist: b. Shippensburg, Pa., 2 Feb. 1862. He engaged in journalism as a reporter, in 1896 contributed special sketches to the Cleveland *Leader*, and is now (1903) on the editorial staff of the Chicago *Record-Herald*. He is the author of 'Budd Wilkins at the Show and Other Verses' (1898); 'Georgie' (1890); 'Love Sonnets of an Office Boy' (1902).

Kishineff, késh-e-néf', Russia, the capital of the government of Bessarabia, 86 miles northwest of Odessa, on the Byk, an affluent of the Dniester. It is a bishop's see, is well laid out on a picturesque site, and among its educational institutions are a seminary for priests, two gymnasias, a public library, and botanic garden. The grapevine and tobacco are cultivated in the vicinity; it has extensive manufactures of woollens; and a considerable commerce with the

East. Kishineff arose around the monastery of Kishnosaref in the 15th century. During the 18th century it was subjected to attacks from the Turks and in 1812 was annexed by Russia. It came into world-wide prominence in 1903 owing to a shocking massacre of Jews on the Russian Easter and succeeding days. Pop. (1897) 108,796, consisting of Russians, Moldavians, Jews, Bulgarians, Wallachians and Tatars.

Kishon, kí'shón, the biblical name of a river in Palestine. It is called El-Mukatta by the modern Arabs. Here Elijah slaughtered the priests of Baal, and Deborah and Barak defeated Sisera. The French and Turks fought a battle on its banks in 1799.

Kiss, an affectionate salute by contact of the lips. This is one of the most natural expressions of human affection, although often objected to now on sanitary grounds. The child expresses its love by a kiss, and men in all stages of refinement do the same. The word in Hebrew for 'kissing' is the usual expression to signify adoration; and the Latin *adoratio* literally means touching with the mouth. With some nations, as the Germans and French, it is customary for men to kiss each other after a long absence, etc. Kissing the hand of the sovereign forms part of the ceremonial of some European courts. Kissing the foot is a common oriental sign of respect. The later Roman emperors, whose court ceremonial was mixed with so many servile customs, first introduced this practice into the West. The popes of the Roman Catholic Church have required it as a sign of respect from the secular power since the 8th century. Pope Constantine I. first had his foot kissed by the Emperor Justinian II. on his entry into Constantinople in 710. Valentine I., about 827, required every one to kiss his foot; and from that time this mark of reverence appears to have been expected by all popes. When this ceremony takes place the pope wears a slipper with a cross, which is kissed. In recent times non-Catholics have not been obliged to kiss the pope's foot, but merely to bend the knee slightly. Even Roman Catholic princes sometimes perform only the genuflexion. When the pope is elected he is placed on the altar, and the cardinals, first of all, perform the adoration. Each approaches the newly-elected pope and kisses his foot, then his knee, and is then embraced by the pope, and saluted on the cheek.

Kissimmee', Fla., city and county-seat of Osceola County, on Tohopekaliga Lake; on the Florida Midland and the Plant system, 18 miles south of Orlando. It has extensive fruit and vegetable interests and is well known as a hunting and fishing resort. The headquarters of the cattle raising industry of the State are here. Pop. (1890) 1,080; (1900) 1,132.

Kissing-bug. See CONE-NOSE.

Kis'singen, a celebrated watering-place in Bavaria, on the Saale, 30 miles north of Würzburg. It is surrounded by walls flanked with towers, and has a magnificent bathing establishment. The springs, five in number, and all saline, contain a large quantity of carbonic acid gas, are used both internally and as baths, and are considered efficacious in gout and affections of the stomach and chest. Besides 10,000 visitors annually attracted by the baths, about 500,000

KISTNA — KITCHIN

bottles of water are annually exported. Pop. (1895), 4,306; (1900), 4,757.

Kist'na, a river of India, which separates the Deccan from southern India. It rises among the Western Ghâts, in the province of Bijapur, 42 miles from the Malabar coast, passes through Haidarabad, where it receives the Bhema on its left, and the Tungabudra on its right bank, both flowing, like it, from the Western Ghâts. Previous to the junction it is commonly called the Krishna, a name which is frequently given to the whole river. The united river falls into the Bay of Bengal. Its course is estimated at 700 miles. The Kistna is, perhaps, richer in gems than any other river of India. In the dry season diamonds, cat's-eyes, onyxes, and chalcedonies are said to be found, as well as a minute portion of gold.

Kit-Cat Club, a club formed in London about 1688, originally for convivial purposes, but which soon assumed a political character, having in the reign of Queen Anne become the resort of Marlborough, Walpole, Addison, Steele, and other leading Whigs. Its name was derived from that of Christopher Cat, who supplied the club with mutton-pies. The portraits (about three-quarters length) of the members were painted by Sir Godfrey Kneller, and hence a portrait of this length is called a "kit-cat." The club was dissolved about 1720.

Kit-fox, or **Swift-fox**, a small fox (*Vulpes velox*) found in the central and northwestern parts of the United States, and especially common in the upper Columbia River region. It is about 20 inches long, with a broad, short face, and has the soles of the feet densely hairy. In summer its fur is of a brownish gray color, tinged with orange on the flanks and white below; in winter it becomes much paler. It is especially noted for its activity, and for the deep burrows which it digs, and in which its young are born and nurtured. It feeds mainly on ground squirrels and small birds.

Kitchen Cabinet, a popular name applied to certain intimate political friends of President Andrew Jackson, who were supposed to have more influence over his actions than his official advisers. They were: General Duff Green, editor of the *United States Telegraph* at Washington, the confidential organ of the administration; Major William B. Lewis, of Nashville, Tenn., second auditor of the treasury; Isaac Hill, editor of the *New Hampshire Patriot*, and Amos Kendall (q.v.) of Kentucky. He was leader of the kitchen cabinet; worked for the Jackson "second choice" movement in Kentucky; and received the office of fourth auditor of the treasury. He was a man of exceeding ability, but of low moral perceptions, and, as a politician, was the incarnation of the worst evils of the American system. Harriet Martineau wrote of him, "I was fortunate enough once to catch a glimpse of the invisible Amos Kendall, one of the most remarkable men in America. He is supposed to be the moving spring of the whole administration."

Kitchen-middens, or **Kjökkenmöddings**, mounds of shells, bones, charcoal, and refuse, remaining upon the site of prehistoric settlements along the coasts of seas, lakes, and rivers in many parts of the world. The exploration of

them has brought to light many relics of the Palæolithic and Neolithic men who formed them, and contributed greatly to the knowledge of prehistoric archaeology. Extensive deposits of this kind occur in various parts of the United States, where they are known as shell-heaps (q.v.); and their formation is going on wherever savage conditions still exist.

Kitchener, kich'é-nér, **Horatio Herbert, 1st Viscount Kitchener of Khartum**, English general: b. near Ballylongford, County Kerry, Ireland, 22 Sept. 1850. He was educated at the Royal Military Academy, Woolwich, and entered the Royal Engineers as a lieutenant in 1871, having already seen some active service on the French side in the Franco-Prussian war. In 1874-8 he was engaged on the survey of Palestine under the auspices of the Palestine Exploration Fund Committee, and in 1878-82, except for a short period as vice-consul in Anatolia, carried out a survey of Cyprus. In 1882 he was appointed to a cavalry command in Egypt, served in the Nile expedition of 1884-5, and for his services was made a brevet lieutenant-colonel and received the Khedive's star and the second class Medjidie. He was governor of Suakin 1886-8, and distinguished himself in the latter year by the bravery and skill with which he led the Egyptian troops against Osman Digna at Handoub. In 1889 he was in command of mounted troops on the Sudan frontier, and for his bravery, was created a Companion of the Bath. From 1888 till 1892 he was adjutant-general and second in command of the Egyptian army, and in 1892 became Sirdar. He commanded the Anglo-Egyptian force which recovered Dongola for Egypt in 1896, and his services were rewarded by promotion to the rank of major-general. He was also made K.C.B. and awarded the first-class Osmanieh order. He utterly destroyed the power of the Khalifa by the battle of Omdurman on 2 Sept. 1898, and for this crowning triumph was raised to the peerage (1898) as Baron Kitchener of Khartum and of Aspall, in the county of Suffolk, receiving also the formal thanks of Parliament and a grant of £30,000. He was appointed governor-general and commander-in-chief of the Egyptian Sudan in 1899, but resigned this post and that of Sirdar of the Egyptian army in the latter part of the same year, in order to accompany Lord Roberts to South Africa as chief of his staff in the war with the Boers. When Lord Roberts left South Africa to become commander-in-chief at home, Kitchener succeeded him as commander-in-chief of the forces in South Africa, and carried on the war to its successful conclusion with the acceptance of peace conditions by the Boers on 31 May 1902. He was now created viscount and appointed commander-in-chief in India in the same year. Consult: Steevens, "With Kitchener to Khartum" (1898).

Kitch'in, George William, English historian and clergyman: b. Hadleigh, Suffolk, 7 Dec. 1827. He was educated at Oxford, took orders in the English Church, and was prominent as tutor and lecturer at the university for many years. He became dean of Winchester in 1883 and in 1894 was translated to the deanery of Durham. He is widely known by his "History of France," a standard work (1873-7); but has also published "Winchester" in the "Historic Towns" series (1890); "Life of Harold

KITCHINER—KITES IN WAR

Browne, Bishop of Winchester' (1895); 'Life of Pope Pius II.' (1881); etc.

Kitchiner, William, English physician and author: b. London 1775; d. there 1827. He inherited a handsome fortune, was educated at Eton, obtained the degree of M.D. from Glasgow, and settled in London. He treated eating and drinking as the only serious business of life; and having caught the attention of the public by singularity of conduct, proceeded to promulgate, under the title of 'The Cook's Oracle,' the laws of the culinary art, professedly founded on his own practice. Besides his 'Cook's Oracle' (or 'Apicius Redivivus'), Kitchener wrote 'Practical Observations on Telescopes,' etc. (1815); 'Peptic Precepts' (1821); 'Art of Invigorating and Prolonging Life' (1822); 'Brief Memoir of Charles Dibdin' (1823); 'The Economy of the Eyes' (on spectacles, telescopes, etc., 1824-5); 'Traveler's Oracle' (1827); etc.

Kite, a small or medium sized bird of prey, of the falconine subfamily *Milvinae*, distinguished from the other hawks by the more or less forked tail, long, pointed wings, absence of facial ruff, generally weak build and certain skeletal peculiarities. Four species occur in the United States, their proper homes being southward and in the interior; but owing to their great powers of flight they occasionally stray to other parts or rarely cross the ocean to Europe. The swallow-tailed kite (*Elanoides forficatus*) is a beautiful bird, with all the grace, figure, and capacity for flight of a gigantic swallow, and is especially prone to wander widely from its home in the lower Mississippi Valley. The remaining three are the white-tailed kite (*Elanus leucurus*), the Mississippi kite (*Ictinia mississippiensis*), and the everglade kite (*Rostrhamus sociabilis*). The last is common in Florida and southward, and has the habits of a marsh-hawk. All of the kites feed largely upon insects and small reptiles, but capture weak birds and mammals also. They nest in trees and bushes. In common with other small hawks the kites have the habit of pausing during flight suspended in mid air, in imitation of which the common paper toy is said to have been constructed and named. When falconry was in vogue in Europe the native species of kite served as the quarry in the most highly developed branch of that sport. The group is more familiar in the warm parts of the Old World than in America.

Kite, a common aerial toy in the form of two crossed sticks covered with paper, and balanced with a tail of string, on which are tied bits of cloth or paper. Kites were first employed in aid of science in 1749, by Dr. Alexander Wilson and Thomas Melville, of Scotland, who by means of a thermometer attached to a kite were able to take temperatures above the earth's surface. Franklin's experiments with electricity by means of a kite and key are familiar to everyone. Among the men who have given much thought and labor to improve kite making are W. A. Eddy, S. P. Langley, Octave Chanute, Lawrence Hargrave, J. B. Millet, J. W. Davis, C. F. Lamson, H. D. Wise, Captain Baden-Powell, and others. The first improvement was to make a tailless kite, and this was perfected by Mr. Eddy. (See **AERODROME**; **FLYING MACHINE**.)

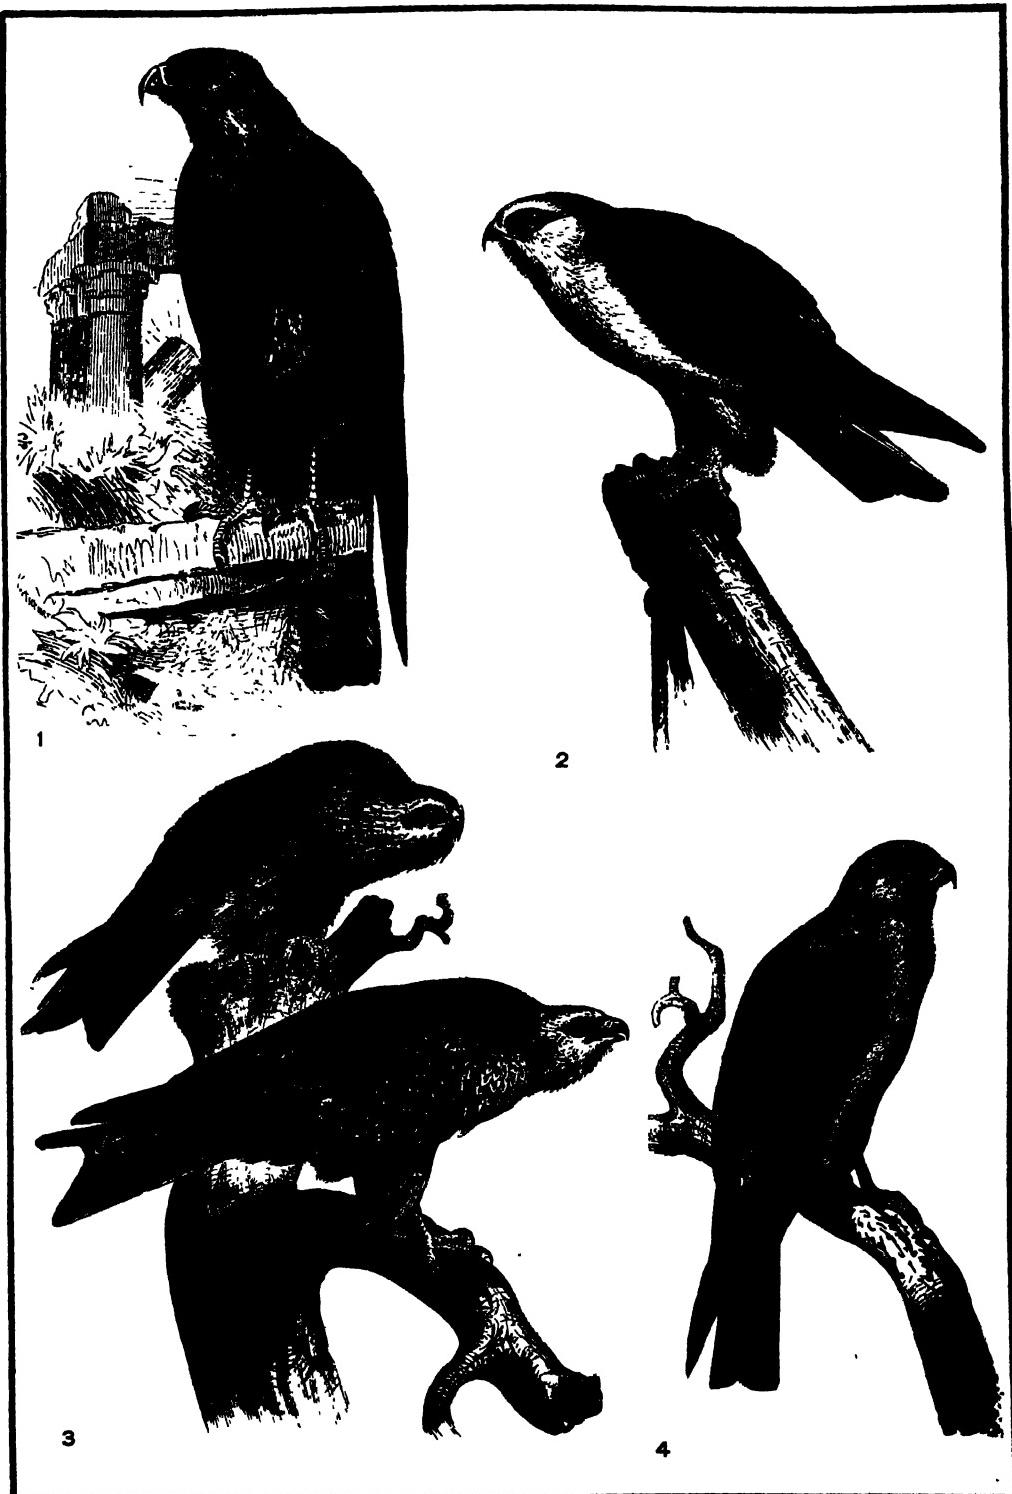

In 1895 Captain Baden-Powell, of England, weighing 150 pounds, was enabled to hoist himself 100 feet in the air by a tandem of five kites. Mr. Hargrave, with three kites, raised a total weight of 208 pounds to the height of 16 feet, as far as he cared to go. Lieutenant Wise, in 1897, with four kites, rose to 42 feet, the entire weight raised being 229 pounds. Mr. Eddy has done much to develop tandem kite flying. In 1897 he made a tandem of nine Eddy-Malay kites on a cord two miles long, with an elevation of 5,595 feet, the same being kept up for 15 hours. At Blue Hill Observatory, near Boston, this height was exceeded, the tandem of seven Malay and two Hargrave kites, with an area of 170 feet, rising 8,740 feet above Blue Hill, or 9,375 feet above sea-level. It took three miles of piano-wire and the work of three men for 12 hours to accomplish this feat. Piano wire has been found preferable to cord, having greater tensile strength and presenting less surface to the wind.

In the United States weather bureau para-kites are used for the purpose of recording the velocity of the wind, and the humidity and temperature at high altitudes, by the meteorograph. These can be obtained at a single observation and several hours before the effects are known in the lower atmosphere. Photographs have been taken by means of a camera fastened on the frame of a kite and operated by a cord, and Mr. Eddy has an arrangement of eight cameras strapped together in which all the shutters can be opened at once, and by this means a complete view of the horizon can be taken. Inventors of flying and soaring machines have made extensive use of kites in planning the construction of their various contrivances.

The first permanent station for kite flying in Europe, and the first in the world established under governmental auspices, is that at Viborg, in the extreme northern part of Denmark, the governments of Denmark, Sweden and France co-operating in the scheme. The most important building at the station is a tower 33 feet high, mounted on circular rails, so that it can be rotated easily, and left open on one side. No matter from which direction the wind blows, the tower is turned with this gap to leeward. Thus the operator can sit within, where the windlasses are, and watch his kites. The latter, of course, naturally take their lines down the wind. There are two windlasses, controlled by electric motors, one being held in reserve for immediate use in case the wire on the other breaks while in service.

Kites in War. Scientific kite flying has become a part of military tactics among European nations. Since kites have been modified and improved, their use has been continually extended, until now they are employed for quite a number of purposes, such as for signaling to a long distance or for locating the position of a camp; for obtaining a photograph of hostile country or of an enemy's fort by suspending a camera from the kite line and operating it by electric wire or clockwork; for making meteorological observations with self-recording instruments, and for lifting men for making reconnaissances. Kites offer great advantages over captive balloons in that they are more easily transported, are less expensive, and can be used in a strong wind.

KITES.

1. Black-winged Kite.
2. Egyptian Kite.

3. Black Kite and Common Kite.
4. Mississippi Kite.

KITSON — Klapka

Kit'son, Henry Hudson, American sculptor: b. Huddersfield, England, 1865. At Paris, he studied at the Ecole des Beaux Arts, under Bounaissieux. He was awarded three gold medals, by the Massachusetts Charitable Mechanics' Association; a gold medal of honor by the American Art Association of New York. He received a medal at the Universal Exposition, Paris, 1889, as well as that in 1900.

Kittanning, Pa., borough and county-seat of Armstrong County, on the Allegheny River and the Allegheny Valley railroad, 43 miles north of Pittsburgh. There is natural gas here and coal and iron ore are found in large quantities in the neighborhood. It has extensive iron and steel mills, foundries, lumber and flour-mills, potteries, brick and clay works, and other industries. Pop. (1890) 3,090; (1900) 4,000.

Kittatinny (kit'a-tin-i) Mountains, a range which extends from Ulster County south and southwest, through the northwestern part of New Jersey and into Pennsylvania. The names by which the range is generally known are in New York, the Shawangunk, in New Jersey, the Kittatinny, and in Pennsylvania the Blue Mountains. The range varies in height from 500 to 1,800 feet. The mountains belong to the Appalachians, and form the eastern ridge of the main part of the system.

Kittery, kit'e-ri, Maine, town in York County, on the Piscataqua River and the Boston & Maine railroad; 4 miles from the Atlantic Ocean, opposite Portsmouth, N. H. The United States Naval Station and Ship-building Yards are located here on Corifincut Island, but are known as the Portsmouth Navy Yard. The town is one of the oldest in New England. It was settled in 1624 and incorporated in 1647. It was the birthplace and former home of Sir William Pepperell. There are numerous hotels and churches here, public schools and the Rice Public Library containing 5,000 volumes. Pop. (1890) 2,864; (1900) 2,872.

Kittim, or **Chittim**, a term of Biblical origin for the inhabitants of the island of Cyprus, derived from the important town of Kition or Cition, the modern Lanarca. The "isles of Kittim" are mentioned in Jeremiah ii. 10, and Ezekiel xxvii. 6.

Kit'tiwake. See GULLS.

Kit'to, John, English Bible student: b. Plymouth, England, 4 Dec. 1804; d. Cannstadt, near Stuttgart, Germany, 25 November 1854. He was the son of a mason at Plymouth, and after obtaining a very scanty education began to assist his father, but met with a fall which deprived him of the sense of hearing. Sent to the workhouse he was presently apprenticed to a shoemaker, who used him so cruelly that the magistrates canceled his indentures. He therefore returned to the workhouse, and there, notwithstanding his physical defect, turned his talents to such account that in 1825 he published "Essays and Letters," which attracted no little attention. Shortly afterward he went abroad in the suite of the British envoy at the Persian court, and from 1829-33 acquired that familiar acquaintance with the East which he afterward employed in his writing. He founded and edited the "Journal of Sacred Literature" (1848-53), and although a layman of the English Church received in 1844 the degree of D.D.

from Giessen. He published "The Pictorial Bible" (1835-8); "Pictorial History of Palestine" (1841); "Gallery of Scripture Engravings" (1841-3); "Cyclopaedia of Biblical Literature" (edited 1843-5); "The Lost Senses: Deafness and Blindness" (1845); "Physical Geography of the Holy Land" (1848); "Daily Bible Illustrations: Morning Readings" (1849-51); "Evening Readings"; etc. In his latter years he enjoyed a pension of £100 a year from the crown.

Kit'ton, Frederic George, English author and artist. After receiving his education at a private school in Norwich, he was put under the training of W. L. Thomas, managing director of the "Graphic," and became an expert draftsman and wood engraver. In 1882 he added literature to his profession of book illustration. Among his delightful appreciations of artists, illustrators and authors of his time may be mentioned "Phiz (Hablot Knight Browne)" a memoir (1882); "John Leech, Artist and Humorist" (1883); "Charles Dickens by Pen and Pencil" (1890); "Dickens and his Illustrators" (1898).

Kit's, Saint. See CHRISTOPHER, SAINT.

Kittul, ki-tool, or **Kittool**. See FIBRE.

Kiushiu, kyoo'syoo', or **Kyushu**, Japan, one of five large islands of the empire; area 13,788 square miles. It contains nine provinces but for administrative purposes is divided into seven *Ken* or prefectures. The island is mountainous and volcanic. The principal harbor is the treaty port, Nagasaki, but in 1889 five special ports of export were opened. Pop. 6,637,551.

Kiwi-kiwi, ke'wi-ke'wi. See APTERYX.

Kizil-Irmak, kiz'il-ir-mäk' (the Turkish for Red River) a river known to the ancients as the Halys, the principal river of Asia Minor. Rising in the east of the peninsula, it flows in a circuitous route for over 500 miles, and enters the Black Sea near Sinope.

Klamath, kla-mät, a name applied to several tribes of American Indians formerly living along the Klamath River in Oregon and California, but now settled on a reservation at Klamath Lake. Their present lands were given them by treaty in 1864, the reservation containing 1,300 square miles. The Klamaths who now number about 800 are fairly civilized and are expert stock-raisers.

Klamath Lake, a small lake in Klamath County, Oregon, at the base of the Cascade Range. It is 44 miles long by 6 to 14 miles wide. It consists of two considerable bodies of water, connected by a narrow strait less than two miles wide. Klamath River is the outlet, and issues from the south end, or Lower Klamath Lake, and flows thence into California.

Klapka, klöp'kö, Gyorgy (GEORGE), Hungarian general: b. Temesvar 7 April 1820; d. Budapest 17 May 1892. He entered the Austrian army in 1838 and rose to high rank, but in 1848, at the beginning of the revolution, joined the Hungarians and distinguished himself in nearly all the battles with the Austrians; in more than one the misfortune of the day was decided by the troops under his command. His most noted exploit was his defense of Komorn, which he continued to hold for some weeks after all the rest of Hungary had submitted.

KLEBER — KLONDIKE

He lived in exile till the amnesty of 1867 permitted him to return home, and then became a member of the Hungarian Diet. He published 'The National War in Hungary and Transylvania' (1851), one of the best works on the subject; 'The War in the East' (1855); 'Memoirs' (1869); 'Recollections' (1887).

Kléber, Jean Baptiste, zhōn bāp-tēst kläbär, French general: b. Strasburg 9 March 1753; d. Cairo, Egypt, 14 June 1800. He first studied architecture in Paris, then entered the military school at Munich; and having joined the Revolutionary army was appointed brigadier-general and sent to La Vendée. He afterward commanded the left wing of the army of Jourdan, directed both the passage of the Rhine at Düsseldorf and the subsequent retreat; defeated the Prince of Würtemberg, and subsequently Prince Charles Bonaparte entrusted the command of the army in Egypt to Kléber, who, deeming resistance useless, concluded the convention of El Arish with the British, by which the French were to be conveyed home with arms and baggage. This being disowned by the English government, Kléber determined upon the resubjugation of the country, in which he was successfully engaged when he was assassinated.

Klein, klin, Bruno Oscar, American composer and pianist: b. Osnabrück, Germany, 6 June 1858. He was graduated from the Gymnasium Carolinum in his native town and studied music at the Royal Music School at Munich. He came to the United States in 1878 and has since made his home in New York, where he is professor of music at the Convent of the Sacred Heart. He has published many songs and motets, a large number of compositions for the piano, and various other works. In 1895 his grand opera, 'Kenilworth,' was produced at Hamburg.

Klein, Felix, German mathematician: b. Düsseldorf 25 April 1849. He was educated at Bonn, became Plucker's assistant in the physical institute in 1866, was appointed lecturer at Göttingen in 1871, professor at Erlangen in 1872, and held chairs from 1875 in the Technical High-school of Munich, from 1880 at Leipsic, and from 1886 at Göttingen. In 1893 he represented Göttingen at the World's Columbian Exposition at Chicago. He exercised large influence on American mathematics, having taught many instructors in institutions in this country. Among his works are 'Ueber Riemanns Theorie der algebraischen Funktionen' (1882); 'Vorlesungen über das Ikosaeder und die Auflösung der Gleichungen vom fünften Grad' (1884); 'Einführung in die höhere Geometrie' (1893), and 'Evanston Colloquium' (1893).

Kleist, Heinrich Bernt Wilhelm von, hīn'rīkh bērnt vī'l'hēlm fōn kl̄st, German dramatist: b. Frankfort-on-the-Oder 18 Oct. 1777; d. Wannansee, near Potsdam, 21 Nov. 1811. He entered the army in 1795, but left it in 1799 to study at Frankfort and Berlin, and later engaged in journalism in Dresden and Berlin. His first drama, 'Die Familie Schroffenstein,' was published in 1803, and was followed by 'Amphytrion' (1807); 'Penthisilea,' a tragedy (1808); 'Käthchen von Heimbrown' (1810); 'Der zerbrochene Krug' (The Broken Jug) (1811). A volume of 'Tales' appeared (1810-11); and posthumously, 'The Battle of

Hermann,' and 'Der Prinz Von Homburg.' He exhibits some of the worst faults of the Romantic school, to which he belongs, but nevertheless his best plays, such as 'The Prince of Homburg' and 'The Broken Pitcher' possess sufficient vigor and fidelity to life to make them popular even at the present day. The best of his tales is 'Michael Kohlhaas,' a story of Brandenburg in the Middle Ages. He failed to gain recognition and shot himself, after first shooting a woman whom he loved, and who like him was weary of life. His works did not receive notice till after his death, when they were made known by Tieck.

Klephthes, kléfts (Greek, "thieves"), Greek bandits who kept themselves free in the mountains, and carried on a perpetual war against Turkish rule, considering everything belonging to a Turk a lawful prize. During the war of independence these Klephthes furnished the Greeks with some of their best soldiers and leaders. Whole tribes, as the Siliotes and Chimaariots in Epirus, and the Sphakiots in Crete, are to be numbered among them.

Kleptoma'nia (from Greek κλέψτειν, steal, and μανία, madness), a mania for stealing, a propensity often regarded as being irresistible and involving a kind of moral insanity. It is frequently pleaded in law courts as an excuse for theft, although the act constitutes a legal offense. See INSANITY.

Klinger, Max, German painter, etcher and sculptor: b. Leipsic 18 Feb. 1857. He was a pupil of Gussow at Karlsruhe and later at Berlin; studied also at the Berlin Academy; was active at Rome in 1888-92; and from 1893 in Leipsic. He was at first chiefly an etcher (1879-86), perhaps the best of his work in this sort being the 'Brahms-Phantasien' (1894), deriving their subjects from various music of that composer. Then he directed his attention to painting in oils, and executed heroic canvases of 'The Crucifixion' and 'Christ on Olympus.' One of the best of his plastic works is his polychromatic statue of Beethoven (Leipsic Museum), in which onyx, bronze, and differently colored marbles are combined. He published 'Malerei und Zeichnung' (3d ed. 1899).

Klip'springer, a small, robust antelope (*Oreotragus saltator*), about equal in size to the chamois, and resembling it in habits, found in the mountainous districts of South Africa. It is yellowish-gray, and the hair is long, and makes a rough fur. The flesh of the klip'springer is particularly esteemed; the hair is also valued for stuffing saddles; and it has therefore become rare in localities where it was once common. The pinnacles and precipices in which it delights make hunting it with dogs impossible, but to get within rifle shot of it is not difficult. Many interesting habits are given by writers on South African zoology and natural history.

Kloet, a volcano on the island of Java. Although among the smaller of the numerous volcanoes there, it came prominently into notice on account of its eruption in May 1901, in connection with which, besides its destructive effects, there were peculiar atmospheric phenomena.

Klon'dike, The, a famous gold-bearing stream which enters the Yukon, the principal

KLOPSCH — KNAPP

river of the Northwest Territory, Canada, 45 miles below the mouth of Sixty Mile Creek. In recent years the term Klondike is applied to the region surrounding the river and its tributaries, which lies between Alaska and the British possessions. As early as 1862 gold was discovered in Alaska, but no special notice was taken of it; 13 years later gold was found at the head of the Stikine River. In 1880, Juneau, a Frenchman, with a companion started out from Sitka and traveling north discovered gold in a creek which they named Gold Creek, and at the mouth of this creek founded a town first called Harrisburg and later Juneau and which soon became the centre of mining supplies and a considerable fur trade. In 1886 a rich find was reported on Stewart River, in the Yukon district, and the following year an expedition was sent out by the Canadian government, headed by George M. Dawson, which explored the Upper Yukon and reported the existence of an abundance of gold. The difficulties and hardships to be encountered in reaching the location were so great that but a few hundred miners attempted to seek their fortunes there. These, however, persevered and established Circle City on the Alaska side of the boundary and by 1892 were taking out an annual total of about \$300,000.

It was not till 1897 that the wonderful riches of the Klondike region were made known through George McCormick, who went from Illinois to Alaska in 1890 and there married an Indian squaw. In 1897 he located at the mouth of the Klondike River for the purpose of salmon fishing, but this not proving profitable that season he in company with some Indians moved up the river till they came to Bonanza Creek, which they began to explore for gold. They found large quantities of paying dust and located an extensive claim. Going to the Indian village from which they came for supplies, the news of their find quickly spread, other claims were forsaken, some of the prosperous towns were deserted and miners from every direction poured into the newly found gold fields. Joseph Ladue, an old prospector and well-known miner, was one of the first to explore the country, and his statements gave an impetus to the steadily increasing stream of gold hunters.

Clarence Berry, a miner, returned to Juneau in the fall of 1897 on his way home to San Francisco with \$130,000 in dust which had been thawed and sluiced out of 30 box lengths of soil in a few weeks' time. And this is but one of many similar experiences, which aroused the wildest excitement all over the United States, with which the Californian "gold fever" of 1849 stands no comparison. All through the fall and winter of 1897 the mad rush for the Klondike region continued. The almost unknown towns of Juneau, Dyea and Skagway sprang into sudden prominence and rapidly added to their population, while Dawson City in which the first hut was built in September 1896, six months later had 500 houses, and in 1901 had grown to a prosperous city with handsome residences, hotels, banks, schools, churches and many modern improvements.

The Klondike is not far from the arctic regions, and for seven months of the year intense cold prevails, varied by furious snow storms which begin in September and occur at intervals till May. By 20 October ice is formed over all the rivers. The ground for the better part of the

year is frozen to the depth of from 3 to 10 feet, and the only way to get at the gold is to thaw the earth by building a fire and afterward break up the soil with a pick. When the warmer weather comes this is washed in running water which carries away the dirt and pebbles, leaving the gold at the bottom of the pan or sieve. Many nuggets of fine gold have been found varying in value from a few dollars up to a hundred. The amount of gold dust and nuggets taken out of the Klondike region within two months after the discovery was \$5,000,000, and up to the close of 1902 the entire output was estimated at \$30,000,000. See ALASKA.

Klopsch, klöpsch, Louis, American journalist and philanthropist: b. Germany 26 March 1852. As proprietor of the New York 'Christian Herald' he has instituted several extensive international charities. Since 1892 he has raised through his paper and distributed for the relief of human suffering over \$2,000,000. In 1892, during the Russian famine, he was received by the present Czar Nicholas II., and in 1898 President McKinley appointed him one of the commissioners to relieve the reconcentrados of Cuba. In 1900 he visited the famine fields of India; in 1901 Li Hung Chang by cable interested him in behalf of the starving people of Shensi, and in 1903 he visited the famine districts of the north of Europe, where he had audiences with the King and Queen of Sweden, Queen Alexandra of England, the Empress of Russia, and the King of Denmark. Since 1900 he is supporting and educating 5,400 famine orphans in India.

Klopstock, Friedrich Gottlieb, frē'dērīh götlēb klop'stok, German poet: b. Quedlinburg, Prussia, 2 July 1724; d. Hamburg 14 March 1803. He is widely famous as the author of the sacred epic, 'The Messiah,' the first three cantos of which were published in 1748. They excited general attention, and in consequence Klopstock was invited to Copenhagen by the minister Bernstorff, and offered a small pension. In 1764 he wrote his drama 'Hermanns Schlacht' (Battle of Arminius), and in 1771 left Copenhagen for Hamburg, under the character of Danish secretary of legation and counsellor of the margravate of Baden. In Hamburg he finished his 'Messiah' (1773). He also wrote 'Die Gelehrtenrepublik' (The Scholar's Republic) (1744), his chief work in prose; 'Geistliche Lieder' (1758); 'Oden' (1771); and several dramas, in addition to the one already named. His reputation was greater in his own day than has since been the case, but he is admitted to have done great service to German literature in assisting to free it from foreign, especially French influence. Consult: Lyon, 'Über Klopstocks Verhältniss zu Goethe' (1879); Lappenberg, 'Briefe von und an Klopstock' (1867).

Klotz, klōts, or Clotz, Matthias, Tyrolean violin-maker: b. about 1640; d. about 1696. He was a pupil of Jakob Stainer at Abson near Innsbruck, there established himself, and made violins much in Stainer's manner, so that only the less metallic tone of Klotz's instruments offers a distinguishing feature. His violins range in date from 1675 to 1696.

Knapp, năp, William Ireland, American educator: b. New York 10 March 1835. He

KNAPSACK — KNICKERBOCKER

was graduated from Colgate University, Hamilton, N. Y., and was professor of modern languages there, 1860-5. He held similar positions at Vassar College 1865-7; Yale 1879-92; and the University of Chicago 1892-5. He has since lived in Europe and has published 'Life of George Borrow' (1883); and several Spanish and French text-books; and has edited several Spanish authors as well as Borrow's 'Lavengro,' and 'Romany Rye' (1900).

Knap'sack, a bag or case of leather or strong cloth, used by soldiers, tourists, and other travelers for carrying light personal baggage. Knapsacks are made in various styles, and are usually strapped to the back.

Knapweed. See CENTAUREA.

Knaus, Ludwig, lood'vig knows, German painter: b. Wiesbaden 5 Oct. 1829. From 1845 to 1852 he studied art at Düsseldorf under Sohn and Schadow, but soon shook himself free from their influence and started on a path of his own. He chose scenes from country life and in 1850 painted 'The Country Dance'; 'The Players,' now in the gallery at Düsseldorf, a replica being in the gallery of Leipzig. His early pictures in this style were received with favor, although characterized by the dark, dull coloring of the Düsseldorf school. In 1852 he went to Paris, and resided there for eight years, which were fruitful in many well-known pictures of his early style, 'The Golden Wedding' (1858); 'The Baptism' (1859); and 'Starting for the Dance.' Returning to Düsseldorf in 1866, he remained there for eight years, during which period he produced the pictures on which his reputation as a genre painter is chiefly founded. Amongst these is 'The Child's Party' (1869), in the Berlin National Gallery; 'Funeral in a Hessian Village' (1871); 'The Goose-Girl' (1872). These works are distinguished by naturalness and naïveté, by delicate humor, mastery of detail, lifelike coloring and vivid expression. After his appointment to the direction of a studio in the Art Academy at Berlin he reached his latest manner, which was formed largely by his study of the Dutch school, from which he acquired his final skill as a colorist. His pictures, however, no longer showed the naïveté, the directness of his earlier productions; which were replaced by thoughtfulness and a striving after the didactic or admonitory. The most remarkable paintings of this period are 'The Holy Family' (1876); 'Tavern Scene—Bad Ways' (1876); 'The Refractory Model' (1877); etc. He has also painted many portraits combining the picturesqueness of genre with lifelike expression. Among his miscellaneous works are his designs in Watteau style for room decorations, his lead pencil sketches and aquarelles. Very many of his works have been reproduced by photography or engraving.

Kneeland, nē'lānd, Samuel, American naturalist: b. Boston, Mass., 1 Aug. 1821; d. Hamburg, Germany, 27 Sept. 1888. He was graduated from Harvard in 1840, practised medicine in Boston 1845-50, and was an army surgeon during the Civil War. In 1866 he became professor of zoology and physiology in the Massachusetts Institute of Technology. He was a member of numerous scientific societies, and in addition to editing 'The Annual of Scientific Discovery' (1886-9), a translation of 'Andry's Diseases of the Heart' (1847), and Smith's

'History of the Human Species,' wrote 'Science and Mechanism' (1854); 'The Wonders of the Yosemite Valley and of California' (1871); 'An American in Iceland' (1876).

Kneipp, knip, Sebastian, German clergyman: b. Stefansried, Bavaria, 17 May 1821; d. Worishofen, Swabia, 17 June 1897. He studied theology at Dillingen and Munich, became a Roman Catholic priest in 1852, and pastor at Worishofen in 1881. He became known for the 'Kneipp cure,' which he advocated for years. This method was based on water, fresh air, sunshine, and a scheme of regular activity, and included walking barefoot in dew-moistened grass and on snow. Kneipp wrote: 'Meine Wasserkur' (1887; Eng. trans. 1891); 'Mein Testament' (1894); 'Vortrage in Wörishofen' (1894-8); and other works.

Kneisel, nī'zēl or knī'zēl, Franz, German-American musician: b. Rumania 1865. He was a pupil in violin-method of Grun and Hellmesberger, became concert-master of the orchestra at the Hofburg Theatre of Vienna, of Bilse's orchestra at Berlin, and later of the Boston Symphony Orchestra. He appeared prominently with the Symphony as solo violinist, and organized under his leadership the Kneisel quartette for chamber-music, in which he played the first violin part. This quartette, all of whom were also members of the Symphony, withdrew from the latter in 1903 to undertake an extensive tour.

Kneller, nē'lēr, Sir Godfrey, originally GOTTFRIED KNILLER, Anglo-German portrait painter: b. Lübeck 8 Aug. 1646; d. Twickenham, England, 19 Oct. 1723. He studied under Bol and Rembrandt at Amsterdam. He visited Italy in 1672, and painted several historical pieces and portraits both at Rome and Venice. On his return he visited England, in 1675, and was introduced to Charles II., by whom he was much patronized. He was equally favored by James II. and William III., for the latter of whom he painted the "beauties" at Hampton Court, and several of the portraits in the Gallery of Admirals. He also painted the portrait of the Czar Peter for the same sovereign, who in 1691 knighted him, and made him gentleman of the privy chamber. Queen Anne continued him in the same office, and George I., in 1715, made him a baronet. He continued to practise his art to an advanced age. He left money and instructions for a splendid monument to himself in Westminster Abbey, erected by Rysbrick in 1729, which bears an epitaph by Pope. His coloring is true and harmonious, and his drawing correct, but he displays a great want of imagination in his pictures, the attitudes, action, and drapery being insipid, unvarying, and ungraceful. Many of the portraits bearing his name were only partly painted by himself, the less important portions being done by assistants.

Knickerbocker, nik'ēr-bōk-ēr, Herman, American lawyer and legislator: b. Albany, N. Y., 27 July 1782; d. Williamsburg, N. Y., 30 Jan. 1855. He studied law at Albany, N. Y., was admitted to the bar in 1803, and entered practice in Albany. In 1809-11 he was a Federalist representative from New York in the 11th Congress, in 1816 was elected to the New York State assembly from Rensselaer County, and for some time also held the office of county judge. He became a Democrat during Jackson's admin-

KNICKERBOCKER'S HISTORY OF NEW YORK — KNIGHTS OF HONOR

istration. Through his hospitality he was known as "Prince Knickerbocker."

Knickerbocker's History of New York, a celebrated work written by Washington Irving (q.v.). It gives picturesque description of the early burgomasters, the patroon Killian Van Rensselaer, Stoffel Brinkerhoof, William Kieft, called "William the Testy," Antony Van Corlear the trumpeter, Peter Stuyvesant with his silver leg, and a complement of Indians, Dutch, and Yankee settlers. "Before the appearance of my work," says Irving, "the popular traditions of our city were unrecorded; the peculiar and racy customs and usages derived from our Dutch progenitors were unnoticed or regarded with indifference, or adverted to with a sneer."

Knight, nit, Charles, English editor and publisher: b. Windsor 19 March 1791; d. Addlestone 9 May 1873. He succeeded his father as a bookseller in Windsor, and for several years edited a Windsor newspaper. Having removed to London in 1823, he established "Knight's Quarterly Magazine," in 1827 undertook the superintendence of the publications of the Useful Knowledge Society, for which he superintended and published the "Library of Entertaining Knowledge"; the "Penny Magazine" and the "Penny Cyclopaedia," afterward remodeled as the "English Cyclopaedia"; etc. Other publications of his were the "Pictorial Bible," the "Pictorial Prayer-book," "Pictorial Shakespeare," and many others. The Shakespeare was edited by Knight himself, and has, both for its text and notes, taken a high place among editions of the great dramatist. The most important of his own writings, the "Popular History of England," appeared 1854-61.

Knight, Daniel Ridgeway, American painter: b. Philadelphia, Pa., 1850. He has been a pupil of Gleyre and a student at the Ecole des Beaux Arts, at Paris (1872), and four years later was in the studio of Meissonier, from whom he learned many of the secrets of brilliant technique. He has received honors from Paris, Munich, and Antwerp for his exhibited works, and has also been awarded medals in his own country. He is a painter, rather French than American, and he has idealized the French peasantry in more than one of his refined and delicately designed pictures, among which we may mention as especially characteristic of his charming qualities "The Veteran" (1870); "The Old Beau" (1873); "Washerwomen" (1875).

Knight, Edward Henry, American mechanical expert: b. London, England, 1 June 1824; d. Bellefontaine, Ohio, 22 Jan. 1883. After studying both surgery and steel engraving he came to this country in 1845 and settling in Cincinnati was a patent attorney for seven years. In 1863 he entered the civil service in Washington, D. C., where he prepared the annual reports of the Patent Office and established the "Official Gazette of the United States Patent Office" in 1871. He served on the international juries of world's fairs at Philadelphia (1876), Paris (1878), Atlanta (1881), and was made a chevalier of the Legion of Honor in 1878. He published "The American Mechanical Dictionary" (1872-6); "The New Mechanical Dictionary" (1876-80).

Knight, Sarah Kemble, American author: b. Boston 19 April 1666; d. near Norwalk,

Conn., 25 Dec. 1727. In 1706-13 she conducted at Boston a school in which Samuel Mather and Benjamin Franklin were at one time pupils. By New England custom she was styled "Madam" Knight as a token of respect. Her "Journal Kept on a Journey from Boston to New York in the Year 1704" (1825) is a diary record evidently compiled from daily notes made on the way. It is valuable for its account of customs and manners and its descriptions of the settlements.

Knights of Columbus, a Roman Catholic fraternal, insurance organization for men; founded in 1882 in New Haven, Conn., by Rev. Michael J. McGivney. The order has as its basic principles, charity, unity, fraternity, and patriotism. For admission one must be 18 years of age, a practical Roman Catholic, and not engaged in the liquor business in any form. The headquarters are in New Haven, Conn., where they have a magnificent house, and business is transacted under a charter granted by the State of Connecticut. The local branches are called councils. Each State having four councils or over, with a membership of not less than 400, may form a State council. The national council is composed of delegates from the State councils. The national council elects the board of directors. Councils have been established in many parts of the United States and Canada and in the Philippines and Porto Rico. The report of 1 Jan. 1904 shows a membership of 103,000; 38,000 of whom are insured members. The reserve fund (belonging to the insured members) amounts to \$900,000; the net assets are over \$980,000. The per capita surplus for the insurance members is \$26.32.

Knights and Ladies of Honor, a fraternal beneficiary society founded in the United States in 1877. In 1902 it reported a membership of 63,000; benefits disbursed since organization, \$19,000,000. The benefits disbursed in 1902 amounted to \$1,173,000. The society has a Supreme Protector, 16 grand lodges and 1,160 sub-lodges.

Knights of the Golden Circle, a secret organization in the United States, established a few years before the Civil War, and formed with the object of destroying the Republic and setting up a great Southern empire with negro slavery as its cornerstone, and also with the purpose of controlling the great commercial interests of cotton, sugar, and tobacco. With its centre at Havana, Cuba, the "Golden Circle" intended to embrace in the territory of the new government a radius of 1,200 miles, and to include parts of Central America. The organization was never fully consummated, although thousands of persons joined in the movement and many lodges or councils were instituted.

Knights of the Golden Eagle, a secret society founded in the United States in 1873. It had in 1902, 15 grand castles, 800 sub-castles and 75,597 members. The benefits disbursed during 1902 amounted to \$231,794.

Knights of Honor, a fraternal benevolent society founded in the United States in 1873. Its membership in 1902 was reported at 62,173; benefits disbursed since organization, \$71,231,447, and during 1902 the amount was \$3,074,649. It has a supreme dictator, 36 grand lodges, and 1,918 subordinate lodges.

KNIGHTS HOSPITALLERS — KNIGHTS OF PYTHIAS

Knights Hospitallers. See HOSPITALLERS.

Knights of Labor, an American labor organization which originated among the garment-cutters of Philadelphia in 1869. It was founded by 10 members of the trade under the leadership of Uriah Stevens (q.v.), as a secret society, with a rather elaborate ritual. It grew slowly at first; though workmen of all trades were admitted, it was not until 1872 that the second local assembly was formed, but in that year 27 locals were organized, all in Philadelphia; the first local organized outside that city was that of the gold-beaters of New York. In its first organization politicians, physicians, lawyers, and liquor-dealers were excluded from membership; the two latter classes are still excluded. The first general assembly was held at Reading, Pa., in 1878, where seven States were represented. At this meeting a declaration of principles was adopted which remains substantially the same: the purpose was declared to be "the organizing, educating, and directing of the power of the industrial masses," in order to "make industrial and moral worth, and not wealth, the true standard of national and individual greatness," and to "secure to the workers the full enjoyment of the wealth they create." To secure these aims, the organization demanded certain legislative remedies, including the referendum, the establishment of a bureau of labor statistics, abrogation of class laws, prohibition of the employment of children under the age of 15, abolition of the contract system on public works, and of the convict-labor system, and reforms in the financial and land laws; and in the industrial field it proposed to "establish co-operative institutions which will tend to supersede the wage-system," to secure both sexes equal rights, and gradually to reduce the hours of labor to 8 per day. In 1881 all secrecy was abolished, and in 1882 a revised constitution adopted, in accordance with which the organization consists of local assemblies, of not less than 10 members, of whom three fourths must be wage-earners or farmers; district assemblies, formed by not less than five locals, and the general assembly, which meets annually for the election of officers and the transaction of business. The executive officers are a general master workman, general worthy foreman, general secretary-treasurer, and general executive board. The constitution provides also for the support of strikes approved by the executive board after all attempts at conciliation have failed. The organization grew rapidly after this time, till in 1886 delegates at the general assembly represented over 300,000; at that time, however, dissensions began which resulted in a split and the formation of the American Federation of Labor (q.v.). Though the organization remained powerful for several years, its numbers began to decrease, and in 1903 it reported only 40,000, and its influence gradually declined. In 1890 'The Journal of United Labor' was established; later the name was changed to 'Journal of the Knights of Labor,' and it is the official journal of the organization.

The Knights differ radically from the trades unions in the basis of their organization; their ideal is to organize labor without distinction of trade, and to harmonize individual and trade interests with the interest of the whole; though locals may be organized on trade lines, no

autonomy of trades is allowed. This and the fact that the general executive board tried to exercise a too centralized authority were among the chief causes of dissatisfaction. Strikes were at one time condemned by the general assembly (1880), but later the organization took part in a number of strikes and also made use of the boycott; violence has been at all times condemned. Consult: Mac Neill, 'The Labor Movement; the Problem of To-Day'; Powderly, 'Thirty Years of Labor'; Wright, 'Historical Sketch of the Knights of Labor' (in 'Quarterly Journal of Economics,' Vol. I., p. 137).

Knights of the Mac'cabees, a fraternal and benevolent association, founded in 1883, and numbering in the United States more than 294,000 members. It has a supreme commander, 6 grand tents and 4,300 subordinate tents and hives. It has disbursed in benefits since its organization \$14,159,246, and during 1902, the amount was \$2,178,124. All offices are located at Port Huron, Mich.

Knights of Malta, Ancient and Illustrious Order of, a secret society founded in Jerusalem, Turkey, and in the United States in 1889. There are now 5 grand commanderies, 233 sub-commanderies and 27,000 members. In 1902, benefits to the amount of \$40,000 were disbursed.

Knights of Pythias, a brotherhood organized to disseminate the principles of friendship, charity, and benevolence. The order was founded at Washington, D. C., 19 Feb. 1864, by Justus Henry Rathbone and four associates. An official declaration affirms that "toleration in religion, obedience to law, and loyalty to government" are its three cardinal tenets. The theme upon which the entire fabric of the society rests is the story of Damon and Pythias,—friendship even unto death being a paramount doctrine. The order at present is confined, in its jurisdiction, to the continent of North America; efforts earlier in its history to include the world as its field of action having proved futile. The name chosen, Knights of Pythias, rather than the more historically accurate designation of "Knights of Damon," was probably due to dramatic license, the reasons for which, like that of poetry, are obscure.

Origin.—The first drama of Damon and Pythias was a comedy, written 1571 A.D. The next effort of record was produced by John Banim,—the Irish poet,—associated with Richard Talor Sheil, who took the liberty of transposing the characters, making Pythias the hostage instead of Damon. This play was a tragedy and was first performed at Covent Garden, London, England, 28 May 1821. It was from the dramatic version of the story of Damon and Pythias that the founder of the order drew his inspiration, and it is the source from which has flowed the great Pythian river,—changing even the name of the society. The introduction, by the Irish poet, of the "fair Calanthe," the *affiancé* of Pythias, suggests an auxiliary order in which woman might labor with the Knights of Pythias, but no official recognition has ever been accorded to a branch admitting women to membership.

Founder.—Justus Henry Rathbone was born in Deerfield, Oneida County, N. Y., 29 Oct. 1839. He fitted for college at Utica, and be-

KNIGHTS OF PYTHIAS

came an *alumnus* of Madison University. His father, Justus Hull Rathbone, was a prominent attorney at Utica, N. Y., and his mother came of the famous Dwight family of New England. The original ritual was written during the autumn, winter, and spring of 1858-9, while Mr. Rathbone was a teacher in Michigan. He lived to see the order of the Knights of Pythias firmly established in all its branches,—with a membership of over 300,000. He died 9 Dec. 1889. On 27 July 1898, at Utica, N. Y., a monument raised to his memory was unveiled with imposing ceremonies. This memorial was erected by the order, from the proceeds of a 10-cents-per-capita voluntary contribution.

History.—On 15 Feb. 1864, in Washington, D. C., five clerks of the government met to organize the new order. Their names were: Justus Henry Rathbone, Robert Allen Champion, William Henry Burnett, and his brother, David L. Burnett, and Edward Sullivan Kimball, M.D. Four of these, including Rathbone, were members of the Arion Glee Club of Washington, organized in 1863. Rathbone and Champion were affiliated with the Improved Order of Red Men, the other three did not belong to a civic society. The first enactment recited that "This association shall not be a copy, or imitation, of any existing order, but that it shall be instituted independently, and be intensely American." The obligation administered was not altogether "in form," but proved sufficient. The ritual was then read by its author. "This work," said a survivor, "embodied practically all the tenets of the order of the Knights of Pythias, as now exemplified, although the arrangement was afterward changed somewhat, and its principal features were elaborated." The four eager auditors heard the dramatic possibilities which have made the society popular, wherever introduced, and parted to meet four evenings later, in a room in F Street, between 9th and 10th, N. W. Each agreed to invite other clerks to be present, it being Rathbone's suggestion that the membership be restricted to this class of employees in the governmental departments. One J. T. K. Plant was to be especially invited, because he belonged to several organizations, and was familiar with their methods and regulations. "Washington Lodge, No. 1, was organized in Temperance Hall, Friday evening, 19 Feb. 1864," so run the minutes. The number of members is not stated; but, at the close of the year, these had increased to 52. The "founder" was elected worthy chancellor, with associate officers: Vice chancellor, venerable patriarch, worthy scribe, assistant scribe, banker, assistant banker, worthy guide, inside steward, and four choral knights. Evidently the resolution, adopted on the 15th, had not yet gone into effect. The grand lodge of the District of Columbia, was formed 8 April 1864, with J. T. K. Plant as grand chancellor. The other grand officers followed the titles adopted by the subordinate lodge. Franklin Lodge No. 2 was organized at Washington Navy Yard 12 April 1864, and others followed in rapid succession. Then the order waned, until, 1 Aug. 1865, Franklin No. 2 was the only lodge in existence; and it was an acting grand, as well as a subordinate lodge. When the year 1865 closed, the membership in No. 2 was nearly 60 there was a treasury of \$200, and the "sole survivor" was in a prosperous condition, notwithstanding a

loss of \$255.55 through its "banker." On 1 May 1866 the grand lodge was reorganized, and the order spread to other jurisdictions. When the supreme lodge was constituted, 15 May 1868, the grand lodges of the District of Columbia, Pennsylvania, New Jersey, Maryland, and Delaware were represented. Through many trials, beset at times with disloyalty within and litigation without, from this beginning sprang the great order of the Knights of Pythias.

Government.—This is representative, and threefold, like the society's tenets. It is divided into three departments, namely: Legislative, executive, and judicial. These are regulated by statutes based upon constitutional provisions. In these particulars, and, in its methods of administration, the order has differentiated itself from others of its class. The government is vested in a supreme lodge, the source of all authority in the order; in State and provincial grand lodges, possessing subordinate authority over 10 or more lodges; in subordinate lodges, which create the membership by the acceptance of petitioners, and conferring upon them the ranks of "page," "esquire," and "knight." The supreme lodge was incorporated 5 Aug. 1870, under an Act of Congress approved the previous 5th of May, and many of the grand and subordinate lodges are, also, corporations. The order has, in addition to its three ranks, or degrees, an "endowment" rank, the insurance feature; and a "uniform" rank, the military division,—affiliation with which is voluntary, and predicated on regularity and good standing in the lodge. The titles borne by officers naturally follow the ritualistic structure. In the supreme body, with the prefix "supreme," these are, a chancellor, vice chancellor, prelate, keeper of records and seal, master of exchequer, master at arms, inner and outer guards. The endowment branch is managed by a board of control, the president of which is a supreme officer; and the uniform rank is commanded by a major-general, who is, also, an elective official. Prefix "grand" and the first eight become the names of officers of grand lodges. With one or two ritualistic variations, the officers of a lodge bear the same titles, excepting the prefix. Representatives are accorded the honor of "grand" or "supreme" in consonance with the name of the body in which they are elected to take seats. The executives are, respectively, the supreme and grand chancellors, and the chancellor commanders of subordinates. The judiciary consists of tribunes nominated by the executives and confirmed by the legislative bodies. Collectively these constitute the courts of last resort in the supreme lodge, and in grand lodges. Trials in subordinate lodges are conducted by committees. This judicial system has attained the dignity of a settled jurisprudence, the decrees of which are often recognized in actions brought in the civil courts.

Uniform Rank.—The organization of the display branch dates from 1878. The "rank" sprang at once into popularity, and the notable parade at Cincinnati in 1888 served to induce the supreme body to perfect its rules and regulations. Before that year creditable appearances had been made, but then trained soldiers, properly officered, were in line. Since that time the Pythian army has been a regular feature of all assemblages. "Not only this," says the major-general, commanding, "but the uniform—"

KNIGHTS OF THE ROUND TABLE—KNORTZ

has been most cordially welcomed by those outside of the order, and business and professional men, in our towns and cities, take pride in their local companies; while, in military circles, it has been hailed as a worthy addition to the military organizations of this continent." The ritual is emphatically patriotic; and the offer made to the United States government by this army of disciplined troops, for service in the Spanish-American war, is worthy of note. The powers of this branch are delegated to a supreme assembly,—with a representation in the aforesaid governing bodies,—and the organization follows the lines of the United States army, the "uniformed knights" using the government tactics.

Nomenclature.—Within the recesses of "castle halls," the terminology of the ages represented by the terms "page," "esquire," and "knight," govern the speech of those assembled. The jurisdictions of supreme and the grand lodges are called "domains," and all assemblies of the Knights of Pythias, "conventions." Members address one another as "brother knight." Documents are dated by the Pythian era, beginning with 1864. To find it, subtract 1863 from the common era. For example 1903—1863=40.

Statistics.—The reports for 1903 show 562,327 members, gathered in 6,992 subordinate lodges, governed by 54 grand lodges, and a supreme lodge. The total annual receipts are \$7,130,074.32; expenditures for relief, \$1,470,120.71; cash on hand, \$2,558,039.74; aggregate of lodge assets, \$11,109,913.57.

Bibliography.—Carnahan, "Pythian Knighthood, its History and Literature"; Van Valkenburg, "Jewels of Pythian Knighthood"; "Constitutions of the Supreme Lodge Knights of Pythias."

H. L. STILLSON,
Grand Tribune, Vermont.

Knights of the Round Table, the knights of King Arthur, according to some accounts 12 in number, famed for their valor, who sat at a round table in token of their perfect equality. Other versions of the legend give their number as 50 or more. The most famous of them are Lancelot, Tristram, Galahad, and Gawayne. See ARTHUR; ARTHURIAN LEGENDS; GRAIL, THE HOLY.

Knights of St. John and Malta, a secret society founded 1883. It has a grand encampment, 68 subordinate encampments and 3,227 members. Since organization the society has disbursed \$551,000 in benefits; and during 1902, the amount was \$65,000.

Knights Templars. See MASONIC FRATERNITY, THE.

Knightstown, Ind., town in Henry County, on the Blue River, and on the Cleveland, C. & St. L., and the Pittsburg, C. & St. L. R.R.'s, 34 miles east of Indianapolis. Near the town are the State Soldiers and Sailors' Orphans' Home. The town has excellent water power, natural gas, flour-mills, torpedo works and other industries, and owns the electric light and waterworks plants. Pop. (1890) 1,867; (1900) 1,942.

Knipe, Joseph Farmer, American soldier: b. Mount Joy, Lancaster County, Pa., 30 Nov. 1823; d. Harrisburg, Pa., 18 Aug. 1901. In 1842 entered the United States army, and served

in the Dorr Rebellion in Rhode Island, and subsequently in the Mexican War. At the outbreak of the Civil War he entered the volunteer service and was commissioned colonel of the 46th Pennsylvania regiment in August 1861. In May 1862 he was made a brigadier-general for gallant conduct, and after the War was postmaster at Harrisburg, 1866-9.

Knitting, an industrial and ornamental art allied to weaving, but of much later origin. It does not appear to be more than three or four centuries old, and seems to have been first used in the manufacture of stockings. It consists in forming a series of loops with a single thread, through which another row of loops is passed, and so on consecutively. In hand-knitting, steel-wires are used to form the loops on. For manufacturing purposes hand-knitting has been entirely superseded by machinery (see KNITTING-MACHINE), which is constantly receiving new improvements. Hand-knitting, however, still forms an agreeable domestic occupation, and also furnishes many women in some parts of the world with means of subsistence.

Knitting-machine. Of the many kinds of knitting-machines in use, one of the best known has a bed-plate with a vertically projecting and grooved needle-guiding cylinder or bed, and which is secured to a table or other suitable support. On the bed-plate is a loose ring with a thread-guide for conducting the thread to the needles, and about the needle-cylinder is a revolving cylinder with an annular groove interrupted by a cam-portion and provided with adjustable cams, which govern the downward motion of the needles, and consequently the length of the loops, and raise the needles; two of these latter cams being needed for reversing the machine for knitting a heel or a flat web. The cam-cylinder is moved by a bevel-gear connected to a driving-crank, and when moved continuously in one direction knits a circular web; and this web may be narrowed as desired, to fashion the leg, by removing needles, and placing their loops on adjacent needles. One needle receives the thread within its hook, and is subsequently moved by the cam-cylinder so as to form the thread so taken into a loop. When the heel is to be formed some of the needles are drawn up, their loops thus being retained and the number of needles left in action corresponds with the width of the heel to be formed. The cam-cylinder is now to be reciprocated in opposite directions, and in order to keep the thread-guide in advance of the descending needles sufficiently far, so that the thread will be caught, pins are inserted in the bed-plate to engage the heel of the thread-carrier and stop it just before the cam-cylinder is stopped.

Knolles, nörlz, or Knowlles, Richard, English historian: b. probably Cold Ashby, Northamptonshire, about 1550; d. Sandwich, Kent, 1610. He was graduated at the University of Oxford in 1565, and became master of the grammar school of Sandwich. He wrote a "General History of the Turks" (1603), the style of which is highly commended by Johnson, Hallam, and other critics. An improved edition, with continuations, by Sir Paul Rycaut, was published (1687-1700).

Knortz, nörzt, Karl, American miscellaneous writer: b. Garbenheim, near Wetzlar, 28

KNOT—KNOTTING AND SPLICING

Aug. 1841. He was educated at Heidelberg University and came to the United States in 1863. He taught in Detroit, Oshkosh, and Cincinnati, 1864–74, edited a German daily in Indianapolis for some years, and since 1892 has been superintendent of German schools in Evansville, Ind. Among his numerous works are: 'Tales and Legends of the North-American Indians' (1871); 'American Sketches' (1876); 'Longfellow' (1879); 'From the Wigwam' (1880); 'Indian Legends'; 'Pictures of American Life' (1884); 'History of American Literature,' in German (1891); 'Individuality' (1897); 'Child Study' (1899). He has very materially assisted in making American authors known in Germany.

Knot, a snipe (*Tringa canuta*) known in its migrations throughout the world, but breeding only in the extreme north, where its pale-green, spotted eggs have been found in only one instance. It appears in small flocks along all shores, and is a favorite with gunners under the names robin-snipe and gray snipe. Its plumage is a mingling of black and white suffused with a reddish tint on the under parts. The book-names refer to its habit of seeking its food just at the edge of the surface, where King Canute is fabled to have seated himself in defiance of the tide.

Knot, a term synonymous for a nautical mile. The log-line is divided by knots (or otherwise) into sections $\frac{1}{120}$ of a geographical mile in length, hence the number of sections run out in half a minute (the 120th of an hour) indicates the number of knots or geographical miles per hour at which the ship is going. The rate at which a vessel sails, or can sail, is usually given in knots per hour, the Admiralty knot or measured mile being 6,080 feet. It is longer than an ordinary statute mile by about one mile in seven; or the nautical mile of 6,080 feet = 1.151 statute mile.

Knot, Black. See FUNGI.

Knot-fungus. See FUNGI.

Knot-grass. See GRASSES.

Knot-root. See LABIATÆ.

Knots. See KNOTTING AND SPLICING.

Knott, nōt, James Proctor, American legislator and legal scholar: b. near Lebanon, Marion County, Ky., 29 Aug. 1830. He studied law in 1846–51, was admitted to the Missouri bar in 1851, and entered practice at Memphis, Scotland County. In 1858 he was elected to the Missouri legislature, in 1859 was appointed to the office of attorney-general of Missouri to fill a vacancy and in 1860 was elected to that post. Having refused, at the beginning of the Civil War, to take an oath of allegiance which he considered too severe, he was for a time imprisoned in the St. Louis arsenal. In 1862 he removed to Kentucky, where he established himself as a practitioner at Lebanon; and in 1867–71 and 1875–83 served in Congress as Democratic representative from the 4th Kentucky district. He was long chairman of the House committee on the judiciary. In the 41st Congress he made his well-known speech on Duluth, ridiculing the pretensions of the lake town, and gaining a national reputation as a humorist. He was governor of Kentucky in 1883–7, a delegate to the Kentucky constitu-

tional convention in 1891, professor of civics and economics in Centre College (Danville, Ky.) in 1892–4, and from 1894 professor of law and dean of the law faculty of Central University.

Knotting and Splicing, the fastening or tying of ropes or cords. There are hundreds of varieties of knots, most of which are used only on shipboard. Generally the requirements of a useful knot may be stated to be that it should neither "slip" nor "jam," that, while it holds without danger of slipping while the strain is on it, when slackened it should be easily untied again. The simplest knot is the common one tied on the end of a thread or cord to prevent it slipping. By passing a loop instead of the end of the cord the common slip-knot is formed; and a useful fixed loop is got by tying a simple knot, or the "figure of 8 knot" on the loop of a cord. One of the simplest and most useful running knots for a small cord is made by means of two simple knots. The most secure method of fastening a line to, say, a bucket is the standing bowline; and a running bowline is formed by passing the end through the loop thus making a running loop. Out of the score or so of methods of fastening a boat's painter the one which will be found most useful is the well-known two half-hitches. The timber hitch is useful for attaching a line to a spar or a stone, and the clove hitch is invaluable for many purposes. It is very simple and cannot slip. A simple method of fastening a rope to a hook is the blackwall hitch, where the strain on the main rope jams the end so tightly against the hook that it cannot slip. There are many methods for shortening a rope temporarily, one of them being the sheepshank.

Of the methods for uniting the ends of two cords the simplest and one of the most secure is the common reef knot, which must be carefully distinguished from the "granny," which will jam if it does not slip; the reef knot will do neither. For very small cords or thread the best knot is the weaver's. The fisherman's knot is a very useful one for anglers, and is formed by a simple knot in each cord being slipped over the other; when drawn taut it is very secure, and it is easily separated by pulling the short ends. A useful method of uniting large ropes is to tie a simple knot on the end of one rope and interlace the end of the other, and draw taut. This tie may also be made with the figure of 8 knot. For very large ropes the carrick bend is the simplest and most secure. The bowline bend is formed by looping two bowline knots into each other. For attaching a small line to a thick rope the becket hitch is very useful.

"Splicing" is the process employed to join two ropes when it is not advisable to use a knot. The three chief varieties of the splice are the short splice, the long splice, and the eye splice. The short splice is made by unlacing the ends of two ropes for a short distance and fitting them closely together; then, by the help of a marlinspike, the ends are laced over and under the strands of the opposite rope. When each strand has been passed through once, half of it is cut away and the remainder passed through again; half of the remainder being also cut away, it is passed a third time, and, when all the strands are so treated, they are hauled

KNOUT—KNOW-NOTHING MOVEMENT

taut and cut close. This reducing the thickness of the strands tapers off the splice. The long splice is employed when the rope is used to run through a block, as it does not thicken it. The ends of the two ropes are unlaid for a much longer distance than for the short splice, and similarly placed together. Then one strand is taken and further unwound for a considerable distance, and its vacant place filled up with the corresponding strand of the other rope, and the ends fastened as in the short splice. Other two of the strands are similarly spliced in the opposite direction, and the remaining two fastened at the original joining place. The eye splice is, as the term implies, used to form an eye, or round a dead eye.

To prevent a rope fraying at the ends a variety of methods are employed, the simplest being to serve or whip the end with small cord. Other methods are by interlacing the ends.

Knout, nowt, or noot, the official instrument of punishment formerly used in Russia, made in various forms, but usually being a whip of leather thongs artificially hardened, twisted with wire, etc. One hundred strokes with the knout were considered equivalent to a sentence of death, as the victim seldom survived the infliction.

Knowles, nōlz, Frederic Lawrence, American writer: b. Lawrence, Mass., 8 Sept. 1869. He was graduated from Wesleyan University in 1894 and since 1900 has been literary adviser of the Boston publishing firm of Dana, Estes & Co. Beside editing '*Cap and Gown*' (1897); '*Golden Treasury of American Lyrics*' (1897); '*A Year Book of Famous Lyrics*' (1901); and other compilations, he is the author of '*Practical Hints for Young Writers, Readers and Book Buyers*' (1897); '*A Kipling Primer*' (1900); '*On Life's Stairway*', verse (1900).

Knowles, G. Sheridan, English painter: b. Manchester 25 Nov. 1863. He was educated at private schools and studied art at Manchester and London, working at the Royal Academy Schools from 1884 to 1888. From that date he has actively pursued painting as a profession and has exhibited in the Royal Academy every year. His pictures are popular and romantic genre, and many of them have been engraved. His principal works are: '*The Last Minstrel*' (1889); '*The Return from the War*' (1892); '*The Wounded Knight*' (1895); '*Glasgerion*' (1897); '*The Flight of Huguenots from France*' (1900).

Knowles, James, English architect and editor: b. 1831. He was educated as an architect and among professional works of his are Tennyson's Surrey home, Aldworth; several churches in Clapham, and the fountain in Leicester Square, London. He originated the Metaphysical Society in 1869, edited the '*Contemporary Review*', 1870-7, and founded the '*Nineteenth Century*', of which he is the editor and proprietor.

Knowles, James Sheridan, Irish dramatist and actor: b. Cork, Ireland, 21 May 1784; d. Torquay, Devonshire, 30 Nov. 1862. He went upon the stage in 1806, but meeting with small success, taught elocution in Belfast and Glasgow. His tragedy of '*Caius Gracchus*' was performed at Belfast in 1815 with success, and from this time he had a prosperous career. In

1845 he retired from the stage from scruples of conscience, and in 1852 became a Baptist preacher and published several theological works. In 1849 he received a pension of £200 a year from Government. Among his principal works are the dramas: '*Caius Gracchus*' (1815); '*William Tell*' (1825); '*Virginius*' (1829); '*The Hunchback*' (1832); '*The Wife of Mantua*' (1833); '*The Love-chase*' (1837); '*Love*' (1839). In 1847 and 1849 he published two novels, '*Fortescue*' and '*George Lovell*'.

Knowles, Lucius James, American inventor: b. Hardwick, Mass., 2 July 1819; d. Washington, D. C., 25 Feb. 1884. He became a clerk in a shop at Shrewsbury, Mass., turned his attention to inventing, devised the Knowles safety steam-boiler feed-regulator, and constructed and operated several models of steam-engines. In 1843 he invented a machine for the spooling of thread, and this machine he manufactured at New Worcester in 1843-5. He then built spinning-machines for the manufacture of four- and six-cord thread, and manufactured cotton thread and warps at Spencer and Warren, Mass. (1847-53), and woolen goods at Warren (1853-9). Subsequently he manufactured a safety boiler-feeder, a steam pump, and a tape loom, under his own patents. He was elected to the lower house of the Massachusetts legislature in 1862 and 1865, and in 1869 became State senator.

Knowlton, nōl'tōn, Frank Hall, American botanist: b. Brandon, Vt., 2 Sept. 1860. He was graduated from Middlebury College, Vt., in 1884, was assistant palaeontologist on the United States Geological Survey 1889-1900 and palaeontologist from the last named date. Among his scientific monographs are: '*Fossil Wood and Lignite of the Potomac Formation*' (1889); '*Fossil Flora of Alaska*' (1894); '*Catalogue of the Cretaceous and Tertiary Plants of North America*' (1896).

Knowlton, Helen Mary, American artist and author: b. Littleton, Mass., 16 Aug. 1832. She studied art under William M. Hunt (q.v.) and Duverneck and has for 30 years taught art in Boston. Beside compiling Hunt's '*Talks on Art*', she has written '*Hints to Pupils in Drawing and Painting*' (1879); '*Life of William Morris Hunt*' (1899).

Knowlton, Thomas, American soldier: b. West Boxford, Mass., 30 Nov. 1740; d. battle of Harlem Plains, N. Y., 16 Sept. 1776. A farmer at Ashford, Conn., at the beginning of the Revolution, he was elected captain of a militia company organized after Lexington, and with 200 other Connecticut troops was sent to Charlestown. His detachment, ununiformed farmers with shot-guns, fought at Bunker Hill. On 8 Jan. 1776 he made a successful invasion of Charlestown, and subsequently became lieutenant-colonel of a regiment of Connecticut rangers. He was killed while leading his command, at the battle of Harlem Heights, and was highly praised by Washington in general orders.

Know-nothing Movement, The, a secret political association organized in the United States for the purpose of obtaining the repeal of the naturalization law, and of the law which permitted others than native Americans to hold office. It started in 1852 and existed two or three years. The principles of the Know-noth-

KNOX

ing party were embodied in the following propositions (at New York, 1855): (1) The Americans shall rule America. (2) The union of these States. (3) No North, no South, no East, no West. (4) The United States of America—as they are—one and inseparable. (5) No sectarian interferences in our legislation or in the administration of American law. (6) Hostility to the assumption of the Pope, through the bishops, etc., in a republic sanctified by Protestant blood. (7) Thorough reform in the naturalization laws. (8) Free and liberal educational institutions for all sects and classes, with the Bible, God's holy word, as a universal text-book. A society was formed in 1855 in opposition to the above, called Know-somethings. Both bodies were absorbed into the two parties, Democrats and Republicans, at the presidential election in 1856.

The Know-nothing organization was primarily the result of foreign emigration. In 20 years from 1825 to 1845, the immigration amounted to 1,028,225. The consequence was a sharp awakening of native American prejudice and alarm. The sentiment first showed itself in New York, where the alien population had reached portentous proportions, in the estimation of citizens of the old stock. A native organization for political purposes was effected, and in 1844 it succeeded in electing James Harper mayor on a native American ticket. About this time began the great immigration due to the Irish famine, and in the five years from 1845 to 1850 there came in about as many aliens as had been received during the whole 20 years before. Native Americanism flamed up hotter than ever, and its political conflagration extended to other cities and States. The great volume of the Irish immigration was Roman Catholic, and animosity to that church gave it fire. At Philadelphia two Roman Catholic churches were destroyed in riots between natives and Irish; at Boston a convent was burned. Six native American representatives were elected to the 29th Congress, that of 1845, four from New York and two from Pennsylvania. Between 1850 and 1855 the immigration amounted to nearly 2,000,000; and the native spirit was aroused even more hotly. Moreover, the anti-slavery agitation, expressing itself in opposition to the extension of slavery to the Territories, was disturbing party allegiance, and special efforts were made to kindle the native American spirit into a hot flame, with an ulterior motive, it was believed, of turning the current of public sentiment into other channels.

In 1852 the Know-nothing organization, distinctly, made its appearance. It was so-called because it was a secret oath-bound fraternity, regarding whose objects and whose real name its members always answered when questioned: "I don't know." "Americans must rule America!" was its rallying cry, and relentless hostility to the increasing power of the Roman Catholic Church and a demand for the extension of the naturalization to 21 years were its main purposes. The Know-nothings started off brilliantly. In 1854 they carried the State elections in Massachusetts and Delaware, and polled a great number of votes in New York. In 1855 they elected governors and legislatures in New York and four New England States, and at the South they were successful or nearly approached success in nine States. In 1856 eight of the

32 States had native American governors, but in the presidential election of that year the party cast only about one fifth of the popular vote and obtained only eight electoral votes, or the votes of the single State of Maryland. In the 35th Congress, 1857, it had 5 senators and 14 representatives. In the next Congress it had 2 senators and 23 representatives, all of them from Southern States. Soon thereafter Know-nothingism went to pieces rapidly and no more of it was heard in politics. It had no representation in Congress after the 36th. See also AMERICAN PARTY.

Knox, nōks, Adeline Trafton, American novelist; daughter of Mark Trafton (q.v.); b. Sacarappa, Maine, 8 Feb. 1845. She was married to Samuel Knox, a lawyer of St. Louis, Mo., in 1889. She has written: '*Katherine Earle*' (1874); '*His Inheritance*' (1878); '*An American Girl Abroad*'; '*Dorothy's Experience*' (1891).

Knox, George William, American Presbyterian clergyman; b. Rome, N. Y., 11 Aug. 1853. He was graduated from Hamilton College, Clinton, N. Y., in 1874, and from Auburn Theological Seminary in 1877. He subsequently was employed in missionary labors in Japan and was professor of philosophy and ethics in the Imperial University of Japan in 1880. On returning to the United States he became pastor of a Presbyterian Church in Rye, N. Y., and was a professor at Union Seminary, N. Y., 1897–9. He has written (in English): '*A Japanese Philosopher*' (1893); (in Japanese) '*A Brief System of Theology*'; '*Outlines of Homiletics*'; '*Christ, the Son of God*'; '*The Basis of Ethics*'; '*The Mystery of Life*'; '*The Christian Point of View*' (1902).

Knox, Henry, American general and cabinet officer; b. Boston, Mass., 25 July 1750; d. Thomaston, Maine, 25 Oct. 1806. He was the 7th son of William Knox, a native of St. Eustatius, West Indies, who settled in Boston and became a shipmaster. After the father's death in 1762, the son was employed by a Boston bookseller, and in 1771 he opened a bookstore of his own. When a young man he threw in his lot with the patriot cause and spent his leisure studying books on the military art, supplementing his reading by observing and questioning the British officers stationed in Boston. His marriage (16 June 1774) to Lucy Flucker, the daughter of an aristocratic loyalist of Boston, did not prevent him from joining the Colonial army at the outbreak of hostilities in the spring of 1775. He fought in the battle of Bunker Hill and then aided in constructing the defenses of the camps around Boston. The army being in pressing need of artillery, Knox proposed to Washington the plan of bringing heavy cannon and stores from Fort Ticonderoga near the Canadian frontier. He set out (15 Nov. 1775) on this perilous enterprise with a squad of mounted men. In the face of great difficulties he succeeded in getting 55 guns, loaded them on sleds, with 2,300 pounds of lead and a barrel of flints, and reached Cambridge in safety (24 Jan. 1776). For this brilliant exploit he was warmly complimented by Washington. After his return he received his commission as colonel of the one artillery regiment, the appointment having been made by the Continental Congress (17 Nov. 1775). The cannonade of

KNOX

Knox's batteries (on the night of 1 March 1776) enabled General Thomas to take possession of Dorchester Heights, which resulted in the evacuation of Boston by the British forces. In the summer of 1776 he was stationed at New York city with Washington, who found him a true friend and an able officer. In December he was promoted to brigadier-general of the artillery. He distinguished himself in the battles of Trenton and Princeton, and took part in the engagements at Brandywine, Germantown, and Monmouth. He helped (May 1777) General Greene in planning the defenses of the Hudson River. In the trying winter of 1777-8 he was in camp at Valley Forge, with his young wife. Many of Washington's letters refer to Knox in terms of high appreciation. He rendered valuable service in the operations against Cornwallis in October 1781, his skill as an artillerist being praised by the Frenchman, De Chastellax. He was made major-general (22 March 1782) and appointed to the command at West Point (29 Aug. 1782). Upon him devolved the delicate task of disbanding the army late in 1783. He had already formed the Society of the Cincinnati to keep alive the friendships of officers formed during the war.

Congress appointed Knox Secretary of War (8 March 1785), a position he worthily filled for ten years. In 1794 he was also at the head of the Navy Department, just organized. Owing to insufficient salary, he resigned from Washington's cabinet (2 Jan. 1795). His remaining years were passed at his home in Thomaston, Maine. Consult: Drake, 'Life and Correspondence of Henry Knox' (1873); Noah Brooks, 'Henry Knox, a Soldier of the Revolution' (1900).

EUGENE PARSONS,
Editor 'The World To-day.'

Knox, John, Scottish Protestant reformer: b. Giffordgate, Haddington, Scotland, 1505; d. Edinburgh 24 Nov. 1572. (The society of antiquaries of Scotland discussed the subject of his birthplace in 1858, when Mr. John Richardson of Haddington brought forward evidence that he was born in Giffordgate, a suburb of Haddington, and not in Gifford, a village near that town. He was supported in this view by Mr. Laing, the editor of the reformer's works.) After receiving his preliminary education at the grammar school of Haddington, he went in 1521 to the University of Glasgow, where for several years he studied scholastic philosophy and theology. Noted as a master of dialectic subtleties, he was ordained prior to 1530, and became a teacher of philosophy at St. Andrew's. The study of the fathers, especially of Jerome and Augustine, had shaken his religious opinion: as early as 1535, but it was not till 1542 that he became an avowed and marked reformer. The long period of silence, before in mature age he explained his views with completeness, has been regarded as proof that he was naturally of a prudent and peaceful disposition, and not a turbulent partisan, as his after career would indicate. His reprobation of certain practices of the Church caused him to retire from St. Andrews to the south of Scotland, where he was declared a heretic. After the death of his friend George Wishart, he remained in retirement till he took refuge with many other Protestants (1547) in the castle of St. Andrew's, which the regent was vainly attempt-

ing to reduce. There for the first time he became known as a powerful preacher against the papacy. The regent, re-enforced by a French squadron, obliged the garrison to surrender. The terms of the capitulation were violated, and Knox with his comrades was transported to France, where he was imprisoned on the galleys for 19 months. He experienced extreme hardships, and on his release (1549) directed his course to England, where he was appointed to preach at Berwick and at Newcastle, and became one of the chaplains of Edward VI. For the boldness of his discourses he was several times called to account, but was able to vindicate himself. A bishopric was offered to him, but he declined it from scruples as to the divine authority of the episcopal order. On the accession of Queen Mary he fled from England to Dieppe, and passed thence to Geneva, where, after taking part in the memorable troubles at Frankfort and after a short visit to Scotland, he became pastor (1556) of a small English congregation. The two years of his residence in Geneva, in the society of Calvin, Beza, and other learned men, were among the happiest of his life. While in Scotland he had been cited to appear before an assembly of the clergy to be held at Edinburgh, and after his return to Geneva the citation was renewed, and he was condemned to be burned as a heretic, and the sentence was executed on his effigy. Against this condemnation he published the 'Appellation of John Knoxe.' He also wrote a tract entitled the 'First Blast of the Trumpet against the Monstrous Regiment of Women' (1558), a vehement attack on the political government of women, at a time when Mary of Guise was regent of Scotland and Mary Tudor queen of England, and the nearest in succession to both thrones were females. Invited by the Scottish Protestants to resume his labors in his native country, he landed at Leith in 1559. The queen regent had laid her plans for the forcible overthrow of the reformation. At a convention of the nobility and clergy in Edinburgh all the demands of the Protestants were refused. Several of the reforming preachers were summoned to appear at Stirling for trial, but by the dissimulation of the regent were prevented from attending and then outlawed for their failure. Knox hastened to meet them at Perth, where he preached against the "idolatry of the mass" and the veneration of images. At the conclusion of the service there was a violent outbreak. The images in the churches were demolished, the pictures torn from the walls and trampled under foot, the holy recesses invaded, and the "rascal multitude," as Knox calls them, did not stop till they had sacked and laid in ruins the houses of the Dominican and Franciscan friars and the Carthusian monastery. The queen regent advanced upon Perth with an army, but, finding the Protestants well prepared for resistance, proposed terms of accommodation which were accepted. The Protestants, in order to consolidate their strength, formed a religious bond or covenant, and began to be distinguished as the congregation, and their leaders as the lords of the congregation. Iconoclasm was a prominent feature in the Scottish reformation. Events similar to those at Perth followed at Stirling, Lindores, Cupar, St. Andrews, and other places. Knox had preached in the cathedral of St. Andrews with such success that the

KNOX—KNOX COLLEGE

magistrates united with the inhabitants in desolating the churches and monasteries, and in establishing the reformed worship. Meantime civil war raged throughout the kingdom between the regent, assisted by French troops, and the lords of the congregation. In political as well as ecclesiastical affairs Knox was a conspicuous adviser, and took up his residence in Edinburgh after an extensive circuit through the southern and eastern counties. After a contest of 12 months, the vigorous assistance rendered by Elizabeth, and the death of the queen regent while the English troops were investing Edinburgh led to a truce and to the summons of the Parliament to settle differences. Parliament assembled in August 1560, the reformed religion was established, and Roman Catholicism interdicted by law in Scotland. Soon after the arrival of the young Queen Mary (21 Aug. 1561) she summoned the influential and noted reformer to her presence. Six interviews are recorded between him and the queen, and the questions which she raised were discussed by him with a rude vehemence and rigor, which once drove her to tears. She caused his arrest on a charge of treason in 1563, but all the councillors except the immediate dependents of the court voted for his acquittal. The vehemence of his public discourses led him into frequent difficulties. In 1562 he disputed publicly for three days with Abbot Quentin Kennedy at Maybole; in 1565 he quoted certain texts which gave offense to the court, and was for a short time prohibited from preaching. He fled from Edinburgh when the queen returned from Dunbar after the death of Rizzio; and he preached a sermon at the coronation of the infant king at Stirling (29 July 1567). Under the brief regency of Moray, the work of Knox seemed to be completed, but after the assassination of Moray, civil and religious confusion returned under the regency successively of Lennox and Mar. Weakened by a stroke of apoplexy in 1570, Knox yet reappeared in the pulpit, but so violent was the enmity excited by his animadversions that he left Edinburgh for St. Andrews 5 May 1571. He returned in the following year, and his last energies were put forth in denunciations of the perpetrators of the massacre of St. Bartholomew's.—The doctrines of Knox embraced a Calvinistic creed and a Presbyterian polity. The "Order of Geneva," a liturgy which he shared in preparing for the use of the church at Frankfort, and subsequently employed in his congregation at Geneva, was introduced into Scottish Protestant churches in 1565. His character was marked by a stern realism, which could be beguiled by no social pretensions, no conventional dignities, no pompous traditions. From this sprang his scornful bitterness and his insensibility to the social graces and refinements which Mary exhibited. He was not a thinker except on political topics. His "History of the Reformation of Religion in the Realme of Scotland" is the best known of his writings. Consult: "Lives," by McCrie (1813); Taylor (1885); P. H. Brown (1893); Lorimer, "John Knox and the Church of England" (1875); Carrick, "John Knox and his Land" (1902).

Knox, John Jay, American financier: b. Knobxboro, N. Y., 19 March 1828; d. New York 9 Feb. 1892. He was graduated at Hamilton College in 1849, and was a banker till 1862. In

that year he received an appointment from Secretary Chase, and subsequently had charge of the mint coinage correspondence of the Treasury Department, becoming in 1867 deputy comptroller of the currency. A bill which he proposed was passed with a few modifications, and is known as the Coinage Act of 1873. In 1872 he was appointed comptroller of the currency, resigning in 1884, to become president of the National Bank of the Republic, New York. In addition to various Reports, he published "United States Notes" (1884, revised 1887).

Knox, Philander Chase, American lawyer and politician: b. Brownsville, Pa., 4 May 1853. He was graduated from Mount Union College, Ohio, in 1872; studied law and was admitted to the bar in 1875. He was assistant United States district attorney for the western district of Pennsylvania in 1876-7; resigning this position he took up the practice of law in Pittsburgh in partnership with J. H. Reed. The firm's practice grew rapidly, and Knox became known as one of the most successful corporation lawyers in the United States; in 1892 he was counsel for Carnegie during the Homestead strike. April 1901 he was appointed attorney-general of the United States. In this office he has necessarily been involved in the "anti-trust" agitation; he has dealt with the question from a purely lawyer's standpoint, and in 1902 brought suit against the Northern Securities Company and the so-called "Beef Trust" on the ground that they were violating Federal statutes, seeking in this way to test and enforce the laws for controlling large combinations of capital.

Knox, Thomas Wallace, American journalist and traveler: b. Pembroke, N. H., 26 June 1835; d. New York 6 Jan. 1896. He went to Colorado in 1860 and there engaged in journalism, and during the Civil War served as volunteer aide. He made a journey around the world as a newspaper correspondent in 1866 and again in 1877, and wrote many popular books for young people. Among his very numerous published works are: "Underground Life" (1873); "How to Travel" (1880); "Boy Travelers Series" (15 vols. 1880-94); "Lives of Blaine and Logan" (1884); "Decisive Battles since Waterloo" (1887); "The Lost Army" (1894); "Hunters Three" (1895); "In Wild Africa" (1895); etc.

Knox College, a coeducational institution, founded in 1837 at Galesburg, Ill., as Knox Manual Labor College. The school was opened in 1841, and in 1857 the name was changed to Knox College. The original plan for founding and maintaining the school was to secure subscriptions to the amount of \$40,000 and to purchase lands in the Mississippi Valley, at government price, the lands to be resold at a profit. Every subscriber who purchased 80 acres of land was given free tuition for one student for 25 years. In 1902 the productive fund amounted to about \$250,000. The tuitions and other fees amounted to \$14,526; the income from the productive funds and other sources was nearly \$15,000. There are in the library about 10,000 volumes. In 1903 there were connected with the school 35 instructors and professors; and 700 students. A music department was established in 1883. The famous Lincoln-Douglas debate, in 1858, was held on the grounds of this college.

KNOX-LITTLE — KNOXVILLE

Knox-Little, William John, English Anglican clergyman and author: b. Stuartstown, County Tyrone, Ireland, 1839. He was educated at Cambridge University, took orders in the English Church, and after holding several curacies was rector of St. Alban's, Cheetwood, Manchester, 1875-85. Since 1885 he has been canon residentiary of Worcester Cathedral and vicar of Hoar Cross. He is an "advanced" churchman and has several times visited the United States, where he has preached in many Episcopal churches conspicuous for High Church leanings. He is a popular religious writer, and among his many books are: 'Meditations on the Three Hours' Agony of Our Blessed Redeemer' (1877); 'The Broken Vow: a Story' (1887); 'The Child of Stafferton' (1888); 'The Perfect Life' (1899); 'Studies on South Africa' (1899); 'Holy Matrimony' (1900).

Knoxville, nöks'v'il, Iowa, city and county-seat of Marion County, on the Chicago, B. & Q., and on the Chicago, R. I. & P. R.R.'s, 35 miles southeast of Des Moines. Here is the State Industrial Home for the Blind, court house, high school and public library. It is the centre of an extensive coal-mining, stock-raising and agricultural district, and has flour-mills, canneries and machine shops. Pop. (1890) 2,632; (1900) 3,131.

Knoxville, Tenn., city, county-seat of Knox County; on the Tennessee River, and on the Knoxville & A., the Knoxville, C. G. & L., the Southern, and the Atlanta, K. & N. R.R.'s; about 110 miles northeast of Chattanooga. It is connected with South Knoxville, on the south side of the river, by a magnificent steel bridge. The site is a picturesque one, being near the centre of the valley between ranges of the Alleghany and Appalachian Mountains, which are visible from several points in and about the city. It is built on a series of sloping hills and their intervening valley-like spaces; the average elevation above the sea-level being about 1,000 feet. It is the commercial centre of a large area of territory, embracing, besides the eastern division of Tennessee, also western North Carolina, southwestern Virginia, North Georgia, and a large part of eastern Kentucky. The rich coal fields which furnish so large a proportion of the fuel supply for the Southern States are from 25 to 60 miles distant from Knoxville. These are the Coal Creek and Jellico districts, and the operators of a majority of these mines have their headquarters in Knoxville.

History.—Knoxville was founded in 1791, by Gen. James White, who had been an officer in the American army in the War for Independence. It was named in honor of Gen. Knox, of Revolutionary fame, the first secretary of war. The first building, a block house, was erected for the protection of the pioneer settlers against the attacks of Cherokee Indians. For a number of years Knoxville was a government military post, barracks being erected for the accommodation of those in the military service. In those days Knoxville was the centre of interest in connection with Indian depredations so common in the settlement of Tennessee.

Trade and Manufactories.—For more than a third of a century Knoxville has been doing a large wholesale business. Wholesale merchants have reached out for additional markets into all the surrounding States. It has good shipping

facilities and a branch of the Louisville & Nashville road, about 65 miles in length, is being built and when completed will give the city additional direct connection with the Northwest. During two thirds of the months of the year small steamboats ply on the Tennessee and French Broad rivers, above and below the city and do a large amount of local business. The growth in the number and the capacity of manufacturing establishments in the past decade has been very marked. More than 28 per cent of the entire population of the city is engaged in manufacturing. The chief manufactures are woolen and cotton goods, furniture and cabinet mantels, marble sawed and polished, bar iron, boilers, stoves, castings, coffins and caskets, iron fencing, ready-made clothing, beer, desks, and flour. The woolen and cotton factories, the marble works and the flour mills are large establishments. The growth of small manufacturers in the past ten years is a feature that is attracting attention. The marble which is found in quarries at the very gates of the city is used for ornamental purposes in almost every large public or private building being erected in any part of the United States, and the hardwood cabinet mantels being manufactured here are sold in almost every State in the Union. The great abundance and close proximity of raw material—timber, a large number of varieties: coal, iron ore, marble, and zinc, make the place desirable as a manufacturing site.

Climate.—The near proximity of the tall mountains on either side, almost surrounding the valley of which Knoxville is so nearly the geographical centre, does much to modify climatic conditions, and to render them different from those of other cities situated in about the same latitude. The city and surrounding country has been comparatively immune against destructive storms. The average mean annual temperature for a period of 25 years, as shown by the local records of the Government Weather Bureau, is 57°, the mean summer temperature 74°; mean winter 40°; mean spring 57°; mean autumn 58°. The temperature in winter has occasionally gone as low as zero, slightly below, but has continued only for a short time. The maximum mid-day summer temperature has gone as high as 100°, but as a rule the nights are cool.

Banks.—There are eleven banks in the city, five of them national banks. Their combined capital is \$1,050,000, with \$472,000 surplus and undivided profits. The transactions of the clearing-house have trebled in the past ten years, and during the present year (1903) have averaged over a million dollars weekly.

Churches and Schools.—There are 42 churches in the city for the white population and 17 for the colored. All but one of these are Protestant. The leading denominations, reckoning on the basis of the number of communicants, are the Methodists, Baptists and Presbyterians, in the order mentioned. There are two Protestant Episcopal, three Christian, and two Lutheran churches. It is the seat of the University of Tennessee, the East Tennessee Female Institute, the Tennessee Normal College, the University (preparatory) School, and Saint Mary's Academy. The Knoxville College, for colored students, founded and maintained by the United Presbyterian Church, is located here. The public schools have ten

KNURR-AND-SPELL — KOCH

buildings for the white children, and four for the colored. About 100 teachers are employed. The school session is nine months in the year at an average annual cost of about \$55,000. The State School for Deaf Mutes is located in Knoxville, also the Lyons View branch of the State Hospital for the Insane.

Benevolent Institutions.—Among the chief of these is the Industrial School for Juveniles, sustained at the expense of Knox County, capable of housing and giving instruction to 200 girls and boys; the Home for Aged Women and an orphanage. The Knoxville General Hospital was erected at a cost of more than \$50,000, and is one of the leading institutions of its kind in the South.

Government.—The city is governed by a mayor and board of aldermen elected by the people for the term of two years, and a board of public works elected in the same manner. The assessed value of property for taxation is \$14,000,000 which is not exceeding 75 per cent of its actual value. The bonded debt of the city is \$1,200,000, most of which was created for paving streets, constructing sewers, building bridges, and other public improvements. The city is supplied with pure wholesome water, from the Tennessee River, by a private corporation which owns the water plant. The lighting plants, gas and electric, are also owned by private corporations.

Population.—The population by the census of 1900 was 32,637; in 1890 it was 22,535; in 1880 9,663; in 1870 8,682. In 1900 the colored population numbered 22.5 per cent of the whole and the foreign population 2.7. The increase in recent years has been very rapid, and it is claimed now (1903) with good reason, that the population of the city and close in suburbs, not embraced in the municipal limits, is at least 60,000.

W.M. RULE,

Editor Knoxville 'Journal and Tribune.'

Knyphausen, knip'how-zēn, BARON **Wilhelm von**, German soldier: b. Lützberg 4 Nov. 1716; d. Cassel 7 Dec. 1800. Educated at Berlin, he entered the Prussian army in 1734, in which he became in 1775 a general officer under Frederick II. (the Great). He came to the United States in that year as second in command of the Hessians in the English service, and superseded Gen. von Heister as commander-in-chief in 1777. He fought at Long Island, White Plains, Brandywine, and Monmouth; and during the temporary absence of Clinton in 1780, commanded New York. In 1782 he returned to Germany, where he later became military governor of Cassel. He was a capable soldier, and had no high opinion of his unreliable mercenaries.

Koa'la, a remarkable marsupial (*Phascolartos cinereus*) of the family *Phalangeridae*, found chiefly in the interior of New South Wales, and known to the colonists as "native bear." It is about two feet long, and has a heavy, depressed, somewhat bear-like form, no tail, strong limbs with five digits armed with long claws on each, the inner digit on the hind feet and two inner on the fore feet opposable to the others, the ears large and like the rest of the body covered with a dense gray woolly fur. These characteristics fit it for an arboreal existence, and it lives alto-

gether in trees, descending only occasionally to dig for roots. It is especially active at night and feeds on leaves and buds of eucalyptus trees. It is timid and defenseless, and is killed with clubs by the Australian blackfellows, who eat its flesh. Compare WOMBAT, and consult authorities cited under MARSUPIALIA.

Kobbé, köb'bä, Gustav, American author and journalist: b. New York 4 March 1857. He was graduated at Columbia University in 1877, and at its Law School in 1879; and has since been employed in newspaper and magazine work. He has published: 'The Ring of the Nibelungen' (1889); 'Wagner's Life and Works' (1890); 'My Rosary and Other Poems' (1896); 'New York and Its Environs' (1891); 'Plays for Amateurs' (1892); 'Miriam' (1898); 'Opera Singers' (1901); 'Signora, a Child of the Opera House,' a novel (1902).

Kobbe, köb, William A., American general: b. New York 10 May 1840. He was educated in Germany till 1862 and was graduated from West Point in 1873. He served in the Civil War in the 7th New York regiment and rose to the rank of captain. In the war in the Philippines he was placed in command, in January 1900, of an expedition to the southern extremity of Luzon, and in March following was appointed military governor of the Province of Albay (Luzon), and Catanduanes Island, and temporary governor of the islands of Samar and Leyte. On the reorganization of the regular army in February 1901, he was appointed one of the new brigadier-generals.

Kobé, kō'bē, Japan, a treaty port and former municipality of the main island Hondo, on the west shore of the Gulf of Osaka, adjoining on the northeast the prefectoral city of Hiogo (q.v.), with which it was united in 1892. It is the most important of the treaty ports with the largest trade, a fine harbor, docks, wharves for ocean steamers, ship-building yards, railway shops and other important industrial establishments. Kobé is well laid out with wide streets, electrically lighted. Pop. (1898) 215,780.

Ko'bold, a species of elf in the popular superstition of Germany, corresponding to the English *goblin*. The kobold is connected with a house or a family, and appears in bodily shape.

Koch, kōh, Robert, German bacteriologist: b. Clausthal, Hanover, 11 Dec. 1843. He received a medical education at Göttingen (1862-6), was assistant-surgeon in the Hamburg general hospital, was in private practice at Langenhagen (Hanover), Rakwitz (Posen), and Wollstein (Posen), and in 1872 was appointed to the Imperial board of health. In 1882 he succeeded in isolating the tubercle bacillus, in 1883 was made privy councillor and became director of the cholera commission to India and Egypt. He discovered in 1884 the cholera spirillum, or comma bacillus, regarded as a positive test of the presence of Asiatic cholera. For this service he received by legislative act a gift of 100,000 marks (\$25,000). In 1885 he was appointed professor in the University of Berlin, director of the newly established Hygienic Institute of Berlin, and also director of the Prussian board of health. He announced in 1890 the discovery of a substance called tuberculin, which, he asserted, would cause to cease the growth of the tubercle bacillus.

KOCK—KOKOMO

Subsequent experiment failed in the judgment of scientists to confirm his claim in connection with the treatment of human beings. Among his writings are: 'Beitrag zur Aetiologie der Tuberkulose' (1882); 'Ueber die Cholerabakterien' (1884); and 'Weitere Mitteilungen über ein Heilmittel gegen Tuberkulose' (1890).

Kock, Charles Paul de, shär'l pôl dë kôk, French novelist: b. Passy, France, 21 May 1794; d. Paris 29 Aug. 1871. He was the son of a Dutch banker who was guillotined in 1794. At 15 he was placed in a banking-house, but presently took to writing, and his reputation was soon established by such works as 'Georgette' (1820); 'Gustave, ou le mauvais Sujet' (1821); 'Mon Voisin Raymond' (1822). The last is regarded as the typical romance of its kind. His scenes are cast in the lower ranks of middle-class life. His narrative is a constant succession of stirring incidents without catastrophe. The incidents are always gay and lively, frequently somewhat gross, but scarcely to the extent of indecency. The worst feature of Paul de Kock's works is his style, which is barely presentable, a fault evidently due to deficiency of education. This accounts for his popularity being greater abroad than at home, as the defects of style disappear in translation. Besides his novels, which are very numerous, he wrote several dramas, chiefly taken from them. Consult: Trimm, 'La Vie de Charles Paul de Kock' (1873).

Ko'dak, a portable photographic camera of special type for taking instantaneous negatives. It is made in the form of a small box having a lens and a shutter in one side and a reflector on top by which the operator can focus the lens. When this has been done a button is pressed and the snap-shot is taken. The kodak is provided with a continuous roll of sensitized film on which successive negatives can be made.

Koehler, ké'lér, Robert, American artist: b. Hamburg, Germany, 28 Nov. 1850. He came with his parents to the United States in 1854; was educated at Milwaukee, Wis., and learned lithography which he practised in Pittsburg, Pa., and New York. After studying drawing in the night classes of the National Academy of Design, he went to Munich where he learned painting under Loeftz and Defregger and chose genre as his special field of activity. His principal pictures are: 'Holiday Occupation'; 'Her Only Support'; 'The Socialist'; 'The Strike'; 'The Family Bible'; and 'Father and Son.' Since 1893 he has been director of the Minneapolis School of Fine Arts.

Ko'el, one of a group of East Indian and Australian fruit-eating cuckoos, of the genus *Eudynamis*, which are popularly known as "rain-birds." They are parasitic, but have many peculiarities, among which are the glossy black plumage of the males, and the fact that, contrary to the rule, the immature young resemble the males instead of the females, which have a reddish dress. A Philippines species (*E. mindanensis*) is locally called "phow." They utter loud whistling cries.

Kogia, kô'jî-a, the generic and ordinary name of the "pigmy" sperm whales of the Pacific, which differ from the true sperm whales (q.v.) in anatomical particulars, and conspicu-

ously in size, not exceeding about 15 feet in length. There are several species of these cetaceans which belong mainly to the New Zealand region, although one species visits the coast of California, but they are little known.

Koh-i-Nûr, kô'é-noor', or Kohinoor. See DIAMOND.

Kohl, Johann Georg, yô'hän gä'örg kôl, German traveler and historian: b. Bremen 28 April 1808; d. there 28 Oct. 1878. Nearly his entire life was devoted to travel and historical investigation in Europe and in North America, where he spent four years and published as the fruits of researches: 'Travels in Canada' (1855); 'Travels in the Northwestern Parts of the United States' (1857); 'History of the Discovery of America' (1861); and several essays on American cartography. Other works are: 'Travels in the Interior of Russia and Poland' (1841); 'The British Isles and Their Inhabitants' (1844); 'The Rhine' (1851); 'The Danube' (1853).

Kohl-Rabi, kôl-ra'bî, a botanical variety of the same species as cabbage (q.v.), from which it differs in the swelled, turnip-like stem with a tuft of loose leaves on the top. This bulbous stem, which may be six inches in diameter, is used for human and stock food, less in America than in Europe. Its quality and texture are less agreeable, except in very young plants, than are those of turnips and cabbage.

Kohler, ko'lér, Kaufmann, American rabbi: b. Furth, Bavaria, 10 May 1843. After completing his studies at the universities of Munich, Berlin, and Leipsic, he was chosen as rabbi in Detroit in 1869, and two years later elected rabbi of Temple Sinai, Chicago, where he introduced Sunday lectures, a novelty in those days. In 1879 he was called to Temple Beth El, New York. At his initiative in 1885 a rabbinical conference was held at Pittsburg, Pa., which formulated a platform for Reformed Judaism. In later years he frankly receded from the radical standpoint and assumed a more conservative position. In 1903 he was elected president of the Hebrew Union College. He has been a frequent contributor to the Jewish press, and in addition to various volumes and critical papers has written: 'Der Segen Jakobs' (1868), and a 'Guide to Instructions in Judaism' (1900).

Kohlsaat, kôl'sät, Herman Henry, American publisher. He was educated in the public schools of Chicago and Galena, Ill., and after acting as traveling salesman for several years for Chicago firms, became in 1880 a junior partner in a wholesale bakery. He subsequently acquired a fortune in the bakery business and other enterprises, and in 1891 became part owner of the *Inter-Ocean* of Chicago, and in 1894 owner of the *Chicago Times-Herald*, now *The Record-Herald*, and of the *Chicago Evening Post*.

Koko-nor, kô'kô-nôr', or Kuku-nor, a lake in Tibet, not far from the Chinese province of Kan-su. It lies 12,097 feet above the level of the sea. Its very salt waters, exquisitely blue in color, cover 66 miles by 40. It contains five islands, one with a Buddhist monastery.

Kokomo, Ind., city, county-seat of Howard County; on the Wildcat River, and on the Toledo, St. L. & K. C., the Pittsburg, C. C. & St. L., and the Lake Erie & W. R.R.'s; about 55 miles north of Indianapolis. It was settled in 1844 by

KOLA-NUT — KONGO FREE STATE

Daniel Foster, incorporated as a town in 1845 and chartered as a city in 1855. Kokomo is located in a region of good farms, but it is a manufacturing and commercial city. The chief manufacturing establishments are plate, opalescent and table glass works, potteries, steel-mills, a fibre-bond mill, stove works, rubber works, automobile factories, bit works, pulp- and paper-mills; all employing about 7,500 men. There are seven churches, a classical school, a high school, public and parish schools, and a public library. The three banks have a combined capital of \$300,000. The government is vested in a mayor and 10 councilmen, elected biennially. Pop. (1890) 8,261; (1900) 10,609; (1903) 17,000, of which about 1,500 are Germans; 1,000 French, and 1,000 Irish.

J. A. KANTZ,
Editor of 'Kokomo Tribune.'

Kol'berg. See COLBERG.

Kolb's Farm, Engagement at. After the action at Pine Mountain (q.v.), 15 June 1864, Gen. Sherman closed in on the Confederate army defending Marietta and the railroad south to the Chattahoochee, and began the extension of his lines to the right. The Confederates made a corresponding move to the left, and on the night of the 21st Hood's corps of two divisions, Hindman's and Stevenson's, moved from the right, near the railroad north of Marietta, to the Marietta and Powder Springs road, near Zion Church, about four miles southwest of Marietta, and a mile east of Kolb's Farm. Hood now occupied the extreme left of the Confederate line, and had been instructed by Gen. J. E. Johnston to endeavor to prevent any progress of Sherman's right toward the railroad, the course of which was nearly parallel to the Confederate left and centre, and which was seriously menaced by Hooker's and Schofield's corps. On the morning of the 22d Schofield had advanced one division, Hascall's, on the road from Powder Springs Church to Marietta, with orders to take position on Hooker's right, near Kolb's house. Hooker, in going to the right and forward, reached to the Marietta road at Kolb's, and made connection with Hascall's division. Williams' division, massed by brigades, held Hooker's right, Geary's division was on the left of Williams, and Butterfield's division was further to the left on the line of Howard's Fourth corps. Williams and Hascall had very sharp skirmishing in getting into position, and from prisoners taken of Hood's corps it was learned that Hood, supported by Hardee, was about to attack, upon which both Williams and Hascall were ordered to deploy their divisions, and they threw up breastworks, Hascall in heavy woods, and Williams, for the greater part, on open, commanding ground, giving good positions for artillery. The deployment had not been completed and but few breastworks had been thrown up when, about 5 P.M., Hood made his attack. As he advanced from the woods which had sheltered him and concealed his line, his right was met by a terrific fire of shell, case-shot, and canister, that tore great gaps in the line and partially broke up his formation; but he pressed on and, coming under still closer canister fire and deadly volleys of musketry, was repulsed after a most desperate struggle of less than an hour. The attack fell upon the divisions of Williams and Hascall, Williams losing only

130 killed and wounded, and Hascall a less number. Hood's loss was 1,012 killed and wounded and about 100 missing. Consult: 'Official Records,' Vol. XXXVIII.; Cox, 'Atlanta'; Johnston's 'Narrative.'

E. A. CARMAN,

Kol'lock, Mary. American painter: b. Norfolk, Va., 20 Aug. 1832. She studied at the Academies of New York and Philadelphia, as well as in the Julian school at Paris. In 1877 she was elected instructor in painting to the Ladies' Art Association of New York. She has been industrious in filling many canvases with her graceful landscapes and simple genre groups, and her latest works include: 'Road in Normandy'; 'The Italian Brigand'; 'Washing in Pont-Aven, France'; and 'The Gossips.'

Kolmar, kôl'mar, Germany, city and capital of Upper Alsace, formerly in the French department of Haut Rhin, 39 miles south of Strasburg. Its fortifications were destroyed in 1673, and it is now surrounded by boulevards, and entered by three gates. Here is the public library with 36,000 volumes, and some pictures by Schön, Albert Durer, etc.; and the museum, where, among other curiosities, a remarkable aerolite is preserved, which fell near Ensisheim in 1492, and originally weighed about 284 pounds. The portion here weighs about 142 pounds. Kolmar has manufactures of printed goods, calicoes, silks, etc., besides cotton-spinning mills, tanneries, and chamois-leather works. It has a considerable trade in the manufactured goods of Alsace, and in iron, grain, wine, madder, etc.; and in colonial produce, with which it supplies Switzerland. In 1552 Kolmar was surrounded by walls and towers, and made an imperial free town. In 1632 it was taken by the Swedes, who kept it two years. It was united to France in 1697 by the Peace of Ryswick, and surrendered to Germany by the Treaty of Versailles, 26 Feb. 1871. Pop. (1890) 30,411; (1900) 36,736.

Kolyma, kô-lé'má, a river of Siberia, in the government of Yakutsk, which rises in the mountains of Stanovoi-Krebet. After a course of about 1,000 miles it falls into the Polar Sea. The chief tributaries are the Greater and the Lesser Aniuj and the Omolon, which enter it on the left not far from the sea. Afterward the river divides into two, and subsequently into three branches, forming a delta. The Kolyma has sufficient depth for any vessel, but navigation, especially at the entrance, is rendered dangerous by shifting sand-banks.

Kom'ba. See GALAGO.

Kongo, kông'gô, or Congo, Free State, an independent State in Central Africa, constituted in 1885. It is bounded northwest and north by French Kongo and British East Africa, the dividing line being partly the Kongo itself and its tributary the Ubangi; on the east it is bounded by British East Africa, German East Africa, Lake Tanganyika, and British Central Africa; on the south by the Portuguese and British territories. It reaches the Atlantic at the mouth of the Kongo by a narrow neck of land. The territory has an area of about 900,000 square miles, and is divided into 15 administrative districts, namely, Banana, Boma, Matadi, the Falls, Stanley Pool, Kwango, Oriental, Kassai, Lake Leopold II., Bangala, Equator, Ubangi, Welle, Stanley Falls, Aruwimi, and Lualaba, each of these districts being under a commissioner. The northeastern portion of the State,

KONGO RIVER—KONGO-SNAKE

forming fully one third of the whole, is mostly under dense and almost impenetrable forest, but the remainder largely consists of arable land of considerable fertility. Among the cultivated plants are maize, millet, manioc, tobacco, coffee, sugar-cane, hemp, bananas, etc., and most of the fruits and vegetables of Europe have been found to thrive excellently. The wild animals include the elephant, hippopotamus, crocodile, buffalo, antelopes of various kinds, the chimpanzee, soko, etc. The imports consist mostly of woven goods, spirits, tobacco, and firearms, and the exports comprise ivory, rubber, ground-nuts, palm-oil, gum-copal, wax, etc. The climate is very unhealthful to white men, owing to the combination of great heat with a very moist atmosphere, but in a few of the more elevated spots it is much better. There are two rainy seasons, namely, October-December and February-May, the latter being much the wetter, and between these intervene the two dry seasons. There are not as yet many good roads in the State, but there are thousands of miles of navigable rivers. The Kongo is navigable from the sea up to Matadi, and again for 1,000 miles between Stanley Pool and Stanley Falls, but the portion between Matadi and the Pool is obstructed by cataracts. A railway has, however, been opened between these two places. The bulk of the inhabitants are of Bantu stock, but in the extreme north the proper negro type is found, and in some of the eastern parts of the State Arabs and other ethnical groups occur. Large numbers of the inhabitants are cannibals of the most pronounced type, and the vast majority are heathens.

After Stanley had proved the identity of the Lualaba with the Kongo, a Comité d'Etudes du Haut Kongo was formed under the auspices of Leopold II., king of the Belgians; and in 1879 this body commissioned Stanley to return to the Kongo region with a view to preparing for the development of its resources. He established his first station at Vivi, and afterward founded others at Isangila, Manyanga, Leopoldville, Equatorville, Stanley Falls, and elsewhere, several of these being connected by good roads. In 1884 the African International Association replaced the committee, and in the following year it secured the foundation of the Kongo Free State and the recognition of its independence by the Congress of Berlin. Trade and navigation on the Kongo and all the rivers, lakes, and canals connected with it were declared absolutely free, and the suppression of the slave-trade was provided for. Leopold II. was made sovereign, and Brussels was named as the seat of the government. In 1889 Leopold bequeathed his sovereign rights to Belgium. In 1890 the territories of the State were declared inalienable, and in that year also the right was reserved to Belgium of annexing it after 10 years. This convention expired on 3 June 1903, when the Belgian government decided to abandon the project of annexation, allowing the option to expire, the reasons given being popular opposition and the attitude of Great Britain. The central government, located at Brussels, comprises the king of the Belgians as sovereign, and a secretary of state, etc. At Boma there is a governor-general, under whom of course there are numerous officials. There is an army of native Africans, having an effective strength of about 16,000, com-

manded by European officers. Besides Boma, the capital, the chief stations are Banana, Matadi, Vivi, Isangila, Manyanga, Leopoldville, Mswata, Kwamouth, Bolobo, Lubolela, Equatorville, Bolombo, Stanley Falls, Nyangwe, Yambuya, Basoko, Benabendi, etc. Pop. estimated at from 14,000,000 to 30,000,000; number of Europeans (1898) 1,678—mostly Belgians.

Kongo, or Congo, River, Africa, a large river in southwest Africa, flowing into the Atlantic Ocean in lat. 6° S.; lon. 12° 40' E. Its estuary was discovered by the Portuguese, Diego Cam, in 1482; and the lower part of its course was first explored by Capt. Tuckey in 1816. The upper part of the river remained unknown till Stanley, by descending from Nyangwe on the Lualaba to the mouth of the Kongo (1876-7), proved the two rivers to be identical. The Kongo is formed by the junction of the Luapula and the Lualaba in about the same latitude as the mouth. Of these the former issues from the south end of Lake Bangweolo, bends northward, and flows into Lake Moero, on leaving which it pursues a northwesterly course. The chief inflowing river of Bangweolo is the Chambesi, which enters the lake on the east after flowing southwest from the mountains of northeastern Rhodesia. The Lualaba rises by several headstreams in the south of Kongo Free State and flows north and north-northeast through a series of lakes to its junction with the Luapula. The river thence flows north and slightly west to Nyangwe, receiving the Lukuga on the right from Lake Tanganyika, thus being connected immediately with the great lake system of Central Africa. It then follows a northerly course for about four degrees, near the equator turns to the northwest and holds that direction till it reaches about lat. 1° 45' N., when it turns first west and then gradually southwest. About the place where the river first crosses the equator there are seven falls, called Stanley Falls; and about lon. 17° E. and lat. 2° 30' S. there begins a series of cataracts and rapids. In this part of its course it receives some very large tributaries, the most important of which are the Aruwimi, the Rubi, the Mongalla, and the Mobangi (or Ubangi), which join it on the right, and the Boloko, Lopori, Ikelemba, Ruki, and Kwa, which join it from the left, the latter representing the collected waters of the Kassai, the Kwango, Sankuru, etc. Below the Livingstone Falls, near Stanley Pool, the course of the river, which is there contracted, again expands, till at its mouth it attains a breadth of 10 miles. It is navigable for about 110 miles from its mouth up to the cataracts, and above Stanley Pool steamers ply for about 1,000 miles. The amount of water which the river discharges is greater than that discharged by the Mississippi, the volume of water being next to the Amazon. The length of the river is estimated at 3,000 miles, and the area of its basin is about 1,600,000 square miles. Consult: Stanley, 'Through the Dark Continent' (1878).

Kongo-snake, one of the slender amphibians of the family *Amphiumidae*, which take an intermediate place between the cocilians and the salamanders as the lowest family of the tailed (urodelous) amphibians. Several genera occur in Asia and North America. The giant "salamander" (*Cryptobranchus maximus*) of the mountain-streams of Japan sometimes more than

KÖNIGSBERG—KOOKAS

five feet long, and the American hellbender (q.v.) are of the same family. The term "Kongo-snake," however, belongs specifically to the typical genus and species, *Amphiuma means*, which inhabits suitable localities in all the warmer parts of the United States, where it receives its name from the negroes of the Southern States. It is an eel-like creature, with very small, three-toed and almost useless limbs, one pair near the head and the other almost at the caudal extremity, which haunts shallow stagnant waters, is numerous in the southern rice-fields, and is superstitiously feared by many persons although perfectly harmless. It feeds on small fishes, snails, crayfish, insects, etc., which it darts upon in the water or roots out of the mud. It reproduces by eggs, deposited at the end of the summer in a damp place, as under a rotting log, which, provided with shells, are connected by a gelatinous cord, and are protected by the female who coils her body about them and afterward takes care of the young. The embryos have well-developed external gills, but these disappear with growth, and even gill-clefts are greatly reduced in adults.

Consult: Cope, 'Batrachia of North America' (1889); Gadow, 'Amphibia and Reptiles' (1901).

Königsberg, kén'igz-bérg, Prussia, a seaport town, capital of the province of East Prussia and of the government of the same name, on the Pregel, about $4\frac{1}{2}$ miles above where it enters the northeast extremity of the Frische Haff. It was once the Prussian capital, and the residence of the electors of Brandenburg, and still is a residence of the sovereigns and the place of coronation. It is surrounded by ramparts and detached forts. The larger part of the town is on the north bank of the Pregel, on hilly ground, a feature being an ornamental sheet of water with richly wooded banks, called the Schloss-Teich (Castle Pond). The older portion is divided into three parts—Altstadt, or Old Town, on the west, Lobernicht on the east, and Kneiphof, on an island of the Pregel. The town, provided with electric street railroads, has on the whole a modern appearance. The principal public buildings are the cathedral, begun in 1333, an interesting Gothic structure, situated in the Kneiphof; a new Gothic church in the Altstadt; the Haberberg Kirche, a conspicuous church in the southern portion of the city; the Schloss, or palace, a large building, containing apartments for the royal family, once the residence of the grand-masters of the Teutonic Order; the Schlosskirche, occupying a wing of the palace, in which Frederick I. in 1701 and William I. in 1861 placed the crown on their own heads as kings of Prussia; the old citadel of Fredericksburg; the handsome exchange, of recent erection; the university, founded in 1554 by the Margrave Albert, and hence called the Albertine, attended by 800 to 900 students, accommodated in handsome new buildings in the Renaissance style, and having connected with it a library of 220,000 volumes, a zoological museum, etc.; an observatory which the labors of Bessel have rendered famous, a botanical garden, a conservatory of music, museums, an ecclesiastical seminary, and other superior schools; town-house, law-courts, post-office, provincial government buildings, a theatre, a lunatic asylum, an infirmary, and several hospitals and benevolent endowments. The town contains other valuable libraries in addition

to that of the university. The manufactures include machinery and iron castings, woolen cloth, yarn and thread, leather, sail-cloth, copper, steel, and ironware, chemicals, tobacco and cigars, pasteboard, vinegar, articles made of amber, earthen and stone ware, liqueurs, and artificial mineral waters. There are also breweries and distilleries, and some ship-building. Large vessels bound for Königsberg stop at Pillau, which is considered its port. The principal exports are grain, flax, hemp, oil-cake, bones, timber, etc. Königsberg is the seat of many important provincial courts and public offices. It was founded in 1255. In 1365 it became a member of the Hanse League; was the residence of the grandmaster of Teutonic knights from 1457-1528; in 1626 was surrounded with walls; in 1657 it received a strong additional defense in the citadel of Fredericksburg, though the object of the margrave who built it is said not to have been so much to defend the town as to overawe its citizens. It suffered much during the Seven Years' war and from the French in 1807. Pop. (1900) 189,483.

Koo-cha-bee, koo-chä'bē, a food prepared formerly by the Indians from the dried pupæ of certain flies of the family *Ephydriidae*, which form in the water of some of the lakes of northern California and Nevada, and drift ashore in vast numbers in midsummer. They are dried, ground into meal, and baked into edible cakes. A similar food is obtained in Mexico by gathering the eggs of another aquatic fly of the same family, and is called "ahuatle."

Koo'doo, one of the largest species of antelope (*Strepsiceros kudu*), originally found throughout the entire southern and eastern parts of Africa but now nearly extinct in Cape Colony. The males bear great, rough, twisted horns nearly four feet long, and wound in a wide, open, spiral of about two turns; the females are hornless. Both sexes have short hoofs, a fringe of rough hair along the middle of the back and a similar one on the throat; and are marked with narrow vertical stripes on the flanks, a spinal band, and a chevron on the face, all of white. The koodoo lives in pairs or small parties in thick forests, especially on the rough hilly districts of Nyasaland. In many districts it has been decimated by the hide-hunters. A smaller species (*S. imberbis*) inhabits the low bushy countries of Somaliland and the Kilima Njaro region.

Kookas, koo'kaz, or **Kukas**, a sect of fanatical Hindus in the Panjab, which originated after the annexation of that territory to British India (1849), in consequence of jealousy of the equal political rights granted to the Mohammedans of that region under British rule. They are a body of reformers of extreme views, and are hence regarded with as much hostility by orthodox Sikhs as they are by the Mohammedans, whose rights they are anxious to invade. The chief right conceded to the Mohammedans by the British government of India, and objected to by the Kookas, is that of killing cows, which are regarded as sacred animals in the Sikh religion; and it was mainly this practice that led to the consolidation of the most violent and fanatical adherents of the Sikh religion into a distinct sect. Their number has been variously estimated at from 50,000 to 800,000. In 1871 they were incited to attack and massacre the

KOOSOO — KORAN

Mohammedan butchers who killed cows in different parts of the Panjab, but they were quickly suppressed by the British government.

Koo'soo, or Kosin, a bitter drug prepared from the dried flowers of an Abyssinian plant (*Brayera anthelmintica*), which contains much tannin, and is used as a vermifuge.

Kootenay (koo'tē-nā) River, a tributary of the Columbia, rising in British Columbia. It is 400 miles long. After flowing south into Montana and Idaho it again enters British Columbia.

Kopisch, August, ow'goost kō'pish, German poet and painter: b. Breslau 26 May 1799; d. Berlin 3 Feb. 1853. He studied art in the Prague Academy (1815) and in Vienna. From 1819 to 1822 he continued painting, when an injury to his hand disabled him, and he started on travels through Italy, and in Rome and Naples applied himself to the study of local poetry and archaeology. It was he who discovered the famous 'Blue Grotto' or 'Grotto of the Nymphs' on the island of Capri. He returned to Germany in 1823, and received the title of professor in Berlin. He removed to Potsdam in 1847 and occupied himself in writing an account of the royal castles there and in the neighborhood. Most of his pictures are mere sketches. His witty poems, clever stories, and translations, including one of Dante, are all included in his 'Gesammelte Werke' (1856).

Kopitar, kō'pē-tär, Bartholomæus or Jernej, Austrian philologist: b. Carniola, Austrian Hungary, 1780; d. 1844. He was educated at the German gymnasium of Laibach, and completed his studies at Vienna, where he became curator of the imperial library. In 1814 he set out on his travels through Europe, his tour embracing Germany, England, Italy and France, to which last country he went with the special mission of recovering the Slavic manuscripts carried off by the French in 1809. His contribution to philological science consists in pioneer work in Slavic grammar. His principal works are: 'Grammatik der slawischen Sprache in Krain, Kärnten, und Steiermark' (1808); 'Glagolita Clozianus' (1836); and 'Hesychii Glossographi Discipulus Russus' (1839).

Kopp, Georg, gā'ōrg kōp, German cardinal and statesman: b. Duderstadt 27 July 1837. He was the son of a poor weaver and attended the gymnasium at Hildesheim. In 1856 he became a telegraph operator in the employ of the Hanoverian government. From 1858 to 1861 he studied theology and in 1862 entered the priesthood. He rose rapidly in his profession and in 1872 was made vicar-general at Hildesheim and three years later bishop of Fulda. His reasonable ultramontanism was exercised in bringing about a better understanding between the German government and the papal curia. Being elected member of the house of lords he obtained a mitigation of the harsh provisions which characterized the May laws. In 1887 with the approval of the Prussian government the pope appointed him prince-bishop of Breslau, and in 1893 he was made cardinal.

Kopp, Joseph Eutychius, Swiss antiquarian: b. Beromünster, Canton of Lucerne, 25 April 1793; d. Lucerne 25 Oct. 1866. He studied theology and philology in Lucerne and Freiburg, and in 1819 was appointed professor of

Greek in the Lyceum of the former town. While serving in the legislative body of the republic, he was led as a "conservative Catholic" into such bitter controversy with the Jesuits, that in 1845 he was compelled to retire into private life and undertook a tour by way of Vienna to Rome, for the purpose of examining such archives as might throw light upon the history of his native country. He was elected corresponding member of the Academies of Berlin and Vienna. Self taught as he was, he became the Niebuhr of Swiss history, and proved how her true annals had been obscured by such legends as those of William Tell, etc. Among his chief publications are 'Geschichte der Eidgenössischen Bünde' (1862); 'Geschichtsblätter aus des Schweiz' (1856); 'Dramatische Gedichte' (1866).

Köppen, Peter Ivanovitch, pā'tér ē-vän'ō-vich kep'pēn, Russian archæologist: b. Khar-kov, Russia, 19 Feb. 1793; d. Karabagh, Crimea, 4 June 1864. He was educated at the University of Khar-kov and subsequently traveled widely in order to procure historical and archæological material for his work. The outcome of his investigations, written in German, is comprised in the reports of the Academy of St. Petersburg, but among other works of his are: 'Kulturgeschichte Russlands' (1825) and his famous 'Ethnographical Map of European Russia' (1851).

Koran, kō'rān or kō-rān' (Ar. *quran*, *qoran*, reading, from *qara*, read; with the Arabic article, *Alkoran*; also called *Furkan*, salvation, *Al-Mushaf*, the volume, *Al-Kitab*, the book, *Al-Dhikr*, the reminder or the admonition), the sacred scripture of the Mohammedans, written in Arabic and professing to be the revelation of Allah (God) to Mohammed. It contains a code for the government of all Moslem transactions, and is accepted by true Mussulmans as uncreated and eternal. According to orthodox Mohammedan belief it was written from the beginning in golden rays on a magnificent tablet in heaven, and was communicated to Mohammed on the night of Al-Kadr, in the sacred month of Ramadan, by the angel Gabriel, chapter and verse as they stand, on parchment made of the skin of the ram which Abraham sacrificed instead of his son Isaac, in a volume ornamented with precious stones, gold, and silver from paradise. Other traditions are different, one being that Mohammed was assisted in composing it by a Persian Jew and a Nestorian monk. Its revelations cover Mohammed's entire prophetic career, 610-632 A.D. It is the first work known in Arabian prose, its scattered discourses being preserved on stones, palm-leaf ribs, leather, etc. Except in a few instances, Allah is the speaker. Mohammed named the book at the time of imparting the first revelations, and the name was retained for the collection when this was made in 633 by Zaid, son of Thabit, under direction of Abu-Bekr, father-in-law of the prophet. The authorized text, ever since accepted, was produced under the caliph Othman, 650 A.D., from the fragments, originally thrown together without order, and afterward gathered in a volume with no attempt at arrangement, not long after Mohammed's death. In order to free the book from various readings, Othman commanded the destruction of all other copies, and in purity of

KORAN

text the Koran stands alone among religious scriptures. The chronological order has never been clearly determined, and many conjectural rearrangements and subdivisions have been made by Mohammedan and other scholars.

In size the Koran is nearly the same as the New Testament; it is divided into 114 suras or chapters, each beginning: "In the name of God"; the suras have various subdivisions. The Koran is dogmatic throughout; from beginning to end it is dominated by the positive keynote: "There is no doubt in this book." Its author was indebted to many other writers. Of the sacred writings of the Jews he directly cites only the Pentateuch and the Psalms; of the New Testament, with which internal evidence shows him to have been acquainted, he cites nothing; but besides the religious writings of the Jews and Christians he knew the systems of the Magians, the Sabians, and other sects, from whom he derived many materials to be incorporated in a new religion for his own country, where numerous and diverse faiths already existed.

Mohammed lived much in solitude, meditating on his mission and his doctrine; he did not reject the teaching of any sect; asserted his desire to restore the purity of the true faith; announced as his fundamental doctrine the unity of God. This idea, together with conceptions of divine might, sovereignty, compassion, and other attributes of Godhead, is all-pervading in the pages of the Koran; "God is God," it declares, "and Mohammed is his prophet." He felt that the unity of God had been the essential doctrine of all true religion, in which custom and ceremony were but accidents. "We make no difference," he says, "between that which God has taught us and that which Abraham, Isaac, Ishmael, the twelve tribes, Moses, and Jesus have learned from the Lord." "God commands thee to receive the religion which he prescribed to Noah, which he has revealed unto thee, and which he imparted to Abraham, Moses, and Jesus." To Jesus Mohammed assigns a place in the seventh or highest heaven, in the immediate presence of God.

The Koran dwells much on the resurrection and the last judgment, setting these forth somewhat after the manner of the Apostle Paul: "When the trumpet sounds the second time, they shall rise quickly from the graves to appear before God." "A sound of the trumpet of judgment will assemble all men before my throne, and every one shall there receive the reward of his deeds." In its presentation of the last judgment the Koran resembles the teachings of the Jews and the Magians; in the passage of the narrow bridge to paradise—Al-Sirat, over the abyss of hell, finer than a hair, sharper than a razor; in the book wherein all the actions of men are set down, and the scale in which they are weighed. Quite Jewish and Magian also are the Mohammedan views of paradise. The doctrine of predestination as contained in the Koran was successfully employed by Mohammed to encourage his followers in the face of every trial and danger. Herein he probably availed himself of beliefs already widely held, especially among the Sabians, with their worship of intelligences supposed to reside in the heavenly bodies, controlling the lives of men and the course of events, and by the Magians, who held a system of dual-

ism, the influence of these beliefs having exerted itself upon the Arabians.

In the matter of religious exercises Mohammed largely adopted such as he found, to those which were narrow or vague, giving more of universality and precision. The Koran prescribes prayer, fasting, alms, and the pilgrimage to Mecca; prayer embraces ablutions, purifications, and all other exercises needful to preparation for it; to those who sought to be relieved from these observances Mohammed replied, "Religion without prayer is nothing"; prayer he calls "the key to paradise." Surpassing the severity of the rabbis, he prescribed prayer five times a day, with the face of the suppliant turned toward Mecca. To give alms was always an Arabian practice, but the Koran makes it obligatory. Concerning polygamy, divorce, inheritance, etc., it follows the law of Moses and the decisions of the rabbis, adapting them to the prejudices and customs of the prophet's people; it forbids few of the old practices save idolatry; "God," it says, "intended that his religion should be easy, else, as he well knew, you would only become hypocrites."

Although the Koran is written in prose, the different parts of a sentence end in rhymes, and there is marked diversity of style, yet withal an impressive unity, characterized by a free and forcible eloquence unequaled in any other Arabic writings. The earlier utterances of the prophet seem often to be outbursts of unbridled imagination, though still the solemn words of prophetic earnestness proclaiming God with power to reach and sway the hearts of men. In later portions of the book the tone takes more of calmness; imagination is subdued; the author dictates extended passages to be taken down by his hearers. The highest elevations are where he speaks of the greatness of God and describes the last judgment, the pleasures of paradise, and the pains of hell.

The moral precepts of the Koran exhibit a lofty feeling of humanity and a profound sense of ethical law reduced to most practical forms. They inculcate all the noblest virtues and pieties—obedience to divine commandments, charity, humility, mildness, temperance, toleration, and the strong virtues of courage, faith, and justice. To death in the cause of religion it ascribes a peculiar merit. The influence of this book through many centuries and among many peoples has been vast, and it still controls the lives of a great portion of the human race. "From the Atlantic to the Ganges," says Gibbon, "the Koran is acknowledged as the fundamental code, not only of theology, but of civil and criminal jurisprudence; and the laws which regulate the actions and the property of mankind are guarded by the infallible and immutable sanction of the will of God." The divinity and authority of the Koran have at times been assailed among Mohammedans themselves. The first serious heresy, about 740, was suppressed by the execution of its chief author, but appeared again in the next century, and was not finally crushed out until 842, when Harun II. prohibited all discussion regarding the character of the Koran, which has since been everywhere held by Mohammedans in admiration as the great Arabian classic, and in reverence as the book of religious authority. Once each day it is read through in the mosques of the Sultan and in the adjoining chapels. By the faithful

KORAS — KOREA

it is never carried below the girdle; not without their own purification may they even touch it; and on walls, doors, banners, etc., its texts are frequently written.

Commentaries on the Koran are almost innumerable. The library of Tripoli, in Syria, is said to have contained no less than 20,000 of them. Many editions have been published in different countries. For English readers that of Sale (1734), with its comprehensive introduction, covering all the important aspects of Mohammedanism, is still of prime value. The translation of E. H. Palmer's (1880) is authoritative, as is also that of Rodwell (2d ed. 1876). Several versions in German have appeared in which it was attempted to reproduce the rhyming style of the original: J. von Hammer's (1811), A. Sprenger's (1861-5), Fr. Ruckert's (1888), and M. Klaproth's (1890). Other editions which have their special values are Hinkelmann's (1694), Maracci's (1698), and Flugel's (1883). Consult: Sprenger, 'Leben und Lehre des Mohammed'; Kremer, 'Herrschende Ideen d. Islam'; Braun, 'Gemälde d. Islam'; Deutsch, 'Islam'; Dozy, 'L'Histoire d'Islamisme'; Muir, 'Life of Mahomet and History of Islam'; Gibbon, 'Decline and Fall,' ch. L.; Irving, 'Mahomet and his Successors'; Carlyle, 'Heroes,' 'The Hero as Prophet'; Lane, 'Selections from the Koran'; Johnson, 'Oriental Religions: Persia,' sec. "Islam"; Conway, 'The Sacred Anthology' (for many good extracts from the Koran); Hirschfeld, 'New Researches into the Composition and Exegesis of the Koran (Eng. trans., 1902). Kordofan, kör-dō-fän', a province of Egyptian Sudan in lat. $12^{\circ} 30'$ and $15^{\circ} 30'$ N.; lon. $29^{\circ} 20'$ and $31^{\circ} 30'$ E.; between the White Nile and Darfur. The surface is generally flat and the soil naturally fertile. The principal articles of export are gum, hides, and senna leaves, all monopolized by the government as most lucrative; ivory, cattle, tamarinds, ostrich eggs and feathers, gold, salt, slaves, etc.; the imports spices, sugar, coffee, sulphur, rice, soap, cotton and linen cloth, etc. From 1821 onward Kordofan was subject to the Viceroy of Egypt, the country having been subdued by Mehemet Ali. In 1883 it took part in the successful Mahdist revolt, but was regained for Great Britain and Egypt in 1898. Pop. about 300,000, chiefly Arabs.

Korea, or Corea (from the native pronunciation of Chinese Kao-li—see *History*; Li Tan in 1392 revived the old name Cho-sen or Cho-són, Chinese "morning freshness" or "dawn-land"—that is, "the east"; in 1897 the official name was made Dai Han). An Asiatic kingdom northeast of China, comprising a strip of coast and a peninsula projecting southward from Manchuria, divided from it by the great valleys of the Yalu or Amnok southwest and the Tuman northeast, both rising in the colossal peak of Paik-tu (White Head), 8,300 feet high. The Japan Sea divides it from Japan, whose southernmost island (Kiushiu) approaches its southern tip within 100 miles, separated by Korea Strait with large islands midway; to the west, Korea Bay and the Yellow Sea, marked off by Shantung peninsula, divide it from China. A dense archipelago fringes it south and west. Its parallels

are from $34^{\circ} 17'$ to 43° N., or about the same as from Concord, N. H., to Wilmington, N. C., and average much south of Ital'y; its meridians, $124^{\circ} 38'$ to $130^{\circ} 30'$ E. It is about 600 miles long by 135 broad; area 80,000 to 90,000 square miles. Population probably 15,000,000 to 20,000,000.

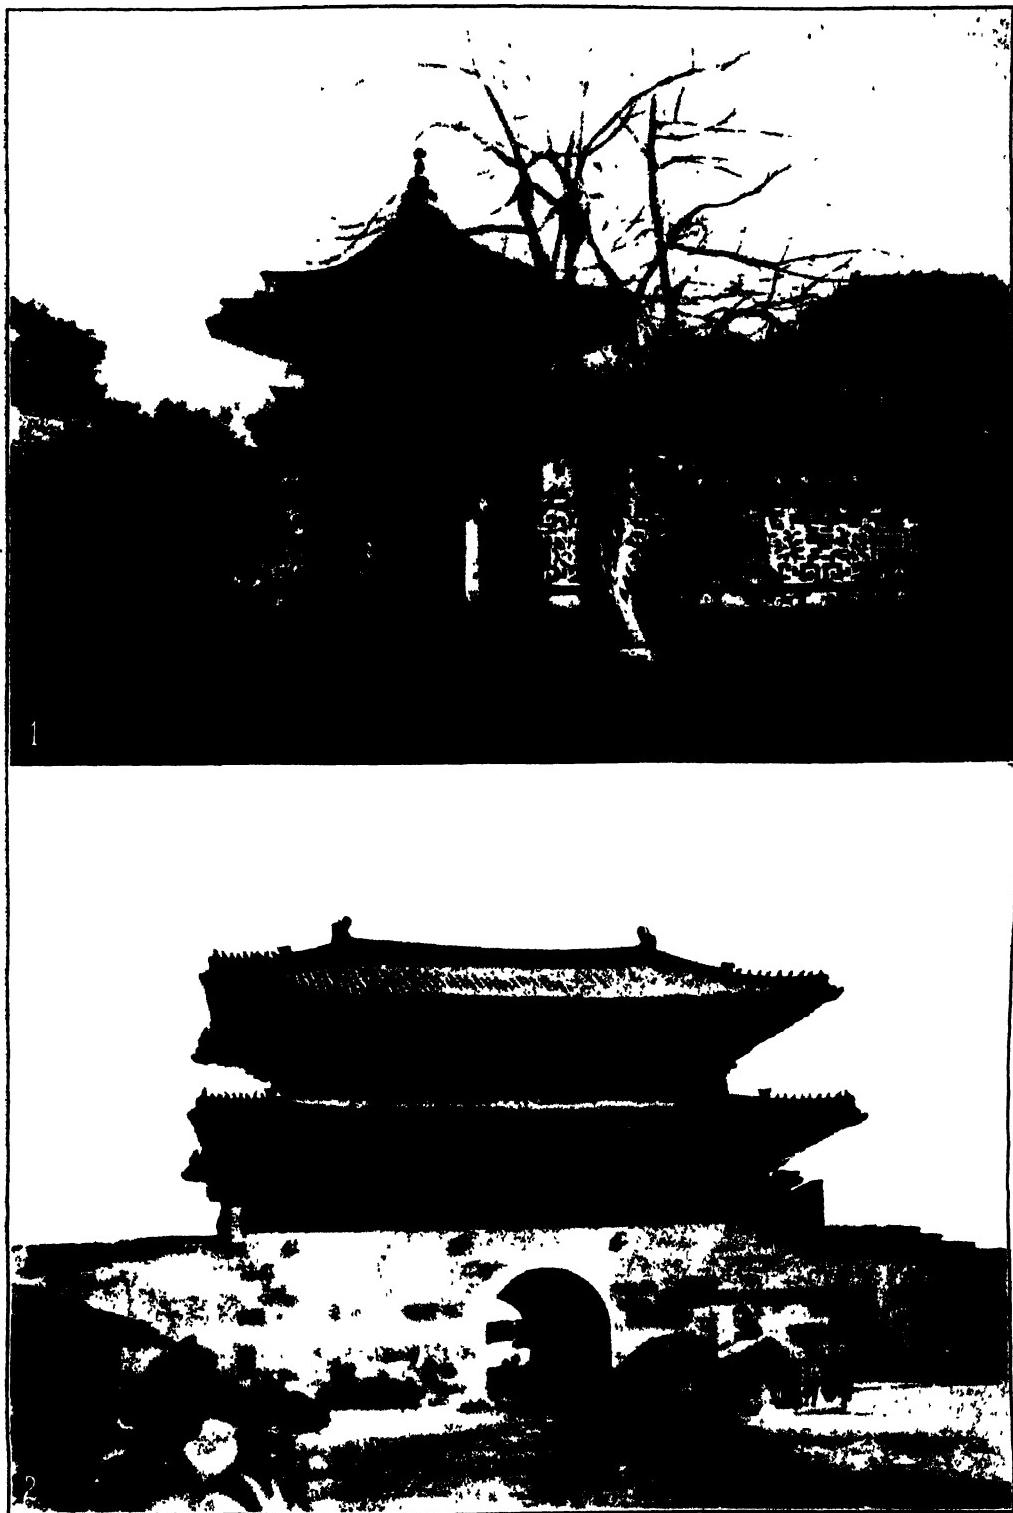

Korea is traversed north to south by a mountain backbone of striking individuality: a perpetual zigzag, skirting the eastern shore with slender coast-lands, in a steep solid wall unbroken for hundreds of miles save by Yung-hing or Broughton's Bay at the northern neck. In the north it has summits 4,000 to 8,000 feet high, and at Cape Pelissier, about lat. 37° , culminates in Mt. Popoff (4,800 feet); thence the main chain turns southwest, and ends in the extinct volcano of Mt. Auckland (6,700 feet), on Quelpaert Island, while to the east it throws out low hills and plateaus. The islands of the southern archipelago, verdant rocks worn into the semblance of fantastic castellated ruins, are the ends of its spurs. On the eastern side the ridge is timbered to the summit; on the west almost treeless, and seamed with deep ravines shallowing out into broad fertile plains, occupying most of Korea. On the east below the boundary there is but one river of any size, the Nak-tong along the southeastern uplands, and almost no islands; the west has 10 considerable streams, and the coast is thickly notched with harbors and fringed with fertile islets.

The chief rivers are, from the north: The great Yalu or Amnok, a mile wide and rising 40 feet in flood, navigable 30 miles for seagoing junks, and 175 for boats, to Wi-wön. Opposite it the Tuman. The Tai-dong or Ta-tong, navigable for boats 75 miles to Ping-yang. The Han ("the river"), rising on the western slopes of the eastern ridge but 30 miles from the Japan Sea, draining nearly the whole breadth of the peninsula with two main arms, and flowing into a bay of the Yellow Sea among islands. About 30 miles up lies Seoul, the capital, and a line of small steamers runs between it and Chemulpo, on Imperatrice Gulf as much farther south; boats ascend nearly 100 miles more. The Nak-tong (above) empties into Korea Strait near Fusan, and is navigable 140 miles for vessels drawing $4\frac{1}{2}$ feet. The best harbors are Gen-san and Port Lazareff, on Broughton's Bay; the best on the south coast is Fusan on Korea Strait. The tides on the west and south are very high and rapid, often leaving vessels stranded on mud banks.

The climate is much like that of the eastern coast of America in the same latitudes; the north and centre have very hot summers and severe winters; the south is like the Carolinas, and tempered by the ocean breezes. The Han is frozen in winter so that at Seoul, where it is 400 yards wide, is available for cart traffic three months of the year, from December to February. The rainfall averages 36 inches, 22 in the crop season. A fall of only 4.1 inches in 1901 created a famine.

Flora and Fauna.—There is a great variety of excellent hardwood timber on the east slopes and the northern mountains; in the west it is scarce and sparingly used; lack of coal has caused much wasteful denudation in other parts. The one surpassing animal of the native fauna is the man-eating tiger, who fills the native proverbs and literature, depopulates whole vil-

KOREA

laces, and even besieges houses for days, sometimes leaping on the thatched roof and tearing his way down through. Besides him there are leopards, tiger-cats, and foxes; deer, beaver, badgers, otters, martens, etc., and a great variety of birds.

Products.—The great native crop is ginseng, which grows wild in the Kange Mountains, and is extensively cultivated about Kai-seng; it is a government monopoly, and despite much smuggling, yields some \$500,000 a year, or a ninth of the state revenue. Among other products are rice, wheat, millet, sesame, Indian corn, beans, cotton, hemp, and perilla (for oil and pigment). The domestic animals are few. The cattle are excellent, the bull being the usual beast of burden; the ponies very small but hardy, fowls good, pigs inferior. Iron ores of excellent quality are mined; and there are copper mines in several places. In 1886 the value of gold exported was \$503,296; the silver output is very small. Three fourths of the trade is with Japan, and over four fifths of the remainder with China.

Government.—This is a hereditary absolute monarchy: till 1895 tributary to and receiving investiture from China, and like it in administrative forms, with officials appointed by examination in the classics. On the declaration of independence (see *History*), the entire system was abolished, as well as the privileges of the aristocracy, and a cabinet of 10 ministers in charge of different departments formed, who with five councillors form a grand council of state to lay measures before the emperor. Till 1896 the country was divided into eight *do* or provinces; it was then redivided into 13, including a metropolitan province around the capital. These are divided into 339 *kun* or prefectures, 7 under *pu-yan* or city governors; 4 treaty ports are under *kamni* ("trade overseers"), ranking with consuls. The revenue is about \$4,500,000 a year. The standard is gold, and a native coinage is made, supplemented by Japanese paper and coin. The weights and measures are the same as the Chinese. There is an army of 17,000 men with foreign training and equipments, and a bodyguard of 1,000, but no navy.

Social Conditions and Education.—The usual dwellings are mud hovels thatched with straw, and the conditions of life for the masses, as in China, are hard and squalid; but actual distress is rare and beggars are few. Caste till recently was iron-bound, and no offices of even local importance could be held by other than nobles, who are distinguished by colored clothing and horsehair hats. Women are secluded; concubinage is allowed, but only one legal wife at a time. The immemorial system of education was almost wholly in Chinese, which contained the only written memorials needing it, and was of Chinese classics. But in 1894-5 a department of education was established, and a thoroughly graded public-school system, including normal training. There are also schools of foreign languages taught by speakers of the languages.

Religion.—See *History* for the vicissitudes of Christianity. There are now about 30,000 Roman Catholic and 2,500 Protestant natives. The popular religion is the degraded Shamanism (q.v.); the higher classes are Confucians; the anciently all-powerful Buddhism, crushed by

the revolution of 1392, is slight and uninfluential, with a few ignorant monks.

Population.—The people are a mixed race of disputed elements, apparently Mongoloid and Aino with Manchu and Malayan infusions. As in all Eastern countries, where a census means a tax and conscription list (see *CENSUS*, par. 1), no accurate statistics can be had. An official census of adult males liable to tax in 1900 was 5,608,351; which must mean toward 20,000,000 total population, enormous as the figure is for an agricultural people on this size of territory. Foreign population 21,783, including 16,142 Japanese and about 5,000 Chinese.

The chief cities are Seoul (Han-yang), the capital, estimated at over 200,000; Ping-yang, perhaps 40,000; and Kai-seng. A trolley line nine miles long, built 1899, is operated in Seoul by Americans.

History.—The traditional founder of Korean nationality is the Chinese noble Ki-tse, who left China with 5,000 followers 1122 B.C., and established a kingdom with capital at Ping-yang. The first authentic history is the annexation to China 108 B.C. A century or so later it split into three princedoms, of which, about 960, Koryu (Kao-li) came to the front, probably from borrowing the higher Chinese civilization. It recast the administration upon the Chinese model, introduced Chinese methods and arts, and initiated several centuries of brilliant progress and prosperity, enriched by art and literature. Buddhism was the paramount religion, and developed a powerful and rigid ecclesiastical hierarchy. As a result, a Protestant movement took place, and in 1392 a revolution headed by Li Tan founded the present dynasty and expelled the priests. The capital (*seoul*) was fixed at Han-yang. When the Manchu power began to rise in the 15th century, China, to protect herself against its ravages, desolated a strip of fertile territory many thousand square miles in extent, then or early in the 17th century destroying four cities and many villages and removing 300,000 inhabitants; and down to 1875 this zone of 60 miles wide by 300 long was kept as a permanent buffer between China and Korea. During the rise of the Japanese shogunate out of the 16th century anarchy, Hideyoshi, as a preliminary to invading China, sent an army into Korea, rapidly overrunning it. But Korea is like Spain, easy to conquer and impossible to hold; and the stolid resistance of the natives, with the Chinese armies, gradually forced the Japanese out of the peninsula six years later, retaining Fusan on the southeast coast as a trading station. Thirty years later the Manchus, previous to their conquest of China, invaded it and exacted a tribute, which was continued to the Manchu dynasty in China; in 1653 it was reduced to a third, and for generations down to 1894, when it was finally abolished, had been only nominal, as an acknowledgment of Chinese supremacy and a trading license. But the Chinese wisely attempted no permanent occupation.

Korea had always as intense a determination to seclude herself from foreign influences as ancient Egypt, and practically the first knowledge obtained of it by modern Europe was through the shipwreck of some Dutch on the coast in 1653, though the Jesuit missionary Cespedes had entered it in 1594. In 1784 new missionaries came and planted Christianity in the peninsula,

KOREA

despite steady persecution; in 1835 the French missionaries reinforced them. But in 1864 came a fiercer blast. The then king died childless, and his oldest widow set aside the natural successor, her nephew, and nominated Yi-Hevi, the present king—the 12-year-old son of a royal prince, Ni-Kung, whom she made regent. The latter was a savage reactionist, and let loose fire and blood to extirpate the foreigners, rigidly excluding all new ones. A futile French expedition was sent against him in 1866; the same year a stranded American schooner, the General Sherman, was burnt and her crew murdered in sight of Ping-yang. An American expedition sent in 1871 had no success. Meantime several nations were attempting to force Korea into treaties of commerce and gain trading privileges, but Japan was the first to succeed, having the ports Gensan and Fusen opened in 1876, and Chemulpo in 1880. Meantime the "neutral strip," for many years a nest of brigands and pirates, was abolished by Li Hung Chang in 1875. In 1882 Commodore Shufeldt negotiated a treaty of friendship between the United States and Korea, and thence on, other nations were rapidly admitted—Great Britain and Germany in 1883, Italy and Russia in 1884, France in 1886, Austria in 1892, and China in 1897.

The flood of new ideas and habits aggravated the conflict between the progressives and the reactionaries, in which the former won, and Korean embassies began to visit other countries,—Japan in 1880, the United States in 1883. The nativists raised an insurrection in 1884. The greatest breach with the past, however, was the result of the Chinese-Japanese war of 1894-5, one of the pretexts of which was the action of China in assuming the ancient suzerainty over Korea. It was at Ping-yang that the first heavy defeat was inflicted on the Chinese, and off the Yalu River that the Chinese fleet was destroyed. On 8 Jan. 1895 the king of Korea proclaimed its independence, and the Chinese Gate at Seoul was publicly destroyed with impressive ceremonies. The Treaty of Shimonoseki was then made with Japan; and Korea has become a "sphere of influence" for the Japanese, who will not let it mold in antiquarian ideas. The present conflict, however, is not between Japan and China in the control of Korea, but between Japan and Russia, the latter needing southern ports for her Pacific empire, the former thinking that Russian control of her neighbor means the permanent crippling of her naval development—in which the history of England might reassure her. In 1897 the king proclaimed the country an empire, named it Dai Han, and took the title of emperor.

Language.—Korea since early times has employed two languages: Chinese for writings and native Korean for speech, Chinese if spoken being an acquirement like French in America. The literature in Chinese is sometimes translated into Korean, however; and the recent Korean declaration of independence has produced a revival of appreciation for the native tongue, as with so many other nations from like causes. The reforms of 1897 were proclaimed in the vernacular.

Korean is of a not extreme agglutinative type, belonging to the polysyllabic branch of the Mongol-Tartar languages like Japanese, and unlike the monosyllabic Chinese; it is structurally

unrelated to the latter, though it has very many Chinese loan-words, pronounced after its own phonology. Its resemblances to Japanese are far closer: mutual translations word for word, and even particle for particle, are quite feasible. The particles and grammatical terminations in both represent punctuation, emphasis, and inflection of nouns and verbs. The honorific vocabulary—almost a complete ceremonial language even in construction, to express relations between superiors and inferiors, and equals—is common to both. The differences are mainly euphonics: Korean vowels are heavily assimilated to those which follow, the syllables need not end with a vowel, and the spelling is as irregular as English, none of which is true of Japanese.

The grammar of Korean is extremely flexible and pregnant; like Chinese, the roots are invariable. There are no inflectional forms for number, person, or case, or conjugation of verbs, and no form for gender; all are indicated by particles without meaning, or whose meaning has been lost, affixed to the stem, and varying with its terminal letter, as consonant, vowel, or liquid. There are no pronouns of the first and second person; the third, with relational particles, serving for both. Development has depended itself on the verbs, which are marvels of varied, flexible, and ingenious expressiveness. Many words not primarily verbs can be turned into them (as in English), and these with the true verbs constitute 20 per cent of the entire vocabulary. The grammatical forms of the verb are said to average 300. Adjectives and adverbs are not distinguished from the verbs, and the prepositions are verb forms. All conditions expressed by inflections in Western languages—present, continuing, past, unfinished or completed, optative, subjunctive, potential, interrogative, participial, etc.—exist in Korean, and a vast number of others expressed by us in long sentences. Some verbs have no passive, but all have a negative voice. There is no number; the three persons in every variant are expressed by courtesy forms—one to or of superiors, one for equals, one for inferiors or of things. The syntax is positional, as with Chinese. The object precedes the verb or other governing word, the prepositions are postpositions, the adjective precedes the noun it qualifies and the adverb its verb or adjective (as in English). A dependent clause precedes its principal.

Korean has an alphabet of 25 letters, 14 consonants, and 11 vowels; a very simple and scientific one, analyzed by organs of speech. The vowels are a, ya, ü, yü, o, yo, u, yu, i, eu, ä; with the diphthongs e, e, e'. The consonants are—labials, p, ph, m; dentals, t, th, n, l; palatals, ch, chh, s; gutturals, k, kh; laryngeals (?) h, ng final. There are no letters f, v, w, b, d, g, j, or z, though (except the first, which is replaced by p) they exist in speech. There is but one character for l and r, and neither of them can begin a word, their place being taken by n. The characters—women and children's only, the true "learned" characters being Chinese—are of an extreme simplicity, contrasting strongly with the complex Chinese; and there is a cursive form. This alphabet is called *onmun*, "the vulgar"; and there is a system called *nido*, in which the letters are grouped in the 109 possible combinations and learned by rote. The writing is in syllables, in columns from right to left, as with Chinese.

Ko'ren, John, American statistician: b. Decorah, Iowa, 3 March 1861. He was graduated from Luther College in his native town and from Concordia Theological Seminary, St. Louis, and has since been prominent in investigations of the liquor problem, in State and municipal employ. He has published: 'Economic Aspect of the Liquor Problem'; 'The Liquor Problem in its Legislative Aspects' with F. Wines (1897-8).

Körner, Karl Theodor, karl tā'ō-dōr kér-nēr, German poet: b. Dresden 23 Sept. 1791; d. 26 Aug. 1813. After studies at Freiberg, Leipsic, and Berlin, young Körner, through Kotzebue's influence, was appointed dramatist to a Vienna theatre, and wrote light comedies, such as 'The Green Mask' and 'The Night Watches,' and some tragedies, of which 'Zriny' was the most successful. In the uprising of the German nation against Napoleon, Körner not only displayed heroic personal courage in many encounters, but wrote numerous patriotic songs. These were published in 1814 under the title of 'Lyre and Sword.' The most famous of these pieces is the 'Sword Song,' composed only a few hours before the author fell in a skirmish, between Schwerin and Gadebusch.

Kosciuszko, kōs'-ūs'kō, Pol. kōs-choosh'-kō, Thaddeus (Polish TADEUSZ), Polish patriot: b. Mereczowszczyzna, Lithuania, 12 Feb. 1746; d. Soleure (Solothurn), Switzerland, 15 Oct. 1817. He was educated in the military school at Warsaw, and completed his studies in France. On his return to Poland he became suitor to the daughter of Sosnowski, marshal of Lithuania, but his love meeting no return he betook himself to America (1777). Having attracted the notice of Washington, he was appointed him engineer, with the rank of colonel, and afterward general of brigade. He performed excellent service and at the end of the war received the thanks of Congress, with the brevet of major-general. He returned to Poland in 1786, and on the occasion of the reorganization of the Polish army in 1789 was appointed major-general, and having declared for the constitution of 3 May 1791, he fought in the war which soon after broke out, with the rank of lieutenant-general. When Stanislaus Augustus in 1793 agreed to the second partition of Poland, Kosciuszko withdrew from the army and retired to Leipsic. At this time the legislative assembly in France conferred on him the

title of French citizen. When a new insurrection broke out in Poland for the purpose of delivering the country from the Russians in 1794 Kosciuszko was recalled and made commander-in-chief of the insurgent army. He defeated the Russians at Raclavice, but at the battle of Maciejovice his army was defeated, and he himself wounded and taken prisoner. He remained in captivity for two years, and he then proceeded to England, and thence to America. In 1798 he returned to Europe on a mission from Congress to France, and contributed to bring about an understanding between the latter country and the United States. In April 1814, he addressed a petition to Alexander I., emperor of Russia, requesting him to grant an amnesty to all expatriated Poles, to accept the title of King of Poland, and to give that country a free constitution similar to that of England, but the petition remained without effect. In April 1817 he issued a letter of emancipation to the serfs on his estate of Siechnovice, in Poland. His death was occasioned by a fall from his horse. In 1818 his body was removed at the expense of the Emperor Alexander of Russia to Cracow, where it was buried in the cathedral, and a monument erected to him.

Consult: Lives by Falkenstein (1834), German; Chodzko (1837), French; Paszkowski (1837), Polish.

Kosciuszko, Mount, in Australia, one of the highest mountain peaks in the Muniong Alps, in New South Wales, near the frontier of Victoria. It is 7,308 feet high.

Kos'mos. See COSMOS.

Kossuth, kōs-sooth', Hung. kōsh'oot, Lajos (Louis), Hungarian patriot: b. Monok, Hungary, 27 April 1802; d. Turin, Italy, 20 March 1894. He came of a family of noble rank and of the Protestant religion, studied and practised law, and in 1832 entered the parliament of Pesth, becoming also editor of a newspaper circulated in writing. For persisting in publishing the parliamentary debates he was condemned to four years' imprisonment, but was released in 1840 before the end of this period. In 1841 he became editor of the Pesth 'Journal,' a paper that advocated very advanced views; and in 1844 founded the national league in opposition to the Viennese government. In 1847 he was elected to the Hungarian diet by the national party, and in 1848 became minister of finance in the Hungarian government. His influence had much to do in bringing about the revolution which followed, and in which he played the most prominent part, being appointed governor or dictator by his fellow-countrymen; but the intervention of Russia rendered all the efforts of the Magyars unavailing. He resigned his position in favor of Görgei (whom he accused of treachery), and in 1849 he found it necessary to take refuge in Turkey, where he was kept as a prisoner. Being released in 1851 through the influence of Great Britain and the United States, he soon after visited both these countries and was received in the most enthusiastic manner. He endeavored subsequently to induce Napoleon III. as well as Victor Emmanuel to act against Austria in favor of Hungarian independence, but without success. Though by the amnesty of 1867 he might have returned to his native land he did not do so, but lived chiefly in Italy, and was

KOTO — KRAFT

never fully reconciled to the union that had taken place between Austria and Hungary. His 'Memories of My Exile' appeared in English in 1880.

Ko'to, a Japanese musical instrument, having a long box, larger at one end than the other, and with a convex top over which 13 silk strings are strung and fastened tightly at each end, each string having a bridge. To tune the instrument it is necessary to move the bridges. The instrument is played with both hands like a harp.

Kotow, kō tow' or -tō', a Chinese form of obeisance; the ceremony of prostration, in which an inferior, kneeling, touches his forehead to the ground. Kotowing is unknown outside of China.

Kotzebue, August Friedrich Ferdinand von, ow'goost fred'rih fer'di-nand fōn kōt'-sē-boo, German dramatist and Russian official: b. Weimar 3 May 1761; d. Mannheim 23 March 1819. In 1781 he went to St. Petersburg, where, obtaining the patronage of the empress, he was made governor of Esthonia and ennobled. About 1800 he returned to Germany, and attacked Goethe and other great German authors who had refused to associate with him. In 1806 he went again to Russia, and lived from 1807 on his estate Schwartze, in Esthonia. In 1813, as counsellor of state, he followed the Russian headquarters, constantly writing to excite the nations against Napoleon. In 1817 he received a salary of 15,000 roubles, with directions to reside in Germany, and to report upon literature and public opinion. Kotzebue, who during the whole campaign had written in favor of the Russians, even at the expense of his native country, and had expressed the utmost contempt for liberal principles and institutions, was now odious in the eyes of most of his countrymen, and regarded as a spy. This feeling was so strong in the case of a young enthusiast named Sand, that he assassinated him as a traitor to liberty. Kotzebue wrote more than 100 plays, a history of Germany and other works, most of which are now forgotten. Two of his plays, 'The Stranger' and 'Pizarro,' are still performed on the English stage.

Kotzebue, Otto von, Russian navigator; second son of A. F. F. Kotzebue (q.v.): b. Reval 30 Dec. 1787; d. there 15 Feb. 1846. In his 17th year he accompanied Krusenstern in his voyage round the world. In 1815 he was appointed to the command of the ship Rurik, destined to ascertain the practicability of a northeast passage in the direction of Bering Strait. He discovered several groups of islands in the Pacific, and a large sound on the southeast of Bering Strait, which now bears his name; and returned after a three years' absence. The results of the voyage were published in a work called 'A Voyage of Discovery in the South Sea and to Behring's Strait in Search of a Northeast Passage' (1821-23). In 1823 he was commissioned by the Emperor Alexander to make a third voyage round the world. He returned in 1826, publishing the results of the voyage in a work which has been of great importance to hydrography, particularly that of the Pacific, 'Neue Reise um die Welt' (1830).

Kou'miss. See KUMISS.

Kuropatkin, Alexei Nikolayevitch, Russian soldier: b. 17 March 1848. He was trained for the army in the Imperial Military College and the Academy of the General Staff; was sent abroad to study military conditions in various European countries; in 1874 became a member of the general staff of the army; in 1876-7 assisted Skobeleff in the conquest of Khokand, Turkestan, and its reorganization as the territory of Ferghana; and in 1877-8 won high distinction in the Russo-Turkish war by his services at Plevna and the Chipka Pass. In 1878 he was made colonel and in 1878-9 was chief of the Asiatic bureau of the general staff. In 1880-1 he was in Middle Asia, where he commanded the main detachment against the Tekke-Turkomans, and, after a forced march of 600 miles across the desert, stormed Geok-Tepa, by which victory he won his greatest reputation. He was made major-general in 1882, lieutenant-general in 1890, governor of the Trans-Kaspian district and commander of the troops in that district in 1890, and minister of war in 1898. In 1901 he became general of infantry. At the outbreak of the hostilities with Japan, he was sent to command the Russian forces in the Far East. As a military writer he is favorably known by several volumes, including 'Kashgaric' (1879), for which he received the gold medal of the Imperial Russian Geographical Society; 'The Operations of the Troops of General Skobeleff during the War of Russia with the Turks' (1885); etc.

Kowloon, or Kaulun, a district in China, forming a peninsula at the mouth of the Canton River.

Koyunjik, koo-yoon-jēk', or **Kuyunjik**. See NINEVEH.

Kraft, kräft, Adam, German sculptor: b. Nuremberg 1440; d. Schwabach, Bavaria, 1507. Nothing is known of his teachers, his student travels or his fortunes. His known productions begin with the seven reliefs (Stations of the Cross) set up in Nuremberg 1490 near the entrance of Saint John's Church; these are now in the German Museum, their original place being taken by sandstone copies. He executed many sepulchral monuments, and in the Church of Saint Sebaldus is the statue he made for Sebald Schreyer, 1492. In the choir of the same church is his bas-relief of three scenes from the Passion, the figures being life-size. He also carved the monument for the Pergerstorff family in the Frauenkirche (Church of St. Mary, the Virgin); that for the Landauer family in a chapel of the Church of St. Egidius. His last work was the Entombment, a group of 15 life-size figures in the mortuary chapel of the Holzschuhschen family, a part of the Church of St. John (1507). He also executed several works of minor importance, as decorations of private and public buildings. His masterpiece is the tabernacle in the Church of Saint Lawrence which he took seven years (1493-1500) in completing. It is more than 50 feet high, and is an example of gorgeous Gothic carving enriched with numerous figures. At the foot he has placed his own portrait, life-size. His style is bold and vigorous, his conceptions are profoundly religious, and his power of life-like characterization is wonderful. He is the finest exponent of the Nuremberg school of Gothic sculpture.

ALEXEI NICOLAEVITCH KOUROPATKIN.

KRAIT—KREOSOTE

Krait, one of the most dreaded of Oriental poisonous snakes (*Bungarus caeruleus*), nearly related to the cobras. It inhabits nearly all India and Ceylon, is very common in Bengal and southern India, and causes more deaths than any other snake, since in its pursuit of rats, lizards and snakes, it frequently enters camps and village houses; furthermore, its venom is astonishingly rapid in its effects. It reaches a length of four feet, has smooth scales, a ridge along the spine, no hood, and is bluish or brownish black with highly variable bars and markings of yellow and white. Other deadly species of the same genus of bungars or rock-snakes are the larger *raj-samp* or "king-snake" (*B. fasciatus*), noted for its active killing of cobras and other snakes; and other species in Ceylon and the Indo-Chinese region. Consult the works of Fayerer and of Ewart on the poisonous snakes of India, and the 'Proceedings' of the Zoological Society of London for 1899.

Krakatoa, a volcanic island in Sunda Strait, between Sumatra and Java; area, 6 square miles, formerly about 12 square miles. The island, now uninhabited, is known as having been the scene of a terrific volcanic eruption on the night of 26–27 Aug. 1883. The volcano had been practically inactive for over 200 years until May of 1883, when there were indications of an eruption, which culminated at the date mentioned. A number of explosions occurred, the noise of which was heard for many miles. A mass of rock, in the form of dust, ashes, and small stones, and of the volume of about a cubic mile, was thrown up for a considerable distance. The dust was projected, vertically, nearly 20 miles, and distributed to all parts of the globe by the upper air currents. The effect, especially as shown in brilliant sunrises and sunsets, was visible for many months. The disturbance created a series of extensive sea-waves which swept over the shores of Java and Sumatra, destroying many villages and causing the loss of more than 30,000 people. The wave-motion was observed in South America. About one-half of the island was destroyed, including the highest mountain. One immediate effect was the darkness which alarmed many people, and which made 27 Aug. 1883 known as one of the dark days.

Kraken, krä'- or krä'kēn, the term, of Norwegian origin, applied to a fabulous sea-monster, generally assumed to be a gigantic squid (q.v.). It was first described by Pontoppidan, bishop of Bergen in Norway, but other old writers have accounts of substantially the same kind of monster. It is described as of enormous size; rising from the sea like an island about 1½ miles in circumference, with enormous mast-like arms with which it wrecked ships, created whirlpools, and realized all that was prodigious and strange in size, habits, and appearance. The kraken stories led to a similar creation by Victor Hugo in his 'Toilers of the Sea,' which, considered zoologically, is almost as far from possible truth as was that of old Pontoppidan.

Kra'nach, Lucas. See CRANACH.

Krausé, Lyda **Farrington**, "BARBARA YECHTON," American novelist and writer for young people: b. Saint Croix, W. I., 1864. She was for many years on the staff of 'The Church-

man' in New York, and among her published books are: 'Christine's Inspiration' (1892); 'Toinette' (1897); 'A Young Savage' (1899); 'Fortune's Boats' (1900).

Krausse, krows, **Alexis Sidney**, English author and publicist: b. Islington, London, 1859. He was educated at University College, London, has since devoted much time to foreign, especially Asiatic history and policy, and has been an industrious contributor to newspapers and magazines. Among the books he has published are: 'Starving London' (1886); 'China in Decay' (1900); 'Russia in Asia' (1899); 'The Story of the China Crisis'; 'The Far East, its History and its Question' (1900).

Krefeld, krä'fēld, or **Crefeld**, Prussia, a town in the government of Düsseldorf, 12 miles northwest of the town of Düsseldorf, and about four miles west of the Rhine. It consists of straight spacious streets and well-built houses; is the seat of several courts and public offices; contains churches for Roman Catholics, Old Catholics, Protestants, Mennonites, and Jews; a royal textile college, gymnasium, a monument of Moltke erected in 1897, hospitals, etc.; and is the principal locality in Prussia for the manufacture of silk and mixed silk goods, which was introduced by refugees from Juliers and Berg in the 17th and 18th centuries. The number of factories producing silk goods is about 120, exclusive of nearly 50 silk-dyeing works. The town also contains railroad shops, boiler-works, machine-shops, iron-foundries, chemical works, distilleries, sugar-refineries, soap-works, tanneries, paper-mills, etc. Krefeld came into the possession of Prussia in 1702, and except during the Napoleonic ascendancy it has remained with her ever since. Pop. (1890), 105,376; (1900), 106,928.

Krehbiel, krä'bēl, **Henry Edward**, American musical critic: b. Ann Arbor, Mich., 10 March 1854. He was musical critic successively on the Cincinnati *Gazette* and the New York *Tribune*. His published works include: 'The Technics of Violin Playing' (1880); 'How to Listen to Music' (1896); 'Studies in the Wagnerian Drama' (1891); 'The Philharmonic Society of New York: a Memorial' (1892); 'Music and Manners in the Classical Period' (1898); 'Music of the Modern World' (1897). He also edited an 'Annotated Bibliography of Fine Art' (1897).

Krem'lin, a Russian citadel, especially the citadel of Moscow (q.v.). It lies in the centre of the city, and contains the royal edifices and churches, particularly the residence of the emperor.

Kremnitz, krém'nīts, or **Cremonitz**, Hungary, a free mining town (called in Hungarian Körmöcbánya), in the county of Bars, in a deep valley surrounded by lofty hills, 15 miles northeast of Schemnitz. It consists of the town proper, surrounded by walls, and containing a castle, and of several large suburbs, in which are almost all the public buildings. There are some old churches, a Franciscan monastery of the 17th century, a mint, hospitals, etc. The manufactures consist of paper, delft-ware, vitriol, and cinnabar; but the prosperity of the town depends chiefly on the gold and silver mines in the vicinity. Pop. about 10,000.

Kre'osote. See CREOSOTE.

KRIEGSPIEL — KRUGER

Kriegspiel, krēg'spēl ("war-game"), a game of German origin, played with maps on a large scale, and colored metal blocks, on the same scale as the map, representing bodies of troops of various strength (brigades of infantry, battalions of rifles, regiments of cavalry, besides artillery, engineers, etc.). The players are usually two on each side, and the game forms an exact miniature of tactical operations. It is played by alternate moves; each move represents the lapse of two minutes, and rules are given to determine the distance that each branch of the service may move over in that time. When two bodies of men on opposite sides come into contact, the weaker in numbers and position is held to be defeated; but when they are equal in these respects victory is determined to one side or the other by the use of a die.

Krieker, krē'kér, a gunner's name for jack-snipe (q.v.).

Kris. See **CREESE**.

Krishna, krish'na, in Hindu mythology, the eighth avatar of Vishnu and the most popular deity in the Hindu pantheon. See **AVATAR**; **VISHNU**.

Kriss Kringle, a sort of St. Nicholas. On Christmas eve, Kriss Kringle, arrayed in a fur cap and strange apparel, goes to the bedroom of all good children, where he finds a stocking or sock hung up in expectation of his visit, in which depository he leaves a present for the young wearer. The word means Christ-child, and the eve is called Kriss-Kringle eve. See **St. NICHOLAS**.

Kronstadt, krōn'stāt, or **Cronstadt**, Russia, a maritime fortress in the government of St. Petersburg, and about 25 miles west of that city. It stands in the narrowest part of the Gulf of Finland, opposite to the mouth of the Neva, on a height of the long, narrow, rocky island of Kotlin, forming, both by its position and the strength of its fortifications, the bulwark of the capital, and the most important naval station of the empire. It was founded by Peter the Great in 1710, and has spacious, regular streets, with many handsome houses; Greek, Lutheran, English, and Roman Catholic churches; very large marine establishments, a navigation school, a naval arsenal, a cannon-founding, a barracks, building-yards, docks, etc. The harbor consists of three separate basins—a merchant haven, capable of containing 1,000 ships; a central haven for the repair of ships of war; and the war haven, which, in addition to the other works of the place, is defended by the strong fort of Kronsbot, built on two small adjoining islands. The chief disadvantage of Kronstadt as a port is the long period during which the harbor is blocked up by ice. The construction of a canal affording better access by sea to the capital has diminished the trade of Kronstadt, which in consequence will cease to be a commercial port. Pop. (1897) 59,539.

Kropotkin, Peter Alexeievitch, pā'tér ā-lék-si-ā-vich krō-pōt'kīn, Russian geographer and revolutionist: b. Moscow 9 Dec. 1842. He was educated in the Corps of Pages at St. Petersburg, and joining a regiment of Cossacks of the Amur went to Eastern Siberia as aide-de-camp to the military governor of Transbaikalia, becoming later attaché for Cossacks' affairs to the governor-general of Eastern

Siberia. He was connected with a prison commission and strove to get some reforms introduced into Siberian convict prisons, but his efforts proved of no avail. From 1863 he devoted his energies to a scientific investigation of Manchuria and the neighboring parts of Siberia, and his work in this department gained him the gold medal of the Russian Geographical Society in 1864. In 1871 he was sent by the Geographical Society to Finland to study glacial phenomena. Arrested in 1874 for promulgating radical ideas of social reform, he was confined in the prison of the military hospital, from which he contrived to escape to England in 1876. In the following year he went to Switzerland, where he founded at Geneva an anarchist journal called '*Le Révolté*', but in 1881 was expelled by the Swiss authorities on the demand of Russia. Returning to England in 1882, he wrote and lectured against the government of Alexander III. Having gone to France, he was arrested by the authorities and condemned (Jan. 1883) to five years' imprisonment for participation in the International, but he was released in January 1886, in consequence of a strong appeal made by leading French and English savants. Since then he has lived chiefly in London, engaged in literary work. He has written much on scientific subjects and has contributed to various encyclopedias. His separate publications include: '*Paroles d'un Révolté*' (1885); '*In Russian and French Prisons*' (1887); '*La Conquête du Pain*' (1888); '*L'Anarchie, sa Philosophie, son Idéal*' (1896; Eng. trans. 1897); '*The State: its Part in History*' (1898); '*Fields, Factories, and Workshops*' (1899); '*Memoirs of a Revolutionary*', first issued serially in '*The Atlantic Monthly*' (1899). Prince Kropotkin is one of the ablest representatives and most eloquent exponents of that theory of society known as anarchist-communism. He is opposed to all societies based on force or restraint, and looks forward to the advent of a purely voluntary society on a communistic basis. He desires to see the division of labor, which is the dominant factor in modern industry, replaced by what he calls the "integration of labor," and is a stanch believer in the immense possibilities of intensive agriculture. In 1901 he delivered a course of lectures at the Lowell Institute in Boston.

Krout, Mary H., American journalist: b. Crawfordsville, Ind., 3 Nov. 1857. She was for 10 years on the staff of the *Chicago Inter-Ocean*, has traveled extensively as a staff correspondent and is the author of '*Hawaii and a Revolution*'; '*A Looker-on in London*' (1899); '*Alice in the Hawaiian Islands*' (1899); etc.

Kruger, kroo'gér, Stephanus Johannes Paulus, Boer statesman: b. Colesberg, Cape Colony, 10 Oct. 1825; d. Clarens, Switzerland, 14 July 1904. At 11 he accompanied his parents in the "great trek" or migration of Boers, whom the British administrators had antagonized, from the Cape Colony,—a movement which resulted in the colonization by Boers of Natal, the Orange Free State, and the Transvaal. He and his parents resided for a time in the Orange Free State, but they ultimately made their home north of the river Vaal. At 16 he was assistant to a field cornet, and not long afterward became a field cornet himself. From that time he was constantly connected with either the military or the civil government of the

KRUMMACHER—KRUTTSCHNITT

Transvaal, and his force of character gradually brought him to the front. In 1863 he became commandant-general, and in that capacity put down civil feuds and defeated the Basutos. At the time of the annexation of the Transvaal to the British territories in 1877 he was vice-president under President Burgers. Upon the reorganization of the Boer government by the national committee in 1880, he again assumed the office of vice-president, and in the war of 1880-1 with Great Britain, he took a leading part. He was elected president in 1883, and re-elected in 1888, 1893, and 1898. He visited England in 1883 in order to obtain a revision of the Pretoria Convention of 1881, and before his return in the following year he secured its replacement by a new convention practically granting independence—except in so far as relations with foreign countries were concerned—and authorizing the renaming of the State as the South African Republic. Kruger's position in the republic was now one of almost unlimited influence and authority. The enormous influx of foreigners after the discovery of the rich gold deposits of the Witwatersrand created problems of the utmost gravity. The greed of the British South African Company was extreme, the Uitlanders complained of injustice, and the Boers on their part were determined to resist foreign aggression. A crisis presented itself in the so-called 'Jameson Raid' (q.v.) of December 1895, which was easily crushed by the Boers, and at the same time led them to look forward to another and greater struggle with the English and to accumulate a large supply of military stores. Kruger managed with much diplomatic skill the difficult matters connected with this affair. In the second war with Great Britain Kruger remained in the country till the fall of Pretoria (5 June 1900), then escaped into Portuguese territory, and thence 19 Oct. sailed for Europe, hoping to enlist some of the European powers on behalf of the Boer republics, but failing in this he took up his residence in the Netherlands. In the summer of 1901 he proposed visiting the United States for the purpose of inducing the government to give its moral support to the Boers, but on being informed that neither President McKinley nor after him President Roosevelt would receive him in other than a strictly unofficial manner, the project was abandoned. His wife died at Pretoria in July 1901. See also SOUTH AFRICAN WAR. Consult: Van Dordt, 'Paul Kruger' (1900); Statham, 'Paul Kruger and his Times' (1898).

Krummacher, Friedrich Adolf, frēd'rīkh ä'dölf kroom'mäh-ér, German theologian: b. Tecklenburg 13 July 1767; d. Bremen 4 April 1845. A minister in the German Reformed Church and a professor of theology, he became widely known by his 'Parables' (1805), which ran through many editions and are familiar in an English translation. They were as a rule short, written in simple prose, on such subjects as 'The Blind Man,' 'Life and Death,' 'The Hero,' etc. None of his other writings won popularity.

Krupp, kroop, Alfred, German inventor and metallurgist: b. Essen, Prussia, 26 April 1812; d. there 14 July 1887. He was a son of Friedrich Krupp (q.v.). In 1848 he assumed charge of the Krupp Steel Works at Essen and presently discovered the method of casting steel

in very large masses. In 1851 he sent to the London Exhibition a block of steel weighing 4,500 pounds, and was able to cast steel in one mass weighing more than 100,000 pounds. Although he manufactured a great variety of articles for use in various peaceful industries, his world-wide fame arose from his production of the enormous siege guns used by the Germans when they invested Paris. Several of Krupp's processes in the manufacture of steel and in the making of cannon were very carefully kept from the knowledge of the outside world and only employees were admitted to his foundries.

Krupp, Friedrich, frēd'rīkh, German manufacturer: b. 1787; d. 1826. He established a small forge at Essen, Rhenish Prussia, in 1870, experimented in the making of cast-steel, the secret of which was then carefully kept in Great Britain, and was able in 1812 to manufacture some of the material. In 1818, on the site of the present large Krupp establishment, he built a small plant of eight melting furnaces, each with one crucible. He turned out a steel of excellent quality, though not perfectly successful; but demand for the product was then slight, despite its use for mint-dies and some other purposes, and the activity of the manufactory was correspondingly small.

Krupp, Friedrich Alfred, German gun-maker: b. Essen, Germany, 17 Feb. 1854; d. there 22 Nov. 1902. He was known as the "Cannon King" in Germany and was the son of Alfred Krupp, who invented a new Bessemer steel, out of which he made rifles and cannons, a seamless tire for car-wheels; and discovered a new method of hardening armor plate. His grandfather, Friedrich Krupp (q.v.), founded the steel industry of Essen, beginning in 1817 with two laborers. The present Krupp works cover 150 acres, and the daily output is about 1,877 tons. The Krups have been head of the iron and steel industry of Prussia for many years; their establishment is one of the greatest in the world. Friedrich Alfred Krupp was the richest man in the empire. He was generous to his operatives, built for them 5,469 dwellings, each with its garden, besides providing convalescent hospitals and orphanages. He also maintained a pension fund of \$4,125,000 for their benefit. He vastly improved the capacity of the business by taking in other steel works at Rheinhausen and in the neighborhood of Magdeburg; acquiring coal mines in Germany, and iron mines in Spain, as well as in Germany. The shipyards and engine shops of Kiel and Berlin which he amalgamated with the mining and founding business, were sources of great wealth, and he owned a fleet of steamers for the exportation of his goods. Thus although he took no active part in his business on its technical side (in which he differed from his father and grandfather) his skill in finance was so great that in 15 years he almost doubled his inherited fortune. Compare: ARMOR-PLATE; IRON AND STEEL INDUSTRY; and ORDNANCE.

Krupp's Steel. See STEEL.

Krutt'schnitt, Ernest Benjamin, American publicist and lawyer: b. New Orleans 17 April 1852; son of John and Peninah (Benjamin) K. He studied three years at Washington College (1867-70), and then entered its law school, being admitted to the bar in 1874. He has oc-

KRYPTON—KU-KLUX

cupied many positions of prominence in New Orleans, and was particularly interested in its public schools, being since 1890 president of the board of directors. In 1898 he received the degree of LL.D. from Washington and Lee University. He was chairman of the Democratic State Executive Committee (1892-6) and later chairman of the Democratic State Central Committee. In 1898 he was elected president of the Louisiana Constitutional Convention.

Kryp'ton, a gaseous element discovered in the atmosphere by Ramsay and Travers, in 1898. (The history of this member of the argon group is so bound up with that of argon itself, that reference should be made to the article ARGON, and to the references there given.) Krypton was discovered in the last fraction remaining after the evaporation of a considerable quantity of liquid air. The residue consisted chiefly of argon, oxygen and nitrogen; but when the oxygen and nitrogen had been removed, a spectroscopic examination of what remained showed lines that indicated the existence of at least one new element, in addition to argon and helium. To this new element the name "krypton" was assigned, from a Greek word signifying "hidden," in allusion to the circumstances under which the discovery was made. (See also NEON and XENON.) Little is known, as yet, concerning the properties of krypton. When it was isolated by means of a tedious diffusion process, it was found by Ramsay and Travers to have a density about 40.75 times as great as that of hydrogen, and an atomic weight of about 81.5. The ratio of its specific heat at constant pressure to its specific heat at constant volume was found to be 1.66, as in the cases of argon and helium. Subsequent experiments by Ladenburg and Krugel have indicated a density of about 29.5, and therefore an atomic weight of about 59. Travers, in his book issued subsequently to these later experiments, makes no reference to them. Considerations based upon the periodic law (q.v.) appear to indicate that the results of Ramsay and Travers are the more probable; but this point is as yet undecided. Krypton exists in the air in the proportion of about one part in a million. It has the chemical symbol Kr, and appears to be as inert, chemically, as argon.

Ktistola'tra. See MONOPHYSITES.

Ku-klux (kü'klüks) Klan, a secret organization founded at Pulaski, Tenn., in 1866. Formed originally for purposes of amusement only, it soon developed into an association of "regulators," and became notorious for the lawless deeds of violence performed in its name. The proceedings of the Ku-Klux in the Southern States were a feature of the determined struggle to withhold from the emancipated slaves the right of voting. The outrages and murders which convulsed the country in 1868-9 ended in the calling out of troops and the formal disbandment of the society in March of the latter year; but its name and often its disguises were used for years to cover the violence of political desperadoes. At the first meeting in 1866 a name was suggested — "Ku-Klo," from the Greek "Kuklos," a band or circle. On the mention of this name some one cried out, "Call it 'Kuklux.'" Nearly all present were Tennesseans, with only one or two from farther south. On the name being pronounced, a Geor-

gia man present remarked: "Kuklux, that sounds like 'Coletz,' our old society, called the 'Lost Clan of Coletz.'" The Coletz Indians were a clan, not a tribe, that had existed some 200 years previously. The name was adopted and the society provided for the following officers: A Grand Cyclops or President; a Grand Magus or Vice-President; a Grand Turk or Marshal; a Grand Exchequer or Treasurer, and two Lictors. There were the outer and inner guards of the "Den," as the place of meeting was designated. Each member was required to provide himself with the following outfit: A white mask for the face, with orifices for the eyes and nose; a tall, fantastic cardboard hat, so constructed as to increase the wearer's apparent height, and in shape like those placed on the heads of the heretics formerly burnt in the Portuguese and Spanish *auto-de-fés*; a gown or robe of sufficient length to cover the entire person. The color and material were left to the wearer's fancy, and each selected what would in his judgment be most hideous and fantastic. Each member carried also a small whistle, with which, by means of a code of signals agreed on, they held communication with one another. The Klan increased in numbers and in power, an *imperium in imperio*, until its decrees were far more potent and its powers more dreaded than that of the visible commonwealths which it either dominated or terrorized. In April 1867 the Grand Cyclops of the Pulaski den sent out a request to all the dens scattered over the South to appoint delegates to meet in convention at Nashville, Tenn., in the early summer of 1867. At the time appointed this convention was held. Delegates were present from the Carolinas, Alabama, Georgia, Louisiana and other Southern States. A plan of reorganization previously prepared was submitted to the Convention and adopted, and the delegates returned to their various States as secretly as they had come.

The grand officers were: The Grand Wizard of the Invisible Empire and his ten Genii. The powers of this officer were almost autocratic. The Grand Dragon of the Realm and his eight Hydras; the Grand Titian of the Dominion and his six Furies; the Grand Cyclops of the Den and his two Nighthawks; a Grand Monk; a Grand Exchequer; a grand Lictor; a Grand Scribe; a Grand Turk; a Grand Sentinel. The Genii, Hydras, Furies, Goblins and Nighthawks were staff officers. The gradation and distribution of authority were perfect.

One of the most important things done by this Nashville convention was to make a positive and emphatic declaration of the principles of the order. It was in the following terms:

"We recognize our relations to the United States Government; the supremacy of the Constitution; the constitutional laws thereof; and the union of the States thereunder."

This Nashville convention also defined and set forth the peculiar objects of the order as follows:

1. To protect the weak, the innocent, and the defenseless from the indignities, wrongs, and outrages of the lawless, the violent and the brutal; to relieve the injured and the oppressed; to succor the suffering, and especially the widows and orphans of Confederate soldiers.

2. To protect and defend the Constitution of the United States and all laws passed in con-

KUBELIK — KUMISS

formity thereto, and to protect the States and people from all invasion from any source whatever.

3. To aid and assist in the execution of all constitutional laws, and to protect the people from unlawful seizure, and from trial except by their peers in conformity to the laws of the land.

The Klan had a very large membership; it exerted a vast, terrifying and wholesome power, but its influence was never at any time dependent on or proportioned to its membership. A careful estimate placed the number of Kuklux in Tennessee at 40,000, and in the entire South at 550,000. The organization was disbanded in March 1869.

Kubelik, Jan, yän koo'bë-lék, Bohemian violinist: b. Miehle, near Prague, 1880. He studied at the Prague Conservatory and subsequently performed at semi-private musicales. In 1898 he appeared at a public orchestral concert and in 1900 with the Berlin Philharmonic Society, and made his début in London in June of that year. Subsequently he made a brief but successful tour on the Continent and in England, and in December, 1901, came to the United States, where he was most enthusiastically received.

Kùblai Khan, koob'lì khän (more properly KHÜBLAI KHAN), called by the Chinese Chi-Tson, Mongol emperor: b. 1214; d. 1294. He was the founder of the twentieth Chinese dynasty, that of the Mongols or Yuen. He was a grandson of Genghis Khan, and in 1259 succeeded his brother Mangú as Khagan or Grand Khan of the Mongols, and in 1260 he conquered the whole of northern China, driving out the Tartar or Kin dynasty. He then ruled over the conquered territory himself, and 19 years later added to it southern China, the dominion of the Song dynasty, which had originally summoned his assistance in driving out the Tartars from the north. Kùblai thus became sole ruler of an empire extending over a large part of Asia, as well as over those parts of Europe that had belonged to the dominion of Genghis Khan. He repaired the evils of so many wars by a wise administration, and by the encouragement which he gave to letters, commerce, industry, and agriculture, brought them all to a very flourishing condition. Marco Polo, the celebrated Venetian traveler, who lived 17 years at the court of this prince, gives some interesting information regarding him. Kùblai Khan is the subject of a poetical fragment by Coleridge.

Kuch Behar. See COOCH BEHAR.

Kuen-lun, kwén-loon', a great mountain system of central Asia, between the Himalayas on the south and the Thian-Shan on the north. It extends from the Pamir plateau in about lon. 75° E. eastward into China, terminating in about lon. 120° E. It varies in breadth, both extremities being compressed, its middle portion consisting of numerous more or less parallel chains. Nearly the whole group is between lat. 30° and 40° N. The most northern part on the west is a continuous mountain-wall having several names and being farther continued by the Nan-shan and other chains well into China. Toward the south are three roughly parallel shorter ranges, the last of which, with its eastern continuations, forms the southern boundary of a mountainous region in which are the Tsai-

dam salt waste and the Koko-Nor lakes. Between the last named group and one farther south the Hoang-ho rises. The most southerly chain of the central Kuen-lun is that of the Yang-la Mountains. The greatest elevation of the Kuen-lun is in the western ranges, and reaches over 22,500 feet, while the chief western ranges average about 20,000 feet. Most of the peaks of the eastern chains, in China proper, are under 17,000 feet.

Kugler, Franz Theodor, fränts tā'ō-dör koog'lér, German writer on art: b. Stettin 19 Jan. 1808; d. Berlin 18 March 1858. He was appointed a professor of fine arts in the University of Berlin in 1833, and subsequently became a member of the Academy of Berlin. His works have undoubtedly exercised great influence on German art and culture; notably a 'History of Painting from Constantine the Great to the Present Times' (1837); 'Hand-book of the History of Art' (1841-2); 'History of Architecture' (1856). He also wrote a 'History of Frederick the Great' (1840), which is popular in Germany. His 'History of Art' was continued by W. Lübke (q.v.).

Kuhns, kooms, Oscar, American educator and author: b. Columbia, Pa., 21 Feb. 1856. He was graduated from Wesleyan University in 1885 and has been professor of modern languages there from 1890. He has written 'The German and Swiss Settlements of Colonial Pennsylvania' (1900); 'The Treatment of Nature in Dante's Divina Commedia' (1897); etc.

Kulturkampf, kool'toor-kämpf, a German term denoting the contest for political and legal rights waged between the authorities of Germany on the one hand and the authorities of the Roman Catholic Church on the other. The conflict was initiated by Bismarck in 1872 and had for its main point of dispute the control by the State of educational and ecclesiastical appointments. He urged that the declaration of Papal infallibility by the Vatican council in 1870 was an arrogation of rights dangerous to the state and that the Roman Catholic Church had assumed an attitude of aggression dangerous to the laws of the state. The ill feeling arising from the questions at issue led the Reichstag to pass a law in 1872 expelling the Jesuits from the German empire. The outbreak of the Kulturkampf, however, dated from the enactment of the May Laws (1873) aiming at state control of the clergy. The Roman Catholic bishops, clergy, and people refused to recognize the validity of the new laws. This opposition was met by still more drastic government measures and in 1875 all recusant priests were deprived of their salaries and all religious orders were abolished. The accession of Pope Leo XIII. prepared the way, however, for a resumption of friendly relations between the Imperial government and the Roman Catholic Church, and negotiations began in 1878 resulting in a nullification of the laws of 1873.

Kumas'si. See COOMASSIE.

Kumiss, koo'mis, a preparation of milk, whether cow's, mare's, ass's, or goat's, which is said to possess wonderful nutritive and assimilable properties, so that it is very valuable in the treatment of consumption, scrofula, chronic diarrhoea, and debility and emaciation in general. It consists essentially of milk in process

KUMQUAT — KURDISTAN

of fermentation, and cow's milk is what is used for making it in Great Britain. On the Asiatic steppes, where it has been long used as a beverage, it is made of mare's milk, but kumiss of mare's milk or goat's milk has a somewhat unpleasant smell. The manufacture of kumiss is carried on in Switzerland, Russia, and elsewhere. An analysis of a Swiss variety showed that it was composed of fully 90 per cent of water, nearly 3/4 of alcohol, rather more than 2 of sugar, about 1/4 each of butter and albuminates, besides lactic acid, free carbonic acid, and inorganic salts.

Kumquat, küm'kwöt, a tree about six feet high, one of the *Citrus* group, closely related to the orange and growing in China and Japan. There are groves of it in the island of Chusan. The fruit, which is oval, is about the size of a gooseberry, and has a sweet rind and an acid taste. The Chinese make preserves of it, which are largely sold in American cities.

Kuntze, koont'sé, Edward J., German-American sculptor: b. Pomerania 1824; d. United States 1870. After studying in the Academy of Fine Arts, Stockholm, Sweden, he took up his residence in London, but eventually (1844) went to New York, where he was elected Associate of the National Academy (1869). His reputation was made in the United States by his statuettes, among which that of Lincoln was extremely popular. He also executed figures of Shakespeare and Goethe on the same scale; while his statue of 'Psyche,' his bust of 'Mirth,' and his medallion portraits are all in their way excellent.

Kunz, koonz, George Frederick, American gem expert: b. New York 29 Sept. 1856. He was educated at Cooper Union, and became a special agent of the United States Geological Survey in 1883. He was placed in charge of the department of mines at the Omaha, Atlanta, World's Columbian and Paris Expositions. He has been president of the New York Mineralogical Club and vice-president of the American Institute of Mining Engineers, and is a member of many societies at home and abroad. Beside contributing innumerable papers on gems, minerals, etc., to magazines and reviews, he has published 'Gems and Precious Stones of North America'; and annual reports on the 'Production of Precious Stones,' in 'Mineral Resources of the United States,' etc.

Kunz'ite, the name of a recently discovered precious stone found in southern California; so called in honor of Dr. George F. Kunz, the special agent in charge of precious stones, United States Geological Survey, since 1882. It is a brilliant gem and is between the topaz and pink sapphire in color. A rose-lilac is the tint which marks this stone, a color new among gems; and its radiance is peculiar and beautiful.

Kunzite was brought to light in 1902 near Pala, in San Diego County, Cal., and was sent for classification to Dr. Kunz, the eminent mineralogist of New York. Much attention was attracted by the beautiful lilac-colored crystals, for nowhere in the country, not even in the American Museum of Natural History at New York, which has the finest collection of spodumene, under which the new gem was classed, had there been seen such remarkable and perfect specimens as these. Dr. Kunz identified the

gem and described it; but Dr. Charles Baskerville, professor of chemistry in the University of North Carolina, finally subjected it to ultraviolet light, then to the rays of high penetrative power, and lastly to the bombardment of the corpuscles shooting out from radium, which resulted in some wonderful effects new to the scientific world. Of these effects Dr. Charles Baskerville, who took the liberty of naming the gem "Kunzite," for his friend, gives the following account:

"On examining this gem we directed our attention to discovering the effect of radium on precious stones. It was shown early in the experiments of the French mineralogist, Curie, that many diamonds phosphoresce, that is, glow in the dark, after being exposed to the emanations of radium. All diamonds phosphoresce with radium, as we learned by applying the test to about two thousand gems collected from some fifteen thousand. The gem in which we were particularly interested belongs to the class of spodumene. Mineral spodumene is usually obtained in large opaque whitish crystals, but from time to time small specimens, often richly colored and transparent, are found. The three characteristic varieties of the latter are a clear yellow gem spodumene of Brazil, the green hidrite, or lithia emerald of North Carolina, and the lilac sometimes found in Connecticut. These are without doubt remnants of large specimens, which must have been elegant. Spodumene is very subject to alteration and has usually lost all its transparency and beauty of tint."

The California spodumene crystals are of a rose-lilac tint, varying with the spodumene dichroism, from a very pale tinge when observed transversely to the prism, to a rich amethystine hue longitudinally. No such crystals of spodumene have ever been seen before, and the discovery is of great mineralogical interest. The crystals have been etched by weathering and have a twinning like the hidrite variety. When cut and mounted parallel to the base, they yield gems of great beauty. Baskerville, Kunz and Crookes have found this almost as luminescently responsive to the action of radium as the diamond.

Kurdistan, koor-dis-tän' (Persian, "land of the Kurds"), an extensive territory of western Asia, comprehending the greater part of the mountainous region which borders on the western side of the great plateau of Iran or Persia, and stretches westward till it overhangs the low plains of Mesopotamia on the southwest, and reaches the borders of the Turkish provinces of Diarbekir and Erzerum on the northwest. Its limits, as nearly as they can be defined, lie between lat. 34° and 39° N.; and lon. 42° and 47° E., with an area of nearly 40,000 square miles. The surface is very mountainous, and is traversed by lofty ranges stretching northwest to southeast. The whole surface on the west of the Persian frontier is drained by the Tigris and the Euphrates and their tributaries. Unless Lake Van is considered as partly within the territory, there are no lakes of any consequence. The mountains are covered with forests of oak and other hard timber. Many of the valleys are under regular culture, with corn-fields, orchards, and vineyards. One of the most remarkable vegetables is manna, expressively called in Turkish *Kudret-hal-vassis*, or the Divine sweet-

KURIA MURIA ISLANDS—KYANITE

meat, which is used as food. Fine horses and oxen are bred, and sheep and goats are kept in large numbers.

The Kurds are a stout, dark race, well formed, with dark hair, small eyes, wide mouth, and a fierce look. Most of the men are armed, using lances, sabres, daggers, muskets, and pistols. Many of the tribes are still nomadic. The language is of the same stock as the modern Persian. The great body of the Kurds are Mohammedans. They care little for trade, although they send to Kirkuk, Hamadan, etc., gall-nuts, tobacco, honey, sheep-skins, and cattle; obtaining in return coffee, rice, leather, and clothing, chiefly cotton goods. Their allegiance to the Turkish sultan is but slight. The famous Sultan Saladin was a Kurd. It is very difficult to form even an approximate estimate of the whole Kurd population; the Turkish portion is supposed to contain about 2,500,000, and the Persian portion 400,000; but another estimate would give for these numbers 1,300,000 and 500,000 respectively.

Kuria Muria (koo'rē-ä moo'rē-ä) Islands, a group of islands situated off the southern coast of Arabia at distances varying from 10 to about 30 miles, with a total area of over 25 square miles. Guano deposits are found in these islands, but they are considered to be barren, and have very few inhabitants. In 1854 they were ceded to Great Britain.

Kuriles, koo'rīlz, a chain of islands in the North Pacific Ocean, belonging to Japan (q.v.). The chain extends southwest to northeast from lat. $43^{\circ} 40'$ to 51° N.; lon. 145° to 156° E. They are divided into the Great and the Little Kuriles.

Kuroshiwō, koo-rō-shē'wō (Japanese, "black current"), a current of the Pacific Ocean somewhat analogous to the Gulf Stream. It takes its origin in the great north equatorial current along the southeast of Asia, flows past the Philippine Islands and Formosa, which somewhat deflect it, past Japan, the Kuriles and the Aleutian Islands, and thence bends southward toward California. As it approaches the American coast the current increases in breadth. It is much inferior to the Gulf Stream both in volume and in high temperature. It was formerly thought that the Kuroshiwō had a moderating effect upon the Pacific coast climate of this continent, but this view has been abandoned by reason of the scientific knowledge that the prevailing winds of the North Pacific bring eastward the warmth and moisture which produce the climatic moderation observed upon its shores.

Kurtz, koorts, Charles M., art expert: b. Pennsylvania about 1855. He was graduated from Washington and Jefferson College in 1876, studied at the National Academy of Design (New York), was for some time on the staff of the New York *Tribune*, was nine years editor of 'National Academy Notes,' and edited the 'Art Union Magazine' in 1884. In 1891 he withdrew from journalism and was appointed assistant chief of the department of fine arts in the World's Columbian Exposition (Chicago 1893). In 1894-9 he was art director of the St. Louis annual exposition, in 1899 was appointed assistant director of fine arts for the United States at the Paris exposition of 1900,

and in 1901 assistant chief of the department of art at the Louisiana Purchase exposition.

Kusi, koo sē. See Coosy.

Kuskoquim, kūskō-kwim, Alaska, the second river in size in the Territory, rising on the northern slopes of Mount McKinley, and after a southwestern course of over 500 miles, flowing through the wide estuary of Kuskoquim Bay into Bering Sea, about 200 miles south of the Yukon Delta. The trading stations along its banks are Kolmakoof, Oknagamut, Odgavigamut, Gavimamutt and Bethel. The inhabitants in the region are chiefly Indians and Eskimos. Gold was discovered in the valley of the Kuskoquim in 1903.

Kutchin, kū-chin', a name given to the tribes of the Athabascan Indians who live near the Yukon River in Alaska, and in British North America. They are also called Loucheux and Quarrelers. They number less than 2,000.

Kutztown, koots'town, Pa., borough in Berks County, on the Philadelphia & R. railroad, 18 miles northeast of Reading. There is a normal school here and manufactures of flour, leather, shoes, hosiery, etc. Pop. (1900) 1,328.

Kuyp, Albert. See CUYP, ALBERT.

Kuyper, ki'pér, Abraham, Dutch theologian and politician: b. Maassluis, Netherlands, 1837. After a course of theology at Leyden he became a preacher, and in 1874 was elected member of the lower house of Parliament, or Second Chamber, where he formed the Anti-Revolutionary party. He soon afterward quitted parliamentary life and launched out into the career of a publicist and journalist, still leading his party with great éclat. In theology he is the leader of staunch Calvinistic orthodoxy, and is opposed to all "modernism." In 1880 he founded in Amsterdam the Free University. His political organ is the 'Standaard'; his religious organ the 'Heraut.' Among his works is 'Ons Program' (1880); he has also edited the works of the Polish reformer Jan Laski, and is well known in the United States from De Vries's English translation of his 'Encyclopedia of Sacred Theology' (1898).

Kwalhiokwa, kwäl-hē-ō'kwā, a tribe of Athabascan Indians, formerly living on Willo-pah River, Washington, near the Lower Chinook Indians. They are frequently confounded with the Owilapsh or Whilpah.

Kwanza, kwän'zä, or **Coanza**, kō-än'zä, a large river of Portuguese West Africa. Rising in Lake Mussombo, it flows at first in a north-easterly direction, then north, and finally in a westerly and northwesterly course, and enters the Atlantic Ocean near lat. $9^{\circ} 10'$ S., not far south of Saint Paul de Loanda. In the lower part of its course there are many falls, the last being the Livingstone or Kambambe Falls, below which for a distance of about 170 miles the river is navigable for small steamers. Its total length is about 800 miles.

Kyanite, ki'a-nit, or **Cyanite**, a native aluminum silicate, Al_2SiO_5 , identical in composition with sillimanite and andalusite but very different in its physical properties. Its hardness varies on different faces from 4. to 7. Its specific gravity is 3.56 to 3.67. It is triclinic, the crystals usually being long-bladed, transparent or translucent, and of a beautiful sky-blue color in

KYANIZING — KYRIE ELEISON

the centre. Stout crystals of a grass-green color occur in North Carolina. The finest specimens come from Faido, Switzerland, occurring in paragonite schist. Cyanite abounds throughout the New England and Middle Atlantic States.

Ky'anizing, a process for preserving timber, cordage, etc., from the effects of dry-rot, named from an inventor of the name of Kyan. It consists in immersing the material to be preserved in a solution of corrosive sublimate and water, in the proportion of 1 pound of the former to from 10 to 15 gallons of the latter, according to the strength required. The time during which timber must be allowed to remain in the solution depends upon its size and thickness. For boards and small timbers 24 hours are required for each inch of thickness. This process is now almost entirely disused, as wood

is much better preserved by being saturated with kreosote or coal-tar.

Kym'ry. See **CYMRI**.

Kyrie Eleison, *kir'i-ē ē-lā'i-sōn* (from the Greek *Kyrie eleison*, "Lord, have mercy"), an invocation following the introit of the mass. It is almost the only part of the liturgy in which the Roman Catholic Church has retained the use of Greek words. Just after the introit the priest celebrating the mass and the servers repeat alternately three times "Kyrie eleison," and then as many times in the same manner "Christe eleison," and so on alternately. When it is sung the leading singer takes the part of the priest, and the choir that of the servers. The introduction of the Kyrie into the mass is attributed to Pope Sylvester I., in the beginning of the 4th century.

L

L the twelfth letter of the English and most of the other modern European languages. Its definitive form in the Greek alphabet is **Λ**, but in very early Grecian, Hebrew and Phoenician monuments it has the form **ν** or **λ**. Its name in Hebrew and Phoenician is lamed and in Greek lambda.

The sound of **l** is produced when the tip of the tongue is brought into contact with the palate behind the upper front teeth, and, with the jaws apart, the breath is emitted. The sound of **r** is produced in nearly the same way, but in sounding the **r** the tongue is not in contact with the palate and may vibrate. Thus these two letters represent sounds that are much alike. But there are nations that cannot sound the **r**, as the Chinese and sundry other races; these substitute **l** for **r**: the technical name for this vice of utterance is lambdacism; the opposite vice is an inability to pronounce **l**, for which **r** is substituted, as by the Japanese. In languages whose syllabaries admit both these sounds the two letters are freely interchanged or confounded. In languages belonging to one common family, the Aryan, for example, a word which in one language has **r**, in another has **l**, and *vicc versa*; examples: Lat. *prunus*, Eng. *plum*; Lat. *ulmus* (elm), Fr. *orme*. The like is seen in the formation of derivatives within one language. Thus in Latin the adjective termination *alis* (Eng. *al*, as in *liberal*) is changed to *aris* when the word has already an **l**: for example: from *peculium* comes *peculiaris*, from *auxilium*, *auxiliaris*, and *vice versa*, **r** for a like reason is changed to **l**: thus from *per* and *lucidus* comes *pellucidus*, from *inter* and *lectus*, *intellectus*. **L** is also substituted in one language for **n** in another; for example: Gr. *pneumon* (lung), Lat. *pulmo*. Or **d** and **l** are interchanged: Gr. *Odysseus*, Lat. *Ulysses*; the like is seen in the two Latin words *odor* and *olor*; and the Latin *lingua* was once written *dingua*, allied to Eng. tongue and Ger. *zunge*.

In Italian the **l** of Latin words is often changed to **i**: Lat. *planus*, *plumbum* (lead), Ital. *piano*, *piombo*.

In English **l** is often silent: palm, calm. In French **al** becomes **au**; **à le** becomes **au**, **cheval** (horse) plu. **chevaux**; and the English auburn is from Latin *alburnus*. In English and most of the other languages **l**, whether single or double, has one sound-value only, the same which it has in pale, pallid; but in French sometimes **ll** has a sound resembling that of **lli** in *million*: in Spanish **ll** may commence a word, for example: *llana* (wool), and is classed as a distinct alphabetic character: its sound-value is the same as that of **ll** in French.

L. E. L., the *nom-de-plume* initials of an English novelist, Letitia Elizabeth Landon, later Mrs. Maclean.

La, in music, the syllable which denotes the sixth note of the diatonic scale.

Laager, lä'gér (Dutch, "a camp"), in South Africa, an encampment more or less fortified. The original Boer laager is an enclosure made of the wagons of a traveling party for defense against enemies.

Laaland, lä'länd, or *Loiland*, an island of Denmark, in the Baltic Sea. Its greatest length, southeast to northwest, is 36 miles; breadth, varying from 9 miles to 17 miles; area, 462 square miles. The surface, as implied by its name, meaning "low land," is so very little raised above the sea, that parts of it along the coast are subject to frequent inundations; and for a considerable distance around it the water is so shallow that there are few places in which vessels drawing 8 feet can approach it without danger. The soil, consisting generally of a heavy loam, is very fertile, and yields excellent crops of corn. Beans, hops, and hemp are extensively grown. Varieties of hardwood timber are abundant. Pop. 65,550.

Laar, or **Laer**, Peter van, Dutch painter: b. Haarlem, Netherlands, 1590; d. sometime after 1658. Early in life he went to France, and subsequently visited Italy (1623). Here he mainly resided at Rome, where he became associated with Claude Lorraine, Poussin and Sandrart. He was small and crooked in stature, and was thus called by the Italians "Bamboccio," and the comic scenes of rustic life painted in his style became known as "Bambocciad." He returned to Haarlem in 1639. He painted pastoral and banditti scenes, fairs, and such like rural incidents, with spirited and vigorous brush, although his coloring is somewhat hard. A masterpiece of his, 'The Market Crier,' is in the gallery at Cassel. Other pictures of his are to be found at Paris, Dresden, Vienna, Munich, etc. About 20 etchings from his hand are also extant, chiefly animals and landscape, which are spirited and finely executed.

Labadie, Jean de, French mystic and separatist: b. Bourg en Guienne 13 Feb. 1610; d. Altona, Prussia, 13 Feb. 1674. He was educated at Bordeaux by the Jesuits, and belonged to their order till 1639. He then quitted it, both because irregularities were detected in his conduct, and he was found to have adopted many very peculiar and extravagant views. For these he was cited before the Parliament, but fled to Geneva. At a later period he returned to France, and took up his residence in Amiens, whose bishop entrusted him with the visitation of the monasteries in his diocese. He also found a patron in

LA BARCA—LABIATAE

the archbishop of Toulouse. His zealous opposition to some of the clergy subjected him again to persecution, and to escape from it he, in 1650, went over to the Reformed Church, but not finding himself so comfortable as he expected, he thought he had received a call to found an apostolic church for himself. He now became a preacher in Montauban, and afterward, on being obliged to leave it, in the town of Orange, from which he proceeded successively to Geneva, Middleburg, and Amsterdam. In the last city he collected his followers into a distinct church or society under the name of Labadists. Toleration being now denied him, he in 1670 proceeded to Herford, where the Palsgrave Elizabeth gave him protection. Driven thence by an imperial edict in 1672, he went first to Bremen, and finally to Altona, where he held private meetings.

La Barca, lä bär'kä, Mexico, town in the State of Jalisco, east of Chapala, and 60 miles southeast of Guadalajara, on the International railroad between that city and the capital. The town was founded in 1529 by Nuño de Guzman, and during the Mexican war for independence the town was the scene of two serious battles. Pop. (1900) 10,000.

La Barre, Antoine Joseph Lefèvre de, French sailor: b. about the beginning of the 17th century; d. 4 May 1688. He rose to early prominence as an officer of the French navy, and was appointed governor of Guiana in 1663. He was successful in recapturing Cayenne which had been occupied by the Dutch. On being commissioned lieutenant-general he sailed for the West Indies, and, in a fight with the English in the Antilles, compelled them to raise the blockade of Saint Christopher. Succeeding Frontenac as governor of Canada in 1682, his irresolution in his negotiations with the Indians was so disastrous that he was recalled in 1684.

Lab'arum, the name given from the time of Constantine to the imperial banner. Eusebius has described it with much particularity. It was in the form of a long pike, crossed at a certain height by a beam, from which depended a banner richly embroidered with gold, and adorned with precious stones. The pike was surmounted by a crown of gold, enclosing within it a monogram of the two initial letters of the name of Christ.

Labat, Jean Baptiste, zhōn bāp'tēst lä-bä, French Dominican missionary and traveler: b. Paris 1663; d. there 6 Jan. 1738. In 1693 he went as a missionary to the French Antilles, landed at Martinique, and undertook the care of the parish of Macouba, which he superintended for two years, after which he was sent to Guadalupe. His mathematical knowledge recommended him to the governor there, whom he accompanied during a tour through the island to assist him in selecting the points best adapted for works of defense. On his return to Martinique Labat received the office of *procureur-général* of the mission, in which an opportunity was afforded him of displaying the whole extent of his useful activity, at the same time that he served the government by his mathematical knowledge. In 1705 he was sent to Europe on business of the order, and landing at Cadiz, surveyed geometrically and scientifically the environs and the whole coast of Andalusia as far as Gibraltar. He returned to Paris in 1716.

His 'Nouveau Voyage aux Iles de l'Amérique,' which has been translated into several languages, contains an account of the natural history, particularly of some of the smaller and less frequented islands; of their productions; the origin, customs, religion, and governments of the inhabitants. He also published a 'Nouvelle Relation de l'Afrique occidentale'; 'Voyage en Espagne et Italie'; 'Relation historique de l'Ethiopie occidentale'; 'Mémoires du chevalier d'Arvie.'

Labédoyère, Charles Angélique Huchet, shärl än-zhâ-lék hü-shâ lä-bâ-dwâ-yär, Comte de, French general: b. Paris 17 April 1786; d. there 19 Aug. 1815. He entered the army in his 20th year, and served with much distinction in Spain, Germany, and elsewhere. Napoleon raised him to the rank of general of division in 1815, and he fought with great courage at Waterloo. After the battle he hurried to Paris, and there distinguished himself by his hostility to the Bourbons. On the capitulation of Paris he followed the army behind the Loire, but returning to Paris, was taken, tried by court-martial, and shot.

Label, Union. See UNION LABEL.

Labezares, Guido de, gwē-dō dā lä-bâ-thâ'rës, Spanish adventurer: b. Bilbao, Spain, 1510; d. Manila 1580. He began his career in South America, from which he made a voyage to Java and Sumatra 1542. In 1550 he discovered the Bay Filipina, in Florida, and in the following year with Luna de Arellano visited and re-named the place Bay Santa Maria. He entered with Legaspi upon the project of conquering and converting the Philippine Islands. His success was complete in the matter of conquest and in 1574 he was appointed governor-general of Manila. By means of new fortifications he so strengthened the place against the Chinese corsairs and the Dutch pirates, that these were driven from the adjacent islands. In 1575 he took the position of lieutenant-governor, under a new governor-general sent from Spain, and kept his position until his death.

Labia'tæ, a natural order of dicotyledonous herbs or sub-shrubs distributed mainly in temperate climates. The species, of which there are more than 2,500, grouped in about 150 genera, are characterized by four-cornered stems; opposite, exstipulate leaves; two-lipped flowers generally in whorls, cymes or heads; and one to four achenes in a persistent calyx. They are noted for their volatile oils, which in many instances are of economic importance either as perfumes, or as flavorings. Some species are cultivated for ornament, but probably the best known are those which have been used for centuries for flavoring food, such as sage, thyme, savory, marjoram, mint, balm, and basil (qq.v.). The species used most frequently in perfumery are probably lavender, rosemary and patchouli. One species variously known as Chinese and Japanese artichoke, chorogi, and knotroot. *Stachys sieboldii* or *S. affinis* yields edible tubers which are eaten raw or cooked in Asia, France and to a small extent in the United States. Many labiates have at some time been reputed medicinal but are now rarely used except to disguise the taste of disagreeably flavored drugs. The best known genera represented in the United States are: *Nepeta* (catnip), *Mentha* (mint), *Origanum* (marjoram), *Salvia*

LABICHE—LABOR CONGRESS

(sage), *Thymus* (thyme), *Marrubium* (horehound), *Satureia* (savory), *Lavandula* (lavender), *Monarda* (horsemint), *Ocimum* (basil), *Melissa* (balm), *Scutellaria* (skullcap), *Lamium* (dead nettle), *Calamintha* (calaminth), *Teucrium* (germander), and *Trichostema* (bluecurls).

Labiche, Eugène Marin, è-zhān mä-rāñ lä-bēsh, French dramatist: b. Paris 5 May 1815; d. there 13 Jan. 1888. He wrote, chiefly in collaboration with other authors, upward of 100 plays, many of them very successful. They are mostly distinguished by extravagant plots, and are full of droll situations. In 1880 he was elected to the Academy, and after that date ceased to write for the stage. His dramatic works were collected in 10 volumes (1878-9). Among the best of them may be mentioned: 'The Italian Straw Hat' (1857); 'Le Voyage de M. Perrichon' (1860); 'Moi' (1864). Consult: Matthews, 'French Dramatists' (1901).

Lablache, Luigi, loo-é-jé lä-blásh', operatic singer: b. Naples, Italy, 6 Dec. 1794; d. there 23 Jan. 1858. He studied at the local Conservatory della Pietà de Turchini under the guidance of Valesis, and made his début as a bass singer, *buffo Napolitano*, in Fioravanti's 'Molinara.' Later he enlarged his repertoire by singing in grand opera, and appeared as Mercadente in 'Elisa and Claudio.' His reputation soon extended over Italy. In his 20th year, when the triumph of Rossini was at its height, he stood forth as the greatest interpreter of that master, and reached the summit of his fame. A medal was struck off in his honor at Vienna in 1825. For the next 17 years he annually appeared in Italian opera in London, Paris, and St. Petersburg. He was equally admirable in comic and serious operas, and the school of music which he opened in Paris had considerable success in handing on the traditions of his style.

Labor. See AMERICAN LABOR.

Labor, American Federation of. See AMERICAN FEDERATION OF LABOR.

Labor and Commerce, Department of. See COMMERCE.

Labor Bureau, more properly the bureau of labor, a sub-department of the Department of Labor and Commerce. Originally the Bureau of Labor was a part of the Interior Department, but at the creation of the new department by the Congress 11 Feb. 1903, the bureau was transferred. It was organized in 1885, and Carroll D. Wright, who had been very successful as chief of the Bureau of Statistics in Massachusetts, was appointed Commissioner of Labor. At the end of three years Commissioner Wright had made such signal success in the new department that the bureau was changed to the Department of Labor, with independent functions. It has issued annual reports, special reports and bi-monthly bulletins of great educational value.

Nearly every State in the Union also has a labor bureau, or department of labor, the oldest being that of Massachusetts, organized in 1869. Several of the State bureaus, particularly those of New York and Connecticut, maintain free employment agencies. The Federal and State bureaus had published up to October 1903 only 500 volumes on labor topics. These State bureaus have been kept remarkably free from partisan politics, and those have been decidedly

successful in the settling of labor disputes and in preventing strikes and lockouts. These organizations proved so successful that European nations soon followed the American example. In 1891 France organized a bureau of labor and in 1892 Germany followed with a labor commission. In 1893 a labor department under the direction of a Commission for Labor was instituted in England. Austria, Italy, Sweden, New Zealand, New South Wales and Canada have since established similar bureaus. Consult: Wright, 'The Workings of the Department of Labor,' and 'The Value and Influence of Labor Statistics,' in 'Monographs on Social Economics' (Washington 1901).

Labor Colonies, or agricultural communities, are common in Europe but almost unknown in the United States. They are maintained for the purpose of giving employment and training to individuals who, on account of misfortune or inefficiency, find it difficult to earn a living. In Holland there are four of these labor colonies, at Wilhelmsoord, Frederiksoord, Wilhelminsoord and Colony No. 7, which have been established for over half a century. They occupy 5,000 acres of land and have a membership of over 2,000. At La Chalmelle, France, is a colony established in 1892. It occupies 318 acres of land and has 300 colonists. In Germany there are 26 colonies all established since 1882. New Zealand has a government farm of 1,000 acres. In Belgium are two colonies which are practically penal institutions for vagrants and beggars. There are several colonies in England, and in the United States three small colonies have been established by the Salvation Army, one each in Colorado, California and Ohio. The most successful is the Colorado colony which has 150 members. The colony system in all the European countries is practically communism under government control, all the colonies being conducted on the co-operative plan.

Labor Congress, an assemblage, either national or international, of representatives of organized labor. In 1866 the first International Labor Congress was held at Geneva, Switzerland, about 60 delegates being present from England, France, Germany, Holland and Switzerland. The results of this meeting were the condemnation of the industrial employment of women, the advocating of technical education and the organization of mutual credit associations. At the congress of 1869, held at Basel, Switzerland, labor representatives were in attendance from Russia, Austria, Germany, France, England, Spain, Italy, and Switzerland. This assembly by a vote of 54 to 4 declared that landed property should be abolished. Other similar congresses were held at Dresden, 1871; The Hague, 1872; Paris, 1886; Berlin, 1891, and Zurich, 1897.

An International Socialist-Labor Congress was held in Paris in 1889. In 1891 a second Socialist-Labor congress was held at Brussels, at which 400 delegates were present from nearly every country in the world, including Canada and the United States. Among the topics discussed were: the eight-hour day, militarism, universal suffrage, and legislative protection of labor. At the congress of 1893 at Zürich, Switzerland, 385 delegates were present, and admission was denied to all avowed anarchists. The congress, now assuming definite organiza-

LABOR, COURT OF—LABOR LEGISLATION IN THE U. S.

tion, met in London in 1896, and arranged to meet every four years thereafter. The anarchists were again denied admission, and resolutions were adopted opposing standing armies, advocating the nationalization of land and the socialization of industry.

The next meeting of the International Socialist-Labor Congress was held in Paris, in 1900, when the assembly discussed the laws regulating strikes and boycotts and favored the abolition of the capitalistic class. Resolutions were passed favoring a fixed minimum wage and the nationalization of mines. The congress for 1901 held 14 Sept. at Amsterdam, discussed the following questions: General strikes; general rules of political socialism; trades unionism and politics; colonial politics; international arbitration; the relation of the trust question to the unemployed problem; emigration. Of this organization which meets every four years there is a standing committee known as the International Socialist Bureau, which meets annually. The meeting for 1903 was held in Berlin.

Various national labor congresses are held in several countries, particularly in England, where an annual convention has been held since 1868. Congresses of anarchists convening under the disguise of labor have been held at intervals in Lyons, Havre, Brussels, Barcelona and other cities. See also LABOR UNIONS; SOCIALISM.

Labor, Court of (Industrial Department of the National Civic Federation). At a conference of representatives of capital and labor, held in New York 17 Dec. 1901, under the auspices of the National Civic Federation (q.v.), a permanent board was appointed to settle differences between the employees and the labor unions. On this board were 12 representatives of organized labor, 12 representative employers and 12 leading educators, clergymen and public men. On 18 Dec. 1901 the committee organized on a permanent basis, with Senator M. A. Hanna as chairman, and Oscar S. Straus and Samuel Gompers, vice-chairmen. The following statement was issued, indicative of the purposes of the committee:

"This committee shall be known as the industrial department of the National Civic Federation. The scope and province of this department shall be to do what may seem best to promote industrial peace; to be helpful in establishing rightful relations between employers and workers; by its good offices to endeavor to obviate and prevent strikes and lockouts; to aid in renewing industrial relations where a rupture has occurred. That at all times representatives of employers and workers, organized or unorganized, should confer for the adjustment of differences or disputes before an acute stage is reached, and thus avoid or minimize the number of strikes or lockouts. That mutual agreements as to conditions under which labor shall be performed should be encouraged, and that when agreements are made the terms thereof should be faithfully adhered to, both in letter and spirit, by both parties. This department, either as a whole, or a sub-committee by it appointed, shall, when requested, act as a forum to adjust and decide upon questions at issue between workers and their employers, provided in its opinion the subject is one of sufficient importance. This department will not consider ab-

stract industrial problems. This department assumes no power of arbitration unless such powers be conferred by both parties to a dispute. This department shall adopt a set of by-laws for its government."

The committee since its organization has been instrumental in settling numerous troubles and disputes between capital and labor. See NATIONAL CIVIC FEDERATION.

Labor Day, in the United States, the first Monday in September, a legal holiday in all the States and Territories except Arizona, Mississippi, Nevada, North Dakota, and Louisiana. The celebration of this day was inaugurated by the Knights of Labor, who in 1882 held a parade in New York, and again in 1884 when resolutions were passed to hold all parades on that day. Workingmen of all organizations then began agitation to have the day made a legal holiday, and in 1887 the first law to that effect was passed in Colorado. The day is celebrated by parades and by meetings addressed by prominent labor leaders. In Europe the celebration of the first of May as Labor Day was begun in 1890 with a demonstration in favor of the eight-hour day; it was at that time and for a few years later much feared and violently opposed by the various governments, and there were many clashes between the police and soldiers and the workingmen. It is now usually celebrated without trouble by parades, large meetings, and the general cessation of work. In the United States, May Day is celebrated by the Socialist-Labor party, but there is no attempt to cease work on that day.

Labor Exchanges, a name erroneously applied to employment bureaus (q.v.). It was also a term given to a class of institutions founded by the followers of Robert Owen (q.v.) in 1832-5. These were designed to bring about an exchange of products of labor without the intervention of money. Many stores were founded but the plan was soon found impracticable.

Labor Legislation in the United States. The problem of protecting the laboring classes against the employing class is of relatively late development in the United States, owing to the superior prosperity of the laborers, the rapid increase in employments and competition for workmen. Of course, direct United States laws on the subject cannot exist, all such legislation being reserved to the States; the most the government can do is to set an example of short hours, high wages, and sanitary conditions in its own workshops or other employments, and make enactments for the District of Columbia. State legislation is too scattered and discordant to present in full; only a classification of the subjects of legislation will be attempted.

The Contract in General.—One of the fundamental principals of the common law, though not expressed in statutes, is that long contracts for personal service, which might end in a form of serfdom, will not be enforced beyond two years; in one State nothing beyond one year is enforceable; which implies that under these limits it could be, but no case has yet arisen. The notice to be given on quitting employment has been regulated in several States by an enactment that an employer shall give an employee the same notice which he exacts by withholding wages, requiring bonds, etc.

LABOR, ORGANIZED — LABORATORY

Rate, Form, Period, etc., of Wages.—There is no statute in any State fixing the rate of wages, nor would it be constitutional, in all probability. The nearest approach is an Indiana statute of 1899 providing a minimum of 15 cents an hour for manual labor. It is often provided in municipal orders, however, that work on contracts shall not be paid at less than current local rates. The wage-paying period has in some cases been legally fixed as weekly; it is not certain that this is either constitutional or wise. More common and of much less doubtful utility are the laws in some States forbidding the payment of wages in orders for goods, or anything but cash, and prohibiting companies from operating or being interested in stores or supply establishments. Maryland and Illinois have this in action; the Pennsylvania statute was held unconstitutional. Laws regulating fines and deductions, weighing, etc., have been enacted, and "screen laws" for the coal mines.

Hours of Labor.—This has been and is one of the most persistently fought of labor questions, but for adult work it has not been very successful thus far on the State-arena, the only statute establishing a general 8-hour law with enforced payment for overtime—that of Nebraska—having been declared unconstitutional. Wyoming by constitution, however, and Missouri and Utah by statute, have established an 8-hour day for the mines; and it is usual to fix 8 hours as a day's work where the contract does not specify any. This is also becoming customary in public work for States and cities, and will doubtless become universal. The State also claims the right to regulate hours in unsanitary or dangerous occupations. On the subject of children's labor, the Northern States east of the Rockies have generally a full and systematic body of legislation; efforts are making by the best citizens of the South to have its States adopt similar laws. These statutes restrict the labor of children under certain years (10 at lowest, more commonly 12 or 14) to a usual 10 hours a day, and 55 to 58 hours a week; 12 hours in Pennsylvania, but even there only 60 hours a week. It is also usual to order the hours arranged so as not to interfere with school hours, unless the children have reached a certain standard. Some States make these laws apply to adult women as well; some prohibit women's labor in the mines altogether.

Personal Liberty.—A number of enactments have been made to prevent intimidation of workmen by threats of loss of employment, etc.; and by pay envelopes or placards in work-rooms drawing menacing pictures of shutting down, discharging men, etc., if certain political results ensue. Forbidding men to join unions, forcing them to contribute to benefit societies, or to employ a company physician, etc., are legislated against.

Government by Injunction (q.v.).—The use of injunctions and proceedings for contempt to suppress labor riots has greatly incensed the workingmen, and in Kansas a statute has been passed which goes so far as practically to make it impossible to enforce any contract that does not sound in damages.

Health, Safety, Moral Conditions, etc.—The evils of the sweat-shop—tenement manufactures, mainly confined to clothing—have drawn out legislation, either extending the factory acts to them, or restricting the manufacture to mem-

bers of the resident family and requiring a license. In factories, there are laws providing a given air space for each hand, and machine appliances for removing dust, guards for belts, shafts, dangerous machinery, elevators, etc., prohibition of cleaning machinery while in motion, sometimes of women or children cleaning it at all, fire escapes, etc. See FACTORIES AND FACTORY INSPECTION.

Employers' Liability.—This branch of law in America is almost entirely the creation of the past 20 years; so much so that a great and flourishing branch of accident insurance, unknown a generation ago, now takes in many millions of dollars in premiums annually. The employer has always been liable in damages to an employee for accident resulting from his own negligence, or defects in his plant, as from breaking machinery, bad floors, etc.; but not from the negligence of fellow employees. The latter has of late years been changed, so that the employer is now liable for all accidents in his service except where the employee's own negligence is the cause; and the large liability superinduced makes it needful to insure the hazard.

Labor, Organized. See UNIONISM.

Labor Union, The American, a Socialist-Labor organization founded in May 1898, as the Western Labor Union. At a convention held in Denver, Colo., in 1902, the scope of the organization was widened and the name changed. It favors international socialism, and the government of the body is more centralized than ordinary federations of trade unions. The Union is composed largely of trade unions in the States of Colorado, Idaho, Montana, Washington, and Wyoming. In 1903 it had 173 local unions, 5 district unions, and a membership of 150,000. The official organ is the 'American Labor Union Journal,' published at Butte, Mont.

Labor Unions. See UNIONISM.

Laboratory (from the mediæval Latin *laboratorium*, meaning workshop). The word is used to denote any room or building devoted to experimental investigations in technics and the sciences, or to the teaching of scientific and technical knowledge by means of experiments. The term is used to denote the work-room of a manufacturing chemist, or to the testing-rooms of an industry. In early times laboratories were used by the priesthood, who tried to throw a mantle of secrecy about them. Chemical operations were carried on in them and drugs and potions were made in them. Out of these early laboratories grew those of the Middle Ages. In this later period they were devoted to astrology, the making of drugs, potions and charms and to the search for the philosopher's stone by means of which it might be possible to change the baser metals into gold. Some of these laboratories were very important in their day, having the nobility for patrons, or being maintained at the public expense.

In 1683, a laboratory for academic instruction was opened at the University of Altdorf. Many private laboratories were established about this time, but their rapid development for instruction and research did not begin until the 19th century.

Among the first laboratories established, open to students, were those of Purkinje, who established a physiological laboratory at

LABORATORY

Breslau in 1825; and the chemical laboratory established through the efforts of Baron von Liebig at the University of Giessen in the same year. The first physical laboratories for students were founded about 1846; one at Heidelberg, by Philipp Gustav Jolly; and one at the University of Glasgow by William Thomson — now Lord Kelvin.

The introduction of the laboratory into the educational system of the United States was made by the Rensselaer Polytechnic Institute, which established a chemical laboratory at about the same time as that established at the University of Giessen; and by the Massachusetts Institute of Technology, which also established a chemical laboratory. The movement for the establishment of laboratories in the United States was independent of that in Europe.

Among the great laboratories of the world may be noted that of the Royal Institution, established in 1800 by Count Rumford, which was to be devoted to the applied sciences, but which soon became the seat of great activity in researches in pure science, conducted by such men as Davy, Faraday, and Tyndall. The Physikalische Reichsanstalt, in Charlottenburg, near Berlin, is a very famous laboratory where there are departments devoted to research in pure science, and other departments for the study of the applications of science to industrial pursuits. In 1875 a Committee of Weights and Measures, made up of representatives of 18 nations, was organized for the purpose of reproducing and furnishing international metric standards to the members. A laboratory for their manufacture and for research was established near Paris. Great Britain has placed the control of a recently founded national laboratory, where standards of weights and measures are to be kept, duplicates made, instruments tested, and research is to be carried on, with the Royal Society. In the United States the Smithsonian Institution (q.v.) was established in 1846. Many important lines of research have been developed there, out of some of which have grown up some governmental departments; as the United States Weather Bureau and the United States Fish Commission. The United States government has established, by act of Congress, approved 3 March 1901, a National Bureau of Standards, a suitable building and equipment also being provided for. The bureau has the custody of the standards of weights and measures, and has power to manufacture duplicates, multiples and submultiples. It also has the power to officially test and calibrate physical and chemical apparatus and issue certificates for them. Research is to be carried on, when of great importance to commercial and scientific interests.

Laboratories for studying science by means of experiment, and for research, have been established in practically all American institutions of learning. In many preparatory schools and in an ever-increasing number of high schools, elementary laboratories are added for the study of physics, chemistry, and biology.

Laboratories for research and for testing form a part of many industrial enterprises, as in the manufacture of steel. The material is tested chemically at different stages of the process in order to determine the treatment in a subsequent process. Physical tests

are made of its strength and density. Investigations are carried out with respect to the effect of different processes of manufacture on its physical characteristics. Another example is the laboratory of the manufacturing chemist, where he tests his product and seeks for new, better and cheaper processes of manufacture.

Many industries of to-day are based on processes devised and worked out in laboratories for research. Some examples are the great plants at Niagara Falls, where metallic aluminum, calcium carbide, sodium hydrate and many other compounds are made. The basis of the progress in applied electricity is research in physics and chemistry. In many lines of industry scientific research in public and private laboratories has made possible new and better processes. In those countries where there is the greatest activity in research in science and its applications there is also the greatest industrial activity.

Research in the biological sciences has helped to a better understanding of life and to its prolongation. The causes of many infectious and contagious diseases have been discovered, and effective methods of prevention and of combating them have been found. The Pasteur institutes in many large cities all over the world are witnesses to these facts.

A general outline and some of the details of construction, equipment, and uses of a few of the most common types of laboratories found in educational institutions of the present day are given below. Many laboratories where excellent work is being done are very much simpler than those described; and, on the other hand, some are much more elaborate in construction and equipment. Some features are common to them all, one of which is the lecture room, where experimental demonstrations are given before many students at one time.

Biological Laboratory.—It is necessary in the present instance to dwell but briefly on any particular subdivision of laboratories devoted to the study of biology. Biological laboratories in Europe were established during the early part of the last half of the 19th century. Louis Agassiz led the movement in the United States in the establishment of biological laboratories, by establishing a zoological laboratory at Harvard.

Agassiz also developed the modern marine laboratory which has led to the establishment of many such laboratories in all parts of the world. The researches in these laboratories have been of greatest value in the biological sciences. Among the marine laboratories of the world must be enumerated the great laboratory established in 1872 by Dr. Anton Dohrn at Naples. Specialists from all parts of the world go to this laboratory to do research work. The United States Fish Commission has established two very important marine laboratories in the United States: one at Woods Holl, Mass., the other at Beaufort, N. C., in 1899. Woods Holl was the centre of activity in 1871 and again in 1875. The first building of the present fish culture and experiment station was completed in 1884. This laboratory has been open to voluntary investigators, tables being assigned to them. The investigators have numbered among them men from the principal universities of the country, and much valuable work both of economic and scientific value has been done

LABORATORY

there. The marine laboratory established at Beaufort, N. C., promises to be one of the greatest, if not the greatest, biological station in the world; larger than the one at Woods Holl or the one at Naples on the Mediterranean.

A second very important marine biological laboratory for research exists at Woods Holl, where scientists from many institutions congregate. This laboratory is devoted entirely to research. There are many other important biological stations along the Atlantic, Pacific, and Gulf coasts and a few on the Great Lakes.

The special appliances necessary to meet the needs of marine laboratories, are boats, both large and small, nets, apparatus for obtaining the vegetable as well as the animal life of the salt and fresh water bodies, and aquariums.

The epoch-making researches of Pasteur in France on bacteria have led to the establishment of important bacteriological laboratories throughout the world. The universities and colleges in the United States have many laboratories devoted to teaching and investigation along the different groups of the biological sciences.

The botanical laboratory is devoted to the study of the life of plants, and their classification according to their distinguishing characteristics and structure.

The laboratories for the whole group of biological sciences have much equipment in common. The laboratory rooms should be well lighted, preferably with north light and with window bars done away with as much as possible; the building should be situated so as to have a low horizon. This is important in microscopic and microphotographic work, in order to get a uniform lighting of the slide on the microscope stage. The rooms should be provided with tables, on which is placed a full equipment of reagents, staining and preserving solutions. Dissecting instruments are among the individual needs of the students. The microscopes for the more advanced work should have three objectives, one of comparatively low power, another of higher power, and the third an immersion objective. Microtomes are needed for cutting sections, to be mounted on slides for examination under the microscope. The photomicrographic camera aids very materially in the careful, systematic study of specimens. The negatives thus obtained are available for making lantern slides for projection purposes and for making enlarged photographs. In some lines of research work, as in bacteriology, culture media, in which the particular form of life may grow and multiply, may be used. Often the cultures must be kept for hours at a certain temperature, thus necessitating incubators, of which the temperature is regulated by thermostats. Frequently rooms are set apart for cultures. Dark rooms are essential for the development of negatives resulting from the photographic work.

Chemical Laboratory.—The chemical laboratory is one of the most important factors in the educational and industrial systems of our civilization. The rooms of the chemical laboratory should be well lighted and ventilated. Special lines of work should be isolated. The lecture room for demonstration purposes should be much the same in its general features as the physical lecture room (q.v.). The lecture room should be supplied with dif-

ferent gases, including common illuminating gas, oxygen, and hydrogen. The oxygen and hydrogen are generally supplied in heavy steel tanks under high pressure. A demonstration lantern should be conveniently placed. The table top should have one or two holes in it connected to the suction fan for carrying off fumes and gases, thus keeping them from being disseminated through the room.

The inorganic laboratories, for elementary purposes, may be divided into three principal divisions: first, that devoted to the study of the simple reactions by the beginner, who there learns experimentally what takes place in the simple reactions, as that of the production of hydrogen gas by pouring sulphuric acid on zinc, forming zinc sulphate and liberating the gas. The second division is that part devoted to qualitative analysis, where more complex reactions are studied and where the student learns to recognize and to test for the presence of the different elements. Under the third division is found quantitative analysis, which, as the name implies, is devoted to the study of the quantitative relations of compounds.

The work in these three divisions leads up to the more complex work of organic chemistry and research work. The equipment of these laboratories will give a general outline of the whole. Wide top tables should be provided. The tops should be impervious to water and as little acted on by acids as possible. Alberene stone is excellent material for such purposes. A good construction is to have the tops slope a little from both sides to the centre line, where a trough is placed to carry off the wastes to the sewer. Racks for the storing of bottles containing reagents should be placed so as to be easily reached by the students from both sides of the table. Beneath the top should be drawers and shelving so subdivided that each student may keep his apparatus separate. The tables should be provided with gas and water, with plenty of taps, and with electrical connections. Means should also be furnished for boiling under reduced pressure. For the experiments where noxious gases are given off, hoods should be provided, the bases being of the same material as the table tops, the sides and top of fixed glass with a glass window that may be opened in front. For ventilation within the hood there should be openings to a flue connected with a blower which produces a suction of the gases from the hood. One of the openings should be well toward the top and the other at the bottom of the hood. If artificial lighting is required it should be from above the glass top. Plenty of stop-cocks for gas, water, and suction should be provided for each hood.

Among the independent rooms needed, are those for the following purposes: A hydrogen sulphide plant is an absolute necessity, and it should be isolated to the extent of having a well ventilated room of its own. It should, however, be situated as conveniently as possible to the main divisions of the laboratory. Sometimes it may be advantageous to pipe the gas to different rooms. Near the quantitative laboratory should be a balance room well stocked with analytical balances supported on solid tables or wall brackets. A combustion room and a furnace room are often required. The furnace room should be

LABORATORY

so located as to get a good draft or so as to be connected to a suction fan system. Dark rooms for photography and spectroscopy should have a dead black finish, and those for photography should be supplied with means for obtaining ruby light.

The study of the spectrum of gases makes it necessary to have a good induction coil to produce a spark spectrum, which may be viewed by the eye, or which may be photographed. The range of temperatures at which chemical phenomena are now studied calls for very high and very low temperatures, which means that the electric furnace and a liquid air plant are often desirable. Apparatus for distillation under different pressures, and for obtaining constant temperatures are very necessary in some phases of the work. The rooms for gas analysis should be so situated as to make it possible to have but small temperature fluctuations. A north exposure, thus getting rid of direct sunlight and yet getting good illumination, is preferable. The principal part of the equipment needed for gas analysis by the Hempel method includes gas buretts, to measure volumes, absorption pipettes for the different reagents used to absorb different gases, combustion pipettes and oxygen generators.

The physical chemistry laboratory requires much apparatus and equipment needed in physics and in the other divisions of chemical work, including analytical balances, thermometers, barometers, manometers, calorimeters, thermostats, motors, stirring gear, refractometers, spectrometers, apparatus for studying polarized light, ammeters, voltmeters, resistances, and many other pieces. Among the subjects studied in the student laboratory are density, viscosity, vapor pressure, boiling and freezing points, heats of fusion and vaporization, critical temperatures, pressures and volumes, heats of combustion, solubility and the various divisions of electrolysis and electro-chemistry.

Electrical Laboratory.—The student and investigator in the field of electricity should have a thorough grounding in general physics and physical laboratory methods. The student in the electrical laboratory becomes acquainted with the relations of electric currents, electromotive forces and resistances; and the production and transmission of electrical energy, electrical quantity, capacity, magnetism and the relations between electricity and magnetism. The laboratory should be of strong construction on account of the lines of shafting and the heavy machines used. In the general laboratory will be found for purposes of investigation: dynamos of the various direct and alternating current types; direct and alternating current motors, the latter covering synchronous, two-phase and three-phase motors, induction motors, and rotary converters. Portable and variable inductive and non-inductive resistances; portable and fixed instruments for measuring current, electrical pressure or potential and power should be plentifully supplied. The fixed machines, instruments, the private rooms and tables should have lines of wire connecting them with a central switchboard through which any desired grouping of stations may be made. Among the separate departments may be one for testing and studying transformers; one for investigating the magnetic properties of iron, steel and other

metals; a potentiometer room in which to test and calibrate the instruments used in electrical measurements. Some interesting and important parts of the work are the investigation of the resistance and strength of insulators and conductors; the study of condensers and their effect in a circuit; the study of self and mutual induction and the measurements of them. Separate rooms which can be made dark, the walls of which absorb as much light as possible, or which can be made any color desired by a proper arrangement of coverings, where work in lighting and photometry may be performed, are also important parts of the equipment of an electrical laboratory.

The electrical engineering student should find it possible to make tests in all lines of his profession, approximating, as nearly as possible, actual working conditions in the commercial world. In order to give the greatest usefulness to the laboratory, the equipment should be kept abreast with the advances in the best engineering practice.

Engineering Laboratory.—Engineering laboratories have been developed within the past forty years along all lines of engineering and technical education. The divisions are many, but only a few of them will be considered here. The electrical engineering laboratory has been discussed above under the head of *Electrical Laboratory*. Under the division of Mechanical Engineering may be placed railroad engineering, marine engineering and the like. Among the subdivisions under Civil Engineering are mining engineering, hydraulic engineering, sanitary engineering and bridge engineering, for all of which laboratories have been developed.

The mechanical laboratory, as its name implies, treats of mechanics, the sources of mechanical energy and its transmission. The laboratory should be a solid structure with massive foundations for the heavy machines used. Boiler rooms, engine rooms, material testing rooms, and general experimental rooms on mechanical devices, are the requisites. The boilers tested comprise fire-tube, water-tube, and shell boilers. Tests are made of fuels, as to their steaming qualities, the ash, and flue gases, by means of calorimeters, gas meters, thermometers, thermo-elements, and balances. Engine tests may be made on many steam motors comprising steam turbines, simple slide valve, Corliss, and compound engines of high and low pressure types. For these tests are needed steam gauges, thermometers, indicators communicating directly with the inside of the cylinders, together with "reducing motions" for obtaining automatic records of the steam pressure within the cylinders during a complete stroke, from which data may be obtained by means of which to compute the energy put into the engine; and dynamometers to measure the output in useful work.

Another department is devoted to internal combustion motors. Under this class are included hot air engines, oil and gas engines, which require dynamometers, gas meters, and other measurers of the fuel supplied, and means for testing the products of combustion. In the mechanical laboratory, water motors, fans, blowers, air compressors, compressed air machines and tools, different methods of power transmission, as by shafting, gearing,

LABORATORY

belts, ropes and chains, and the like, are studied. Measurements of the coefficients of friction of different substances are found, and the effects of lubrication by different substances are investigated. Lubricants are tested under various conditions, such as at various temperatures, pressures, and in the presence of different vapors or gases. The testing of materials is common to mechanical and civil engineering laboratories. It will be outlined under the latter head.

In the civil engineering laboratories, calculating and measuring instruments are tested and calibrated. Among these instruments are transits and levels, and all instruments having graduated circles, cross-hairs and spirit levels; steel tapes; chains and bars for measuring lengths; chronometers for measuring time; barometers and thermometers. Here also is studied the magnetometer; and by means of it the strength of the horizontal component of the earth's magnetic field. The variation and dip of the earth field are also investigated. The "acceleration of gravity" is determined.

In the hydraulic division of these laboratories are studied the flow of water in pipes, "skin friction," the flow of water through different orifices under different conditions, the flow of water over weirs and its measurement. This is very important in irrigation.

The laboratory devoted to the testing of materials is a very important one in all engineering work. All kinds of materials used in engineering work are tested. The apparatus required comprises machines for testing the resistance to compression, of tensile strength, of torsion and flexure of materials. Cements are tested for their resistance to tension and compression and for the length of time required for them to set. For the last test named, automatic apparatus has been devised which registers time and amount of "set." Forms in which to mold the briquettes, and water tanks in which to immerse them for setting, are among the required equipment. Tests on concretes are made in a similar manner. Abrasion machines are used to make tests on paving material and other material subject to wear.

Physical Laboratory.—The requirements of the modern physical laboratory depend greatly upon the work to be done, but a few of the chief requisites that are common to all may be noted. The housing and equipment of a physical laboratory is of very great importance. The building in which the laboratory is to be located should be so situated as to reduce to a minimum all jar and tremor, and to do away with all outside magnetic disturbances, such as those due to electric car lines.

Many rooms are needed for special divisions of the work; such as constant temperature rooms, which require special precautions in design and construction and which are best situated below ground. Special rooms are demanded for radiometers, spectrometers, potentiometers, and such other instruments as require constant conditions to insure good results. Dark rooms are necessary for work in light, which includes experiments requiring diffraction gratings, photometers and the phenomena of light in general. Since photography has become of very great practical importance, fully equipped dark rooms are desired; also a sky-light room where enlargements and reductions of negatives may be made, and lantern slides prepared. It should be possible

to introduce sunlight into some of the rooms.

A lecture room in which experimental demonstrations may be given is a necessity, and much attention should be given to its arrangement. The lecture room should be well lighted but should be provided with arrangements for readily darkening it. The experimental lecture table should be placed so as to be easily seen from all parts of the room. This table should have water, gas, air blast, suction, water motors and other motors, sink, and terminals for obtaining direct and alternating currents. A solid masonry pier upon which to set up delicate apparatus and that requiring no vibration, should be provided. The table tops should be impervious to water and so far as possible acid-resisting.

An apparatus room in which is kept demonstration apparatus should be situated conveniently to the lecture room; general apparatus may also be kept there. The opening between the apparatus room and the lecture room should be large enough to admit the passage of large pieces of apparatus, and also to allow experiments to be set up on wheeled tables in the apparatus room, then wheeled directly into the lecture room.

Separate rooms should be provided for research work. It is desirable that it be possible to connect some of the rooms in suites, and to provide dark rooms for some of the suites.

Research rooms should contain water and gas, both ordinary illuminating and acetylene gas. They should have electrical connections to a central switchboard sufficient to obtain various types of current at one time. The floors of the building should be solid. Stone tables built in the walls form good supports for instruments, but there should be provided in some cases stone piers with independent foundations.

The general laboratories should have plenty of light and should be provided with separate rooms for some classes of work, as in light and sound, where it is often necessary to have darkened rooms. A heat bench or table should be provided; it should have an impervious top with enough pitch to drain into a central trough or hole to conduct away the waste. A rack with hooks above the bench, from which to suspend thermometers, is convenient. The rooms should be well supplied with tables, and along the walls stone shelving built in the walls, will be found useful. The dirt incident to primary batteries may be concentrated if all the cells be kept together, their terminals leading to a switchboard to which are connected the terminals of lines leading to the various stations in the rooms.

Some of the apparatus needed may be noted: projection lanterns for demonstration purposes; pulleys; weights; pendulums; machines for studying the acceleration of bodies; balances of different capacity and sensitiveness; vacuum pumps; pressure pumps; apparatus for comparing densities of substances; apparatus for testing the gas laws; calorimeters; thermometers; hydrometers; dividing engines; chronometers; chronographs; standard tuning-forks, some electrically driven; resonators; sirens; lenses; mirrors; prisms; spectrometers; radiometers; photometers; permanent and electromagnets; electrosopes; electrometers; many types of galvanometers, some for the measurement of electrical differences of potential or pressure, some for measuring current, and others for measuring quantity; ammeters; voltmeters; wattmeters;

LABORI

bridges, for measuring resistances; condensers; Leyden jars; electric machines; potentiometers; and a plentiful supply of standard cells and resistance boxes.

The laboratory should also have storage batteries, and, if necessary, have its own dynamos in order to procure direct and alternating currents. An acetylene gas plant, and a compressor and liquefier for obtaining liquid air and other gases, are becoming necessary parts of the general equipment of a Physical Laboratory. A plant for the production of oxygen and hydrogen is also often desirable. A workshop in which to repair and build apparatus is a great convenience. The wiring and plumbing should be open and accessible as possible. All dark rooms as well as other rooms should be well ventilated, as it is often imperative for an observer to be confined in a room for hours at a time. Further reference to physical laboratory equipment will be found under the head of *Electrical Laboratory*.

Psychological Laboratory.—Since the establishment of the first psychological laboratory in Leipsic in 1875, by Wilhelm Wundt, where one room was devoted to apparatus and research, the development of the psychological laboratory has been rapid. One of Wundt's first students, G. Stanley Hall, established the first psychological laboratory in America at Johns Hopkins University in 1881.

The requirements of the psychological laboratory have increased very rapidly with the development of the subject, until its housing and equipment has become a problem of great importance and interest. Many rooms and much equipment are now required for a detailed study of the various subdivisions of the subject. Beside the rooms necessary in teaching psychology by means of experiments, other rooms for research are needed. Quiet and relaxation being often necessary, it is important to so arrange the rooms that the work of one student will in no way interfere with that of another student. The separate rooms should be provided with gas, electric lights, and water. Where absolute quiet is required, piping of all kinds should be excluded, the heating being done by indirect radiation if necessary, and only incandescent electric lighting being used. The rooms should be wired for electrical inter-communication between those which may likely be desired to be used in suites. They should also have wires leading to the rooms where chronometers and electrical recording devices are located.

For the study of the sensations of light and the eye, its capacity and limitations, suites of rooms are desirable in many instances. These rooms should be capable of being either well lighted or darkened to any desired degree. The equipment of this part of the laboratory includes models of the eye and the muscles governing its movements, sectional models; apparatus for studying color sensations, color mixing, color blindness, contrast, brightness independent of the color sensation; apparatus for studying optical illusions, the sensitiveness of the retina at different points, the sensitiveness of the eye to changes in position, the sense of location, and the imperfections of the eye; and apparatus for studying reactions and reaction times.

The sensation of sound requires isolated rooms where the noises produced may not reach other parts of the laboratory, and for certain

parts of the work, rooms that are sound and light proof. In this part of the laboratory the sensitiveness, range, and analyzing power of the ear are studied. The equipment for the work in sound comprises models of the ear; instruments for producing sound, such as tuning-forks, sirens, organ pipes, and other sources of vibrations; and resonators for analyzing complex sounds.

Other rooms are needed for studying the sense of heat and cold, pressure, pain, and the locations of the various end organs. The apparatus necessary is that required to produce the corresponding sensations. The effects of different sensations on the respiratory organs and heart action is another subject for investigation. Other parts of the laboratory are devoted to the senses of taste and smell. The equipment comprises the substances with which to test the various parts of the tongue, and also substances to produce different odors.

Among the special pieces of apparatus necessary may be mentioned the chronometer, the chronograph, electrically driven tuning-forks, sources of mechanical and electrical energy, and induction coils.

Medical Journal 1900-1); Cajori, 'History of Physics' (1899); Sanford, 'Experimental Psychology' (1898); Scripture, 'The New Psychology' (1897); Titchener, 'Experimental Psychology' (1901).

ERNEST BLAKER,
Assistant Professor of Physics, Cornell University.

Labori, Fernand Gustave Gaston, fér-nān güs-tav gás-tōn la-bô-rē, French lawyer and editor: b. Rheims 18 April 1860. He studied at the Rheims Lycée and for two years in Germany and England; took his degrees in the law faculty of Paris in 1881 and 1883, and was enrolled at the bar of the court of appeals in 1884; was secretary of the conference of advocates in 1887-8; took a high professional rank; and was especially prominent as counsel for the defense in notable cases, as the libel action by Compayré against Numa Gilly, and the trials of the anarchists Duval and Vaillant. In 1898 he defended Emile Zola (q.v.), accused of libeling the army and the president of the republic in the letter concerning the Dreyfus case. He was junior counsel to Demange in the defense of Dreyfus at the trial at Rennes in 1899, and thoroughly confuted his opponents by his logic and his brilliant cross-questioning. He did not make the final plea, but his 'Notes de Plaiderie' were published in the 'Compte-rendu Sténographique In-extenso du Procès Dreyfus à Rennes.' On 14 August, while on his way to the court, he was dangerously wounded by a revolver bullet fired by a fanatic or mercenary. He was shortly enabled, however, to continue the case. In 1903 he defended the Humbert swindlers (see HUMBERT SWINDLE, THE). He was editor-in-chief of the judicial daily *La Gazette du Palais* in 1888-94; established the 'Revue du

LABOUCHÈRE — LABRADOR

Palais' and 'Grande Revue' in 1897; and published a 'Répertoire encyclopédique de Droit Français,' in twelve volumes (1898). See DREYFUS, ALFRED.

Labouchère, là-boô-shâr', **Henry**, English politician and editor: b. London 1831. He was educated at Eton; was in the British diplomatic service in 1854-64, being at one time a member of the British legation at Washington; in 1865-6 sat in Parliament for Windsor; was then unseated on petition; but represented Middlesex in 1867-8 and Northampton in 1880-1902. During his parliamentary career he strongly advocated Home Rule. He was at one time part proprietor of the London *Daily News*, to which he contributed letters from Paris during the German siege (1870-1) over the signature 'The Besieged Resident.' In 1876 he established and became editor of 'Truth,' a weekly journal in which he has expressed his opinions with great vigor. Indeed, as both parliamentary speaker and journalist, Labouchère gained an important place in English public life through his wit and incisiveness.

Laboulaye, Edouard René Lefebvre, à-doo-ar ré-nâ le-favr la-boô-lâ, French publicist and jurist: b. Paris 18 Jan. 1811; d. there 25 May 1883. He studied law and in 1842 he joined the Paris bar. He was a close student of the great German writers on jurisprudence, whose works and researches he introduced to his countrymen in a series of able essays, written in an admirable style. The Academy of Inscriptions and Belles-Lettres crowned his 'Histoire du Droit de Propriété Foncière' (1839), and elected him to its membership in 1845. An 'Essai sur la Vie et les Ouvrages de Savigny' (1840), was followed by 'Recherches sur la Condition civile et politique des Femmes depuis les Romains jusqu'à nos Jours' (1843), and an 'Essai sur les Lois criminelles des Romains concernant la Responsabilité des Magistrats' (1845), both crowned by the Academy of Moral Sciences. In 1849 he was appointed professor of comparative legislation of the Collège de France. After the foundation of the Second Empire he constantly strove to rouse opposition to it, and in several published works as well as in his lectures held up the American constitution to the admiration of his countrymen. He sacrificed his popularity, however, by his support of the plebiscite in 1870, and soon afterward he resigned his chair at the Collège de France. After the fall of the Empire he was elected for Paris in 1871. In 1875 he was elected a life senator. Besides the works above-mentioned he wrote: 'Histoire des Etats-Unis d'Amérique' (1854); 'Etudes Contemporaines sur l'Allemagne et les Pays Slaves' (1854); 'Souvenirs d'un Voyageur' (1857); 'Liberté Religieuse' (1858); 'Etudes sur la Propriété Littéraire en France et en Angleterre' (1858); 'Abdullah' (1859), an Arab romance; 'L'Etat et Ses Limites' (1863); 'Paris en Amérique' (1863), an ingenious and extremely popular satirical romance; 'Contes Bleus' (1863), a series of admirably told tales; 'Nouveaux Contes Bleus' (1866); 'Prince Caniche' (1868), another extremely popular satirical novel; 'Contes et Nouvelles' (1868); 'Discours Populaires' (1869); 'Questions constitutionnelles' (1872); 'Lettres politiques' (1872); 'La Liberté des Enseignements' (1880); and 'Trente Ans d'Enseignement au Collège de France' (1888), a

posthumous collection of lectures. He translated into French several of Channing's works and the 'Memoirs and Correspondence of Franklin.'

Labrador, läb-râ-dôr', a large peninsula at the northeast of the North American continent, lying between Hudson Bay and the Gulf of Saint Lawrence, extending from lat. 49° to 63° N., and from lon. 55° to about 79° W.; greatest length from the Strait of Belle Isle to its most northern cape, Wolstenholme, 1,100 miles; area, 420,000 square miles; pop. about 6,000, collected chiefly at the Moravian missionary stations of Nain, Okkak, Hebron, and Hopedale.

The Atlantic coast is stern and precipitous (1,000 to 4,000 feet high), entirely destitute of vegetation, deeply indented with narrow fiords, and fringed with chains of rocky islands. The inner parts have been but very imperfectly explored; the greater part consists of a plateau, about 2,000 feet above sea-level, and mostly covered with fine forest trees, firs, birches, etc. Numerous lakes, including Mistassini, also exist inland, and, connecting with the rivers, afford in summer continuous waterways for great distances. There are numerous rivers, 200 to 300 miles long and 2 and 3 miles wide at their mouths, flowing toward the Atlantic and Hudson Bay. The Grand Falls on Grand River are believed to be among the largest in the world, and are calculated to be little short of 2,000 feet in height. The rivers abound in fish, especially salmon and whitefish. The principal fur-bearing animals are bears, wolves, foxes, martens, otters, beavers, lynxes, etc., which are trapped by the inhabitants in winter. Of the mineral resources little is known; but iron and labradorite are abundant. The climate on the coast is very rigorous, owing mainly to the ice-laden Arctic current which washes the shores. The short three months' summer is marred by the swarms of mosquitoes and black flies. The mean annual temperature at the missionary stations varies from 22° to 28°. The winter is dry, bracing, and frosty. Since 1809 the coast region has been annexed for administrative purposes to Newfoundland. The remaining parts of the peninsula are designated the Northeast Territory. By far the most important wealth of Labrador is its fish—cod, salmon, herring, and trout. As many as 30,000 fishermen from Newfoundland, Canada, and the United States visit its fishing grounds in the season. The annual catch is valued at more than \$5,000,000. The coasts of Labrador were probably visited by the Norsemen about the year 1000; they were again sighted by Cabot in 1498. In 1500 a Portuguese navigator, Cortereal, seems to have visited it and to have given it its name, which means "laborers' land." Civilized man is found at a few settlements on the Saint Lawrence and Atlantic coasts, and at some widely separated posts of the Hudson's Bay Company. The natives of the northern coast are Esquimos, while some tribes of nomadic Indians are thinly scattered over the interior. The Indians of the interior are all tribes of the once great Algonquin race, and could at one time bring 1,000 warriors to repel the incursions of the Eskimos, whom they still bitterly hate. The Eskimos live almost entirely by fishing. They are mild, hospitable, and honest, and well provided with wolf-like dogs, which can draw them over the snow in sledges at the rate of from 6 to 10 miles an hour. See also ESKIMOS.

LABRADOR DUCK—LABYRINTH

Labrador Duck, a rather small handsome sea-duck (*Campylaimus labradorius*), allied to the eiders, of the northeastern American coast; it bred in Labrador, and migrated in winter as far south as Chesapeake Bay, but was never very numerous, and became extinct about 1875, leaving only about 35 specimen-skins in the museums of the world. No very satisfactory theory exists to account for the closure of the species, since the fault does not seem chargeable to excessive shooting or disturbance of breeding-places. The race seemed to be waning, and an epidemic of disease or some weather-disaster destroying many eggs and young, may have been a final blow. The last one seems to have been killed in 1875. Consult: Stejneger, Vol. IV. ('Birds') of 'Standard Natural History' (1885); Lucas, 'Ann. Rept. Smithsonian Inst.' 1888; Dutcher, article in 'The Auk,' January 1894.

Labrador Tea, or Marsh Tea, either of two species of heath of the genus *Ledum* (*L. latifolium* and *L. palustre*). They grow in the northern parts of both Europe and America, and are low shrubs with alternate entire leaves clothed underneath with rusty wool. The fragrant crushed leaves are used by the natives of Labrador as a substitute for tea. They possess narcotic properties, render beer heady, and are used in Russia in the manufacture of leather, yielding an oil known to druggists as ledum oil, rich in tannin and resinous properties. The plant finds a place in medicine as an astringent and tonic.

Labradorite, a plagioclase feldspar of the albite-anorthite series, corresponding chiefly to Ab_nAn₃ (see FELDSPARS). It is, therefore, a silicate of aluminum, calcium, and sodium. It has a hardness of 5 to 6 and a specific gravity of 2.73. It ordinarily occurs in cleavable or granular masses, or as an essential constituent of certain basic eruptive rocks, such as norite, gabbro, diabase, basalt, dolerite or andesite. In these it is associated with some member of the pyroxene or amphibole groups. Labradorite abounds in the Adirondacks, but its type locality is along the coast of Labrador, where it occurs in pure masses of enormous size which exhibit a wonderful change of colors, from dull gray to a gorgeous blue, or more rarely green, copper-red, purple or yellow. It has been used as an ornamental stone, especially in inlaid work.

Lab'ridae, a family of marine fishes, the grasses, representing the highly specialized sub-order *Pharyngognathi* by a large number of beautiful and useful species inhabiting all the warmer seas, and traceable as far back as the Eocene period. These are brilliantly colored fishes usually elongate in form and of large size, with cycloid scales and thick fleshy lips. There are powerful teeth on the margins of the jaws, but none on the palate; while the united lower pharyngeals are much thickened and form a plate beset with rounded, rarely acuminate grinding-teeth. The upper pharyngeals are usually separate, bearing similar teeth. Jordan enumerates 60 genera and 450 species, "chiefly of the tropical seas, living among rocks or kelp." The typical genus *Labrus* is almost wholly European. The principal genera represented in American waters are *Ctenolabrus* (cunners), *Tautoga* (tautogs), *Harpe* (lady-fishes), *Pimelometopon* (fatheads), and *Iridio* (doncellas); and by some authors the parrot-fishes (*Scaridae*) are included.

Consult: Jordan's 'Review' of the family in 'Report U. S. Fish Commission for 1887.'

La Bruyère, Jean de, zhōn dē lä brü-yär, French moralist: b. Paris 17 Aug. 1645; d. Versailles 10 May 1696. He was educated for the law, became treasurer at Caen, and through the influence of Bossuet, was employed in the education of the Duke of Bourbon, grandson of the great Condé, with a pension of 3,000 livres, and was attached to his person during the remainder of his life. In 1688 he published the 'Characters of Theophrastus,' translated into French, to which he added others of his own, in which he represented the manners of his time with great accuracy, and in a style epigrammatical, ingenious, and witty. The work contained 386 "characters"; the 4th edition (1689), 340 additional ones, while the 9th, in press at the time of the author's death, included over 1,100 "characters." Consult: Rahstede, 'La Bruyère und seine Charaktere' (1886); Allaire, 'La Bruyère dans la maison de Condé' (1886); Pellisson, 'La Bruyère' (1893).

Labuan, la-boō-äp', an island of the Malay Archipelago, belonging to Great Britain, situated on the northwest coast of Borneo; about 12 miles in greatest length by 7 miles in greatest breadth; area, 32 square miles. It is mostly low and marshy, and not very fertile, but it is well supplied with water, and has a good harbor at the settlement of Victoria, on its southeast side. Coal of excellent quality is plentiful, and has been mined for many years. The chief town is Victoria. Pop. 5,853, mostly Malays.

Labur'num, Golden-chain, or Bean-tree, a genus of trees and shrubs of the order Leguminosæ. The few species, which are natives of southern Europe and western Asia, are characterized by trifoliate leaves and brilliant yellow blossoms in pendulous many-flowered racemes produced during late spring and early summer. The larger species yield a very hard, heavy, tough, fine-grained, dark green or brown wood, which can be highly polished and is valued for inlaying, cabinet work, turning, etc. The species are also prized for ornamental planting in shrubberies, not only for their flowers, but also for their glossy foliage, which remains green until late in the autumn. No part of the plant is relished by insects, and all parts, but particularly the seeds, are reputed poisonous. Nevertheless, it is said, the young stems are greedily eaten by rabbits, and may thus be made to serve as a sacrificial protection to other shrubbery. The best known species, probably, is the English laburnum (*L. vulgare*), which sometimes attains a height of 40 feet but usually not more than 20 feet. It is hardy nearly as far north as Massachusetts. The Scotch laburnum (*L. alpinum*) is harder, more erect and rigid, bears broader leaves and much longer and slenderer racemes of dark yellow flowers, and continues in blossom about two weeks later than the preceding. By some botanists it is considered only a form or variety of *L. vulgare*. Laburnums thrive in any well-drained soil in either partial shade or full sun. They are readily propagated by seeds generally spring-sown, and also by layers. Choice varieties, of which there are many, are grafted upon seedlings.

Lab'yrinth, a structure having numerous intricate winding passages. The legendary laby-

LABYRINTHODONTA—LACANDONES

rinth of Crete, out of which no one could find his way, but became the prey of the Minotaur, was said to have been constructed by Dædalus. The hint of this legend was probably given by the fact that the rocks of Crete are full of winding caves. The Egyptian labyrinth was a building situated in central Egypt, in the district now called the Fayoum. The building, half above and half below the ground, contained 3,000 rooms. It was probably a place of burial. The labyrinth at Clusium, in Italy, was erected by the Etruscans, according to Varro, for the sepulchre of King Porsenna. Imitations of labyrinths, called mazes, were once fashionable in gardening. They were made of hedges; the best known is that at Hampton Court, near London.

Labyrinthodon'ta, or **Stegocephali**, a group of primitive four-footed animals, forerunners of modern amphibians and reptiles, whose remains are found fossil in Peruvian, Carboniferous and Triassic strata, and which are the oldest known lung-breathing terrestrial quadrupeds. They were first discovered through finding their footprints imprinted in the Triassic rocks (Keuper beds) of Germany, long before the actual fossilized remains were brought to light. The footprints were described at first as those of a hypothetical form to which the name *Cheirotherium* ("hand beast") was given. As geological science and research progressed, the remains of the labyrinthodonts were discovered, when a comparison of their structure with the footprints showed that some of the latter were made by these creatures; many of the tracks, however, are unidentified. Later, when a great variety of related remains had been discovered, the term *Labyrinthodonta*, which relates to the curious "labyrinthine" infoldings of the enamel-wall of the teeth, was restricted to a single group or suborder (also called *Stereospondylit*) within the general amphibian order *Stegocephalia*. This suborder contains highly developed and mostly large forms, characterized by the complication in tooth-structure above mentioned, and by co-ordinate anatomical distinctions. The principal genera are *Laxomma*, *Trematosaurus*, *Metopias*, *Capitosaurus*, *Mastodontosaurus*, and *Labyrinthodon*, the last including the most recent forms of the Upper Trias, at the close of which period the group appears to have become extinct. See *STEGOCEPHALIA*.

Lac, various products of the lac insect (*Coccus lacca* or *Carteria lacca*), for which see *Coccus*. The insects infect the young branches and twigs of various Asiatic trees, especially figs, and excrete resinous and coloring matters under which they become buried often to the depth of more than a quarter of an inch. They are often so numerous at times of migration that the twigs seem to be concealed by red dust. In northern India and in Assam the production of lac is fostered by hanging infested twigs in non-infested trees, and regular collections are made each autumn and spring, the former being of greater commercial importance, the latter mainly for propagating purposes. Trees in ordinary vigor are considered best, and are said to furnish six or eight crops before being given a rest, though some trees may yield more than twenty crops.

Two methods are commonly employed in preparing lac for market. In the commoner, the twigs are broken or powdered and thrown into

and kneaded in hot water to melt the resin, dissolve the coloring substance and separate the dead insect remains and wood. Several alternate washings and dryings follow in order to have the resin as free as possible from coloring matter. The dried lac is then suspended in coarse cotton sacks before charcoal fires. The bags are twisted to force out the resin, which is caught in films upon pieces of wood upon which it hardens and becomes commercial shellac. The finest quality is a light brown or deep orange. Imperfect removal of the coloring matter results in dark-colored lac. Button lac and plate lac are merely the drops of various sizes which missed the sticks and fell to the ground. The lac that falls to the ground from the trees is collected and sold as seed lac, a name also given to the resin before it is fused but after it has been purified by washing. The first water mentioned above is strained and evaporated, the purple pigment cut in cakes and marketed as lac dye. The other process of purifying the crude lac consists in crushing between rollers, mixing with water, stirring in a cylinder, precipitating the coloring matter with lime, removing the lac, withdrawing the water, pressing the precipitate into cakes and drying them in the sun. The resin, in this process, is melted by steam heat, poured upon tilted, flattened zinc tubes filled with warm water. After cooling it is marketed.

Lacs are prized because of their varnishing properties, because they can be highly polished when dry, and because they are translucent and, in some of the finer grades, transparent, thus allowing the grain of the wood to show clearly through them. They are also used for making the finest grades of sealing wax, vermillion and other colors being added to them after pulling and twisting to make them opaque.

Lac, or **Lak**, from the Sanskrit *lakshā*, or *laksha*, that is, 100,000. In the East Indies it is applied to the computation of money. Thus, a lac of rupees is 100,000. A lac of rupees was equal to about \$46,350. A lac of Sicca rupees was equal to about \$50,000; 100 lacs, or 10,000,000 of rupees, make a *crore*. In 1835 the British government remodeled the currency of India, establishing a more uniform system, and the value of the rupee is now fixed at 32 cents.

Lacaille, *Nicolas Louis de*, né-kō-lâ loo-é dé lä-kâ-é, French mathematician and astronomer: b. Rumigny, France, 15 March 1713; d. Paris 21 March 1762. He was educated for the Church, but soon renounced theology for astronomy. He took an important part in the work of measuring an arc of the meridian, and in 1746 was appointed professor of mathematics in the Collège Mazarin. In 1751 he went to the Cape of Good Hope at the expense of the government, where he determined the position of some 10,000 stars with wonderful accuracy. As his departure from the Cape was delayed, he employed the interval in measuring a degree of the southern hemisphere. His works on geometry, mechanics, astronomy, and optics were numerous. Among them are: '*Leçons d'Astronomie*', and '*Astronomiae Fundamenta*'; '*Cœlum Australē Stelliferum*'; '*Journal historique du Voyage fait au Cap de Bonne Espérance*'.

Lacandones, lä-kān-dō'nës, an Indian tribe living in Guatemala and Mexico. At one time numerous and powerful, they waged war against

LACCADIVE — LACE

the whites. There are now about 1,000 left, of whom a part are friendly to the white people, though retaining their native customs.

Laccadive (läk'ä-div) Isles, a group of small coral islands in the Indian Ocean, about 150 miles off the coast of Malabar. They form 20 separate reefs, containing, however, but 13 islands, only 8 of which are inhabited. The surface soil is naturally so barren that there is little or no spontaneous vegetation on the majority of the islands, and their prosperity must ever depend on the cultivation of the cocoanut. The natives of these islands, a race of Mohammedans called Moplas (of mixed Hindu and Arab descent), are a mild and inoffensive race and dwell in low, thatched, stone-built houses, and live poorly. Vasco de Gama discovered these islands in 1499. They were ceded to the British in 1792. Pop. 6,800.

Laccolith, läk'ō-lith, or Laccolite (Greek, «stone-pit»), a mass of lava or intrusive rock having a mammiform shape supposed to be due to its spreading laterally when forced up from below, the rocks above it being lifted up into dome-like forms. Laccoliths were first described from mountains in Utah.

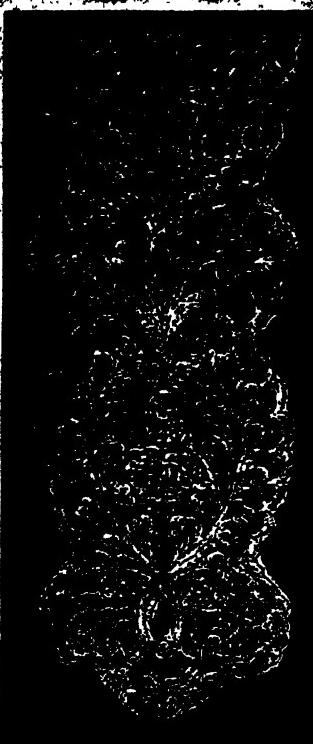

Lace. Authorities differ regarding what constitutes a lace fabric, whether we adhere strictly to the technical distinction of an ornamental open work fabric made with threads by knotting, twisting or stitching, or sewing with a needle, or include fabrics that resemble embroidery, made in combination with something woven. In some statements on the subject prepared for the writer some years ago by the late Dr. Thomas Wilson, one of our highest lace experts, it was set forth that lace is not a textile, because not woven, and that it was not embroidery, its peculiarity, and its principal difference from these being that it is made a mesh or loop at a time, each one being complete in itself, and not made on any previously prepared foundation. There are, however, netted fabrics which would never be called lace although made in the same way, because they do not work out an ornamental design or pattern. All authorities agree that lace is an ornamental fabric, the word ornamental being the one characteristic that distinguishes a lace fabric proper from a fine fishing net, or a Yucatan hammock, in which the threads are netted or twisted precisely as some forms of lace are made, though these articles are not lace. On the other hand, there are fabrics made with threads which have the appearance of lace, embodying in their fabrication artistic, graceful, or ornamental designs, but which are not lace, such as drawn-work, where the design is wrought in a woven fabric by drawing out certain threads forming the fabric, as well as other manipulation.

It is impossible to say when or where lace was first made. We know that the art of weaving is older than any written records, and that flax threads were wrought into fabrics by rude weaving processes in the early Stone age in Europe; and that the art was brought to a high degree of perfection in the later Bronze age. We know that attempts at ornamentation, in the form of more or less elaborate fringes are found in some of the delicate Egyptian linens of 4,000 years ago. The art of embroidering is likewise ancient, for it had reached a high state of perfection before the period of the Pharaohs, and has been prac-

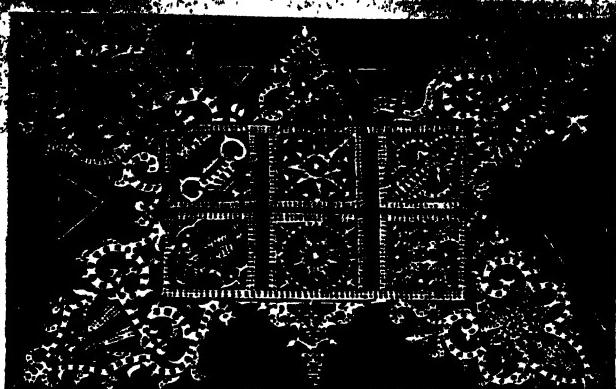

tised by all countries and peoples from time immemorial. The art of lace making, however, must have developed, by a kind of evolution, from early attempts at the ornamentation of fabrics—possibly as early as the 12th century—these first attempts being mere loops of plaited or twisted threads in the form of small cords, attached to the hems of garments. In the earliest productions of lace there was a foundation of woven fabric, such as very fine linen, and the design was wrought by means of needle-point stitches, or darning, something after the manner of embroidery, the uncovered portion of the woven fabric being afterward removed, and a number of such designs skillfully joined together. Thus, from needlework or embroidery, which has come down from Bible times, we may imagine lacemaking was developed. The fabrication of the true laces, according to Dr. Wilson's definition of "a knotted or twisted fabric made one mesh or loop at a time," dating back no farther than the latter part of the 15th century, and it has been said that it is extremely doubtful if any particular specimen can be identified as having been made prior to the middle of the 16th century, at which time lace first appeared as a perfected fabric. The point lace of the earliest period of manufacture came nearer being what might be termed a pure art creation than that which followed in a later period; that is to say, the motive or design having been worked out from a thought in the brain of the maker, and not from a set pattern, as was the case in the fabrication of the later or second period needle-point laces. The earliest work is supposed to have been produced by nuns, and the patterns or motives not only give evidence of high artistic merit, with originality, but the practice of a patience on the part of the worker that would hardly be appreciated in this practical and rapid transit age. The designs from the period which followed were quite as beautiful, but were more set, and show the restrictive influence of copying rather than directly producing original forms as the work progressed.

Italy, France, Belgium, and Germany have all claimed the invention of lace-making, but the country to which the honor belongs is unknown. Dr. Thomas Wilson held it remarkable that lace-making should have sprung up, or been invented at about the same period by two entirely distinct processes without relationship or evolution between them, and that the people of the countries wherein either of the inventions was made were not only unknown to each other, but apparently neither had any knowledge of the process of lace-making invented or employed in the other country. One of these processes is by the employment of the needle and a single thread, wherein the work was perfected mesh by mesh, each mesh being completed as the work progressed. The other process was by the use of many threads at once, each one attached to bobbins for the purpose only of separating them, the meshes being made by twisting the threads a greater or less number of times. When each mesh is only partially completed, the thread is carried on to the next, and so on from side to side the entire width of the fabric. While the countries in which these processes were invented are unknown, the evidence points to Venice as the seat of the former, and to Belgium as the seat of the latter. By these two totally distinct

LACE

processes fabrics are produced so nearly alike as often to require an expert to distinguish the difference, which, though many times easily determined, yet not infrequently requires the aid of an expert.

It is seen, therefore, that there are two distinct classes of hand-made lace, though many varieties of each:—(1) needle-point lace, and (2) bobbin or pillow lace. Manufactured lace, a third class, is a recent invention, and while it has been the means of bringing a form of ornamental lace fabric within reach of everybody, it can never be compared with the exquisitely delicate and wonderful fabrications of hand-wrought lace, many examples of which are of priceless value.

Lace is chiefly made from linen, cotton and silk threads, usually of the finest numbers, and often specially prepared—some of the finest threads being spun in underground rooms where a damp atmosphere can be maintained, and where the only light is a single beam directed upon the work. Gold and silver threads have also been used, as well as other fibres than those named, such as aloe fibre, or ramie, which is now considerably used in machine-made laces. Mohair and fine wool have also been employed, and even horsehair has been used to stiffen portions of the work in some laces.

Point lace, or fabric made with the needle point, is the oldest known form, its most celebrated examples being the beautiful Venetian designs, and the exquisite French laces of Alençon and Argentan. The early French industry doubtless derived its inspiration directly from Venice, as Colbert, in the time of Louis XIV., is said to have brought from Italy 30 or more of the best lacemakers, and, encouraged by the king, this lace—also known as Point de France—soon became in such vogue that many establishments sprang up in other places in France to supply the demand.

In the oldest designs in point lace there was a foundation of delicate linen, as we have seen; there was also a reticulation of threads attached to a light frame, the patterns being worked over with the button-hole stitch upon these threads and into the linen foundation, which, as the work progressed, was completely hidden by the design. The portions of the foundation outside of the design were cut away, and a number of the design or patterns joined together by means of connecting threads. But sometimes no foundation was employed, the patterns simply wrought upon threads stretched upon the frame as above described, the button-hole stitch being employed. The Venetian point had attained a wonderful perfection by the middle of the 16th century, some of the examples in complexity of stitch, delicacy of design, and artistic merit being masterly conceptions.

Point d'Alençon and Brussels point are still manufactured, the former maintaining many of the distinctive characteristics for which it was so esteemed in the 17th century. Other varieties of needle-point or Guipure laces are Rose point, Portuguese point, and Maltese point. The first-named is especially characterized by the figures being worked in high relief.

Brussels point differs from the Venetian and French needle-point chiefly in the manner of making the stitch, a plain thread being used, and not overcast with the button-hole stitch. In early

times Spanish point enjoyed a wide celebrity, but as much Flemish lace was imported into Spain, there was a decline in the industry, though point laces from the Spanish convents, in the early part of the last century, were very similar in character to the Venetian point. Point d'Espagne is said to have been merely a commercial name used in the 17th century, for which the French manufacturers were responsible. Point d'Angleterre owes its name to an effort on the part of the Flemish lace-makers to evade the restrictive measures which were adopted by Great Britain in the latter part of the 15th century, to encourage the home lace industry. The prohibition worked effectively, smuggling was difficult, and in time Flemish lace-makers were induced to settle in England, whereby some of the characteristics of Flemish laces have been perpetuated in the English pillow laces.

It has been claimed that pillow lace manufacture was the invention of Barbara Uttman, of St. Annaberg, Saxony, about 1561, though some authorities assert that she only introduced the manufacture, probably from Flanders. At any rate, paintings from an earlier period give evidence that lace was manufactured in Flanders at least half a century before her time. Pillow lace is made by working the design over a parchment pattern upon a pillow or cushion, the threads being wound upon bobbins. The method was to attach the pattern to the pillow, pins being inserted at regular intervals following closely the lines of the pattern or design. The figure is then wrought by twisting the threads around the pins to form the netted or open-work effect, which characterizes this form of lace. The Flemish laces of the 16th century became quite as famous as the Italian, and the art, as practised in Flanders, was early introduced into many countries of Northern Europe. Among the more important laces that are made with the pillow and bobbins, may be mentioned Brussels (both Saxony and Flemish), Mechlin, Lille, Chantilly, Valenciennes, Honiton, Buckinghamshire, and Limerick or Irish lace.

The Mechlin laces—sometimes called the queen of laces, and which formerly enjoyed a wide celebrity—are products of Mechlin, Antwerp, and Lierre. Ordinary Mechlin is made with a hexagonal mesh, as is also Brussels pillow. The Lille laces embody a simple pattern, marked by a thick thread, and are said to be "the finest, lightest, most transparent, and best made of all grounds." The Chantilly silk laces were also very simple in character, particularly in regard to their meshed grounds. The black laces were especially noted, and at one time were in high favor. Valenciennes is probably the most important pillow lace now manufactured in Belgium, the cities of Courtrai, Bruges, Ypres, Ghent, and Alost furnishing the larger part of the supply. That made at Ypres especially is the finest quality. Its predominant characteristics are richness of design, beauty of ground, and evenness of tissue. In this lace the mesh is diamond shaped and closely plaited, without twisted sides to the mesh.

The English laces are chiefly made in the counties of Buckinghamshire, Devonshire, and Bradford. Honiton is the best known of the pillow laces of Great Britain, and the most beautiful. It embodies original characteristics that give it an individuality, although it bears some

LACE BARK — LACÉPÈDE

resemblance to Brussels. British point is an imitation of Honiton. Patronized by the late Queen and by other members of the royal family, Honiton soon became popular and its manufacture for many years has been important. Buckinghamshire is said to be an adaptation of the Mechlin, and the patterns to have been used since the 18th century. Laces are made in other places in England, and in Scotland, for the most part as household industries. As has been said, the Irish lace is made at Limerick; it is justly popular, and holds a high position. The lace industry of Russia is said to have been promoted through court patronage after the visit of Peter the Great to Paris. These laces are especially noted for the uniformity of their designs, or patterns.

We have been considering chiefly lace-making in Europe. In more modern times the art has been introduced into many countries, the European nations especially extending the manufacture into their colonies, the natives being the lace-makers. Even the natives of some of the South American countries practise the art, which was taught them by the missionaries of an earlier period, and which, handed down from generation to generation, has become identified with the people. The peasant women of Fayal have for many years produced an exquisite lace, with designs in high relief, the fibre used being finely prepared filaments of the *Agave Americana*, or "Aloe fibre" as it is known. This lace was formerly sold in Paris at very high prices; and it was claimed a few years ago that there were only 25 women on the island who were skilled in its manufacture. Among the beautiful peasant laces should be mentioned those of Russia, Germany, and Crete, though the Cretan lace manufacture has not survived. Malta produces a pillow lace in white and red threads which is noted, and pillow lace is made in Ceylon which somewhat resembles both the Malta and the Buckinghamshire. The natives of Madagascar, under French tuition, make a fabric resembling antique lace, which is an article of export. Wm. E. Curtis is authority for the statement that the women of Paraguay make a very fine pillow lace which is called Nanduty (Nanduti), the art having been taught them by the Spanish nuns. A native fibre is used which is described as soft and lustrous as silk. The designs are beautiful and the fabric indestructible. The lace is made in small squares and these joined together. In Dr. Thomas Wilson's valuable collection there are also some fine examples of aloe fibre lace from Corfu and Zante.

The third class of lace manufactured is that produced by machinery, the chief centres of the machine lace industries being Nottingham, England, and Calais, France. Nearly every kind of lace can be made by machinery, and the manufacture has been brought to so high a state of perfection, that some of the lace is difficult to distinguish from the fabrics produced by hand processes. While the enormous output and cheapness of machine lace has placed the fabric within reach of all classes, it is claimed that the demand for hand-made lace has not diminished, though prices have been affected.

It would be a hopeless task to endeavor to describe the complicated machines in use today, to make them understood, in so brief an account as appears in this place, and the

student is therefore directed to the 'History of Machine Wrought Lace,' by Mrs. Bury Palliser, London, 1865-9, and to the 'History of Machine Wrought Hosiery and Lace Manufacture,' W. Felkin, 1867. The first attempt at the invention of a lace machine dates back to 1758 when a stocking weaver was able to produce upon a machine a lace in imitation of Brussels. The really practical machine, however, did not appear until 1809, the invention of Heathcote, which is said to have been suggested from machinery employed in the manufacture of fishing nets. A year or two later there were improvements by several inventors, Morley, Leaver, Clark, and others, which with subsequent improvements, have brought the lace machinery of to-day to such perfection. Machine lace is largely made from cotton, though the new fibre ramie has been employed to some extent, and with best results. This textile is very strong, with the lustre of silk, and takes color well. Some machine-made black ramie lace, a fourth of a yard wide, in the writer's collection of textiles, is an exquisite fabric.

Gold and silver lace, strictly speaking, is not a lace fabric, but rather a woven fabrication resembling in the finished state some kinds of embroidery. It is either made from fine filaments of gold and silver (threads), or from textile yarns or threads wound or otherwise covered with the metal.

CHARLES RICHARDS DODGE,
Commercial Fibre Expert, Washington, D. C.

Lace Bark, is derived from the inner bark of several species of trees, and is readily detached in sheets or layers like birch bark, each layer being a delicate network of fibre, which when gently stretched a pentagonal or hexagonal mesh is formed which resembles lace. The most commonly known species is the lace bark of Jamaica, *Lagetta linearia*. It is said that Charles II. was presented by the governor of Jamaica with a cravat, frill, and pair of ruffles made from this substance. The fibre can also be twisted into strong ropes, and in past time thongs and whips were made from it, with which the negroes were beaten. The lace bark tree of New Zealand is an Australian species, *Plagianthus betulinus*, more commonly known as the ribbon tree; its layers of bark showing the same beautiful lace-like texture as the Jamaica form. Another species producing a delicate, white lace-like tissue is the Birabira of South America *Daphnopsis tenuifolia*.

Lacedæmon, läs-e-dē'mōn. See SPARTA.

Lacépède, Bernard Germain Etienne de la Ville, bär-när zhär-män à-tē-én dé là vél lä-sä-päd, COUNT DE, French naturalist: b. Agen, France, 26 Dec. 1756; d. Epinay, France, 6 Oct. 1825. He abandoned the military profession, for which he was destined, and devoted himself to the study of natural history. His teachers and friends, Buffon and Daubenton, procured him the important situation of keeper of the collections belonging to the department of natural history in the Jardin des Plantes. In 1791 he was elected member of the legislative assembly, and belonged to the moderate party. Napoleon made Lacépède a member of the conservative senate, and conferred on him the dignity of grand-chancellor of the Legion of Honor. After the restoration he was made peer of France. He continued Buffon's 'Historie natu-

LACERTILIA — LACHINE

relle' with the titles 'Histoire des quadrupèdes ovipares et des serpents' (1788-9) and 'Histoire naturelle des reptiles' (1789), and published also 'Histoire naturelle des poissons' (1798-1803); 'Histoire des cétées' (1804); etc.

Lacertilia, lăs-ér-til'i-a, or **Autosauri**, the order of saurian reptiles which contains the lizards. These are distinguished from the serpents (*Ophidia*) to which they are most nearly allied by the fact that the right and left halves of the mandibles (lower jaws) are connected by a sutural symphysis, whereas those of serpents are connected by a more or less distensible cartilage. The great majority possess well-developed limbs, movable eyelids and cutaneous scales, covered by a horny epidermis, usually thin, but sometimes thick and rising into pointed projections. In a few degraded and burrowing forms the limbs have been greatly reduced, or one pair or even both pairs completely lost, while the eyes may have become buried beneath the skin and the scales nearly or wholly obsolete. The vertebræ are procoelous, except in some of the geckos, where they are amphicoelous; the ribs of the trunk articulate by their capitular heads only, the reduced tubercula being attached to the vertebræ by ligaments. The limbs are typically formed after the pentadactyl pattern; and the shoulder girdle and sternum are complete. The hyoid apparatus resembles that of birds. In the skull the quadrate bone is movable except in a few degraded forms. The skin is covered with scales formed within it, and the epidermis is horny, and is periodically shed in flakes; but in many cases these scales do not overlap and look like scales, but are represented by bony granules, giving a "pebbly" aspect to the surface; or these osteoderms (which never occur in snakes) may form in the ordinary scales. The skin contains no glands; but in many lizards abounds in chromatophores (q.v.) controlled by muscles whose action causes the variations in surface color of which many lizards are capable, and of which they avail themselves as an aid in hiding from their enemies. The group possesses strong power of regenerating lost parts and especially of renewing the tail, which in many families breaks off under a very slight strain.

The *Lacertilia* are a comparative development of the reptilian race, not traceable beyond the beginning of the Tertiary. Fragmentary remains of several existing families occur in the Eocene and Miocene rocks; and the Pleistocene river-deposits of Queensland, among which was a monitor-lizard 30 feet long. The line probably originated in the *Prosauria* (q.v.), represented by a single living form,—the tuatara (q.v.). Lizards are now scattered over all the warmer parts of the world, and seem to be increasing and developing. They are said by Hoffman to include 434 genera and 1,925 species.

The *Lacertilia* are divided into three sub-orders: (1) *Geckones*, equivalent to the family *Geckonidae*; (2) *Lacertæ*, typical lizards, including the families *Agaenidae*, *Iguanidae*, *Zonuridae*, *Anguidæ*, *Helodermatidae*, *Varanidae*, *Tejidae*, *Lacertidae*, *Scincoidæ* and others of minor importance; (3) *Chameleontes*, with a single family.

For more particular descriptions see CHAMELEON; GECKO; LIZARD; and the names of various lizards, as AGAMA; GILA MONSTER; etc.

Lace'wing, a neuropterous insect of the families *Hemerobiidae* and *Chrysopidae*. About 40 species are found in the United States, the most common perhaps being the golden-eyed flies of the genus *Chrysopa*. These are greenish, ill-smelling, gauzy-winged creatures usually less than two inches long and feeding little or not at all in the adult state. The females lay their eggs upon the summits of silky threads, by which means they are protected from predaceous enemies. The larvæ, as soon as hatched, crawl down the threads and feed upon the first soft-bodied insect they reach—perhaps a brother. They are considered useful in destroying plant-lice, hence the name "aphis-lions" (q.v.), but in California they attack the larvæ of the useful ladybirds. In Europe gardeners search for them, and place them upon trees affected with plant-lice. They spin a tough silken cocoon from which they emerge through a circular lid.

Lachaise, François d'Aix de, frān-swā dā dé la-shāz, French Jesuit confessor of Louis XIV.: b. Château d'Aix 25 Aug. 1624; d. Paris 20 Jan. 1709. He was the provincial of his order when Louis, on the death of his former confessor, appointed Lachaise to that office. The new confessor with admirable tact kept himself clear of the innumerable meshes of court intrigue. Jansenism was at the time a powerful factor in ecclesiastical and political circles, and the Jesuits were its most formidable adversaries, but Lachaise knew how to conduct himself under all circumstances with address, coolness, and sagacity; and never allowed himself to be drawn into violent measures against his opponents. That Louis XIV. married Mme. de Maintenon was owing principally to the counsels of his Jesuit confessor. Lachaise retained the favor of his monarch till his death, and Louis had a country-house built for him to the west of Paris, on an eminence which had received the name of Mount-Louis. Its extensive garden now forms the cemetery of Père Lachaise, the largest in Paris.

La Chaussée, Pierre Claude Nivelle de, pē-är klōd né-vēl de lä shō-sā, French dramatist, founder of the so-called "pathetic comedy" or melodrama: b. Paris 1692; d. there 14 March 1754. 'Le Préjugé à la Mode' (1735) by him, was the first French pathetic comedy. Of 18 dramas by him, among the best are: 'School of Friendship' (1737); 'Melanie' (1741); 'Love for Love' (1742); 'Pamela' (1743); 'School of Mothers' (1745); 'The Governess' (1747). His plays were all written in verse and followed strictly the rules of the classic drama.

Lachesis, lăk'-ē-sīs, in classical mythology, one of the three FATES (q.v.).

Lachine, lä-shēn', Canada, town in Jacques Cartier County, Province of Quebec, Canada; on Lake Saint Louis, and on the Grand Trunk railroad; 8 miles from Montreal. It is a popular resort for pleasure parties in the winter, and in summer is largely used as a residential place for business men of Montreal. It is best known as the terminus of a canal 9 miles long connecting it with Montreal and built to avoid the Lachine Rapids. All the commerce of Montreal by the Great Lakes passes through this canal. Lachine is also the terminus of the Ottawa line of steamers, and daily at noon in summer a steamer of the Royal

LACHLAN — LACORDAIRE

Mail line leaves the town for Toronto, Hamilton, and Kingston. Here are the electric works of the Lachine Power Company (1894-7) with a plant of 21,000 horse-power, designed to furnish power and light for the city of Montreal. The name Lachine was given to the site in 1669. The Indians burned the town and massacred all the inhabitants in 1689. Pop. (1891) 3,761; (1900) 5,561.

Lachlan, läk'län, a river of East Australia, rising in New South Wales, to the west of the Blue Mountains. It is formed by the union of several streams. The river makes a semicircular sweep north of about 240 miles, when, pursuing a generally southwest course, it is joined by the Murrumbidgee; the united stream afterward falling into the Murray at lat. 34° 35' S.; lon. 143° 10' E. The total course is about 700 miles.

Lachrymal (lak'rī-māl) **Organs**. See EYE.

Lach'rymatory, a term applied to small glass vessels, in shape like the alabastron, but with a longer neck, and said to be intended for holding tears consecrated to the dead. Their real use was probably to hold perfumes or ointments.

Lachute, lä-shoot', Canada, town in Argentine County, Province of Quebec, on the Ottawa River; 44 miles from Montreal. It is an important shipping centre for farm and dairy products and has large paper mills, pulp mills, and wood-working industries. Pop. (1901) 2,024.

Lacinaria, lä-sin-ä'-ri-a. See LIATRIS.

Lackawanna (lak-a-wōn'a) **River**, a considerable stream which runs through the northeast part of Pennsylvania and flows into the Susquehanna at Pittston; length about 50 miles. Great quantities of the best anthracite coal are mined in the valleys adjacent to this river. This coal field, being the nearest to New York, supplies a large portion of the anthracite consumed in that city and further east. The greatest thickness of strata belonging to the coal measures amounts in the central portion of the basin to nearly 1,800 feet. On each side they dip toward the central axis at angles sometimes exceeding 30°, gradually lessening till they are found in horizontal and undulating positions near the centre. Toward each extremity of the basin they gradually shelf upward till replaced by the outcrop of the older rocks. The basin is remarkable for the large number of beds concentrated in a moderate thickness of coal measures. Thus at Solomon's Gap as many as 13 beds, varying from 1 foot to 19 feet in thickness, are found in 900 or 1,000 feet of strata, making a total thickness of coal of about 84 feet, or of workable beds 45 or 50 feet.

Lacmus. See LITMUS.

Lacon, lä'kōn, Ill., town and county-seat of Marshall County, on the Illinois River, and on the Chicago & Alton railroad, 35 miles north of Peoria and 128 miles southwest of Chicago. Steamboats ascend the river as far as this point and there are a number of grain elevators and other shipping facilities here; manufactures of wagons, carriages, and woolen goods; a national bank, several newspapers and numerous churches. Pop. (1890) 1,649; (1900) 1,601.

La Condamine, Charles Marie, shär'l mā-rē lä-kōn-dā-mēn, French scientist: b. Paris 28 Jan. 1701; d. there 4 Feb. 1774. He entered the military profession, but soon renounced this career, and devoted himself to the sciences. In 1736 he was chosen, with Godin and Bouguer, to determine the figure of the earth, by measurements to be made in the equatorial regions of South America, and remained abroad for eight years. In 1748 he was elected a fellow of the Royal Society of London, and in 1760 a member of the Academy of Sciences of Paris. His principal works are his account of his travels (1745), his work on the figures of the earth (1749), and that on the measurement of three degrees of the meridian in the equatorial regions.

Laconia, lä-kō-nī-ä, formerly the name for a large tract of land granted by royal patent to Ferdinand Gorges and John Mason. It was located between the Merrimac and Kennebec rivers, the ocean, and the Saint Lawrence River of Canada. The present State of New Hampshire formed a considerable portion of Laconia.

Laconia, a territory in ancient Greece. See SPARTA.

Laconia, N. H., city, county-seat of Belknap County; on the Winnipesaukee River, and on two divisions of the Boston & Maine railroad; about 28 miles north of Concord, the capital of the State, and 100 miles north of Boston. It was settled in 1780-2 by English people from the southern part of New Hampshire. It was incorporated as a town in 1852 and chartered as a city in 1893. It is in an agricultural and manufacturing section, in a beautiful lake region. Its charming scenery, cool climate and opportunities for fishing make it a favorite summer resort. Its principal manufactures are hosiery, railroad cars, machinery, lumber, and paper boxes. The hosiery mills employ about 1,200 operatives; and the car shops employ about 600 men. The State Home for Feeble-Minded Children is located here, also the State Fish Hatchery. The educational institutions of the city are the public and parish schools and the Gale Memorial library. The prominent buildings are 12 churches, an opera house, and the court-house. The three national banks have a combined capital of \$200,000. The government is vested in a mayor and 14 councilmen. Pop. (1890) 6,143; (1900) 8,042.

C. N. VAUGHAN,
Editor of 'Democrat.'

Lacordaire, Jean Baptiste Henri Dominique, French preacher: b. Recy-sur-Ourse 12 May 1802; d. Sorèze 22 Nov. 1861. After studying law in Paris he began practice in that city. He was in religion a deist of the Voltairean school, and it was only after reading the 'Essai sur l'Indifference' of Lamennais (q.v.) that he came to the conclusion that Roman Catholicism was a primal factor in the development of political life. It was with this view that he determined to become a priest. Entering the Seminary of Saint Sulpice in 1824 he was ordained priest in 1827. In 1835, he was appointed preacher at Notre Dame, and always collected an audience that filled the building. He was, however, bent on a wider project, the revival of the Dominican order, the great order of preachers in France. With this view he revisited Rome in 1838, and after the usual novitiate became a Dominican. The Dominican

LA COSA — LACQUERING

is originally a Spanish order, and was never popular in France, and Lacordaire had little success in establishing it there. He was in 1848 elected a member of the National Assembly. He was, however, rebuked by his bishop for calling himself a republican and retired from politics, in 1852. His honest indignation against the *coup d'état* expressed in a sermon roused the animosity of Napoleon III., and he was driven from the pulpit, and became director of the Lycée at Soreze. Consult: Lives by Montalembert (1862); Foisset, 2d ed. (1874); Chocarne (8th ed. 1894); Greenwell (1877); Lear (1882); D'Haussonville (1895); Nicolas, 'Le Père Lacordaire et le Libéralisme' (1880); Fesch, 'Lacordaire, Journaliste' (1897).

La Cosa, Juan de, Spanish navigator: b. about 1460; d. November 1509. He was the companion of Columbus in the discoverer's voyage to Hispaniola in 1493 and settling at Santoña, in Aranham, made his living and reputation as a draughtsman of charts (1496). He accompanied Ojeda in an expedition to the Pearl coast in 1499; and in 1501 explored the northern coast of South America from Venezuela to Panama. In the course of an expedition on which he accompanied Ojeda, the party on landing in the bay of Cartagena was attacked by Indians, and he perished with his companions, of whom Ojeda alone escaped. His map of the New World, beautifully illustrated on vellum, is in possession of the Spanish government, and is the earliest known, having been made in 1500.

Lacoste, la-köst, Sir Alexander, Canadian jurist: b. Boucherville, Quebec, 12 Jan. 1842. He was educated at the College St. Hyacinthe and at Laval University and was called to the bar in 1863. He began practising his profession in Montreal and after a brilliant legal career was appointed Queen's Counsel in 1880. He sat in the Legislative Council of Quebec 1882-4, became a Dominion senator in 1884, and in 1891 chief-justice of Quebec. He was knighted in 1892.

Lacquering, läk'er-ing, the art of polishing or veneering with various preparations of lac (q.v.). It is used in many ways. In Tonking where the abundant production is the object of an important trade with the Chinese, it is so used only for varnishing, while in China the same product from the same sources contributes to most artistic applications. When the Annamites propose to lacquer an object, a box, for example, they first stop up the holes and crevices, covering all the imperfections with a coating of diluted lac by means of a flat, close short brush. Then they cover the whole with a thick coating of lac and white clay. This clay, oily to the touch, is found at the bottom of certain lakes in Tonking; it is dried, pulverized and sifted with a piece of fine silk before being embodied with the lac. This operation is designed to conceal the inequalities of the wood and produce a uniform surface, which, when completely dry, is rendered smooth with pumice stone. If the object has portions cut or sunk the clayey mixture is not applied, for it would make the details clammy, but in its place a single, uniform layer of pure lac. In any case, after the pumicing, a third coating, now pure lac, is passed over the piece which at this time has a mouse-gray color. This layer, known

under the name of *sou lot*, colors the piece a brilliant black. As the lac possesses the remarkable property of not drying in dry air, the object is left in a damp place. When perfectly dried the piece is varnished and the desired color imparted by a single operation. If the metallic applications are excepted, the lac is colored only black, brown, or red.

The following formulas are in use:

Black.—One part of turpentine is warmed for 20 minutes beyond the fusing point; then poured into three parts of lac; at the same time *phœn deu* (copperas) is added. The mixture is stirred for at least a day, sometimes more, by means of the *caï way*, a large paddle.

Maroon.—This is prepared by a process similar to the preceding, replacing half of the copperas by an equal quantity of China vermillion.

Red.—The lac, previously stirred for six hours, is mixed with hot oil of *trau*, and the whole is stirred for a day, after which vermillion is added. The latter should be of good quality, so as to have it brilliant and unchangeable.

The operation of lacquering is then ended, but there are parts to be gilded. These are again covered with a mixture of lac and of oil of *trau*. When this layer is dry the metallic leaves are applied, which are themselves protected by a coating composed also of lac and oil of *trau*. All these lac and oil of *trau* mixtures are carefully filtered, which the natives effect by pressing the liquid on a double filtering surface formed of wadding and of a tissue on which it rests. It can only be applied after several months when the metallic leaf is of gold. In the case of silver or tin the protecting coat can be laid on in a few days.

The wood to be lacquered should be absolutely dry. In Japan when wood is well prepared and the faults have been corrected with pure lac it is dried, pumiced and covered with a coat composed of crushed flax mixed with glue. Then a layer of lac is applied and covered with a fine linen fabric which should perfectly adhere in all its parts. This first preparation, suitably dried, serves as a foundation for the successive applications of 33 layers. Each coating is rubbed with a fine-grained stone before drying in the moist chamber. This is done with the greatest precaution, so as to avoid impurities and dust. The last polish is obtained by rubbing with the powder of calcined deer horn. The piece is then ready to receive the application of gold or of silver, which is effected as follows: The design to be reproduced is drawn on very fine paper prepared with a mixture of glue and alum, and on the back of the paper the outlines are traced with a brush of fine rat's hair, dipped in lac previously boiled over a brisk charcoal fire. This paper is then applied to the object to be decorated, and it is made to adhere by rubbing with a spatula, either of minoki wood or of whalebone. When the paper is removed the design is found transferred damp and is rendered more distinct by the application of a white powder by means of a piece of wadding. With one of these transfer papers 20 reproductions can be secured, and the lines can be retraced with the boiled lac, it is said, so as to procure copies almost indefinitely. The outlines remain damp in consequence of the use of the boiled lac, and imperfections can be corrected. In this case the outlines are retraced with a pencil of

LA CROSSE—LACTIC ACID

hare's hair lightly charged with a preparation of lac not boiled. This operation is delicate and requires great care not to displace the lac from the original outlines. When ended the whole is covered with fine gold, silver, or tin powder, as desired; the powder is applied by means of a piece of wadding. If the object to be decorated is of large dimensions the process is conducted on separate parts, and at each step the piece is placed in a damp closet tightly closed, so as to exclude the dust. When the metallic coating has hardened sufficiently the piece is taken out, and the design is covered with a fine transparent lac laid on with a brush of hare's hair. The gilding or silvering of the succeeding part is never attempted until the preceding has been completely dried in the damp chamber. All the parts of the object are finally rubbed with a piece of camelia wood charcoal in order to equalize the thickness, and then polished with the fingers moistened with a mixture of calcined deer horn powder and oil.

La Crosse, Wis., city and county-seat of La Crosse County, on the Mississippi River and the Chicago, M. & St. P., the Chicago & N. W., and several other railroads; 200 miles northwest of Milwaukee, and 130 miles south of Saint Paul.

Industries, etc.—La Crosse is the centre of the farming, manufacturing and dairying trade of western Wisconsin, southern Minnesota and northern Iowa. There are manufactories of boots and shoes, sash, doors and blinds, plows, agricultural implements, boilers and heavy machinery, extensive carriage works, rubber mills, cracker and knitting factories, etc., large flour mills, pearl button factories, steel and corrugated roofing works, woolen mills, a large tannery, mammoth cooperages, five large breweries, affording a market for 150,000 bushels of barley and 100,000 pounds of hops per annum; extensive cigar manufactories and various other industries. The city has five banks with a combined capital of \$1,102,700 and doing an annual business of \$180,000,000.

Educational Buildings, Public Institutions, etc.—La Crosse has a public library, the Washburn, containing 25,000 volumes, two business colleges, a high school, public school buildings and several Catholic and Lutheran parish schools. The city has a fine city hall, a convent, asylum for chronic insane, Saint Francis and United States Marine hospitals, opera houses, etc.

History and Government.—La Crosse was first permanently settled in 1841 by Nathan Myrick, John M. Levy and others. It became a village in 1851 and was incorporated a city in 1856. Under a revised charter of 1891 the government is administered by a mayor, elected every two years, and a council of 20 aldermen, one-half elected biennially. The council appoints the minor officials. The city owns and operates the waterworks, and has electric light and street railroad plants. Pop. (1903) 30,038.

ROBERT CALVERT,
Secretary Board of Trade.

La Crosse, a Canadian out-door game played with a ball and a stick of light hickory,

bent at the top like a bishop's crozier. The stick is 5 or 6 feet in length. Strings of deer-skin are stretched diagonally across the hooked portion of the crosse, forming a network. Only one ball is employed, made of india-rubber, and eight or nine inches in circumference. Posts or poles about six feet high, with a small flag at the top of each, complete the equipment. The players are usually 12 on each side, but their number as well as the distance of the goals apart, is nearly optional. The object of the game is for one side to drive the ball through their opponents' goal. The ball must not be touched with the hand or foot, but is scooped up from the ground with the bent end of the crosse, on which it is carried horizontally, while the player runs toward one of the goals, trying to dodge his antagonists. If it seems prudent, he pitches the ball off his crosse toward one of his own side who may be in a better position to carry it toward the goal. The players must not strike, trip up, or grasp one another, nor must anyone lay hold of the crosse of another; a player may strike the ball off an opponent's crosse with his own crosse, and not by any other means. The National La Crosse Association of Canada was organized in 1867, and since then Canadian teams have played in England and Scotland. It is played occasionally in the United States, but is not popular.

Lactarene, lāk'tā-rēn, the casein of milk as commercially prepared by being freed from fat, precipitated by an acid, thoroughly purified, dried, and powdered. It is insoluble in water, but is soluble in an alkali, such as ammonia, and in this form is used, like albumen, for fixing pigment colors in calico-printing. The cloth, after it has been printed, is steamed, the ammonia is driven off, and the pigment is thereafter able to resist the action of water.

Lactation. See MILK, HUMAN.

Lacteals, lāk'tē-älz, vessels which, together with the lymphatics, constitute one system for conveying a fluid or fluids from various organs of the body to the veins near their terminations in the heart. The fluid which the lacteals convey is milky after a full meal, and is called chyle, though during intervals of fasting it is a yellowish lymph, as in the lymphatics. The lacteal vessels commence on the intestinal villi, unite with one another in the mesentery and, after leaving the mesenteric glands, discharge their contents for the nourishment of the body into the receptaculum chyli, in front of the second lumbar vertebra. See also LYMPH; LYMPHATIC GLANDS.

Lac'tic Acid ($C_3H_6O_3$). Scheele, in 1780, was the first to describe the acid present in sour milk. In 1832 Liebig and Mitscherlich showed it to be a distinct acid. Lactic acid is widely distributed; there are many modes of preparing it artificially; and its isomeric varieties, of which four have been described, have excited much attention. Its two principal kinds are fermentation lactic acid and paralactic or sarcolactic acid. The former is got from concentrated sour whey by removing the curd, adding lime, filtering, diluting with water, removing the lime with oxalic acid, evaporating, and extracting the lactic acid with alcohol. It is more usual, however, to get it by what is called the lactic fermentation, from sugar or saccharine

LACTIC FERMENT—LADD

substances. The sugar is dissolved in water; to the solution is added decaying cheese and a quantity of fine, well-washed prepared chalk, and the mixture is kept for some weeks at between 86° and 95° F. Fermentation begins, and much lactic acid is formed, which combines with the chalk, and forms lactate of calcium. This salt is then decomposed by sulphuric acid, filtered, and the fluid is boiled with carbonate of zinc. Lactate of zinc is formed, which is collected and decomposed by sulphuretted hydrogen. The fluid filtered from the sulphide of zinc is evaporated, and the syrupy fluid which remains contains the lactic acid. Lactic acid is a syrup (specific gravity, 1.215) which remains liquid even at very low temperatures. It deliquesces in moist air, dissolves in all proportions in alcohol and water; has no odor, and has a purely sour taste. It cannot be distilled, or even heated, without undergoing decomposition, lactic anhydrides being formed; at a higher temperature carbonic oxide is evolved, and a variety of products distil over, and charcoal is left in the retort. By oxidizing agents, such as bleaching-powder and nitric acid, it is converted into oxalic acid; by oxide of manganese into aldehyde.

The paralactic or sarcolactic acid was observed in flesh by Berzelius in 1806, and he considered it the same as that derived from milk. Liebig showed that they were not absolutely identical, but the nature of their differences is at present unknown. This acid is readily got from the cold aqueous extract of flesh by adding a solution of baryta, coagulating and removing albumen, concentrating the solution, precipitating the baryta, filtering, and evaporating. The syrupy residue contains the acid. The calcium salt of the fermentation acid contains more water of crystallization; when heated it retains it for a shorter time; and it is more soluble than the sarcolactate. Again, the zymolactate of zinc contains more water, loses it more quickly on heating, but itself endures a much higher temperature without decomposition than the sarcolactate. The zymolactate is much less soluble in water and in alcohol than the other; the crystalline forms of the two salts also are different. The other salts of lactic acid are for the most part crystalline, and soluble in water. Lactic acid forms compound ethers and substitution acids.

Lactic Ferment, a minute organism which, under the microscope, is seen to consist of small elliptical cells, generally detached, but sometimes occurring in chains of two or three. It is developed in milk when it is allowed to stand for some time, and is the cause of the milk becoming sour, the sugar of the milk changing into lactic acid. It is also developed when cheese is added to a solution of sugar, and kept at a temperature of 35° to 40°. See also **FERMENTATION**.

Lactom'eter, or Galactometer, an instrument for ascertaining the different qualities of milk. Several instruments of this sort have been invented. One consists of a glass tube 1 foot long, graduated into 100 parts. New milk is filled into it and allowed to stand until the cream has fully separated, when its relative quantity is shown by the number of parts in the 100 which it occupies.

Lac'tose, sugar of milk ($C_{12}H_{22}O_{11}$), a substance obtained by evaporating whey, filtering

through animal charcoal, and crystallizing. It forms hard, white, semi-transparent trimetric crystals, which have a slightly sweet taste, and grate between the teeth. It is convertible like starch into glucose by boiling with very dilute sulphuric acid.

Lactuca'rium, the brown viscid juice of the common garden lettuce, obtained by incision from the leaves and flowering stems, and dried in the air. It is a mixture of various substances, including lactucone, lactucin, lactucic acid, mannite, albumin, etc. Lactucarium is hypnotic, anti-spasmodic, and sedative, and has been recommended in cases in which opium is inadmissible, particularly for children. It has been administered with advantage in chronic rheumatism, diarrhoea, and asthma, in doses of two to five grains.

Ladd, George Trumbull, American educator: b. Painesville, Lake County, Ohio, 19 Jan. 1842. In 1864 he was graduated from Western Reserve College, and after spending the next two years in business, entered Andover Theological Seminary, where he was graduated in 1869. In 1869-71 he preached in Edinburg, Ohio; and was pastor of Spring Street Congregational Church, Milwaukee, Wis., 1871-9. He was called to the chair of philosophy at Bowdoin College in 1879 and held that position until he became professor of philosophy at Yale College in 1881. After the death of President Porter he was made Clarke professor of metaphysics and moral philosophy, which position he still holds. Professor Ladd's career as a student and educator has been one of great activity and success. While still a student at Andover he prepared and published two important articles on the origin of the Synoptic Gospels in the 'Bibliotheca Sacra.' His published works include: 'Principles of Church Polity' (1882); 'Doctrine of Sacred Scripture' (1884); 'Lotze's Outlines of Philosophy' (translation, 5 vols. 1887); 'Elements of Physiological Psychology' (1887); 'What is the Bible?' (1888); 'Introduction to Philosophy' (1889); 'Outlines of Physiological Psychology' (1890); 'Philosophy of Mind' (1891); 'Primer of Psychology' (1894); 'Psychology Descriptive and Explanatory' (1894); 'Philosophy of Knowledge' (1897); 'Outlines of Descriptive Psychology' (1898); 'Essays on the Higher Education' (1899); 'A Theory of Reality' (1899); 'Lectures to Teachers on Educational Psychology' (in Japanese); 'Philosophy of Conduct' (1902). Besides his work as an author he has achieved remarkable distinction as a lecturer. During the academic year of 1895-6 he was chosen a member, for the year, of the Faculty of Harvard University and conducted a graduate seminary in ethics. Twice he has been invited by the Imperial Educational Society of Japan to deliver courses of lectures. In the summer of 1892 and again in 1899 he visited and lectured at Doshisha, Kyoto, Tokyo, Hakone, and Kobe. For his distinguished services to the cause of education he was admitted into audience with the emperor of Japan and by him decorated with the third degree of the order of the Rising Sun. In 1899-1900 he lectured on philosophy before the University of Bombay, India, and on the philosophy of religion at Calcutta, Madras, Benares, and elsewhere. His writings have

LADD—LADIES OF THE MACCABEES

been adopted as text-books in Russia, India, Japan, and other countries.

His contributions to the science of psychology have been recognized by all experts. He was one of the founders of the American Psychological Association, was its second president and its delegate to the International Congress at Paris in 1900. He is a member of the American Society of Naturalists, American Oriental Society, of the Connecticut Academy of Science, American Philosophical Association, and of the New Haven Historical Society. Among the most permanent of his achievements is the founding of the psychological laboratory at Yale University, which, under his guidance, has become one of the best equipped in the world. From Yale there has proceeded a continuous stream of teachers of philosophy, whose success has been largely due to the teaching and influence of Professor Ladd.

Ladd, Herbert Warren, American journalist and politician: b. New Bedford, Mass., 15 Oct. 1843. After obtaining a high school education he secured a position on the staff of the New Bedford *Mercury*, and went to the field with the 43d and 44th Massachusetts regiments; his report of Gen. Foster's Tarboro march was published in the Boston *Journal* before the New York papers had news of it. He issued a Sunday edition of the *Mercury* to announce the battle of Fredericksburg, the first Sunday paper published in New England outside of Boston. In 1864 he entered the dry goods business and in 1871 formed the firm of Ladd and Davis in Providence, which in 1887 was incorporated as the H. W. Ladd Company, of which he was president. He founded the Commercial Club in Providence, was vice-president of the board of trade for two years, was a generous patron of Brown University, and in 1891 presented to the University a fully equipped astronomical observatory. In 1889 he was elected governor of Rhode Island, was a candidate for that office in 1890 and was defeated, but was re-elected in 1891.

Ladd, William, American philanthropist: b. Exeter, N. H., 1778; d. Portsmouth, N. H., 9 April 1841. He was graduated at Harvard College in 1797, and subsequently took an active part in organizing the American Peace Society, of which he was for many years president, and in behalf of which he labored efficiently until the close of his life. In the interests of this society he edited the 'Friend of Peace,' commenced by Dr. Noah Worcester, and the 'Harbinger of Peace,' and published a number of essays and occasional addresses on the subject of peace. He carried his views to the extent of denying the right to maintain defensive war, and caused this principle to be incorporated into the constitution of the American Peace Society.

Ladies' Catholic Benevolent Association, a fraternal society of Roman Catholic women organized at Titusville, Pa., in April 1900. The object of the society is the payment of death benefits. In 1903 there was a supreme council, 780 subordinate branches and 77,000 members. The amount of benefits paid during 1902 was \$408,500.

Ladies of the Maccabees of the World, a fraternal beneficiary association, composed ex-

clusively of women and officered and managed by women. It exists solely for the benefit of its members and not for profit, having a lodge system with ritualistic work and representative government, and granting life protection upon satisfactory medical examination. Its jurisdiction is world-wide, but its growth until 1904 has been in North America. It is now entering Great Britain and will extend to other foreign countries where conditions are favorable.

Name.—The name is derived from the Biblical Maccabeian Dynasty, upon whose history and achievements the beneficial laws and ritualistic work are founded.

Origin.—In the 2d century before Christ, an old man named Mattathias lived with his five sons in the little village of Modin, 20 miles northwest of Jerusalem. Like all Jews of that day, they had been trained in an ardent, patriotic, and religious fervor, in which love of country was mingled with devotion to the religion so inseparably connected with that country's glorious past. Amidst the idolatrous beliefs and degraded practices surrounding them, the little Jewish nation worshiped a God who taught them justice, truth, mercy and obedience to his commands. Judge, then, how bitterly the acts of the Syrian monarch, Antiochus IV., were resented when, having taken Jerusalem by treachery, he robbed and desecrated the temple, forbade the observance of the Jewish religious ceremonies, and commanded the conquered people to worship his gods! With the deep religious feeling common to their nationality, Mattathias and his sons had also a sturdy courage and manly independence of spirit that prevented their yielding as many of their countrymen did. When summoned to sacrifice to the heathen gods, Mattathias, filled with righteous indignation, killed the king's officer and overturned the altar erected for this sacrilege. The best of the nation gathered around his standard and a terrible war ensued. Mattathias died soon after its commencement, but his son, Judas Maccabeus (see MACCABEES) led the little army to many a victory against heavy odds. The story of his life is one of high courage and devotion to right through almost incredible toil and suffering and peril. Just before the decisive battle of the war, the Jews became panic stricken and half of them deserted. Yet the heroic remnant conquered and restored the religion of their forefathers. After this marvelous victory Judas Maccabeus and his army set apart a portion of the spoils for the widows and orphans of their deceased comrades. This generous and humane act of the ancient Jewish hero is the inspiration of the Ladies of the Maccabees of the World in their care of the orphaned and needy and their protection of the home.

Founders.—The first Supreme Record Keeper was Miss Bina M. West. She established the association in the original 16 States of its jurisdiction, revised and developed its ritualistic work, assisted in combining the separate State jurisdictions under one central government, and instituted the system of general management. Hers was the responsibility of entering new States and unifying the forces of the old. To her efforts were joined in 1895 those of Mrs. Lillian M. Hollister, present Supreme Commander. The success of the Order

LADOGA

is due largely to the combined efforts and executive ability of these two leaders. Miss West was born in Saint Clair County, Mich., the daughter of Alfred J. and Elizabeth Conant West, a descendant of Roger Conant, first governor of Massachusetts Colony. In 1891, when there were but 3,000 members in the State jurisdiction of Michigan, she was so signally successful as State organizer that she was made a member of the Great Executive Committee. When the Supreme Hive was instituted 1 Oct. 1892, with world's jurisdiction, she was one of its incorporators and founders. Serving continually as Supreme Record Keeper she has seen the association rise to a position of pre-eminence. The certificates in force amounting to \$100,000,000 bear her signature, and in disbursing the Order's benefits she has signed warrants for nearly \$4,000,000.

Mrs. Hollister entered the State jurisdiction of Michigan in 1891, and in 1893 became Great Commander of the Great Hive. Its membership then numbered 13,339, which increased to 30,418 during the two years and eight months of her administration. In 1895, while the Order was in its infancy with only 5,770 members, when representing the Great Hive of Michigan at the Supreme Hive Review she was elected Supreme Commander and has managed the interests of the association with great success and ability.

History.—The origin of the Order dates back to 1886, when the first hive was organized in Muskegon, Mich. It maintained a social existence until 1890, when the benefit feature was introduced. The first hive in New York was organized at Grand Island, 11 March 1891; in Ohio, at Cleveland, 15 July 1892. Other hives were formed in these three States but there was no unity, each State working under different rituals and different laws.

The Supreme Hive of the Ladies of the Maccaees of the World was organized in order to establish unity, its incorporators being members of hives in Michigan, New York and Ohio. No attempt was made to work in the States where Great Hives were already established, but hives were instituted in States not yet organized. Direct representation in the World's Association was soon accorded Michigan, New York and Ohio, all branches thereby becoming recognized as parts of the Ladies of the Maccaees of the World. In 1898, Ohio transferred its benefit certificates and consolidated wholly with the World's Order. In 1899, New York took the same action, the total membership then reaching 72,424.

With uninterrupted success and prosperity, with 150,000 members and protection of \$100,000,000 in force, this association is one of the greatest financial institutions among women of modern times. There is probably no other organization of women to-day, having the direction of business of such magnitude or so valuable to the individual member.

Government.—The government is representative. Business is conducted through the Supreme Hive, Great Hives or State bodies and subordinate Hives or local branches. The subordinate Hive works under a charter issued upon the application of 20 ladies. Great Hives are composed of representatives of subordinate Hives, and meet triennially, amending State laws and electing State officers. The Supreme

Hive is composed of representatives from each State. It meets triennially, and amends Supreme Hive laws, elects Supreme officers, and transacts other business of the Order. The business management is in charge of the Supreme Board of Trustees during the recess of the Supreme Hive. The Order is a representative organization of women, making its own laws, transacting its own business, and making and paying assessments and death benefits involving thousands of dollars, and doing other legitimate acts as outlined by its laws.

Nomenclature.—The officers are commander or president, record keeper or corresponding and financial secretary, finance keeper or treasurer, past commander, lieutenant commander, chaplain, sergeant, sentinel, picket, banner bearers, color bearers and guards. Lodges are called hives, and meetings, reviews. Strict parliamentary procedure obtains, and the mode of address is formal. The ritualistic work is dramatic, forms, ceremonies, garb, mottoes, and emblems being based upon ancient Maccabee history, and typical of the purposes of the Association.

Statistics.—On 1 July 1904 there were 149,060 members gathered in 2,679 hives in 51 States, provinces and countries. The total receipts of the Association since organization amount to \$5,056,519.33; disbursements in death benefits, relief, and general expense, \$3,982,272.21; balance on hand, \$1,074,247.12, of which \$829,070.27 is invested in government and municipal bonds, the securities required by the laws of the Order. No account is kept by the Supreme Management of the property and funds of Subordinate Hives, or the substantial amounts they expend in relief. The benefits are given upon the National Fraternal Congress Table of Rates, which is based upon the death experience of the older societies and leading life companies. The mortality rate of the Order itself is considerably below this experience. An annual valuation is made, the mortality experience computed, and the protective feature handled along scientific lines. Management expense is reduced to the minimum on a per capita basis of ten cents monthly. The Society prepares its own literature and supplies and also edits the 'Review,' a 16-page monthly sent free to its members. It is incorporated under the laws of Michigan, and authorized by the insurance departments wherever it operates.

BINA M. WEST,
Supreme Record Keeper.

Ladoga, lä'dō-gä, the largest lake of Europe, situated in Russia, between the governments of St. Petersburg on the south, Olonetz on the east, and Viborg on the north and west; greatest length, north to south, 130 miles; average breadth, about 75 miles; area, 7,156 square miles. It receives no fewer than 70 streams, the principal of which are the Volkhov and Sias, which enters it on the south, and the Svir, which enters it on the east, bearing the surplus water of Lake Onega. It contains numerous islands, and its shores are generally low. Peter the Great Canal (1718-31) and the Alexander II. Canal (1861-6) connect the Neva and the Volkhov; Sias Canal (1764-1802) and the Empress Maria Feodorovna Canal (1883) connect the Volkhov and the Sias; the Svir Canal and the Alexander III. Canal connect the Sias

LADRONES—LAENNÉC

and the Svir. These canals form a navigable chain around the south of the lake.

Ladrones, là-drôñz', or **Marianne** (má-riän') **Islands**, a group of 16 islands in the North Pacific Ocean, north of the Caroline Islands. Guahan is the southernmost and largest of these islands; and next in importance is Rota. The islands have a total area of 420 square miles. The inhabitants are tall, robust, and active, and naturally acute, lively, and ingenious. Their huts are constructed of palm-trees, and divided by mats into different apartments. The islands were discovered by Magelhaens in 1521, and were settled by the Spaniards. Magelhaens called them Islas de Ladrones (Thieves' Islands), because the Pacific pirates had a rendezvous here. Toward the end of the 17th century they received the name of Mariana or Marianne Islands, from the Queen of Spain, Marianne of Austria, the mother of Charles II., at whose expense the Jesuit missionaries were sent over, who settled here in 1667. The chief inhabitants are settlers from Mexico and the Philippines. The bread-fruit tree was first discovered here. Guahan (Guam) was ceded to the United States in 1898, and the rest sold by Spain to Germany in 1899. Pop. (1850) 65,000; (1900) 10,175.

Lady-birds, beetles of the family *Coccinellidae*. This is a very large family of small beetles of rounded, convex form, usually shining and hairless. The head is retracted beneath the pronotum, the legs are short and hidden, and the elytra are usually brightly colored and marked with dark spots. These colors vary much in the same species, especially in the English *Coccinella septempunctata*,—the pet of children. The most widely known American species is the black one with two red spots (*C. bipunctata*), common all over the United States. These beetles live upon plants, shrubs, and trees, depositing their eggs in little bunches on the lower sides of the leaves. The worm-like maggots are active, searching the leaves for plant-lice, which are eagerly devoured, each kind of beetle choosing a special kind of aphid for its food. In this habit the ladybirds, which are sometimes extremely numerous, perform a valuable service, since their minute prey is highly injurious to the plants. See SCALE-INSECT.

Lady Chapel, a chapel dedicated to the Virgin Mary, and when attached to cathedrals, generally placed eastward from the altar. The lady chapel of Westminster Cathedral is that usually known as Henry VII.'s.

Lady-day, one of the quarter-days in England and Ireland, on which rent is made payable. It falls on 25 March in each year. In the Roman Catholic Church it is held as a great festival under the title of the Feast of the Annunciation. In the English Church it is observed as a feast. In France the day is termed Notre Dame de Mars.

Lady of the Lake, The, a poem by Sir Walter Scott, the most popular of his long narrative poems. The name is derived from the heroine, Ellen Douglas, who lived on an island in Loch Katrine.

Lady of Lyons, The, a play, by Bulwer-Lytton, originally called 'The Adventurer.' It was first produced in 1838.

Lady of Mercy, Our Order of, a Spanish order dating from 1218. It was founded by James I. of Aragon, in compliance with a vow made during his captivity in France. Pope Gregory IX. approved the order in 1230. It was instituted to redeem Christian captives from the Moors. The order was extended to women in 1261. A branch order instituted in France was suppressed at the time of the Revolution.

Ladyfish, **Banana-fish**, or **Bone-fish**, the name of several different marine fishes conspicuous for elegance of outline and handsome coloring. They are found mainly in the tropical regions.

Lady's Fan, The. See GIANTS CAUSEWAY.

Lady's or Fairy's Fingers, Glove, Thimble, etc., are some among many gardener's names for the purple foxglove (*Digitalis purpurea*), in regard to which much provincial folk-lore might be cited. See DIGITALIS; FOX-GLOVE.

Lady's Slipper, or Moccasin Flower, an orchid of the genus *Cypripedium*, several species of which grow both wild and cultivated in the United States. See ORCHIDS.

Lady's-Smock. See CUCKOO-FLOWER.

La'dysmith, South Africa, town of northern Natal, near the Klip River, 119 miles by rail north by west of Pietermaritzburg, and 322 southeast of Pretoria. It is situated in a hilly region about 30 miles east of the Drakensberg Mountains. During the South African war of 1899-1901 Ladysmith was besieged by a strong force of Boers. The complete investment began on 2 Nov. 1899 and the relief was not effected till 28 February of the following year, or 118 days after the Boers succeeded in isolating the town. The town was held by a garrison of about 10,000 men under Sir George White, and during the siege much damage was done by the shells of the Boer artillery. Disease also carried off many of the garrison and the inhabitants. The relief was effected by Gen. Buller after a hotly contested march by way of Pieters and Nelthorpe, to the east of the railway. Three previous attempts by the same general to relieve the town had to be abandoned owing to the strength of the Boer positions and to their superiority in long-range guns. The population numbers about 4,000.

Laennec, René Théophile Hyacinthe, ré-nâ ta-ô-fél è-à-sânt lén-nék, French physician: b. Quimper, France, 17 Feb. 1781; d. near Douarnenez, France, 13 Aug. 1826. He took his degree of doctor of medicine in 1814, and his professional reputation was already so high that in the same year he was appointed principal editor of the 'Journal de Médecine.' In 1816 he was appointed chief physician to the Hôpital Necker, and soon after made the notable discovery of mediate auscultation, that is, of the use of the stethoscope. The original discovery, however, is claimed for Auenbrugger (q.v.). In 1819 he published his 'Traité de l'Auscultation Médiate,' having read a memoir on the subject to the Academy of Sciences in the previous year. The remainder of his life was devoted to the perfecting of this new system of diagnosis, and so far as diagnosis is concerned his treatise has produced an effect not attained by any other work. The special study of Laennec was diseases of the chest, and by means of auscultation, either by

LAERTES — LAFAYETTE

the direct application of the ear, or of the stethoscope as an auxiliary, he elucidated the pathology of these diseases, which were previously involved in the greatest obscurity.

Laertes, king of Ithaca and father of Ulysses. He had been one of the heroes engaged in the chase of the Calydonian boar, and in the expedition of the Argonauts. The absence of his son in the Trojan war plunged him into melancholy; but the return of Ulysses restored his energies, and he took part in the fight with the suitors of Penelope.

Lætare (*le-tā'rē*) Sunday, called also MID-LENT, the fourth Sunday in Lent. The introit for the day in the Roman Catholic Church begins with the words 'Lætare, Jerusalem,' from Isaiah lxvi. 10; hence the name. On this day the music of the organ, suspended throughout Lent, is resumed.

La Farge, *la farj*, **Christopher**, American architect: b. Newport, R. I., 5 Jan. 1862. He studied at the Massachusetts Institute of Technology 1880-1, and in the office of H. H. Richardson (q.v.), and in 1884, with G. L. Heins, took charge of the architectural works of his father, John La Farge (q.v.). Since 1886 he has been a member of the firm of Heins & La Farge, whose principal work is the Cathedral of St. John the Divine, New York. Other works that may be named are the Houghton Chapel at Wellesley College; the Roman Catholic Chapel at West Point; and St. Matthew's Church, Washington, D. C.

La Farge, *John*, American artist: b. New York 31 March 1835. He was the son of Jean Frédéric de la Farge, French midshipman, who escaped imprisonment at San Domingo, 1806, and eventually settled at Philadelphia. John La Farge began life in a lawyer's office in New York, became much attracted by the Arundel prints of Giotto, turned away from the commonplace of the Hudson River School, and with a deep appreciation of Japanese art found a friend and master in William Hunt. He originally developed a taste founded on Japanese literalism, Pre-Raphaelite conventionalism and imaginative conventionalism. Japanese art has certainly determined the line of his success, and his windows in the palaces of New York and elsewhere are beyond criticism. The great 'Battle Window' in Memorial Hall, Harvard, the wall painting in Ascension Church, New York, are evidences of his skill as a colorist, however much we may criticise his inadequate conception, and weakness in drawing. Among his published works are 'Lectures on Art' and 'An Artist's Letters from Japan.'

La Farina, *Giuseppe*, *joo-sēp'pē lä fä-rē'nā*, Italian statesman and historian: b. Messina, Sicily, 20 July 1815; d. Florence 5 Sept. 1863. He studied at the University of Catania; entered the law; implicated in a revolutionary conspiracy, was compelled to flee from Sicily (1837); and finally settled in Florence (1841), where he devoted himself to historical composition. Having returned to Sicily in 1848, he was there successively member of parliament, and minister of education, public works, and the interior. After the suppression of the revolution in Sicily (1849), he resided in France and Italy, was secretary of the National Italian society, and strongly advocated Italian unity. Fol-

lowing the war of 1859, he reorganized the National Italian society, of which he became president; in 1860 was sent to Sicily to represent Victor Emmanuel; and from 1861 sat for Messina in the Italian parliament. His chief work is 'Storia d'Italia dal 1815 al 1850' (2d ed. 1860). He wrote other historical studies, such as 'Storia della Rivoluzione Siciliana nella 1848 e 49' (1851), dramas, and works of fiction.

La Fayette, *Marie Madeleine Pioche de la Vergne*, *mä-rē mad-lēn pē-ōsh dē lä vērny lä-fa-yēt*, COMTESSE DE, French novelist: b. Paris 16 March 1634; d. there 25 May 1693. All her life she was in the foremost literary circles, after marriage her house being a noted rendezvous of wits and scholars, including Mme. de Sévigné, La Fontaine, and La Rochefoucauld. Her first novel was 'The Princess de Montpensier' (1660); followed by 'Zaide' (1670), which among her works ranks next after 'The Princess of Cleves' (1678), her most celebrated work, and one of the classics of French literature. She wrote also a 'History of Henrietta of England' (1720), and 'Memoirs of the Court of France for the Years 1688 and 1689' (1731). Consult Haussouville, 'Madame de la Fayette' (1891).

Lafayette, or **La Fayette**, *Marie Jean Paul Roch Yves Gilbert Motier*, MARQUIS DE, French soldier and statesman: b. Chavagnac, near Brioude, Auvergne (in the present department of Loire), 6 Sept. 1757; d. Paris 20 May 1834. He belonged to an eminent family of France. He was educated in the College of Louis le Grand in Paris, in 1774 entered the army as an officer of the Guards, and on hearing of the declaration of independence by the American colonists determined to lend them his assistance. In 1777 he left France for America with 11 companions, among whom was Baron De Kalb, set sail from Pasages, Spain, in a yacht equipped by himself, and arrived at Georgetown, S. C., 14 April. He proceeded to Philadelphia, and to the Congress there in session volunteered his services without pay. On 31 July he was commissioned major-general, and not long after became a member of Washington's staff. He was severely wounded at Brandywine (11 September), while rallying the American forces from a retreat; was appointed to the command of an expedition for the proposed invasion of Canada, never executed owing to lack of means; and in April 1778 was ordered to join Washington at Valley Forge. On 19 May he was surprised by General Grant with 5,000 troops at Barren Hill (12 miles from Valley Forge), where he had taken post with 2,100 troops and five cannon. Though nearly surrounded by a superior force, he succeeded in extricating himself, recrossing the Schuylkill and reaching Valley Forge in safety. He received the thanks of Congress for his conduct at Monmouth (28 June), where he fought brilliantly under Lee. War between France and England having broken out, Lafayette returned (January 1779) to place himself at the disposal of the French government; obtained for the American cause financial assistance, and the reinforcement of a fleet and 6,000 troops under Rochambeau; and 11 May 1780 rejoined the American army. He was shortly afterward stationed at Tappan with a light infantry corps of observation, and was a member of the court of

LAFAYETTE—LAFAYETTE COLLEGE

general officers by which Major André was tried and condemned to death (29 Sept.). On 20 Feb. 1781 he was sent by Washington with 1,200 New England and New Jersey troops to aid in the defense of Virginia. Reinforced, he pursued Cornwallis from near Charlottesville to Yorktown, thus materially contributing to the decisive operations by which the war was virtually concluded. He sailed from the United States in December 1781, but again returned in 1784, when he was enthusiastically received. He was called to the Assembly of the Notables in 1787, and was elected a member of the States-General, which took the name of National Assembly (1789). Two days after the attack on the Bastille he was appointed (15 July) commander-in-chief of the National Guard of Paris, and gave them the tricolor cockade. It was through his means that the lives of the king and queen were saved from the mob that had taken possession of the palace at Versailles (5–6 Oct.). After the adoption of the constitution of 1790 he resigned all command, and retired to his estate of La Grange. He had previously resigned his title, the abolition of titles having been decreed by the National Assembly. The first coalition against France (1792) soon called him from his retirement. Being appointed one of the three major-generals in the command of the French armies, he established discipline, and defeated the enemy at Philippeville, Maubeuge, and Florennes, when his career of success was interrupted by the factions of his country. During the Reign of Terror commissioners were sent to arrest him, but he escaped to Flanders. Having been captured by an Austrian patrol (19 August), he was delivered to the Prussians, by whom he was again transferred to Austria. He was carried with great secrecy to Olmütz, where he was subjected to much privation and suffering, and whence he was not released until 25 Aug. 1797. He returned to his estate at La Grange, and taking no further part in public affairs, devoted himself to agricultural pursuits. In 1818 he was chosen member of the Chamber of Deputies, where he was a constant advocate of liberal measures. In August 1824 he landed at New York on a visit to the United States, upon the invitation of the President at the request of Congress, and was received in every part of the country with the warmest expression of delight and enthusiasm. Congress voted him \$200,000 and a township of land, his own fortune having been mostly lost by confiscation during the Terror. In 1827 the Chamber of Deputies was dissolved, and Lafayette was again returned a member by the new elections. During the revolution of July 1830 he was appointed general-in-chief of the National Guard of Paris, and though not personally engaged in the event, was, through his activity and name, of the greatest service. When the National Guard was established throughout France, after the termination of the struggle he was appointed their commander-in-chief. Of Lafayette, Edward Everett said: "Who, I would ask, of all the prominent names in history, has run through such a career, with so little reproach justly or unjustly bestowed?" Consult: 'Mémoires et Manuscrits de La Fayette' (1837–40); Tuckerman, 'Life of Lafayette' (1889); Tower, 'The Marquis de La Fayette in the American Revolution' (1895).

Lafayette, lä-fä-ĕt', Ala., town and county-seat of Chambers County, on the Central Railroad of Georgia, 85 miles northeast of Montgomery. Here is the seat of Lafayette College (q.v.), founded in 1885. There is a large trade in cotton and other products, the town being a distributing point for a large section of country. Pop. (1890) 1,369; (1900) 1,629.

Lafayette, Ind., city and county-seat of Tippecanoe County, on the Wabash River, and the Cleveland, C. C. & St. L., the Lake Erie & W., and other railroads; 64 miles northwest of Indianapolis. It is the farming and manufacturing trade centre for the surrounding country; has boot and shoe factories, carpet mills, breweries, soap factories, car works, flour and woolen mills, marble works, and agricultural implement works, and other industries. The city is supplied with natural gas. Here is the seat of Purdue University and the State Agricultural College. The city contains a high school, public library, several National banks; has electric light and street railroad plants, waterworks; and an assessed property valuation of nearly \$12,000,000. In the public square is an artesian well of sulphur. The government is vested in a mayor elected every four years and a city council elected every two years. The city stands on the site of the old French fort built in 1720, called Post Oniatanon. It was surrendered to the British in 1760 and the same year was captured by the Indians. The town was first settled in 1820 and was incorporated in 1854. Pop. (1890) 16,243; (1900) 18,116.

Lafayette, La., town in Lafayette Parish; on branches of the Southern Pacific railroad; about 120 miles west by north of New Orleans. It is 41 feet above the level of the Gulf, and has a healthy climate. It is the commercial centre of a region noted for its sugar, cotton, and rice, and it is near extensive oil fields. It is the seat of the Southwestern Louisiana Industrial Institute (q.v.) and the Mount Carmel Academy (q.v.). It has good church buildings and public and parish schools. The progressiveness of Lafayette Parish is shown by the action taken to secure the location of the Industrial Institute. The act of establishment provided that the institution should be located in that parish of the Thirteenth Senatorial District which should offer the best inducements therefor to the board of trustees. The people of the parish of Lafayette offered a self-imposed tax of two mills on the dollar of the assessed valuation of their property for ten years, supplemented by liberal appropriations from the municipal corporations of the town and the parish, by cash subscriptions from private citizens, and by the private gift of a valuable site of twenty-five acres. The town has a municipal ownership of the electric-light plant and waterworks. Pop. 3,500.

Lafayette, a fish. See Goony.

Lafayette College, a Presbyterian college at Easton, Pa.; founded in 1832. It 1902 it had 30 professors and instructors; 426 students; 20,600 volumes in the library; \$258,250 in productive funds; grounds and buildings valued at over \$1,000,000; benefactions, \$408,000; income, \$68,000; number of graduates, 1,811. It was originally chartered in 1826, but owing to the failure of the legislature to make any appro-

MARQUIS DE LAFAYETTE.

LAFFAN—LA FONTAINE

priation the college was not opened until 1832. Since the Civil War the college has had a notable growth. Ario Pardee of Hazelton endowed a scientific department in 1866. There are now 30 buildings, including Pardee Hall, a memorial library and the Gayley Laboratory of Chemistry and Metallurgy.

Laf'fan, Bertha Jane, "Mrs. LEITH ADAMS," English novelist. She has been on the staff of "All the Year Round" from 1878. She was married to surgeon-general Leith Adams, and subsequently to Rev. R. S. de Courcy Laffan. Her novels have been popular and among them are: "Winstowe" (1879); "Bonnie Kate" (1892); "Accessory After the Fact" (1898). She has also published several songs.

Laffitte, Jacques, zhäk lä-fet, French banker: b. Bayonne 24 Oct. 1767; d. Paris 26 May 1844. He entered the banking-house of the senator Perregaux, and in 1809 became the head of the firm, which he made one of the first houses in France. In the same year he was appointed director of the Bank of France, and in 1814 governor of the same establishment. When the credit of France, in 1815, was at a very dangerous crisis, Laffitte advanced 2,000,000 francs in ready money, by which means a necessary article in the capitulation of Paris was settled. He was elected to the Chamber of Deputies in 1816. In 1819 he was deprived of the presidency of the bank, which was bestowed on the Duke of Gaeta; yet he was in 1822 unanimously re-elected to the office of *régent de la banque* (director). Laffitte was again elected to the Chamber of Deputies in 1827, and took an active part in the revolution of July 1830, being one of the deputies who signed the protest, and declared themselves deputies of France, in spite of Polignac's order to annul the election. He became bankrupt in his latter days, and was obliged to sell all his property to pay his debts; but his Paris hôtel was preserved to him by a national subscription.

Lafitau, Joseph François, zhô-zéf frâñ-swâ lä-fé-tô, French missionary and writer: b. Bordeaux 1670; d. there 3 July 1740. He belonged to the Society of Jesus, and was for some years attached to their missions in Canada. On his return to France, he published: "Mémoire concernant la précieuse plante ging-sang de Tartarie" (1718), the plant here noticed, which was highly valued by the Chinese, having been found by Lafitau in the Canadian forests; "Mœurs des Sauvages Américains comparées aux Mœurs des premiers Temps" (1723); "Histoire des Découvertes et des Conquêtes des Portugais dans le Nouveau Monde" (1733).

Lafitte, lä-fë', Jean, American pirate and smuggler: b. France 1780; d. Silan, Yucatan, 1826 (according to some authorities, at sea 1817). He was at one time a privateer in the employ of Cartagena for the destruction of British and Spanish commerce. Soon he turned to piracy, and by 1812 was leader of a band of desperadoes who maintained headquarters on the island of Grande Terre in Barataria Bay, and thence plundered traders in the Gulf. During the War of 1812, Commodore Percy, commanding the British naval force in the Gulf waters, unsuccessfully endeavored to obtain Lafitte's co-operation in the expedition against New Orleans. Lafitte later offered his services to the

governor of Louisiana and General Jackson, on condition of full pardon for himself and followers. He assisted in the construction of the defenses of Barataria Bay, and in command of a detachment of his band participated most creditably in the battle of New Orleans (8 Jan. 1815). President Madison by proclamation confirmed the amnesty granted to the outlaws. Lafitte was a bold smuggler, and brought to Louisiana cargoes of negro slaves. He was associated with a brother, Pierre, with whom he is often confounded. He is the hero of J. H. Ingram's story, "Lafitte."

Laflamme, lä-fläm', Toussaint Antoine Rodolphe, Canadian jurist: b. Montreal 15 May 1827. He was educated at St. Sulpice College, in 1849 was admitted to the bar, became an editor of "L'Avenir," and was a member of the "Rouge" or liberal reform element in Quebec province. At the same time he continued his legal practice, and was appointed professor of the law of real property in McGill University. In 1872-8 he sat in parliament for Jacques Cartier County, in 1876 was minister of inland revenue, and in 1877-8 minister of justice.

La Follette, lä fôl-lët, Robert Marion, American lawyer and politician: b. Primrose, Wis., 14 June 1855. He was graduated from the University of Wisconsin in 1879, and the next year was admitted to the bar. He became district attorney of Dane County in 1880, retaining that position till 1884, when he took up the regular practice of his profession. In 1887 he was elected to Congress, serving till 1891; he won reputation as an orator, and as a member of the committee of ways and means took a prominent part in the framing of the McKinley Tariff Bill. At the close of his service in Congress he resumed his practice, and remained active in politics, becoming one of the leaders of the younger men in the Republican party. In 1900 he was elected governor of his State, and in 1902 was re-elected. The chief aim of his administration has been to introduce certain tax reforms and to pass a primary election law.

La Fontaine, lä fôn-tân', Fr. là fôn-tân, Jean de, French poet: b. Chateau-Thierry, Champagne, 8 July 1621; d. Paris 13 April 1695. He studied for a time without much seriousness for the priesthood, turned to literature, found a patron in the minister Fouquet and later in others of prominence, and was in habits of intimacy with Molière, Boileau, Racine, and all the first wits of Paris. The candor and simplicity of his character acquired for him the title of *le bon homme*. But he was no favorite with Louis XIV., and was the only writer of merit of the time who did not share in the royal bounty. In 1683 he was elected to the Academy. He is best known for his "Fables," which abound in keen analysis, wise lessons, and skillful descriptive passages. Both the "Tales" (1665) and the "Fables" of La Fontaine have been superbly printed. Of the former (the license of which keeps them out of many libraries) the best edition is that of 1762, with Eisen's designs and vignettes. Of his "Fables" innumerable editions have been printed; but the most magnificent is that in four volumes folio (1755-9), in which each fable is adorned with a plate. Gustave Doré also executed illustrations for these poems. La Fontaine wrote further works, including "Les Amours de Psyche," a

LAFONTAINE — LA GRANGE

romance, and 'Le Florentin' and 'L'Eunooke,' comedies; and he edited a collection of religious verse. The best edition of his works is that by Regnier in the 'Grands Ecrivains' series (9 vols. 1888-92). Consult also the study by Lafenestre (1885).

Lafontaine, Sir Louis Hippolyte, Canadian lawyer and politician: b. Boucherville, Lower Canada, October 1807; d. Montreal 26 Feb. 1864. He achieved prominence at the bar and in Dominion politics, but in 1838 was charged with high treason as implicated in Papineau's rebellion, and though not convicted, withdrew to England, thence to France, and returned to Canada only after the end of the rebellion. In 1848-51 he was premier, and in 1853 became chief justice of the Queen's bench.

La Fourche, lä foorsh, a bayou in Louisiana, and an outlet of the Mississippi River, which begins at Donaldsonville, on the right bank, and flows southeast to the Gulf of Mexico. It has a total length of 150 miles and is navigable by steamboats 100 miles from its mouth.

Lago di Castello, lä'gō dē käs-tē'lō. See ALBAN LAKE.

Lago Maggiore, lä'gō mäd-jō'rē, or **Lake of Locarno** (anciently Verbanus), a large lake in northern Italy, and Switzerland, extending from Sesto to Locarno, about 39 miles long and 7 broad. It is 621 feet above the level of the sea, and at the northern end in some places as deep as 2,500 feet. On all sides it is surrounded by hills, planted with vineyards and plantations of chestnuts, interspersed with villas. There are several islands, two of which, Isola Bella and Isola Madre, called Borromean Islands, are laid out in gardens and pleasure grounds.

Lagoon' (from the Latin *lacuna*, a gap or hollow), a name given to shallow lakes or creeks connected with the sea, which are found along low-lying coasts. It is also applied to the expanse of water in the interior of those coral reefs which present to view above the surface of the water nothing but an external fringe. See CORAL.

Lagos, lä'gōs, Mexico, city in the State of Jalisco, on the Mexican Central railroad. It lies 6,000 feet above the sea; was founded in 1563 by Francisco Martel, and after the war of independence was named Lagos de Moreno after its defender, Pedro Moreno, who died here in battle against the Spaniards in 1817. Pop. (1900) 14,000.

Lagos (lä'gōs) **Colony**, a British possession in West Africa, consisting of Lagos Island and the coast between Dahomey and southern Nigeria; area, 985 square miles. The principal products are palm oil and kernels, ivory, gum copal, cotton, rubber, cocoa, and coffee. There is a railway from Lagos to Abeokuta 60 miles inland. The government consists of a governor and executive and legislative councils. The town of Lagos, the largest on the West African coast, has a population of 35,000. Pop. of colony 85,607.

La Grande, lä-gränd', Ore., city in Union County, on the Grande Ronde River, and on the Oregon railroad; 300 miles east of Portland. It is the commercial and trading centre of an extensive live-stock, grain and fruit growing region, and has flour mills, brick works, lumber

mills, beet sugar, and other factories. Pop. (1890) 2,583; (1900), 3,000.

Lagrange, Joseph Louis, zhō-zéf lōo-é lä-granzh, COMTE, French mathematician: b. Turin 25 Jan. 1736; d. Paris 10 April 1813. His great-grandfather was a cavalry officer in the French army, who afterward passed into the service of Sardinia. When scarcely 19 Lagrange was made mathematical professor in the artillery school at Turin. In 1764 he obtained the prize of the Academy of Sciences in Paris for a treatise on the libration of the moon, and in 1776 for another on the theory of the satellites of Jupiter. About this time he made a visit to Paris, where he became personally acquainted with D'Alembert, Clairaut, Condorcet, and other savants. Soon after his return he received an invitation from Frederick the Great to go to Berlin, with the title of Director of the Academy. Here he lived for 20 years, and wrote his great work 'La Mécanique analytique.' After Frederick's death (1786) the persuasion of Mirabeau and the offer of a pension induced him to settle in Paris. He was the first professor of geometry in the Polytechnic school, and the first inscribed member of the Institute. He took no active part in the revolution, and the law for the banishment of foreigners was not put in force against him. In 1794 he was appointed professor in the newly-established Normal School (Ecole Normale Supérieure) at Paris (1794), as well as in the Ecole Polytechnique. Napoleon bestowed upon him distinguished tokens of his favor, and he became member of the senate, grand officer of the Legion of Honor, and count of the empire. The most important of his works are his 'Mécanique analytique' (1788); 'Théorie des Fonctions analytiques' (1797); 'Résolutions des Équations numériques' (1798); 'Leçons sur le Calcul des Fonctions'; and 'Essai d'Arithmétique politique.'

La Grange, lä-grānj', Ga., city and county-seat of Troup County, on the Macon & Birmingham and on the Atlanta & West Point R.R.'s; 70 miles southwest of Atlanta. A Baptist Female college and a Methodist Female college are located here. The town was settled in 1826, and was incorporated two years later. Under a charter of 1891, the city is governed by a mayor elected annually, and a council elected every two years. It has numerous industries, including cotton and cottonseed-oil mills. Pop. (1890), 3,090; (1900), 4,274.

La Grange, Ill., town in Cook County, on the Chicago, Burlington & Quincy railroad; 15 miles from Chicago. It is a suburban and residential town largely populated by Chicago business men, and has numerous churches, public and private schools, and two weekly newspapers. Pop. (1890), 2,314; (1900), 3,600.

La Grange, Ind., town and county-seat of La Grange County, on the Grand Rapids & Indiana railroad; 45 miles northwest of Fort Wayne. It is the centre of a considerable agricultural section and has numerous manufacturing industries, including flour and lumber mills, chair factories, agricultural implement works, etc. Pop. (1890), 1,784; (1900), 1,703.

La Grange, Texas, city and county-seat of Fayette County, on the Colorado River, and on the Southern P. and the Missouri, K. & T. R.R.'s; 80 miles southeast of Austin. It has a

LA GRANGE COLLEGE — LAING

cotton trade of 15,000 bales annually, and is an important shipping point for grain and live-stock. There are cotton gins and cottonseed-oil mills and other industries here. Pop. (1890) 1,626; (1900) 2,392.

La Grange College, an educational institution in La Grange, Mo.; founded in 1858 under the auspices of the Baptist Church. It had in 1901 12 professors and instructors; 161 students; 7,000 volumes in the library, and productive funds of \$12,500. Its grounds and buildings were valued at \$20,000; income, \$3,000.

La Grita, lä gré'tä, town in Venezuela, in the state of Los Andes; located in a beautiful mountain region 5,000 feet above the sea, and surrounded by coffee, sugar, and tobacco plantations. It lies 75 miles south of Lake Maracaibo. The town, which has a most delightful climate, was founded in 1576 by Francisco de Cáceres. Pop. (1900) 9,700.

La Guayra, lä gwí'rä, or **La Guaira**, city and seaport in Venezuela, about 5 miles from Caracas, on the Caribbean Sea. It was founded in 1588 and is the most important commercial city in the republic. The harbor which was formerly an open roadstead has been improved by a breakwater, and is well protected by a fort. La Guayra exports coffee, cocoa, and skins, and imports chiefly manufactured goods. There is a railroad from here to Caracas. The port was blockaded in 1903 by the British and German fleets, pending the settlement of claims against the government. Pop. 11,000.

Laguna, lä-goo'nä, N. Mex., pueblo town on the Atchison, Topeka & Santa Fé railroad; 40 miles from Albuquerque. The population, some 1,100, is composed largely of various branches of the Laguna Indians, who are industrious and self-supporting. The government granted them 17,000 acres, of which only 215 acres can be used for farming purposes.

Laguna, Philippines, a province of the island of Luzón, situated in the southern part of the island, on the south and east shores of the Bay Lagoon (q.v.); area, including dependent islands, 752 square miles. The province is mountainous in the north, and in the southwest is Mt. Maquiling, 3,666 feet high; there are a number of rivers, and the soil is very fertile. All varieties of tropical plants and trees found in the Philippines grow here; the staple products are sugar, rice, corn, cotton, tobacco, indigo, cocoanut, betel nut, and fruit and vegetables. There are a number of industries, including mills for the extraction of cocoanut oil, furniture manufacture, the manufacture of cheese, and stock raising; there is considerable export trade, products being sent to all parts of the archipelago. Civil government was established in the province in July 1902. The inhabitants are mostly Tagalogs; pop. 170,000.

La Habana, Cuba. See **HAVANA, PROVINCE**.

Lahee, Henry Charles, American writer on musical topics: b. London, England, 2 July 1856. He was educated at St. Michael's College, Tenbury, Worcestershire, where he was chorister 1865-9, and was in the English mercantile marine 1871-9. Coming to the United States he was secretary of the New England Conservatory of Music at Boston 1891-9, and since the last named date has conducted a musical agency in Boston. He has published:

'Famous Singers of Yesterday and Today' (1898); 'Famous Violinists of Yesterday and To-day' (1899); 'Famous Pianists' (1900); 'Grand Opera in America' (1901); 'The Organ and its Masters' (1902).

La Hogue, lä hög. See **CAPE DE LA HAGUE**.

Lahore, lä-hör', India, city and capital of the Panjab, on the left bank of the Ravi 265 miles northwest of Delhi. The city proper covers an area of 640 acres, and is surrounded by a brick wall 16 feet high, flanked by bastions. The streets are extremely narrow, and the houses have in general a mean appearance. Here are the fort, the palace of Jehanghir, the Pearl Mosque, the Great Mosque, the mausoleum of Runjeet Singh, etc. The European quarter and the Meean Meer cantonment (at a distance of several miles) lie outside the walls on the south and southwest. Among the modern buildings and institutions are the Panjab University, the Oriental College, Medical School, Law School, Mayo Hospital, Victoria Jubilee Hall, school of art, cathedral, railway-station, etc. In 1524 Lahore became the seat of the Mogul empire, under which it reached its greatest splendor. Before passing into the hands of the British it was the capital of the Sikhs. Pop. 176,854. Lahore division (commissionership) has an area of 24,872 square miles, and pop. 4,579,794. The Lahore district has an area of 3,648 square miles; pop. (1900) 1,075,379.

Laing, läng, Alexander Gordon, British African explorer: b. Edinburgh, Scotland, 27 Dec. 1793; d. near Timbuktu, Africa, 26 Sept. 1826. After serving for several years in the English army, he entered on his career as an African traveler in 1822, when promoted to the command of a company in the Royal African Corps. An opportunity having presented itself of proceeding on the discovery of the course of the Niger, it was arranged that he should accompany the caravan from Tripoli to Timbuktu. He left Tripoli in July 1825, in company with the Sheik Babani, and after a tedious journey of nearly 1,000 miles arrived at Ghadames; and on 3 December reached Ensala. He quitted Ensala on 10 Jan. 1826, and on the 26th entered on the sandy desert of Tenezaroff. After some fighting with the Tuaregs he arrived at Timbuktu on 18 August, the first European who had ever reached that city. After a short stay he set out on his return, but was assassinated on 26 Sept. 1826. The murder was committed by the order of the son of the prime minister of Tripoli, whose agent Babani was. He prepared for the press a work published in 1825, under the title 'Travels in the Timmannee, Kooranko, and Soolima Countries of Western Africa.'

Laing, Malcolm, Scottish historian: b. Mainland, near Kirkwall, Orkney, 1762; d. there November 1818. He is the nephew of Samuel Laing (1780-1863). He was a lawyer by profession, and later a member of Parliament, but devoted himself principally to historical investigation. He wrote a continuation of Henry's 'History of Great Britain' (1785), and 'History of Scotland' (1800), which may be regarded as supplementary to Robertson's history. In the preliminary dissertation he presents an elaborate argument to prove Queen Mary's participation in the murder of Darnley.

LAING—LAKE

Laing, Samuel, Scottish author: b. Kirkwall, Orkney, 4 Oct. 1780; d. Edinburgh 23 April 1863. Entering the army in 1805 he served in the Peninsular War and in 1834 traveled in the Scandinavian countries. He published 'Journal of a Residence in Norway 1834-6' (1836); and 'A Tour in Sweden' (1839), but is best known by his important translation of the 'Heimskringla or Icelandic Chronicle of the Kings of Norway,' with a 'Preliminary Dissertation' (1844).

Laing, Samuel, English statesman and philosophical writer: b. Edinburgh 12 Dec. 1812; d. Sydenham Hills, Kent, 6 Aug. 1897. He is the son of Samuel Laing (1780-1863). He was prominently identified with railway legislation in England, was for many years prominent in Parliament, and from 1861 to 1863 held the office of finance minister to India. Of his works, 'Modern Science and Modern Thought' (1886), and 'A Modern Zoroastrian' (1887), have occasioned some discussion. His other publications of a miscellaneous character include: 'India and China' (1863); 'A Sporting Quixote; or the Life and Adventures of the Hon. Augustus Fitzmuddle' (1886); 'The Antiquity of Man' (1890); 'Human Origins' (1892).

Laird, lārd, David, Canadian politician: b. New Glasgow, P. E. I., 1833. He was educated in the Presbyterian Theological Seminary at Truro, N. S., and subsequently established the 'Patriot' in Charlottetown, a journal which he edited for many years. In 1871 he became a member of the Assembly of Prince Edward Island, and after the admission of the province to the Dominion, was a member of the House of Commons, 1873-6. He was lieutenant-governor of the Northwest Territory 1876-81, and while minister of the interior 1873-6, concluded the Qu'Appelle treaty which extinguished by purchase the title of several tribes to 75,000 square miles of territory on the route of the Canadian Pacific railway.

Laird, John, English ship-builder: b. Greenock, Scotland, 14 June 1805; d. Birkenhead, Cheshire, England, 29 Oct. 1874. His ship yards were at Birkenhead, on the other side of the Mersey from Liverpool, and he was for a long time the head of the firm of John Laird and Sons. He was the first builder of iron steamships, and built the John Randolph, the Nemesis and the Alabama. The first was the earliest iron vessel that crossed the Atlantic; the second the first armed vessel of iron. The history of the Alabama is well known. He entered Parliament in 1861 when he retired from active business.

Lairesse, Gerard de, Dutch painter and etcher: b. Liège, Belgium, 1640; d. Amsterdam 11 June 1711. He was early a pupil of his father Regnier Lairesse and of Flemalles, and left them for Utrecht, and afterward Amsterdam, where he labored hard for perfection in his art. He first of all confined himself to models of the antique, and the classical ideals of Poussin. His work was thus distinguished by somewhat wearisome mannerism, and his pictures very frequently seem painted in an unnatural silvery, metallic tone. His masterpieces are to be seen in Amsterdam, Schleissheim, Cassel, and in the Louvre, Paris. His ideas on

art, as dictated to his pupils and associates, together with his etchings, were published after his death in two volumes, under the title 'Het Groot Schilderboek' (1712). The work has been translated into German, French and English, and has had a great influence in the art education of the 18th century.

Lais, lǟ̄s, the name of two Greek hetæræ, celebrated for their remarkable beauty. The first lived at Corinth at the time of the Peloponnesian war; the most eminent and wealthy men of the time, including Aristippus the Cyrenaic philosopher, and Diogenes, the cynic, fell under her spell. The younger Lais was the daughter of Timandra and was born at Hycara, Sicily, 422 B.C. She came to Corinth in her seventh year and was educated in her profession by the painter Apelles. Later in life she followed a certain Hippostratus to Thessaly, where she was stoned to death by women in the temple of Aphrodite. But it is impossible to sift the really historic from mere anecdotal tradition in the accounts of these women which have come down to us. Consult: Jacobs, 'Lais, die ältere und die jüngere' (1830); Wieland, 'Aristipp.'

Laity (Gr. λαός, the people). Those members of the church who are not included in the clergy. In the Roman Catholic Church the clergy are divided into eight orders: bishop, priest, deacon, sub-deacon, acolyte, exorcist, ostiarius, lector. By some authorities the episcopate and the priesthood are considered different degrees of the same order, and the lowest of the eight orders is said to belong to all who aspire to the priesthood, postulants or candidates, who are styled clerics. The Protestant Episcopal Church holds, as the prayer-book says, "that from the Apostles' time there have been three orders of ministers in Christ's Church, Bishops, Priests and Deacons." This does not deny the historic existence of other orders, and may be thought simply to interpret the sentence with which the pastoral letter of the first council of Jerusalem opens (Acts xv. 23): "The Apostles and Presbyters and brethren send greeting," the brethren being the laity. See CLERGY.

Lake (Lat. *lacus*), a body of water surrounded by land. Lakes are of two kinds—fresh-water and saline—and have been formed in various ways. Taking first the *fresh-water lakes*, these may be grouped as follows: (1) *Obstruction Lakes*.—Some of these are more or less temporary sheets of water, such as the lake-like expansions of certain rivers, and the deserted loops of river-channels. Other temporary lakes are due to the operations of the beaver; to the choking of the narrower passages of a river-channel by drifted vegetable debris or river-ice; or to the advance of a glacier across the mouth of a lateral valley. (2) *Crater Lakes*.—These occupy the craters of extinct or quiescent volcanoes. (3) *Sink Lakes*.—These lie in hollows caused by subsidence of the surface consequent upon the removal of underlying soluble rocks, such as rock-salt, and calcareous and gypseous rocks. (4) *Earth-movement Lakes*.—Unequal movements or warping of the earth's crust have occasionally originated hollows by direct subsidence. It is possible also that local elevation by affecting

LAKE—LAKE DWELLINGS

the lower ends of valleys may sometimes have obstructed the flow of rivers, and thus given rise to lakes. (5) *Glacial Lakes*.—These consist of (a) hollows of erosion or *rock-basins*, which have been excavated by glacier-ice, and (b) hollows caused by the unequal distribution or accumulation of glacial detritus during the glacial period. (6) *Subterranean Lakes*.—These are found chiefly in calcareous regions, where they occupy the underground channels which have been excavated by the chemical and mechanical action of water. *Fresh-water* lakes are very unequally distributed. They are most numerous in those regions which were overflowed by land-ice during the glacial period, as in the British Islands, Scandinavia, Finland, Canada, and the United States. Lakes occur at all heights above the sea; the most elevated being Lake Tsana in Abyssinia (7,500 feet), Lake Titicaca in the Bolivian Andes (12,500 feet), and Askal Chin in Tibet (16,600 feet). The largest lake in the world is Lake Superior, which covers an area of 31,200 square miles, and has a mean depth of about 475 feet. Lake Baikal, in central Asia, is the largest and deepest mountain lake, its area being 13,500 square miles, and its mean depth 850 feet, but in places it reaches a depth of more than 4,000 feet. Some of the mountain lakes of Europe also attain great depths; thus, Lake Geneva is 1,000 feet, Lago Maggiore 1,158 feet, and Como 1,358 feet.

Salt Lakes.—Two kinds are recognized: (a) portions of the sea cut off from the general oceanic area by epigene or hypogene agencies; (b) lakes, originally fresh-water, which have been rendered saline by evaporation and concentration. Those of the first group range in size from mere pools and lagoons up to inland seas, such as those of the great Aralo-Caspian depression. The Dead Sea and the Great Salt Lake of Utah are good examples of the second group of saline lakes, which might be defined shortly as lakes which have no outlet to the ocean. The Caspian Sea is 97 feet below the level of the Black Sea, has an area of about 170,000 square miles, and is from 2,500 to 3,000 feet deep in the deepest parts. A still more depressed area is that of the Dead Sea, the surface of which is 1,292 feet below the level of the Mediterranean Sea.

Lake. Pigments consisting of coloring matter combined with a metallic oxide are called *lakes*. They are obtained by mixing with the solution of the coloring matter a solution of alum or of a salt of tin, tungsten, zinc, or other metal, and then adding an alkali or alkaline carbonate. The precipitate which forms consists of the color combined with the oxide. Among the pigments prepared in this way may be mentioned *blue* lake, consisting of cobalt blue, indigo, or ultramarine and alumina; *madder* lake, of madder and alumina; *orange* lake, of turmeric and alumina; *carmine* lake, of cochineal and alumina, which is the finest and most important of all; *purple* lake, of logwood and alumina; and so on. The exact tint depends on the proportions of the ingredients and the mode of preparation, as the lakes do not appear to be definite compounds. Lake pigments are largely used not only in painting, but also in calico-printing, but in the latter the

metallic oxide is put upon the cloth, and the color is afterward applied.

Lake Agassiz, äg'a-si, a glacial lake once covering a large area in the Red River Valley of Minnesota, North Dakota and Canada. The lake during its existence was larger than all the Great Lakes combined. The bed of this extinct lake is now a great plain, covered with till and silt, yielding its soil to the growth of wheat and other grain. Consult Upham, 'The Glacial Lake Agassiz' (1895). See also GLACIAL PERIOD.

Lake Bonneville, bon'vel. See GREAT SALT LAKE.

Lake Carp, a fish, *Carpoides Thompsoni*, one of the carp-suckers (q.v.), inhabiting the Great Lakes.

Lake Charles, La., city and parish-seat of Calcasieu Parish, on the Calcasieu River, and Southern P. railroad, 216 miles west of New Orleans. Located on the banks of the picturesque Lake Charles it is one of the most attractive cities in the State. It has Acadia College, the Carnegie Library, Parish court house, high school and numerous churches. It was settled in 1849 and was first incorporated in 1860. Under a new charter of 1886, the city is governed by a mayor and common council, elected every two years. There are extensive cotton and rice mills here and a large trade in lumber. Pop. (1890) 3,442; (1900) 6,680.

Lake City, Fla., town and county-seat of Columbia County, on the Southern, the Florida C. and other railroads; 60 miles west of Jacksonville. Here is located the State Agricultural College and an agricultural experiment station. In 1901 the State legislature granted the town a new charter greatly enlarging its limits. The town has an important trade in cotton, lumber, turpentine, fruit, etc. Pop. (1890) 2,200; (1900) 4,013; (1902) 6,000.

Lake City, Minn., city in Wabasha County, on Lake Pepin and on the Chicago, M. & St. P. railroad, 57 miles southeast of St. Paul. It has a public library and high school, and numerous manufactures, including grain elevators, flour mills, wagon and carriage factories, foundries, machine shops, and an extensive nursery covering 1,400 acres. The city is governed by a mayor and council, and owns the waterworks and electric light plant. Pop. (1890) 2,128; (1900) 2,744.

Lake Cusk, or **Lake Lawyer**, the American cusk (q.v.).

Lake Dwellings are those constructed on artificial or partly artificial islands in lakes. The use of habitations of this nature is a subject which has engaged the attention of archæologists and others very largely since the discovery of the remains of a lake dwelling in Ireland in 1839, of similar ones in Switzerland in 1854, and subsequently of numbers of others elsewhere. The archæological interest thus attaching to these remains has drawn attention to similar dwellings being still used in various parts of the world, in Russia, the Malay Archipelago, Venezuela, New Zealand, and in a modified form in some parts of Central Africa. The first who is known to have described lake dwellings is Herodotus, who mentions that the Persians in their invasion of Thrace and Mace-

LAKE FOREST—LAKE LAHONTAN

donia in the beginning of the 5th century B.C. found certain tribes inhabiting Lake Prasias, whose dwellings were constructed on platforms supported above the surface of the lake by piles driven into its bottom.

The lake dwellings are built after two chief types, one of which has an Irish name, *crannogs*, given to it, from the fact that those of this type are chiefly found in Ireland; and the other of which has a German name, *Pfahlbauten*, because those of this type were first found in Switzerland. Crannogs are made in the following way: Great quantities of small stems, sticks, and the like, are collected and sunk by means of stones in the lake, so as to form an island. Very often advantage is taken of the existence of an island just level with the surface of the water, which can be raised a foot or two above the surface with comparatively little labor. Sometimes a few upright piles are driven in on the top after the chief part of the island has been made in the manner described. When the island is thus raised to a sufficient height it is frequently strengthened by an enclosure of stakes driven into the bottom of the lake perpendicularly. A platform of thin stems of trees, either round or split into boards, is then made on top of the island, and this supports the structures that are built on them. The crannogs of Ireland appear to have been rather used as strongholds than as dwellings.

Pfahlbauten or pile dwellings are made by driving piles into the lake bottom as a support for the platforms on which the dwellings are erected. The piles are sharpened at the lower end, and an examination shows the sharpening to have been performed partly by heat and partly by some cutting instrument, either of stone, bronze, or iron, as is proved by the fact of such instruments frequently being found on the dwellings. Greater solidity and compactness is sometimes given to the structure of vertical piles by means of stakes transversely inserted between them or notched on to them just below the top. In other cases heaps of stones are thrown down between the upright stakes, forming what is called in Germany a *Steinberg*. The upper ends of the vertical piles are brought to an exact level to allow a platform to rest on them similar to that of a crannog. Coarse gravel was frequently strewed over the platform to keep it dry, and the interstices were often filled up with mud. It was also common to make a hurdle wall round the whole artificial island by means of small branches and twigs interwoven between the outermost stakes. Huts were built on the platform in a similar manner to the rest of the structure. The walls were of stakes bound together by wattles, and covered over by a thick clay, and the roofs were probably thatched. A single platform was in many cases large enough to support a considerable number of huts. Among works on the subject consult: Munro, 'Ancient Scottish Lake-dwellings' (1882); Wood Martin, 'Lake-dwellings of Ireland' (1886); and Munro, 'Lake-dwellings of Europe' (1890).

Lake Forest, Ill., city in Lake County, on Lake Michigan, and on the Chicago & N. W. railroad, 28 miles north of Chicago. It is a suburban and residential town without industries or manufactories. There is here a seminary for young ladies, a public library, an

academy for boys and Lake Forest University (q.v.). It was settled in 1859, and is governed by a mayor and council elected every two years. Pop. (1890) 1,200; (1900) 2,215.

Lake Forest College, a school for both sexes at Lake Forest, Ill. The history of the institution shows that in 1855 a number of citizens of Chicago, under the leadership of the Rev. Robert W. Patterson, formed an association for the purpose of establishing an educational institution near Chicago which, despite its proximity to the city, would always retain the advantages of a rural situation. In February 1856 the Lake Forest Association was organized, and the 1,300 acres of land along the shore of Lake Michigan, 28 miles from Chicago, were purchased by the association, which is now the site of the town of Lake Forest. Half of the land was to be association property, every alternate lot being set aside for the university, and 62 acres being left for an "inalienable campus." The educational institution was chartered on 13 Feb. 1857, under the title Lind University. This name was changed in 1865 to Lake Forest University. The boys' department was opened first, and through the bequest of \$35,000 from the Rev. W. W. Ferry the school for girls was founded 11 years later. The college department, known as Lake Forest College, was opened in September 1876. The institution was founded by Presbyterians, but it is not denominational in its character. It has 127 professors, 1,400 students, 21,000 volumes in the library, and an income of \$120,000; productive funds \$500,000; value of grounds and buildings \$700,000. Lake Forest College is also attracting favorable notice from the literary world, owing to the fact that it has received a large endowment for a prize, a library and a lectureship, which, it is believed, will attract as much attention in the United States as the famous Bampton and Gifford lectures have done in Great Britain.

Lake of the Four Forest Cantons, a common name for the Lake of Lucerne. The city of Lucerne, and the towns of Küssnacht, Brunnen, and Flüelen are on its shores.

Lake Geneva, jē-nē'va, Wis., city in Walworth County, on the Chicago & N. W. railroad, 70 miles northwest of Chicago. Situated on Lake Geneva, the city has developed into a popular summer resort. The lake is 9 miles long and from 1 to 3 miles in width, and is fed entirely by springs. The Yerkes Observatory, belonging to the University of Chicago, is located here. There are numerous large hotels, churches, schools, a public library and other buildings. The city was incorporated in 1893 and is governed by a mayor and council elected annually. Pop. (1890) 2,290; (1900) 2,600.

Lake Herring, or Lake Whiting, a local name for certain whitefish of the Great Lakes, especially the cisco (q.v.).

Lake Lahon'tan, an extinct lake which once existed in the western part of Nevada. The pebbly beaches, and other shore-line marks are still quite distinct. It, like Lake Bonneville, in Utah, belonged to the glacial period, when what is known now as the Great Basin had much larger bodies of water than exist now in the same section. The place occupied by

LAKE SCHOOL—LAKEWOOD

Lake Lahontan is at present a saline waste, with here and there small salt lakes. Consult: U. S. Geological Survey, Monograph 11 (1885); Russell, 'Geological History of Lake Lahontan.'

Lake School, or Lakists, a name formerly given to certain British poets who came forward conspicuously at the beginning of the 19th century, and endeavored to substitute a natural and simple taste for the classicism of which Addison and Pope furnish leading examples. They received their name from the picturesque lakes of Cumberland and Westmoreland, where Wordsworth, Coleridge, Southey, Wilson, and others, had fixed their residence permanently or for a time.

Lake Silversides. See SILVERSIDES.

Lake State, The, a popular name given to Michigan. Its shores are watered by Lakes Superior, Michigan, Huron, and Erie. The Indian word Michigan signifies "great lake."

Lake Sturgeon, the great sturgeon (*Accipenser rubicundus*) of the Great Lake region. See STURGEON.

Lake Trout, two salmonoid fishes of the genus *Cristivomer* inhabiting lakes in the northern United States and southern Canada, (1) the Great Lake trout (*C. namaycush*) ; and (2) the siscowet (*C. siscowet*). The former, and more important, occurs in most of the larger lakes and ponds from New Brunswick to Idaho and Vancouver Island, and throughout northern Canada and Alaska. The Canadians call it namaycush, and by other Indian names; in Maine and Vermont it is known as "togue" and "longe" respectively; and on the upper Great Lakes as Mackinaw trout. It is the largest of the trout family, sometimes exceeding 100 pounds in weight, but the average specimen weighs from 15 to 20 pounds; the biggest fish are found in the largest and deepest lakes. It is trout-like in form, thin-skinned, with little or no underlying fatty tissue, and dark gray spotted with round paler spots sometimes of a slightly reddish tinge. It is fierce and voracious, seizing and feeding upon "all fishes with soft fins" and anything else edible that falls in its way; and when mature it can hold its own against any other depredator, so that it may be regarded as ruler of the lakes. It spawns on the reefs in the late autumn, but otherwise dwells in the deeper waters; Jordan says that the usual number of eggs deposited at one spawning is only 5,000 or 6,000. As a game-fish it seems variable, in some waters affording good sport by trolling with a spoon-bait or live minnow, and in others having small repute among anglers. All agree, however, as to the excellence of its flesh on the table; and it furnishes a commercial fishery on the Great Lakes only excelled in importance by that for whitefish. These trout are usually caught by vast gill-nets operated by steam vessels, and three or four tons are sometimes taken in a single haul. About 1885 the supply in the Great Lakes was diminished to an alarming extent; but artificial propagation by the State and National governments soon restored the quantity, so that at the beginning of the present century more could be taken by fishermen than could profitably be sold. It is outranked in market-price and demand, however, by the whitefish.

The siscowet is very similar, but has a deeper body, thicker skin, beneath which is an excessive development of fatty tissue, and paler coloration. It is rarely seen outside of Lake Superior, where it is numerous in deep water. Consult: Goode, 'American Fishes' (1888); Jordan and Evermann, 'American Food and Game Fishes' (1902); Sage and Cheney, 'Salmon Trout' (1902).

Lake of the Woods, a boundary lake, partly in the Province of Ontario, Canada, and partly within the State of Minnesota, 220 miles west of Lake Superior, and 377 feet above its level. It is broken by one long promontory and several smaller ones into distinct portions, of which only the southern, containing Big Island, is properly designated the Lake of the Woods, while the eastern bears the name of White Fish Bay, the northern, which is studded with islands, being called Clear Water Lake, and the northwestern, Shoal Lake. The whole expanse of water forms a single lake of very irregular shape about 70 miles in length and 60 in breadth, the water area being about 1,500 square miles. Rainy River, the principal feeder of the lake, enters it at its southeastern extremity, just below Fort Louise; its discharge is at the north by the Winnipeg. It abounds with sturgeon. The boundary between Canada and the United States follows the Rainy River to its mouth in the lake, and then proceeds across the lake in such a way as to leave Big Island to Canada, whilst giving most of the Lake of the Woods proper to Minnesota. A little west of the meridian of 95° the boundary strikes due south to meet the parallel of 49°, which is then followed, the result being that the United States owns an isolated portion of the land on the northwest shore. There are gold mines in the neighborhood.

Lake-to-Sea Commission. In 1903 President Roosevelt appointed three commissioners to act in behalf of the United States in co-operation with a similar body representing Great Britain, to investigate the question of water routes from the Great Lakes to the Atlantic Ocean. The authority for the President's action is contained in the River and Harbor bill. The commissioners are particularly required "to report upon the advisability of locating a dam at the outlet of Lake Erie." The project which this commission is charged to examine is so vast, not only in its bearing upon the inland commerce of the North American continent, but in its possible effect upon the political relations between the United States and Canada, that its serious consideration by a body of official experts representing the two governments directly concerned becomes a matter of international interest. The idea of an international commission to inquire and report upon the effect of the diversion of the waters of the Great Lakes originated several years since with the Hon. Andrew H. Green of New York, who for nearly 20 years from its organization was a member of a Commission of the State Reservation at Niagara Falls.

Lake'wood, N. J., township and village of the same name in Ocean County; the town is a famous health and winter resort, surrounded by an extensive pine forest, in which are numerous lakes. Here are numbers of large hotels and

LAKEY.—LALLY-TOLLENDAL

many cottages owned by residents of New York and Philadelphia. Known for more than a score of years to a few, discovered and originally promoted by men who found here the conditions which were a necessity of long life, and developed and made successful by the presence of manifold advantages, Lakewood is known on both sides of the ocean, among the most critical and intelligent travelers from Canada to the Gulf and from the Atlantic to the Golden Gate, in Europe and on the Continent, as the most popular resort in America's Middle East. Lakewood has grown steadily in its normal population, as well as its taxable inventory. Its streets and avenues, carefully laid out and well built of stone, are kept in perfect repair during the season, and afford one of the chief charms of the place in an almost endless variety of drives. The lakes of the place, among its great charms, are protected carefully from contamination, and at once furnish an adequate water supply for fire purposes, are points of much attraction at the infrequent times when skating is available, and throughout the season a picturesque viewpoint, admired by thousands. Pop. (1900) 3,094.

Lakey, Emily Jane, American artist: b. Quincy, N. Y., 22 June 1837; d. Cranford, N. J., 24 Oct. 1866. She received her art education at the National Academy of Design in 1873 and in Paris, and made a specialty of cattle pieces. Among her paintings of this character are: 'The Leader of the Herd'; 'An Anxious Mother'; 'The Right of Way'; 'From Pasture to Pool.'

Lakshmi, lāksh'mē (Prosperity), in Hindu mythology, the wife of Vishnu and the goddess of fortune. She is the female or creative energy of Vishnu, and hence is in many cases regarded as an expression of the attributes of Vishnu. She is said to have been produced from the ocean of milk when churned by the gods to obtain the beverage of immortality. She was thus born in the full flush of beauty, adorned with a diadem, and with gems on her neck and arms, bearing in her hand a lotus. As soon as she was born she betook herself to the bosom of Vishnu, to whom she was ever faithful. According to a later view, that of the worshippers of Vishnu, this god produced three goddesses, Brāhma, Lakshmi, and Chandika, the first his creative, the second his preserving, and the third his destroying energy.

Lala, Ramon Reyes, American author: b. Manila, Philippine Islands, 1 March 1857. He was educated in Hong Kong, London, and Switzerland, and after traveling extensively, returned to Manila and engaged in business. By reason of Spanish oppression he came to the United States, and was the first Filipino ever naturalized here. He became widely known in the United States as a lecturer on his native country and has published 'The Philippine Islands' (1888), and many magazine articles on allied topics.

Lalande, Joseph Jérôme le Français de, zhō-zéf zhā-rōm lē frā-n-sā dé lā-lānd, French astronomer: b. Bourg-en-Bresse, Ain, 11 July 1712; d. Paris 4 April 1807. He devoted himself to mathematics and astronomy, and was sent by the Academy in 1751 to Berlin to determine the parallax of the moon, while Lacaille went

with the same object to the Cape of Good Hope. After having finished his operations at Berlin, he was chosen member of the Academy of Sciences in Paris in the year 1753. Thenceforward no volume of their 'Transactions' appeared which did not contain some important communications from him. In 1762 he was appointed professor of astronomy in the Collège de France, where he lectured with great success to the end of his life. His chief works are his 'Treatise on Astronomy' (1764); 'History, Theory, and Practice of Navigation'; and 'Astronomical Bibliography.' He wrote all the astronomical articles for the great 'Encyclopédie,' and re-wrote them for the 'Encyclopédie Méthodique,' and contributed to various scientific periodicals, besides editing the 'Connaissance des Temps' from 1760 to 1775, and from 1794 till his death.

Lalande's Dog. See CAPE FOX.

Lalemant, lāl-mān, Gabriel, French Jesuit missionary in America: b. Paris 1610; d. Huron mission, New France, 1649. He was a nephew of Jérôme Lalemant (q.v.). In 1630 he entered the Jesuit Order, in 1646 went to New France, and was appointed to the mission among the Hurons. During the fatal invasion of the Huron country by the Iroquois he was taken prisoner, tortured, and killed.

Lalemant, Jérôme, zhā-rōm, French Jesuit missionary in America: b. France 1593; d. New France 1673. In 1609 (or 1610) he entered the Jesuit Order, then taught in educational institutions of the order, and in 1638-45 was superior of Huron Jesuit mission in New France. In 1645-50 he was superior of all the missions at New France. After a sojourn in France (1650-9), he returned to America to resume his post. Letters and reports by him appear in the great compilation of the 'Jesuit Relations' (1896-1901). Consult also Parkman, 'The Jesuits in North America' (new ed. 1898).

Lalita-Vistara, lā-li-ta-vis'ta-ra, one of the most celebrated works of Buddhistic literature, of unknown origin and antiquity, existing only in a Sanskrit version. It contains a narrative of the life and doctrine of the Buddha Sakyamuni, and is considered by the Buddhists as one of their chief works treating of religious law.

Lalla Rookh, lāl'a-rook, the greatest and most complete of all the poetic works of Thomas Moore. It consists of four narratives, of which 'Paradise and the Peri' is the finest and most popular. The scene is laid in the Far East, and the learning and ingenuity of the poet, as well as his brilliant imagery and musical versification combine to produce an oriental romance unequaled in the English language. The four stories are told to Lalla Rookh by her lover who attends her on a journey in the disguise of a minstrel. 'Lalla Rookh' was first published in 1817.

L'Allegro, lā-lā'grō, the title of a famous lyrical poem by John Milton, written about 1632.

Lally-Tollendal, lä-lē-tō-lōn-däl, Thomas Arthur, COMTE: b. Romans Dauphiné 1702; d. 9 May 1766. He was of Irish parentage, his father having followed the fortunes of James II. Trained to arms, he was made brigadier

LAMAISM

on the field of Fontenoy for distinguished bravery. He accompanied the Pretender to Scotland in 1745, and in 1756 was selected to restore the French influence in India, for which purpose he was made governor of Pondicherry. He failed in this, surrendered Pondicherry in 1761, and was brought prisoner to England. The following month he was allowed to return to France, where, after a long imprisonment, he was condemned and executed (1766) for treachery, etc. His son (Trophime Gerard, 1751-1830), supported by Voltaire, obtained in 1778 a complete authoritative vindication of his father's conduct.

Lamaism, lä'mä-izm, an Asiatic religious belief, which is a mixture of Buddhism (see BUDDHA), Sivaism (see SIVA) and Shamanism (q.v.). It prevails from the borders of Tibet to the banks of the Volga. It is the religion of Manchuria, Mongolia and Siberia, and is found in various localities in China proper. Its adherents number more than 10,000,000.

History.—Lamaism was not known in Tibet before the 7th century A.D., when two Buddhist princesses, one from India, the other from China, shared the throne of King Sron Tsan, who adopted their religious belief. One of his successors, Thi Sron Detsan, invited Padma-Sambhava, a Buddhist monk, to preach the doctrine of the "Enlightened One" throughout the kingdom. Padma-Sambhava accordingly set about with royal authority to check witchcraft and devil worship. He established, moreover, an order of Lama priests. Lamaism, however, did not reach its culmination of power until Nag-wan Lozang, the fifth Grand Lama, was in 1640 made Dalai Lama (Ocean wide Lama), and united the authority of church and state in one individual. The modern period of this Asiatic cult dates from this epoch.

Doctrine and Religious Belief.—When Padma-Sambhava first preached Buddhism to the Tibetans he took great pains to adapt it to the capacity of his hearers, and even to their prejudices. He therefore accepted their assent or conformity as sufficient evidence of their belief. It was impossible to drive out their ancestral mysticism, practice of magic, and devil worship, and all of these continued to form elements in Lamaism. In this system the cosmogony of Buddhism is preserved intact with the Buddhistic conception of heaven and hell, and the Buddhist canon of morality, and, like the system of the "Enlightened One," Lamaism knows no worship but that of saints. Its essential creed comprises "the three most precious jewels," namely, "the Buddha-jewel," the "doctrine-jewel," and the "priesthood-jewel." Buddha is not god nor creator; but merely the founder of a doctrine, saintly, preeminently wise, powerful, virtuous and beautiful. The doctrine is the embodiment or incarnation of Buddha, all that remained of him on earth after his absorption in Nirvana. The priesthood comprises the incarnate and non-incarnate saints, among whom are the five Buddhas of Contemplation, and myriads of solitaries who attain perfection without Buddha, besides men of supreme holiness, destined to be canonized after death. In an inferior position to these saints stand spirits, whose kings are Indra (q.v.), god of the firmament; Yama (q.v.), god of death and hell;

Yamantaka or Siva as the avenger; Vaisravana (q.v.), god of wealth; besides numerous guardian and other demons who receive worship. The worship of Lamaism is conducted with prayer, reading, hymn-singing, accompanied with loud music. The clergy are summoned by the sound of a bell; the shrines and altars are brightly adorned on festivals, and offerings are made of tea, flour and milk, etc., offerings of flesh being forbidden. Rosaries, prayer wheels, amulets, charms and symbols are employed by the priests, while sometimes a part of public worship is taken up with rites of magic; charms are recited, spells are cast, incantations made, while the worshippers consult those who are reputed to be diviners, necromancers, or astrologers.

Religious Festivals.—The three principal are the New Year, in February, when the return of spring is celebrated as the triumph of Buddha, the "Enlightened One," over six heretical teachers. The second festival is held in commemoration of the incarnation of Buddha and marks the day of his mundane conception; it is the most ancient of these holy days. Third in order comes the Water Festival, marking the approach of autumn and the fall of fertilizing rain.

Religious Rites.—The two principal rites in Lamaism are baptism, and admission to discipleship, the former administered the 3d or 10th day after birth; the latter, as soon as the child can walk and speak. Marriage is a civil contract, but the lama fixes the day, and is feed accordingly; he also receives gifts for rescuing the dead from Yama by religious rites and incantations. It is the lama or priest that attends the dying man or woman, to see that dissolution between body and soul is properly accomplished, and to guide the soul to the western paradise.

Hierarchy.—There are two hierarchs, or spiritual heads, to the followers of Lamaism, Dalai-Lama (Ocean wide Lama), whose seat is at the hill of Potala, near Lhasa, who is really the head and chief of the hierarchy, and all Lamaists in Tibet, Mongolia and China are his children and subjects; the other is Teush-Lama. His official title is "the great teacher-jewel." There are two ranks below these. These orders are supposed to be the reincarnations of the Buddhist saints. The subject of reincarnation plays a prominent part in Lamaism. When the Grand Lama dies his soul is reborn in some child whose birth is coincident in time with his death. Who this child may be out of the many born at that moment used to be decided by lot, unless the deceased had announced before his death the name of the family in which he was about to reappear. At present the emperor of China has great influence in deciding the point.

There are four orders of inferior clergy who generally live in lamaseries or convents and make no claim to be reincarnations of the saints. The lamasery consists of a central temple surrounded by buildings—cells, library, refectory, etc. There are nunneries also where women live in prayer, study and celibacy, but these are few in number.

The Scriptures.—The sacred books are very numerous and make up from 222 to 228 volumes. First is the canon, a collection of the commands or sayings of Buddha. Second is the commentary. The canon contains 1,083

LAMAR—LAMARCK

works, which fill more than 100 volumes of 1,000 pages each. It comprises the following subjects: (1) Discipline, (2) Sermons, or homilies of the various Buddhas, (3) Philosophy and metaphysics. There are also treatises on Nirvana (q.v.), ethics, ritual, etc. Consult: Rockhill, 'The Life of Buddha, and the Early History of his Order' (1884); Köppen, 'Die lamaïsche Hierarchie und Kirche' (1859); Waddell, 'The Buddhism of Tibet' (1895).

Lamar, lä-mär', or **Lamar y Cortezar**, lä-mär' ē kör-tä-thär', José, hö-sä', Spanish-American general: b. Cuenca, Ecuador, 1778; d. San Jose, Costa Rica, 11 Oct. 1830. He went to Spain in his youth, and entering the army there fought against the French at Saragossa. He was ordered to Peru in 1815, and was governor of Callao Castle at the time of its surrender, 21 Sept. 1821. He then joined the revolutionists and in 1824 became marshal. He was elected president of Peru in 1827, caused the deposition of Sucre, president of Bolivia; provoked a war with Colombia, in which he was defeated, and on 29 June 1829 was deposed by his own officers and exiled.

Lamar, Lucius Quintus Cincinnatus, American jurist: b. Eatonton, Putnam County, Ga., 1 Sept. 1825; d. Macon, Ga., 23 Jan. 1893. He was graduated from Emory College (Oxford, Ga.), studied law at Macon, was admitted to the bar in 1847; removed in 1849 to Oxford, Miss., was there professor of mathematics in the University of Mississippi (1850-2), in 1852-5 practised at Covington, Ga., was elected to the Georgia legislature in 1853, and having returned in 1855 to Mississippi, was there elected representative in Congress in 1857 and 1859. In 1860 he resigned his seat in Congress; drafted Mississippi's ordinance of secession; and was a member of the State convention that passed it (9 Jan. 1861). Chosen lieutenant-colonel of the first Confederate regiment organized in Mississippi, he resigned from military service in October 1862, and in 1863-4 was in Europe, whither he had gone as commissioner to Russia, though he did not proceed to his post. After the war he held the chairs of ethics and metaphysics (1866-7) and of law (1867-70) in the University of Mississippi; was a representative in Congress (1873-7) and a United States senator (1877-85); and secretary of the Interior (1885-8). From 1888 he was an associate justice of the United States Supreme Court. On 27 April 1874 he pronounced before the House a eulogy on Charles Sumner, highly praised for its eloquence and generally for its liberal tone, but so displeasing in that respect to many of his constituency that they endeavored to defeat his re-election. His strong opposition to the debasement or inflation of the national currency caused the Mississippi legislature formally to direct him to renounce either his views or his seat in the Senate, both of which he declined to do. He was re-elected to the Senate by an increased majority. His oration at the dedication of the monument to John C. Calhoun at Charleston, S. C. (1887), was one of the best of his public addresses. Consult the study by Mayes, including Lamar's speeches (1896).

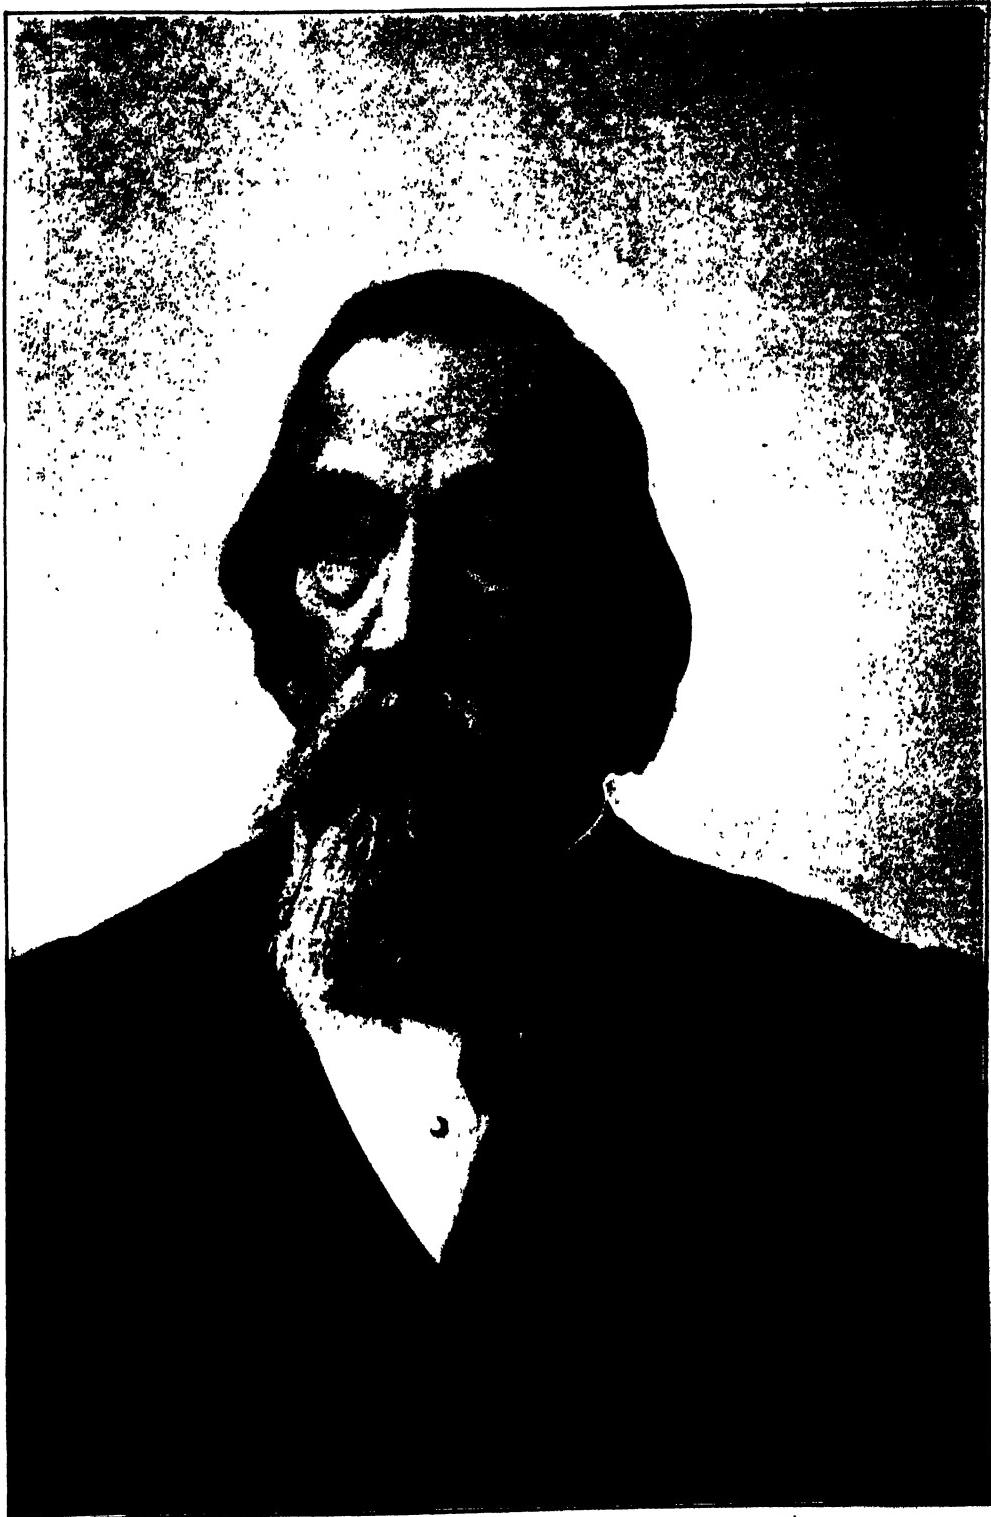

Lamar, la-mär', Mirabeau Buonaparte, American politician, second president of the

republic of Texas: b. Louisville, Ga., 16 Aug. 1798; d. Richmond, Texas, 19 Dec. 1859. After being employed a number of years in mercantile business and farming, he established in 1828 the 'Columbus Inquirer,' a journal devoted to the defense of State rights, and was actively engaged in politics until his removal in 1835 to Texas. Arriving there at the outbreak of the revolution, he at once sided with the party in favor of independence, and participated in the battle of San Jacinto, to the successful issue of which the charge of the cavalry under his command greatly contributed. He was soon after called into the cabinet as attorney-general, a position which he subsequently exchanged for that of secretary of war. In 1836 he was elected the first vice-president of Texas, having for some months previous held the rank of major-general in the army. In 1838 he was elected president, in which office he remained until 1841. Upon the breaking out of war between Mexico and the United States in 1846, he joined Gen. Taylor at Matamoras, and fought at the battle of Monterey. He subsequently stationed himself with an armed force at Laredo, where for two years he was engaged in constant conflicts with the Comanches, whose depredations on the frontier he greatly curtailed. The last public position which he held was that of United States minister to Nicaragua and Costa Rica, from which he had but lately returned when he died. He published 'Verse Memorials' (1857).

Lamar, William Bailey, American politician: b. Jefferson County, Fla., 12 June 1853. He was educated at the University of Georgia and was graduated from the Lebanon Law School, Tenn., in 1875. He was admitted to the bar in that year, practised in Tupelo, Miss., 1875-6, and then returning to Florida was clerk of the circuit court of his native county 1877-81, and county judge 1883-6. He entered the Florida legislature in 1886, was attorney-general of his State 1888-1902, and became a member of Congress from the 3d Florida district in 1903.

Lamar, Mo., city and county-seat of Benton County, on the Spring River and the Missouri P. and the Kansas City, Ft. S. & M. R.R.'s; 39 miles north of Joplin. Lamar College is located here. The city has extensive coal mining and lumbering interests and is the centre of a large agricultural district. It has a large flour trade. Pop. (1890) 2,860; (1900) 2,737.

Lamarck, Jean Baptiste Pierre Antoine de Monet, CHEVALIER DE, French scientist: b. Bazentin, Picardy, 1 Aug. 1744; d. Paris 18 Dec. 1829. He was of noble family, entered the army in 1760, but was compelled on account of an accident, to abandon active military service, after which he devoted his attention to study, first to medicine; afterward, after hearing Jussieu's illustrations of botany, he turned to the study of that science. Jussieu had intimated that the old method of classification in botany was defective and Lamarck determined to remedy the deficiency. He labored with great diligence on a treatise in which he showed the defects of the old classification, and proposed a new one, which met with general approval. He then applied his new system to the plants of France, and delivered to the Academy his 'Flore

L. Q. C. LAMAR.
LATE JUSTICE OF THE UNITED STATES SUPREME COURT.

LAMARCKISM

Française, ou Description succincte de toutes les Plantes qui croissent naturellement en France.' This work was printed, by the recommendation of the Academy, at the expense of the government, for the benefit of the author (1780). Lamarck now turned his whole attention to botanical research, and made several excursions to Auvergne, and into Germany, in the last of which he was accompanied by the son of Buffon. On his return to Paris he undertook the botanical department of the encyclopædia which Panckoucke was publishing, and applied himself to this task with such assiduity that, in 1783, he produced the first half of the first volume, with an introduction, containing a sketch of the history of the science. He published the second volume in 1788. But a dispute between him and the publisher brought the undertaking to a stand, and ended Lamarck's botanical career. At the breaking out of the Revolution he was the second professor in the royal Jardin des Plantes, but in consequence of new arrangements he received a chair in the department of zoology, in which he was soon as much distinguished as he had been in botany. In his writings he shows himself a real forerunner of Darwin. Lamarck's comprehensive mind was also directed toward physics, and he published in 1794 'Recherches sur les Causes des Principaux Faits Physiques,' in which he exposes many false theories. With the same view he also wrote his 'Refutation de la Théorie Pneumatique,' etc., which appeared in Paris in 1796.

The most permanently important work of Lamarck is his 'Philosophie Zoologique,' although at the time it was published, it excited little attention. He was doubtless familiar with Erasmus Darwin's 'Love of the Plants,' which in spite of its many absurdities contained some premonitions of the great discoveries to be made by the author's greater grandson. The essence of Lamarck's theory may be stated in the following propositions: (1) Every considerable and sustained change in the conditions of life produces a real change in the needs of the animals involved; (2) change of needs involves new habits; (3) altered function evokes change of structure, for parts formerly less used become with increased exercise more highly developed, other organs in default of use deteriorate and finally disappear, while new parts gradually arise in the organism by its own efforts from within (*efforts de son sentiment intérieur*); (4) gains or losses due to use or disuse are transmitted from parents to offspring. The main point is of course contained in the last proposition, which is controverted by Darwin and Weismann, and their adherents in England and Germany. There is, however, a Lamarckian school of considerable influence in Paris, and the Neo-Lamarckians of the United States, including Cope, Hyatt and Packard, have much to support their "laws of growth" as involving the inherited effects of use, disuse and new environments. See DARWIN; EVOLUTION; HEREDITY.

Consult: Butler, 'Evolution, New and Old' (1879); Claus, 'Lamarck als Begründer der Descendenztheorie' (1888); Haeckel, 'Die Naturanschauung von Darwin, Goethe und Lamarck' (1882).

Lamarckism, lā-mär'kizm. The theory of organic evolution which, in brief, accounts for the origin of life-forms by change of environ-

ment, the exercise or use, and the disuse of organs, and the transmission of characteristics acquired during the life-time of the individual. It differs from Darwinism in lacking the principle of natural selection.

History of the Rise of the Theory.—Lamarck in 1801, after 25 years' experience as a botanist, and when as a systematic zoologist he had devoted 10 years of labor in classifying the invertebrate animals of the Paris Museum, then the most extensive zoological collection in the world, published a lecture, delivered in 1800, in which he claimed that time without limit and favorable conditions of life are the two principal means or factors in the production of plants and animals. Under the head of favorable conditions he enumerates variations in climate, temperature, change of habits, variation in means of living, of preservation of life, of means of defense, and varying modes of reproduction. As the result of the action of these different agencies or factors, the faculties of animals, developed and strengthened by use, become diversified by the new habits, so that by slow degrees the new structures and organs thus arising become preserved and transmitted by heredity. Although Lamarck did not discover the principle of natural selection, he recognized the fact of competition, of a struggle for existence, but did not dwell on them to the extent that Darwin and later observers did. In 1802, 1803, and 1806 he reiterated and somewhat extended these views, which were published in final form in 1809, in his 'Philosophie Zoologique,' and again in 1815, in the introduction to his 'Animaux sans Vertèbres.' By this time Lamarck had become the greatest zoologist of the period between Linné and Cuvier. He was expert in detecting the limits between species, and has given us the best definition extant of a species.

Lamarck's Factors of Organic Evolution.—These in their essential form are contained in his famous two laws:

First Law.—In every animal which has not exceeded the term of its development, the more frequent and sustained use of any organ gradually strengthens this organ, develops and enlarges it, and gives it a strength proportioned to the length of time of such use; while the constant lack of use of such an organ imperceptibly weakens it, causes it to become reduced, progressively diminishes its faculties, and ends in its disappearance.

Second Law.—Everything which nature has caused individuals to acquire or lose by the influence of the circumstances to which their race may be for a long time exposed, and consequently by the influence of the predominant use of such an organ, or by that of the constant lack of use of such part, it preserves by heredity (*génération*) and passes on to the new individuals which descend from it, provided that the changes thus acquired are common to both sexes, or to those which have given origin to these new individuals.

Lamarck also insisted that animals are modified in accordance with the diversity of their surroundings; that local causes, such as differences in soil, climate, etc., give rise to variations and that the whole surface of the earth affords a diversity in localities and habits, one region differing from another, that though the en-

LAMARTINE

vironment remains the same for a long time and species remain constant for that period, yet there is a slow, gradual change, and species are modified in adaptation to such changes. Moreover such changes induce alterations in the wants or needs of animals; this necessitates other movements or actions to satisfy the new needs, and hence they give origin to new habits, and this leads to the use or exercise of some organ or organs in a new direction, with the result that different parts or organs are modified in adaptation to the new surroundings and necessities of existence. All this is perfectly true. We now know that by geographical changes or from lack of food animals are compelled to migrate into new regions, and are there obliged to adopt new habits and become transformed into new species or types. Thus whales have descended from terrestrial forms; the baleen whale has in its embryo stage rudimentary teeth showing that it is a descendant of toothed whales. Lamarck refers to Geoffroy's discovery in embryo birds of the groove where teeth should be situated, and subsequently fossil birds with teeth were unearthed. The mole with its functionless eyes, due to underground life, the blind *Proteus* of Austrian caves, the headless and eyeless bivalve mollusks, these parts lost by disuse; the evolution by atrophy of the limbs of the snake, due to their lack of use in passing through narrow places; wingless insects whose wings have been lost by disuse; the webs between the toes of ducks, geese, as well as those in the feet of the frogs, sea turtles, otter and beaver, are mentioned by Lamarck as examples of the effects of use and exercise. Other examples of use results are the origin of horns in ruminants; the long neck of the giraffe, which by the absence of herbage was obliged to browse on the foliage of trees "and to make continual efforts to reach it," the shapes of the carnivores, of the kangaroo and of the sloth, which are accounted for by the necessity of their adopting new habits, and, by exercise in new directions, becoming adapted to the new conditions of life. Although Lamarck gave few illustrations, it may be doubted whether any one has since his day more satisfactorily explained the origin of such forms or modifications. Lamarck also accounts for the origin of man, suggesting in a tentative way his rise from an arboreal or ape-like creature, with a detailed hypothesis of the gradual process of his transformation, into a being with an upright posture, an enlarged brain, powers of reason, and other human qualities. But besides these special cases Lamarck was broad and comprehensive in his views of nature and creation. He was the first to show that the animal series was not a continuous chain of being, but rather should be compared to a tree, with its branches. In fact he was the first to construct a genealogical tree, the first attempt at a phylogeny of the animal world. He demanded unlimited time for the process of evolution. He anticipated the uniformitarian views of Lyell. He pointed out that where, as in Egypt, the climatic conditions have remained the same for many centuries, species have remained constant, but that under a varying environment they become modified. He writes of the struggle for existence, shows that the stronger devour the weaker; he refers to the principle of competition in the case of

the sloth. He repeatedly insists on the fact that vestigial structures are the remains of organs which were actively used by the ancestors of existing forms. He shows, what is much insisted on at the present day, that change of functions in organs leads to their transformation or recreation, and that the assumption of new habits precede the origin of new, or the modification of organs already formed. A great deal is now said of the effects of migration and consequent geographical isolation in the origination of new species; Lamarck invoked this factor in the case of man, and he also pointed out the swamping effects of intercrossing. Lamarck's theory of use-inheritance is denied by some, but by others is regarded as an important factor in evolution. He does not, however, refer to the inheritance of mutilations, etc.

All these views lie at the foundation of the theory of organic evolution; yet Lamarck's opinions were set aside, misunderstood, and ridiculed. Some crude and ungrounded hypotheses were mingled with them. In his time the sciences of palaeontology, embryology, and bionomics were undeveloped. Lamarck collected but few facts, and he lacked the experimental skill of Darwin; so that it was reserved for the latter naturalist, half a century later, to convert the world to a belief in evolution. At present, however, it is acknowledged that Lamarckism affords the fundamental principles on which rests the theory of organic evolution, and many of the most eminent naturalists have worked and are working along Lamarckian lines.

Consult: Packard, 'Lamarck, the Founder of Evolution: His Life and Work, with Translations of his Writings on Organic Evolution' (New York, 1901); H. Spencer, 'Factors of Organic Evolution' (New York, 1895); Cope, 'The Primary Factors of Organic Evolution' (Chicago, 1896).

ALPHEUS S. PACKARD,
Professor of Zoology, Brown University.

Lamartine, Alphonse de, French poet and statesman: b. near Macon, Burgundy, 21 Oct. 1790; d. Paris March 1869. After being educated at the Jesuit College, at Belley, he spent some years without any definite occupation, devoting himself chiefly to poetry. By his first production, 'Méditations poétiques' (1820), he at once obtained a high place among the poets of the day. The 'Nouvelles Méditations poétiques' (1823) and the 'Harmonies poétiques et religieuses' (1828) established his poetic fame, and obtained for him admission into the French Academy (1830). In 1837 he was elected a member of the Chamber of Deputies. He still continued to write poetry, but his 'Jocelyn' (1835), 'La Chute d'un Ange' (1838), and 'Recueilllements Poétiques' (1839), exhibited a marked falling off from his earlier performances. In the Chamber, where he represented Bergues, Le Nord, till 1848, his fame as a political orator steadily increased. Holding liberal-conservative views, he was for a time the head of a small independent party calling itself "Le parti social," which aimed at the elevation of the people by a system of legislation based on philanthropic and religious principles. In the beginning of his political career he usually voted with the government, but at last was driven over to the opposition by the reckless obstinacy with which the government opposed all reforms. In 1847 he published his 'Histoire des

LAMB — LAMBERT

Girondins.' After the February revolution of 1848 he became minister of foreign affairs in the provisional government. He was elected by ten departments a member of the constituent assembly, by which he was chosen a member of the executive committee. His alleged collusion with Ledru-Rollin gave the first blow to his favor with the people, which the disturbances of June converted into hatred. The tracts which he published in defense of his conduct were of no avail, and on the occasion of the elections to the Legislative Assembly in 1849 he was rejected. The place which he obtained in the last republican assembly was due to an after-election at Orleans. In consequence of the *coup d'état* of 2 Dec. 1851 he withdrew from public life. He further wrote some hasty works of small worth, including: '*Histoire de la Restauration*' (1851-3); '*Histoire de la Turquie*' (1854); '*Histoire de la Russie*' (1855); '*Le Conseiller du Peuple*' (1849-50); etc. His '*Mémoires*' appeared in 1871. His biography has been written by Pelletan (1869); Janin (1869); Maynet Domville (1888); and E. Deschanel (1893).

Lamb, Charles, *«ELIA.»* English essayist: b. London 10 Feb. 1775; d. Edmonton 27 Dec. 1834. Having entered Christ's hospital at seven, he remained in it till his 15th year, and had among his schoolfellow Coleridge, with whom he formed a lifelong intimacy. On leaving this school he was employed for a short time in the South Sea House, from which he removed in 1792 to an appointment in the accountant's office of the East India Company. Here he remained till 1825, when he retired on a pension of £441, living first at Enfield, and subsequently at Edmonton. The whole course of his domestic life was devoted to the safe-keeping and care of his sister Mary (b. London 1765), who in a fit of acute mania had stabbed her mother to the heart in 1796. She was subject to such fits all her life, but she survived her brother and died in 1847. In 1796 and 1797 some short poems by him appeared with others by Coleridge, and in 1798 he published a volume of poems with his friend Charles Lloyd, which met with little success. He was not more fortunate with a tragedy entitled '*John Woodvil*', written in imitation of the early English dramatists; and a farce entitled '*Mr. H.*', performed at Drury Lane in 1805, also proved a failure. On the other hand, his tale of '*Rosamund Gray*' (1798) was well received. In 1807 he wrote, in conjunction with his sister, a series of '*Tales from Shakespeare*', '*Mrs. Leicester's School*', and the '*Adventures of Ulysses*'. All these proved very popular books for children. In 1808 he published '*Specimens of English Dramatic Poets Contemporary with Shakespeare*', with notes in which he draws attention to the simplicity and purity of the diction of the dramatists of that period. Almost all his other productions were contributions to different periodicals of his day. By far the best known, a series of essays, appeared first in the '*London Magazine*', under the name of '*Elia*'. They have been frequently republished in a collected form since 1823, with '*Last Essays of Elia*', first issued in 1833. Here, in a style ever happy and original, and with humor of the rarest and most pungent description, he has carried the short essay to a point of excellence perhaps never before attained. With some failings

Lamb was a man of fine character, and was beloved by a wide circle of friends. Consult Talfourd, '*Life and Letters of Charles Lamb*' (1837); Talfourd, '*Final Memorials*' (1848); Ainger, '*Charles Lamb*' (1882).

Lamb, Isaac Wixom, American inventor and Baptist clergyman: b. Hartland, Mich., 8 Jan. 1840. He is known principally by his invention of the Lamb knitting machine (1863-5), which can produce more than 30 kinds of knit goods, and make about 4,000 loops in a minute at ordinary speed. He entered the Baptist ministry in 1869 and continued in the active discharge of pastoral duties till 1899.

Lamb, John, American soldier: b. New York 1 Jan. 1735; d. there 31 May 1800. He at first worked in New York with the elder Lamb in the trade of optician and mathematical instrument maker, but in 1760 entered the liquor trade. He was one of the 'Sons of Liberty' (q.v.) and active in all the early Revolutionary scenes in New York. Commissioned captain of artillery in 1775, he took part in Montgomery's expedition against Quebec, where he was wounded and made prisoner. Later, he rose to be colonel, and at the time of Benedict Arnold's treason, commanded at West Point. After the Revolution he was elected to the State legislature of New York, and for some years previous to his death held the post of customs collector of New York port. Consult the biography by Leake (1857).

Lamb, Martha Joan Reade Nash, American historian: b. Plainfield, Mass., 13 Aug. 1829; d. New York 2 Jan. 1893. She was married to Charles A. Lamb in 1852 and removed with him to Chicago, Ill., where in 1863 she was secretary to the United States Sanitary Commission Fair. She made her home in New York from 1866, and was editor of the '*Magazine of American History*' from 1883 till her death. Her publications include a scholarly '*History of the City of New York*' (1877-81); '*The Homes of America*' (1879); '*Wall Street in History*' (1883); '*The Christmas Owl*' (1881); '*Snow and Sunshine*' (1882).

Lamb, Mary Ann. See LAMB, CHARLES.

Lambayeque, läm-bä-yä'kä, Peru, capital of the department of the same name, which was created in 1874. It is situated on the Lambayeque River, about 6 miles from the Pacific Ocean, the outlets for its trade being the ports of Eten and Pimentel, with which it has railway connection. Cotton and woolen fabrics are manufactured on a small scale. Its inhabitants, mainly of mixed blood, number about 9,000. The department of Lambayeque, lying between the Pacific and the departments of Piura, Cajamarca, and Libertad, has an area of only 4,614 square miles, but contains some fertile lands which produce good crops of cotton, rice, and sugarcane. The total population of the department was estimated to be 124,091 in 1896, but is probably much less.

Lambert, Alexander, American pianist: b. Warsaw, Poland, 1 Nov. 1862. He studied in early life with his father, and on the advice of Rubinstein was sent to the conservatory at Vienna, where he graduated in 1880. In 1881 he gave a series of concerts in New York, which he repeated the next season through Germany and Russia. After studying for a while under

LAMBERT — LAMBETH CONFERENCE

Liszt he returned (1884) to the United States and in 1888 became director of the New York College of Music, a position which he still holds. He is author of many compositions, but is best known as a teacher. He has written 'Systematic Course of Studies' (1892).

Lam'bert, Daniel, English citizen famed for his unusual corpulence: b. Leicester 13 March 1770; d. 21 June 1809. Up to his 19th year he gave no indications of the remarkable stoutness which he afterward attained, being an enthusiastic lover of field sports and athletic exercises. Having succeeded his father as keeper of the Leicester prison, he exchanged an active for a sedentary life, and from this time rapidly increased in size till he became an object of public curiosity, and attracted visitors from all parts of the country. He now resolved to turn his obesity to account, and in 1806 commenced an exhibition of himself in Piccadilly, London. He afterward exhibited himself in the principal towns of England. At the period of his death he was 5 feet 11 inches in height, weighed 739 pounds, and measured 9 feet 4 inches round the body, and 3 feet 1 inch round the leg. In diet he was remarkably abstemious, drank water only, and never slept more than eight hours.

Lambert, Johann Heinrich, yō'hān hin'rīch lām'bért, German mathematician and philosopher: b. Mühlhausen 29 Aug. 1728; d. Berlin 25 Sept. 1777. His father was a tailor in humble circumstances, and he was obliged to follow his father's employment. In this situation he spent the greatest part of the night in study, and soon acquired a knowledge of mathematics, philosophy, and the Oriental languages. He afterward became tutor to the sons of Solis, president of the Swiss Confederation. In 1756 he accompanied his pupils to Göttingen, in the following year to Utrecht, and in 1758 to Paris, Marseilles, and Turin. In 1759 he was released from his duties, and in 1764 Frederick the Great appointed him to the head of the Architectural Council, and made him a member of the Academy of Sciences. He enriched the transactions of various societies with his papers and treatises, all of which bear the stamp of eminent and original genius. Most of his mathematical pieces were collected in three volumes by himself. Philosophy, and especially analytic logic, are greatly indebted to him for his 'Novum Organon, or Thoughts on the Examination and Relations of Truth' (1764); and his 'Architektonik, or Theory of the First Simple Principles in Philosophical and Mathematical Knowledge' (1771).

Lam'bert, John, English soldier: b. Kirkby Malhamdale, Yorkshire, 7 Sept. 1619; d. island of Guernsey 1686. He entered the army and had attained the rank of colonel in 1644, when he fought against the king at the battle of Marston Moor. He accompanied Cromwell into Scotland in 1650, where he distinguished himself by great gallantry, and took the lead in the council of officers who gave the protectorate to Cromwell. He subsequently opposed the Protector and was deprived by Cromwell of all his commissions, though a pension of £2,000 was allowed him for past services. When Richard attempted to assume the protectorate Lambert came forward, and became the head of the Fifth Monarchy Men, or extreme repub-

licans. In 1660 he set out for the north to encounter Monk, but was deserted by his troops, seized, and committed to the Tower whence he soon escaped. At the Restoration he was excepted from the act of indemnity, brought to trial, and condemned, but his sentence was commuted to banishment to Guernsey.

Lambert, Louis A., American Roman Catholic clergyman: b. Charleroi, Pa., 13 April 1835. He was educated at St. Vincent's College, Pa., and the archdiocesan seminary, St. Louis, and was ordained to the priesthood in 1859. He was chaplain in an Illinois regiment during the Civil War, was pastor at Cairo, Ill., 1863-9, and subsequently at Seneca Falls and Waterloo, N. Y.; founded the 'Catholic Times' in 1874, and was its editor till 1880, and has been editor-in-chief of the New York 'Freeman's Journal' since 1894. He has published 'Thesaurus Biblicus'; 'Notes on Ingersoll'; 'The Christian Father'; etc.

Lamberton, John Porter, American editor and author: b. Philadelphia 22 Oct. 1839. He was graduated from the University of Virginia in 1858, and after teaching, 1859-80, became an assistant in the library of the University of Pennsylvania. He was associate editor of the American Supplement to the Encyclopædia Britannica, 1881-90, reviser to Webster's Dictionary, 1891-5, and has edited 'Historic Characters and Famous Events' (12 vols. 1894-6); 'Literature of All Ages' (10 vols. 1897-9); 'Literature of the 19th Century' (1900).

Lam'bertville, N. J., city in Hunterdon County, on the Delaware River, the Delaware & Raritan canal and the Pennsylvania railroad; 16 miles northwest of Trenton. Water power is here furnished for extensive paper mills, rubber works, spoke factories, stone-quarries, flour mills and foundry and machine shops. The city was first incorporated in 1849, and under a charter of 1874 is governed by a mayor and council elected every two years. Pop. (1890), 4,000; (1900) 4,640.

Lamberville, Jean de, zhōn dē lāñ-bär-vēl, French missionary. In 1671, as a member of the Jesuit order and under their direction, he settled in the Iroquois village of Onondaga. He had previously spent three years in Canada, and he now became active in cementing the alliance between the Indians and the French. Meanwhile Governor Dongan of New York was straining every nerve to win over the Iroquois League to the English, but without success. Lamberville was obliged to abandon his post by the risk he ran, when the Iroquois delegates were treacherously seized at a point in Ontario to which they had repaired on receiving pledges of a peaceable conference (1687). He died in France.

Lam'beth, a parliamentary and municipal borough in London, on the south of the Thames, opposite Westminster. See LONDON.

Lambeth Articles, in English ecclesiastics, a name given certain doctrines of predestination, justification and free-will, drawn up at Lambeth Palace in 1595 by William Whitaker and other Calvinists. They were approved by Archbishop Whitgift but disapproved by Queen Elizabeth.

Lambeth Conference, an assemblage of Anglican bishops at Lambeth Palace, in England in 1867, at which 67 bishops were present.

LAMBKILL — LAMP

The second conference held in 1878 was attended by 100 bishops. In 1888 there were 145 present, and in 1897 over 190. The conference does not legislate or formulate church doctrines, but finds profit in discussing serious ecclesiastical problems. The conference will continue every 10 years. Consult 'The Lambeth Conferences of 1867, 1878, and 1888' (1889).

Lamb'kill, or Calf-kill. See SHEEP-LAUREL.

Lamb's Lettuce. See CORN-SALAD.

Lamb's-quarters, a roadside "pig-weed" (*Chenopodium album*). See GOOSEFOOT.

Lamech, name of two scriptural personages mentioned in the book of Genesis. (1) Descendant of Cain, and the first polygamist on record. (2) Son of Methusaleh, and father of Noah, lived 777 years, and died five years before the Flood.

Lamennais, Hugues Félicité Robert de, ug fā-lē-sē-tā rō-bār dē la-mē-nā, French religious and political writer: b. Saint Malo 19 June 1782; d. Paris 27 Feb. 1854. He was ordained priest in 1817. The same year appeared the first volume of his 'Essay upon Indifference in the Matter of Religion' (1807-20), a work of profound learning and of strict orthodoxy. He became the critic of Church policy, and his journal, 'L'Avenir' (The Future) was condemned by the pope. He bowed to Rome's decree; but after a year published his 'Words of a Believer' (1834), in which he repudiates all authority of popes and bishops. The little volume is written in archaic style, imitating the language of the Hebrew sacred books; and had an enormous circulation among the masses of the people in every country of Europe. It was followed by 'The Book of the People' (1837), and 'The Past and the Future of the People' (1842), in the same tone. He wrote also: 'Sketch of a Philosophy' (3 vols., 1841).

La Mesa, lá mā'sa, Colombia, a picturesque city, located on a high plain about 25 miles from Bogotá. Owing to its elevation above sea-level (4,225 feet), its climate is genial — neither so cool as that of the national capital, nor oppressively hot, as in the lowlands. The surrounding country is a fertile agricultural region. An active trade is carried on with other towns in the same department (Cundinamarca), and those in the department of Tolima. Pop. 14,000.

Lam'mas Day, in the calendar, the 1st day of August, so called perhaps from the custom which formerly prevailed among the tenants who held lands of the cathedral church in York, England, of bringing a live lamb into the church at high mass on that day.

Lammergeier, lám-ér-gi-ér, the largest of European eagles (*Gypaetus barbatus*), often called griffon-vulture because it frequently feeds on carrion, especially bones abandoned by other animals, which it has power to break, or carries to a great height in the air and then lets fall; it does the same with tortoises, which form an important part of its fare in some countries. The lammergeier is a bird of the mountains and deserts of southern Europe (where it has now been nearly exterminated), northern Africa and southern Asia; it builds a great rude nest on some mountain ledge and lays a single brown-blotted egg.

Lamon, Ward Hill, American biographer. d. Martinsburg, W. Va., 7 May 1893. He was

the law partner of Abraham Lincoln at Springfield, Ill., and after the latter's election as President became his private secretary and was appointed by him marshal of the District of Columbia. He published: 'Life of Abraham Lincoln, from His Birth to His Inauguration as President' (1872); 'Recollections of Abraham Lincoln.'

Lamon, lä-mōn', Bay of, a landlocked bay on the eastern (Pacific) coast of Luzon, Philippines, dividing the southeastern peninsula from the main part of the island. The island of Alabat and smaller islands make an inner bay on the south. The bay is bounded by the provinces of Infanta, Laguna, and Tayabas, on the south and west, and by the provinces of Tayabas and Ambos Camarines (Norte) on the south and east. On the northwest coast of the bay is the port of Lampón, Infanta, which was important in the latter part of the 16th century and the 17th century as the harbor of the Spanish galleons between Manila and New Spain, it being thought a safer way of communication than the straits of San Bernardino.

Lamont, Daniel Scott, American cabinet officer and railway official: b. Cortlandville, N.Y., 9 Feb. 1851. He was educated at Union College, entered journalism at Albany, became a political correspondent, in 1883-9 was private secretary to Grover Cleveland, was later in business, and in 1894-7 was secretary of war in Cleveland's second administration. In 1897 he was elected vice-president of the Northern Pacific railway company.

Lamp, any contrivance which through the formation of its parts affords a means of producing light, and sometimes heat, by the combustion of oils, fats or inflammable fluids, with the aid of a wick, which, by capillary attraction, conveys the substance burned to the flame point. By modern adaptation of the word many appliances for producing light by gas or electricity are designated as lamps. Man ignorant of fire is unknown, therefore, the use of the burning brand as a torch may be regarded as coeval with the race, and the torch as the progenitor of the succeeding lamp. Considered archaically the primitive lamp was a very simple device. An unworked stone, having a natural concavity, a sea shell, or the skull of an animal, constituted the earliest forms. A bit of moss, or a twist of vegetable fibre served as a wick. Fat, grease, or fish oil furnished the illuminant. The introduction of the lamp marked the first stage of man's advancement towards civilization, and may, therefore, be appropriately considered as a figure or symbol on the dial of time pointing to the dawn of his intellectual awakening. When, or where, or by what people the first lamps were made cannot now be determined. Recent archaeological discoveries in the ruins of the long buried cities of the Mesopotamian plain, Assyria, have revealed many terra-cotta lamps of a variety of forms, and of good workmanship, that were in common use 7,000 or 8,000 years B.C. It would be an unwarranted assumption to assert that these well developed creations denote the beginning of the lamp. Stone lamps have been found that are undoubtedly of great antiquity, but this fact alone does not necessarily class them as palæolithic, they are simply prehistoric, and of an age that cannot be definitely determined. The so-called Stone Age

LAMP

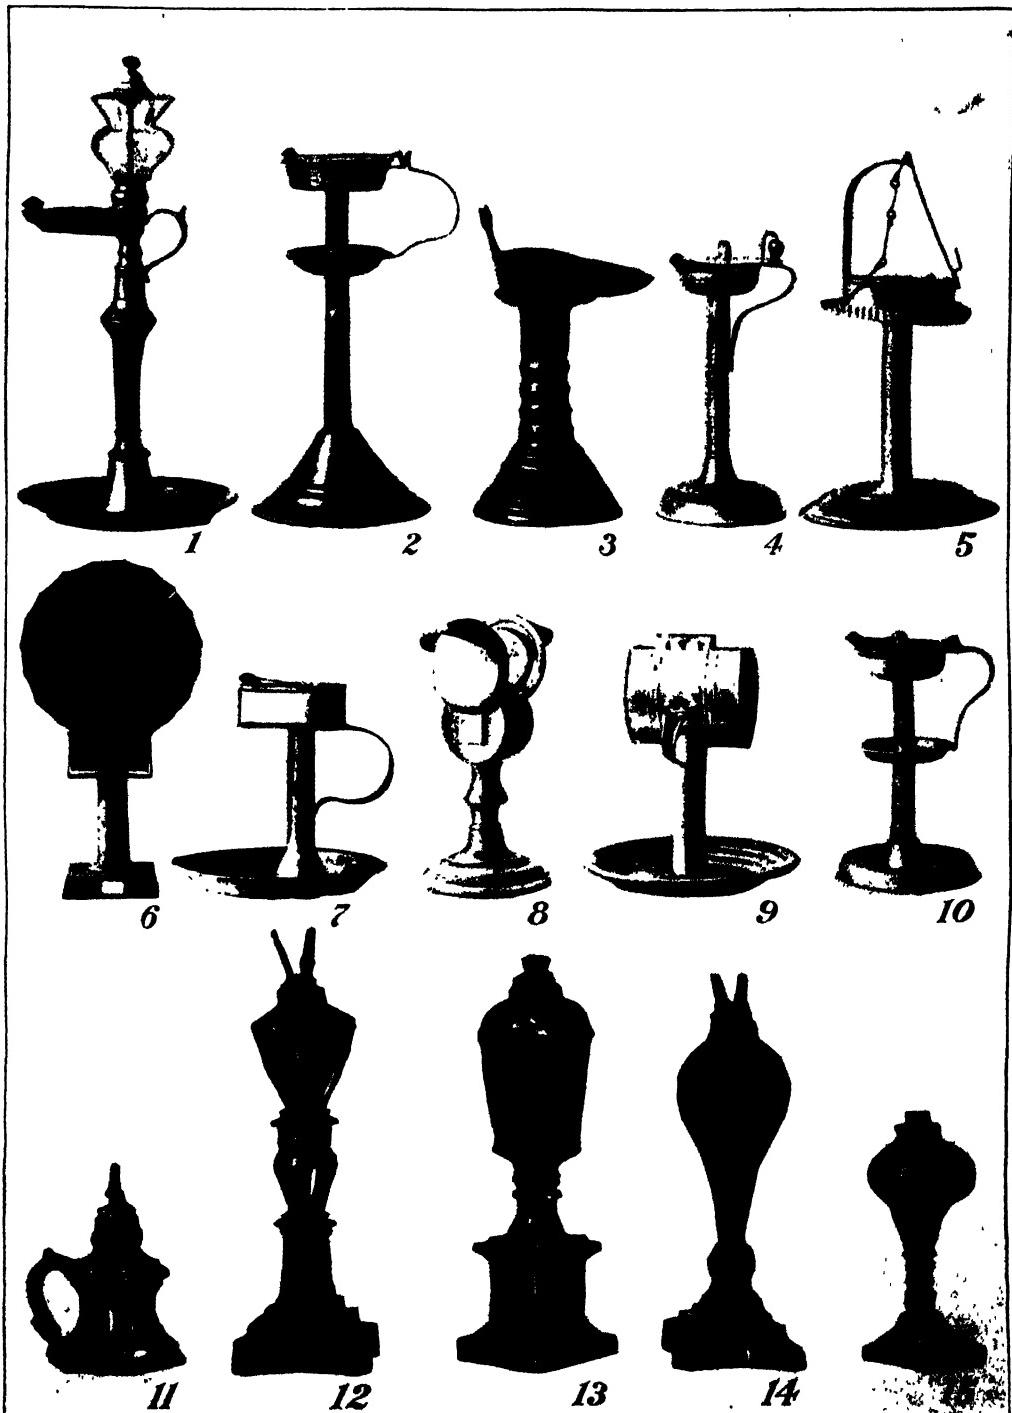

determines so little that is of real chronological value that classifications in archaeology cannot always be wisely made upon data thus furnished. French archaeologists have within a few years recovered from the lakes of Switzerland bronze lamps that were in use by the lake-dwellers at a period late in the Lacustrian Age. These are without doubt the most ancient metal lamps yet discovered.

Early Examples.—Whether the first emigrants from Asia into ancient Greece found the Pelasgic races using lamps, or whether the invaders brought the art of lamp making with them, neither legend nor tradition has left even a mythical answer. In our researches in lamp archaeology we can at the best but work our way backwards, from the known to the unknown, from the ascertained facts to that dim, mysterious darkness of remote antiquity where all traces of chronology are lost, and where our conclusions must be largely sustained by deductions drawn from analogical reasoning. The poems ascribed to Homer, 950 B.C., contain all that we know of the manners and customs of early Greek society. He speaks of the "Festival of Lamps," and makes frequent mention of the torch. The Greek and Roman torch was often simply a terra-cotta, or bronze, lamp-shaped device secured to a staff. The so-called "grease-pot-lamp" of Egypt is without doubt more ancient than the oldest lamp of Greece, and the terra-cotta lamps of Babylonia are also thousands of years older. Egypt as a nation was on the decline when the history of Greece began. Assyrian records found on clay tablets proclaim a nation with a remoteness of antiquity as yet undetermined. Among the many ancient relics discovered in the ruins of the Babylonian cities have been terra-cotta lamps that closely resembled those of early Greece. This similarity of configuration between the earliest examples discovered and those of Greek make of a period that was perhaps mid-way between the first Olympiad, 776 B.C., and the beginning of the Christian era is remarkable. Only the simplest essentials are represented. A shallow, saucer-shaped oil or fat reservoir being the most primitive of terra-cotta lamps. Then comes the oval in shape, with a slight prolongation of the rim into a short, narrow rostrum, or wick support, and the formation of a rudimentary handle. Then the oval-shape with the reservoir enclosed, and one or two wick supports. These constitute the types that were essentially common to all Eastern lands. The later Greek and Roman lamps, both terra-cotta and bronze, are remarkably rich in ornamentation, and artistically graceful in form. These constitute a division that separates the crude primitive from the finished product. The earliest terra-cotta lamps were made in one piece, and baked without glazing. Later Greek and Roman terra-cotta lamps were made in two principal parts, the "crater," or oil reservoir, and the "discus" or covering for the reservoir. Each of these parts were joined together after being molded, and then baked. The ornamentalings were generally confined to the "discus," and were called the "limbus." The "nasus," or wick support, as well as the "ansa," or handle, were most frequently made separately and carefully attached to the body of the lamp before baking. The "discus" had a small circular opening near the centre through which the lamp could be filled. Many of the

better lamps had the maker's name, and often his private mark, stamped on the bottom. Large terra-cotta lamps were frequently made with two, three, and sometimes six or even 12 "nasi." The lamp with "nasus" for one wick was called a "monomyxos," and that for two wicks a "dimyxos," and so on. The Greek and Roman bronze lamps were made in an almost endless variety of forms, and were often beautiful and artistic to a marked degree. Plain iron lamps were used by the common people at a later period. They were either cast or forged in a single piece, and were mostly ectypes of the more artistic and costly terra-cotta and bronze lamps, but were without decorations. The study of the ancient lamp maker was devoted alone to the external form of his wares. Grace, beauty and elegance, as expressed in outlines and decorations, were his chief concern. No attempt was made to improve the light. The pale, smoky, flickering flame continued to shed its uncertain light from the massive and costly silver candelabrum of the wealthy just as it had for untold ages from the simple stone and terra-cotta lamps of their ancestors. Etruscan terra-cotta and bronze lamps so closely resembled those of early Greek make that a separate description is not required in this article. The chief characteristic, however, that distinguished the true Etruscan pottery from that of Greece is the strong coloring that was applied to the former. What was true of the art of lamp making in Greece was also true of the rest of the civilized world, for it was more than 17 centuries after the Christian era before any real improvement was introduced in lamp construction.

The Inventive Age.—Prior to 1783 many lamps and illuminating appliances had been introduced, but there was little if any improvement in the light afforded, or marked advancement in the construction or mechanical arrangement of the parts designed to increase the brilliancy of the flame. The first real improvement was the introduction of the flat, woven, ribbon-like wick, and the securing the wick in a close-fitting support. This arrangement permitted only a small surface of the wick to be exposed to the flame, and the wick being narrow the flame came in contact with the centre as readily as the outward parts and thus most of the free carbon was consumed, consequently there was less smoke than in the old style of loose wick. M. Legers of Paris introduced this improvement in 1783. To this was attached for the first time a spur-wheel, which by rotating adjusted the wick, thus regulating the flame. The same year M. Argand, the Swiss chemist, introduced his improvement in burners, which consisted of a tubular wick attached to a tube which extended through the oil reservoir and opened into the base of the lamp, thus affording a means of centre draught, which supplied an abundance of oxygen to the flame and created sufficient heat to consume all of the carbon and so prevented the escaping of smoke. This was truly the beginning of a new era in lamp making, for the art now entered upon what may be designated as "the inventive age of the lamp." Science and invention now came to the aid of the artisan. Principles involving an understanding of the laws of combustion and the science of light were applied to the construction of illuminating devices. The result was more

LAMPS.

1-10. LAMP

light and better light. Argand's epoch making invention related wholly to his improved burner. His first lamps were simply huge oil reservoirs with his new burner attached to the top. He used sheet iron chimneys formed with a hood opening over the flame. The use of glass chimneys with the Argand burner came about purely by accident. A workman in attempting to heat a bottle over the flame cracked off the bottom, and because the glass had become too hot for him to hold he momentarily placed it over the burner. The result was surprising, the brilliancy of the flame was not only increased but the light became steady and in every way superior to that produced with a sheet iron chimney. The brilliancy of the light on the top of the huge reservoir made a wide shadow. To overcome this was a problem that was finally solved by a German lamp maker, who produced a model in which the burner was secured to the end of a long neck or rostrum, very much like the present so-called German student lamp. The removing of the light away from the great reservoir not only reduced the shadow but afforded a more ready means of supplying the oil to the wick uniformly. In 1800 Carcel introduced his ingenious lamp which was provided with a clock-work device, which operated a small pump, raising the oil from the base of the lamp to the wick-holder, thus keeping the wick uniformly submerged in the oil. This contrivance was too costly to come into general use, and was confined mostly to lamps used in halls and large rooms. Many lamps were offered by makers that were designed to burn crude, heavy whale oil, and others in which lard oil was consumed. Lard oil lamps were inconvenient in cold weather, for the oil would become solid. To overcome this several devices were invented. Perhaps the most successful was the lamp with a copper tube, the upper end of which was between two wick tubes, while the lower end passed through the oil to the bottom of the lamp. Copper being a good conductor of heat, the oil was thus kept in a liquid state while the lamp was burning. For many years lard oil was the only illuminant used in the great lamps of the lighthouses of the world. It was not until after 1880 that burners for lighthouse lamps had been constructed that would satisfactorily consume kerosene oil. Up to about 1800 but few small, portable lamps had been made. Nearly all the appliances so far introduced for domestic illumination were large, so-called, table lamps, and mural lamps. English manufacturers first made small hand lamps of tin, brass and pewter. These were mostly lard or whale oil burners, with a single wick tube. In the whale oil lamps the wick tube was round, in the lard oil lamps the flat, woven ribbon-wick was used, the wick being moved up and down in the lard oil lamps by a spur-wheel. In the whale oil lamps a small aperture in the upper part of the wick tube was provided, through which "a prick" could be inserted by which the wick was pricked up or down. In the large and important field of research and experiment in domestic illumination, American genius and skill very early took a prominent part.

Lamps in America.—Before proceeding to the introduction of a description of early American inventions relating to lamps and lighting appliances, it will be interesting to briefly notice what may be truly designated as the original

American lamp. There has never been found among the remains of the mysterious mound-builders of the Western Continent any utensil that could be rightly regarded as a lamp. The North American Indians, who were found inhabiting the country on the arrival of the first Europeans, did not possess a lamp. The pine torch was their only means of artificial illuminating. The one lamp that can claim the distinction of being really American is the stone lamp of the Eskimo. This is usually a shallow vessel of stone, most frequently of soap-stone, sometimes bone, clay, wood, and the skull of an animal is used. The oil of the seal, walrus and whale is burned in these rude lamps, dry moss serving as a wick. These lamps also serve as stoves, for they are used for cooking and warming. Without these simple lamps human life could not be maintained in the inhospitable regions these strange people inhabit.

The first lamps used in the Plymouth Colony were of Dutch make, and were called by the English emigrants Betty lamps (German, *Besser-better*). The few lamps that the Pilgrim fathers brought with them in the Mayflower on her memorable voyage were of this class. They are of iron, either forged from a single piece or were cast of gray, coarse iron. The earliest of these were known as the open Betty, or "Slot lamp." Then followed the Betty with a top, one part of which was formed as a hinged lid. The wick support was an angular, half round iron secured to the inside bottom of the lamp. There was an upright handle at the back, to which was attached, by a link, a pointed hook, the point of which extended beyond the crook. This was used to suspend the lamp from the high back of the rush-bottom chair, or the point was thrust into the crevice between the great stones of the side of the open fire-place. The Betty was pear shaped, flat on the top and bottom. This form was sometimes made in brass, but rarely was any attempt made at ornamentation. These lamps were in use in some parts of the New England colonies as late as 1790. Prior to 1680 all lamps used in the American colonies were imported, mostly from England. In 1680 a tinsmith of Newbury, Mass., began the manufacture of tin Betty lamps. These, after Newburyport was separated from Newbury, became known as Newburyport Bettys. Later these lamps were made in Rivermouth (Portsmouth, N. H.) and were called Portsmouth Bettys. In 1720 a few pewter and brass lamps had been made by small manufacturers at Salem, Mass., and Providence, R. I. These were heavy and extremely inconvenient to be carried about. Among the earliest makers of pewter lamps and candlesticks in the New England colonies was Richard Graves, a pewterer who came from England, where he had learned the trade, or, as it was then called, the art. He came first to Boston, but moved to Salem, Mass., where he long worked at his business, and brought out many fine goods in his line. Henry Shrimpton of Boston was also a maker of fine pewter lamps, and his beautiful lamps and candlesticks graced many of the grand old colonial homes. Among the earliest American experimenters in lamp construction, and inventors of improved burners, was that marvelous investigator, philosopher, statesman and inventor, Benjamin Franklin (q.v.). Not content with perfecting an improved stove known as the Franklin heater, he

LAMP

very early turned his attention to the improvement of domestic lamps. When we recall the fact that Franklin's first manual labor was cutting wicks in his father's chandler shop, it is not surprising that we find his versatile mind turning to the subject of improved illuminating appliances. Prior to 1742 candles were in general use in American colonies. The iron Betty lamps were used in a comparatively few families. The shallow, saucer-shaped clay cruise introduced from Scotland was still used for lighting among the poorer classes, but candles were the chief illuminators. Franklin's first invention consisted in devising two round wick tubes so arranged that, according to his directions given to the workmen who constructed the burner, the distance between the tubes should equal the diameter of one of them. His theory was that the proximity of the two flames created an upward draught that so increased the heat that the liberated carbon was consumed, thus adding to the light and preventing smoke. He observed that the introduction of the third burner, while it consumed a third more oil, and added a third more flame, did not give a corresponding increase in light. Franklin also suggested the improved cotton wick, loosely braided, which afforded a better medium for supplying oil to the flame by capillary attraction. Franklin did not secure patents on his inventions, but allowed manufacturers to freely introduce them, which they did on quite an extensive scale, and small portable lamps of tin and brass with Franklin burners soon became very common.

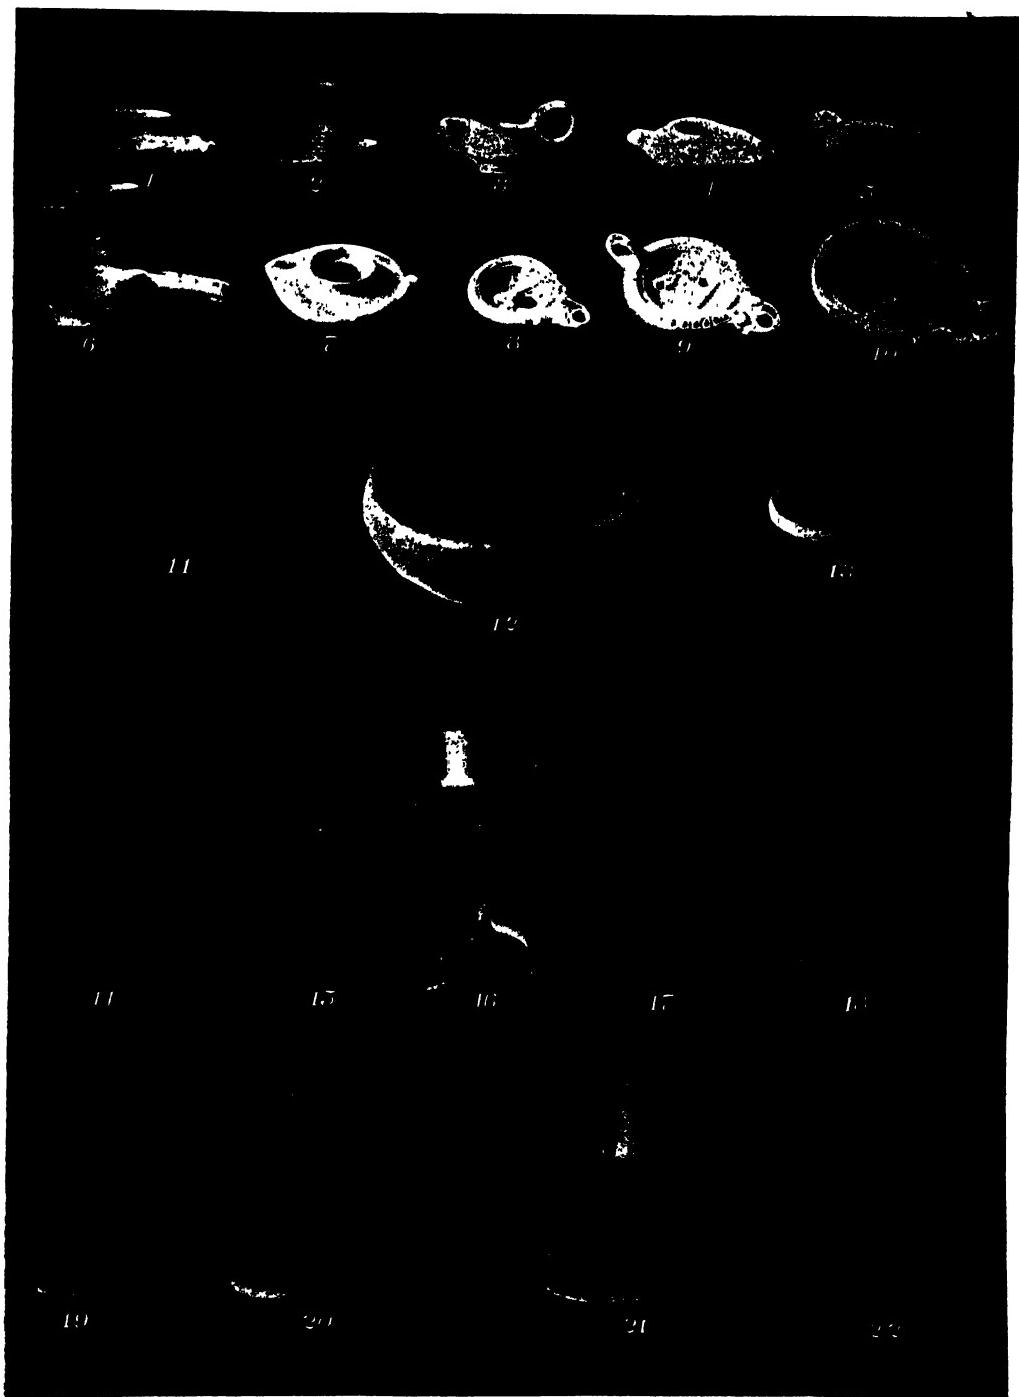

Another American of note, Benjamin Thompson, better known as Count Rumford (q.v.), in 1789 wrote an exhaustive essay on "The Management of Light in Illumination." He constructed over 100 different lamps in his extended experiments. He invented the photometer to measure the relative intensity of light emitted by different illuminants. He found that the purest white light could be obtained by means of lamps properly constructed, using clarified vegetable or animal oil, at less than one eighth of the cost for the same degree of light produced by wax candles, and for about half the cost of tallow candles. He invented but one burner. In this he constructed a centre, flat wick tube, with two similarly shaped tubes placed at acute angles on either side of the wick tube, his design being to supply oxygen through the angular tubes impinging on the wick tube. This burner did not satisfy him, and its introduction did not become general. In his further experiments he confined himself to the Argand burner, and devoted his attention to the better construction of the lamp proper. His aim was to produce a lamp in which the shadow should be eliminated as much as possible. He invented what was known as the "Astral lamp," which consisted of constructing the oil reservoir in the form of a flat, circular tube with radiating arms attached to the pedestal of the lamp, and securing the burner within the circle. He also introduced what he called the "Balloon Illuminator." This was for use in halls, ball-rooms, and salons. He also made what he called a "Dining-room Illuminator," and also a table or reading illuminator. All of Count Rumford's investigations and his extended experiments relating to lights and lamps, were carried on while he was in the public service of the Elector of Bavaria, who created him a count as a reward

for his valuable services, and as a recognition of his great learning, and the importance of his researches and inventions.

Hundreds of patents have been granted to American inventors for lamps and lamp burners. One of the earliest patents on record in the United States Patent Office was for a device in which an adaptation was made of Franklin's two wick tubes by securing them to a perforated disk through which the tubes passed. Beneath the disk was a cork through which the tubes also passed, the cork being cemented to the under side of the disk. This could then be fitted into the top of the lamp the same as a cork fits the neck of a bottle. This was mostly applied to glass lamps, which were first introduced in America in 1810. In 1812 one J. Neal, secured a patent for a lamp provided with a telescopic sliding cylinder, the wick tubes were secured to the top of the cylinder, being screwed into a collar which formed the upper part of the tube. When the lamp was filled with oil, a float on the bottom of the tube extended the cylinder to its full length. The wicks were long, reaching to the bottom of the cylinder. As the oil was consumed the cylinder was correspondingly lowered, thus keeping the wicks uniformly submerged in the oil as long as any remained in the lamp. These lamps were made in tin, brass and pewter, and became quite popular. In 1839 one J. Price of Nashville, Tenn., obtained a patent on an arrangement for burning pine knots. According to the directions the knots were to be cut up into small pieces and inserted into a tube, which had a diameter of about an inch and a half, and a base not unlike an ordinary brass candlestick. A spring inside the upright tube was compressed as the pieces of pine knots were forced in. When the tube had been filled an oval cap or cover with a large opening was placed over the top and secured by a bayonet clutch. The spring forced up the wood to be burned through the opening in the cap, as it was burned away the ash fell into a circular receptacle secured on the upright pedestal. A sheet iron chimney with a broad hood partly surrounding the flame was provided as the specification says, "to convey the ascending smoke away from the face of the person using the lamp." P. S. Moorhouse obtained a patent in 1830 for a lighting device in which balls of cotton or tow saturated with grease or fat were burned while held by an upright supporting claw secured to a pan base, in which the ash was collected. Between 1843 and 1845, S. Rust secured eight patents on lamps, and five on burners. These patents did not introduce any new features, and consisted mostly of the introduction of novelties relating to forms and supposed ornamentation. His inventions in the line of burners did not involve any new features and possessed but little real utility.

The so-called "Solar Lamps," patented in 1843 by the Philadelphia firm of Cornelius & Company, were a great improvement over any table lamp so far introduced. They were constructed to burn lard oil. The burner proper was a modification of Argand's. The wick tube, over which the circular wick closely fitted, extended through the bottom of the oil reservoir, where it was provided with openings for the admission of air. The heat conveyed through the lard oil by the wick tube served to keep the oil in a liquid state in cold weather. The burner was so con-

LAMP

structed that the flame was diffused more generally than in other lamps, while the bulb-shaped glass chimney created a hot-air chamber in which all free carbon was consumed. The light was profuse, white and clear. This firm manufactured a large variety of elegant lamps, which were used extensively in the homes of the wealthy. Benkler's lamp, introduced in 1840, had a tube through which air was admitted to the flame, the angle of the tube being such that an upward movement of air was produced when the oxygen came in contact with the heat, and thus a forced draught was secured which made the light constant, and aided greatly in the consumption of smoke. Through the means thus adopted, cheap heavy oils could be burned without the offensive smell and excessive smoke produced by cheaper lamps when these low grade oils were consumed.

Coal Oil and Kerosene Lamps.—About 1845 was introduced in the United States, a compound that was known as burning fluid, or from its inventor's name, Potter's fluid. This was a highly explosive illuminating fluid, composed of a mixture of about three parts of wood alcohol to one of purified oil of turpentine. This was burned in lamps provided with long slender, tapering brass tubes, secured to a disk that screwed into a collar fitted to the upper part of the lamp. The wick was round, firmly woven cotton, which closely fitted the wick tubes. This was to prevent the escape of the vapor from the fluid. Little thimble-shaped caps, secured by small chains, were provided to cover the end of the wick tubes when the lamp was not in use. This was to prevent the evaporation of the highly volatile burning fluid. Camphene was the trade name of a burning fluid composed of oil of turpentine, purified by being distilled over quick-lime. This fluid was burned in lamps provided with the same class of burners as that described for burning fluid. The highly explosive nature of these dangerous compounds rendered them unpopular for domestic use, and they were soon displaced by the safer and cheaper kerosene oil, which came into general use about 1850. This was first called coal-oil, and in some localities mineral oil, while in others it was known as petroleum oil. Many hundreds of lamps and burners have been invented to use this cheap illuminant. In all successful kerosene burners a glass chimney is necessary. Many attempts have been made to produce a kerosene burner that would afford a clear, brilliant, steady, smokeless flame, without a chimney, but so far no good, practical lamp has been put on the market that successfully accomplishes this much desired result. A lamp was made and introduced in 1869 that burned a vapor of naphtha without a chimney. While the flame from this device was white and brilliant, the light was flickering, and when moved about emitted annoying smoke. The highly explosive nature of the fluid burned made its common use unsafe, so that the vapor lamp never became popular. What is known as the German student lamp, supplied with an improved Argand burner, and the so-called Rochester lamp, employing another modification of the Argand burner, are the best and most successful kerosene lamps so far introduced. There are hundreds, if not thousands, of different kerosene oil burners attached to an almost endless variety of lamps now on the market. These embrace hand lamps, table lamps,

piano lamps, and a variety of library and parlor lamps that are remarkably rich in ornamentation and graceful in form and shape, but in the construction designed to assist the combustion of the oil in producing the illumination the same general principles are involved, and with the exception of the smaller hand lamps the original Argand burner principle is adhered to, with slight modifications and improvements. In the small hand lamps a perforated hood-shaped cap surrounds the wick making a dome-like chamber through which the air drawn from the outside is deflected into the flame, thus supplying the needed oxygen. The flat ribbon wick is used in most of the smaller lamps, the wick being moved up and down by a spur-wheel as before described.

Safety Lamps are lamps so constructed that the danger from the foul explosive air of mines, especially deep coal mines, may be lessened or prevented, by so protecting the flame of the miner's lamp that it will not come in direct contact with the mixed carburetted hydrogen and atmospheric air, which is often present in such quantities as to create an element of great danger. The first safety lamps were called "Steel-Mills," and were devices in which small steel wheels, with roughened edges, were rapidly revolved against a flint, securely held by a powerful spring. The sparks thus produced afforded an intermittent light which was sufficient to illuminate the more dangerous parts of the deep mines. But as this lamp necessitated the employment of a boy to revolve the wheel while the miner was engaged in his work, it proved too expensive for economic use. In 1813, Dr. Canny in England, introduced the first true safety miner's lamp. In his invention he produced a lamp in which the external air was admitted to the burner through a chamber containing water, while the flame was protected by a glass bulb, the product of combustion escaped through perforations in a flat support on which the glass bulb rested. This contrivance was so cumbersome, and so liable to breakage, that it never came into general use. In 1815, George Stephenson and Sir Humphry Davy, contrived a safety lamp that, with slight modifications, has continued in use up to the present time. The air to support combustion was admitted to the flame through small openings in the bottom of the lamp, while the flame was protected by a glass, upright cylinder, the top of which was covered with a wire gauze cap. Several forms introducing slight changes from the original Davy lamp have been made. The lamp in which the flame is protected by a wire gauze cylinder in the place of a glass one was a later invention of Sir Humphry Davy. Mackworth's safety lamp was an improvement over the Canny lamp, and introduced features common to that and the Davy lamp. A water chamber was provided through which the external air passed before reaching the flame. Immediately surrounding the flame was a thick, glass cylinder and above that a fine wire gauze cylinder, making a continuous protection about the flame. Outside of this was an additional wire gauze cylinder added as a means of protection against breakage. Lamps for jewelers, chemists and laboratory use are in reality miniature furnaces, and are generally provided with wide wick supports in which are large cotton wicks. Alcohol is the most common fluid used for generating heat in

LAMPADROME — LAMSON-SCRIBNER

these lamps. Painter's lamps are contrivances in which naphtha is burned under pressure, the resulting heat being employed in the removing of old paint from surfaces which it is desired to repaint. Hand lanterns are simply lamps of various forms, surrounded by glass globes or cylinders to protect the flame from the wind. Ancient lanterns were provided with transparent protectors made of horn scraped thin to permit the light to be reflected through. The word lantern is a combination of lant-horn, and was employed to express a light which was protected with a transparent horn. Another form of early lantern, now designated by collectors as the "Guy Fawkes lantern" was of tin, perforated with small punctures through which the light shone. Early hall, or as they were called entry lanterns, were often massive and elegant ground glass globes, ornate and beautiful to a marked degree. Either candles or oil were used as illuminant. They were suspended by chains from the ceiling, and a glass smoke protector was provided in those of more elaborate make.

C. A. QUINCY NORTON, M.D.

Lamp'adrome, in ancient Greece, a running race with torches, customary at certain sacred festivals. The competitors were young men, to each of whom a lighted torch was given, and he who arrived first at the goal with his torch still alight was the winner.

Lamp, Electric. See ELECTRIC LIGHTING.

Lampasas, läm-pä'sas, Texas, town and county-seat of Lampasas County, on a branch of the Lampasas River, and the Texas C. and the Gulf, C. & S. Fe R.R.'s; 80 miles northwest of Austin. There is a large trade here in agricultural produce, live stock, cotton, grain, wool, and has cotton gins, wagon and carriage factories, flour-mills and other industries. Sulphur springs in the locality have attracted many invalids here. Pop. (1890) 2,400; (1900) 2,107.

Lampblack, finely divided carbon or soot, produced on a commercial scale by the imperfect combustion of organic materials that are rich in carbon, such as tar, resins, pitch, and petroleum. The combustion is usually carried out in brick furnaces, or in cast-iron vessels, to which a smaller supply of air is admitted than would be required for complete oxidation. The dense smoke that results is led through a series of settling chambers, in which the lampblack is deposited, the finest grade being precipitated in the last chamber. Lampblack so prepared contains about 80 per cent of carbon, the remaining portion consisting of oily and resinous matters, together with moisture and certain inorganic substances, such as ammonium sulphate. The resinous and other organic constituents can be removed by heating to redness in a closed crucible, after which the soot is digested with hydrochloric or sulphuric acid, and finally washed to remove the inorganic constituents. Lampblack is used chiefly in the manufacture of paints and printers' inks and for these purposes the crude product is sufficiently pure. For the manufacture of Chinese ink ("India ink") the purified soot is preferable. See also CARBON.

Lamper-eel, or Lampern, a lamprey (q.v.).

Lamp'man, Archibald, Canadian poet: b. Morpeth, Kent County, Ontario, 17 Nov. 1861; d. Ottawa, Ontario, 10 Feb. 1899. He was grad-

uated from Trinity College, Ontario (1882), and after 1883 held an appointment in the Post-office Department of Ottawa. He was a constant contributor of verse to the papers and magazines of the Dominion and the United States, and published two collections of poems, "Among the Millet" (1888); and "Lyrics of Earth" (1895), which reveal a deep love of nature and outdoor life. His "Complete Poems" with "Memoir" by D. C. Scott appeared in 1900.

Lam'prey, an eel-like creature of the group *Cyclostomi* and family *Petromyzonidae*. The anatomical characters are described under *Cyclostomi*. The lampreys feed principally on fishes, to which they attach themselves by their suctorial mouths, and then scrape away the flesh with their rasp-like teeth. There are about 7 genera and 15 species, living mostly in the north temperate zone. Lampreys inhabit both salt and fresh waters, but those of the sea ascend rivers and brooks to deposit their spawn on pebbly shallows, and great numbers die there. Most of them are plainly dark colored, but some of the fluviatile species are bluish or silvery, as the common one (*Ichthyomyzon concolor*), in the Upper Mississippi Valley and Great Lakes, which is about a foot long. The sea-lamprey (*Petromyzon marinus*) is larger, often three feet long and six pounds in weight, and in Europe is taken in great abundance as it ascends the streams in spring to spawn. Formerly the lamprey or "lampern" was much valued as an article of food, and even of luxury. From the time of the Romans up to the Middle Ages these fish formed a notable article in the bill of fare of the great. In the present day the taste for lampreys has greatly declined. See HAGFISH.

Lamp'ton, William James, American journalist: b. Lawrence County, Ohio. He was educated in public and private schools and at the Ohio Wesleyan University and Marietta College; edited a newspaper in Kentucky (1887-8); was reporter for the Cincinnati *Times*, writer for the Steubenville *Herald* and the Louisville *Courier-Journal*, editor of the "Merchant Traveler," Cincinnati, and has been on the staff of the "Critic" and the *Evening Star*, Washington, and of the Detroit *Free Press*. He has also been a special writer for the New York *Sun* and the New York *Herald*, and is a frequent contributor in prose and verse to magazines, his chief distinction perhaps appearing in his verses written in a vein of genial satire or burlesque. He has published "Yawps and Other Things."

Lam'son-Scribner, Frank, American botanist: b. Cambridgeport, Mass., 19 April 1851. He was graduated at the Maine State College of Agriculture in 1873; served two years as clerk to the secretary of the Maine State Board of Agriculture; and was an officer of Girard College (1876-84). In 1887 he was made chief of the Section of Vegetable Pathology in the United States Department of Agriculture, and from 1888 to 1894 was professor of botany in the University of Tennessee, and director of the agricultural experiment station there 1890-4. Since 1902 he has been chief of the Insular Bureau of Agriculture, Philippine Islands. In 1889 he received from the French minister of agriculture the cross of the Chevalier du Mérite Agricole. Among his writings published in the proceedings of various bodies, and in government reports, are: "Weeds of Maine" (1869).

LA NAVIDAD — LANCASTER

'Ornamental and Useful Plants of Maine' (1874); 'Agricultural Grasses of Central Montana' (1883); 'Revision of the North American Melicas' (1885); 'Grasses of Mountain Meadows and Deer Parks' (1889); 'Diseases of Plants' (1885-6-7); and papers on 'Grasses as Land and Soil Binders,' and on 'Grasses and Forage Plants' (1894-1900). He has also published 'The True Grass,' translated from 'Die natürlichen Pflanzenfamilien' (1890).

La Navidad, lä nä-vē-däd'. See NAVIDAD, LA.

Lancaster, läng'käs-ter, Sir James, English navigator: b. about 1550; d. London 9 June 1618. He served under Drake against the Armada, commanded the 'Edward Bonaventure' in the earliest expedition to the East Indies in 1591-4, captured Pernambuco in Brazil in 1594, and commanded the first fleet of the East India Company 1600-3. On his return home he was knighted. He was one of the original board of directors, and did much to promote the voyages of Weymouth, Hudson, and Baffin, in search of the Northwest Passage to India. The strait leading west from the north of Baffin Bay was in 1616 named Lancaster Sound by Baffin. See LANCASTER SOUND.

Lancaster, Joseph, English educator, the founder of the educational system bearing his name: b. London 25 Nov. 1778; d. New York 23 Oct. 1838. In 1798 he opened a school for children in Southwark, which he conducted on the Madras system, previously made known by Dr. Bell. (See BELL, ANDREW.) The principal features of the system were the teaching of the younger pupils by the more advanced students, called monitors, and an elaborate system of mechanical drill, by means of which these young teachers taught large numbers at the same time. He soon found powerful support, and was able to erect a school-house, which in 1805 was attended by 1,000 children. The number of his patrons and the amount of subscriptions continuing to increase, he founded a normal school for training teachers in his system. He made extensive tours through Great Britain and Ireland, and in 1811 had founded 95 schools, attended by 30,000 children. He was reckless and improvident in his habits; became bankrupt, and emigrated to America in 1818, where he at first received some support, but ultimately fell into poverty. His family subsequently removed to Mexico, where his system was very popular, and where his grandchildren, bearing the name Lancaster-Jones, became prominent politically.

Lancaster, William Joseph Cossens, "HARRY COLLINGWOOD," English civil engineer and author: b. Weymouth 23 May 1851. He entered the British navy as a midshipman, but on account of defective eyesight resigned, and became a civil engineer, in that capacity visiting different parts of the world. Under the pseudonym "Harry Collingwood," he is known to juvenile readers in England and America as the author of the popular nautical romances: 'The Secret of the Sands' (1878); 'Under the Meteor Flag' (1884); 'The Pirate Island' (1884); 'The Congo Rovers' (1885), a story of the Slave Squadron; 'The Missing Merchantman' (1888); 'The Cruise of the Esmeralda' (1894); 'An Ocean Chase' (1898); 'The Castaways' (1899).

Lancaster, Mass., town, and several villages combined, in Worcester County, on the Nashua River, and the Boston & Maine railroad; 18 miles north of Worcester. Here is the State Industrial School, a public library, numerous churches, high school, and manufactures of soap, brick, cotton goods, pumps, carriages, etc.; also large dairy and other farming interests. The town was first settled in 1651 by John Prescott, and it was here in 1676, that the Indians laid the place in ruins and killed 40 of the inhabitants. The town owns the waterworks. Pop. (1890) 2,200; (1900) 2,478.

Lancaster, N. H., town and county-seat of Coos County, on the Israel River, 126 miles north of Concord. The town is on the Boston & Maine and the Maine Central R.R.'s; and is a popular summer resort and residential section for New York and Boston people, being situated in an attractive part of the White Mountain region. It has manufactories of drugs, chemicals, lumber, wood-work, and machinery. The town owns and controls the waterworks. Pop. (1890) 3,373; (1900) 3,200.

Lancaster, N. Y., village in Erie County, on the New York Central & H. R., the Lehigh Valley, the Delaware & L. and Erie R.R.'s; 10 miles east of Buffalo. An important manufacturing centre containing iron-works, brass foundries, machine shops, glass-works, flouring-mills, brickyards, knife-works, and other industries. The waterworks plant is owned by the village. Pop. (1890) 1,600; (1900) 3,750.

Lancaster, Ohio, city and county-seat of Fairfield County; on the Hocking river and canal, and the Toledo, the Cincinnati and Muskingum Valley, and other railroads; 32 miles south of Columbus. It is the farming centre for the county; and is engaged in the manufacture of agricultural implements, foundry products, flour, glass, shoes, and has railroad shops and carbon works. It is the seat of the State Industrial School for Boys, Crawfis Institute, and the Columbia commercial school; contains a fine court-house, high school; four banks with a capital of \$125,000; and many churches; and has electric light and street railroad plants; a good water supply; daily, weekly, and monthly periodicals; and an assessed property valuation of nearly \$2,000,000. The city does an annual business amounting to \$750,000. It was first settled in 1800 by Ebenezer Zane, and is governed by a mayor and a city council of seven members elected every two years. The city owns the waterworks and gas plants. Senator John Sherman and Gen. W. T. Sherman were born here. Pop. (1890) 7,555; (1900) 8,990.

Lancaster, Pa., city and county-seat of Lancaster County, on the Pennsylvania, the Philadelphia & Reading, and other railroads; 68 miles west of Philadelphia, and 37 miles east of Harrisburg. It is the manufacturing trade centre for the county; is an important tobacco market; and is engaged in tobacco growing, cigar-making, cattle raising, and the manufacture of cotton goods, iron and steel goods, shoes, and combs. It is the seat of Franklin and Marshall College; contains the Lancaster, Saint Joseph's, and the County Hospitals, Children's Home, Mechanics' and Y. M. C. A. libraries, and Conestoga Park, and has gas and electric light plants, electric

LANCASTER—LAND

street railroads, 12 National and State banks having a combined capital of \$2,485,000; about 50 churches, and an assessed property valuation of over \$16,000,000. The city was founded in 1718 by Mennonites (q.v.) and was called Hickory Town until 1730. In 1777 Congress sat here for a few days, and from 1799 to 1812 it was the capital of the State. It became a borough in 1742 and a city in March 1818. It is governed by a mayor elected every two years, and by a select council of 9 members and a common council of 27 members elected annually. Here was the birthplace of General John Fulton Reynolds (q.v.), and a monument has been erected to his memory. The municipality spends upward of \$250,000 yearly in maintaining the public service. Pop. (1890) 32,011; (1900) 41,559.

H. E. KENNEDY,

Editor of the 'Morning News.'

Lancaster, S. C., town and county-seat of Lancaster County, on the Southern railroad, 84 miles north of Columbia. This is the shipping and trade centre of a large and fertile district devoted to the growing of cotton, tobacco, and grain. There are extensive cotton mills, machine shops, and other industries; public schools, two banks, and weekly newspapers. Pop. (1890) 1,094; (1900) 1,477.

Lancaster, House of, a name given in English history to designate the line of kings — Henry IV. V. and VI., immediately descended from John of Gaunt, fourth son of Edward III. Edmund, second son of Henry III., was created Earl of Lancaster and Leicester. His son Thomas added Derby and Lincoln to his titles, became leader of the baronial opposition to Edward II., and was beheaded for treason. His grandson was advanced to the dignity of a duke and, dying without male issue, the inheritance fell to his daughter Blanche, who became the wife of John of Gaunt. See also ENGLAND.

Lancaster Sound, an outlet of Baffin Bay, in lat. $74^{\circ} 20' N.$, connecting it with Barrow Strait. Though this opening into the Arctic Ocean was discovered by Baffin in 1616, it was first navigated by Parry in 1891. See LANCASTER, SIR JAMES.

Lance, a weapon consisting of a long shaft, with a sharp point, much used before the invention of firearms, and still in use. It was common among the Greeks and Romans. Frederick the Great formed an entire regiment of lancers. The Austrians followed, and soon established three regiments. After the partition of Poland, many Poles entered the French service, and a body of Polish lancers was established. The war with Russia, in which the efficiency of the lance in the hands of the Cossacks, particularly in 1812, was strikingly manifested, brought this weapon into still more repute, and the Prussians formed three regiments. The French lancers were formed in 1813 to cope with the Cossacks. Almost all the armies of Europe have had regiments of lancers. On 4 March 1903 the British War Office issued an order abolishing the use of the lance, in play as well as in work.

Lancelet See AMPHIOXUS.

Lancelot (län'sē-löt) of the Lake, a name celebrated in the traditions relating to King

Arthur or the Round Table. Lancelot was the son of Ban, king of Brucic, and after his father's death was educated by Viviana (the Lady of the Lake). She took him to the court of King Arthur, to make him one of his knights, and to admit him to the heroes of the Round Table. Arthur with his sword (*Escalibor*) dubbed him knight, and Lancelot subsequently distinguished himself by his great heroism. His love for Guinevere, the wife of Arthur, and his disregard of Morgana, a fairy, and the sister of Arthur, placed the knight in the most dangerous situations, from which, however, he always extricated himself. He finally succeeded to the throne, after having defeated King Claudas, the murderer of his father, but was slain by Mordred, the murderer of Arthur, whom Lancelot wished to punish. In his last moments Viviana appeared, and kissed the last breath from the lips of the dying hero, the sole survivor of the Round Table. His remains were deposited near those of Guinevere.

Lancet-fish. See SURGEON-FISH.

Lancewood, the wood of a West Indian tree (*Oxandra virgata*, or *Bocagea virgata*), of small or moderate size, but of great usefulness and value, possessing in a high degree the qualities of toughness and elasticity. It is well adapted for the shafts and poles of light carriages, and for all uses where light, strong, elastic timber is required. Both in strength and elasticity it is considered superior to the best ash. The name is also applied to the trees themselves, as well as to several other trees and their wood.

Lanciani, Rodolfo Amedeo, rō-dō'l'fō ä-mä'dā-ō län-chä'ē, Italian archæologist: b. Rome 1 Jan. 1847. He was educated at the College Romano and the University of Rome, and in 1878 was made professor of Roman topography in the latter. He attained celebrity by his investigations among the ruins of Rome, and is a member of many learned societies. In 1887 he gave a course of lectures at Harvard University, afterward published with the title 'Ancient Rome in the Light of Recent Discoveries' (1888). Other works of his are: 'L'Itinerario di Einsiedeln e l'Ordine di Benedetto Canonicò' (1891); 'Pagan and Christian Rome' (1892); and 'The Ruins and Excavations of Ancient Rome' (1897).

Land, in political economy. In economic theory as in social fact, land holds a peculiar position, by which the laws normal to other industrial objects are deflected. Foremost is the fact that, it being an indispensable *locus* for all industry or even social existence, its price or rental in a community where all the land is taken up is non-competitive, a monopoly which is also a *sine qua non*, as would be that of air or water; and consequently is always higher than its productive value justifies, or what is the same thing, men are content to receive a less return on their capital invested in it than in any other object. This is of course aggravated in countries where, as in England before 1832, all political privileges are annexed to it, the richest manufacturer having no vote unless he bought land and became a freeholder; less so, but still heavily, in England at present, where it and its tenantry confer great social

LAND BANKS—LAND CRABS

and political prestige; but most of all in societies like the south of Ireland, where there is practically no industry but agriculture, and a footing on the soil at some terms is the one refuge from starvation. Farms there in former days were bid for on occasion at ten or a dozen times the gross annual produce, because there are no degrees in impossibility, and they could not in any event be deprived of a bare coarse subsistence. But the only countries in which it is on an economic level with other objects are those like America, where there has been an inexhaustible abundance of land to be had at about the cost of surveying and registering title; and here it has been the economic regulator of other prices and wages, which cannot fall below the profit of free agriculture.

The economic discussion over land in England, where freeholds are very difficult to acquire, naturally took the form of an investigation of the phenomena of Rent (q.v.); and an important part of the first economic philosophies was based on a theory of the origin and mutations of the rent charge. According to them, it could only exist where there were different grades of soils, and represented the difference in profit of farming better ones over that of farming those just sufficient to make their utilization worth while. In fact, however, even if all soils were alike, rent would still be paid for their hire if the labor and capital could produce more than the rental. Another principle early formulated, differentiating the working of land from other industries, was that of diminishing returns: it was said that labor and capital in any other field produce in exact proportion to their volume, whatever that be,—ten times the investment producing ten times the return,—whereas upon the land it is manifestly not so: extra labor produces but a small and rapidly dwindling accretion to the product, till it soon ceases to produce any. Here again there was imperfect observation: two plowings or hoeings would not produce double the crop of one, but double the outlay invested in manures or other fertilizers, loads of loam, etc., often produce very much more than a proportionate extra return. The real difference is, that in other industries the extra outlay can be applied in exactly the same channels, in land it must seek different ones.

Land in this sense refers purely to land used for raising food; where it has other uses, it is subject to the general laws of industry. Land, for instance, on which is located a water-power for manufacturing, or mineral land, if for sale, follows the usual mercantile conditions.

The subject of land belongs under Land Laws; of the single tax, under Taxation; of land nationalization, under Socialism, it being a branch of the question how far it would profit the country to place the entire social machinery under elected instead of self-determined managers; of agrarian difficulties, under the special branches of history concerned—the Roman agrarian contests, for example, shed little light on and are little illumined by the system of peasant distribution in France or the Irish land laws. For the methods followed in the United States, see LANDS, PUBLIC.

Land Banks, Massachusetts. Early in the 18th century, Massachusetts paper currency had driven abroad nearly all her coin, broken her

credit, and demoralized her business; and the failure of the Quebec expedition in 1711 carried the embarrassment to a climax. Encouraged by the success of the South Sea scheme in England, some Boston merchants induced the General Court to make the bills of credit of the province legal tender for debts of seven years previous and three years subsequent. Besides this, a number of notable men, including Peter Faneuil, devised the scheme of a bank whose resources should rest on real estate mortgages, to make loans of its own notes; to encourage subscriptions, it was proposed that Harvard College should have \$1,000 a year out of the proceeds. Gov. Dudley opposed it strongly; his son, the attorney-general, memorialized the General Court against it; and the latter forbade them even to print their scheme till they had laid it before the Court, which then refused to incorporate it. To ward it off and produce the same result, at Dudley's suggestion a public bank was founded, with a capital of \$250,000 provided by the General Court, to lend bills of credit for five years at 5 per cent, one fifth to be repaid each year, the whole secured on real estate mortgages. In 1739, with the bad state of the finances increased by the still worse state created by the paper money of Rhode Island, and silver rated at 27 to 1, the project of a land bank was again brought forward. Several hundred persons were to form it; notes were to be issued up to \$750,000, the security being a mortgage on each partner's real estate in proportion to his holding, or sureties also possessed of sufficient estate, and each partner paying 3 per cent on the loans made him, in bills or in kind, at a rate fixed by the directors. The House of Representatives was largely favorable; but Gov. Belcher denounced it as tending to fraud, disturbance of order, and confusion of business, and he set aside the election of the Speaker and nearly half the council for connection with the bank, besides displacing many office-holders. Despite this, the company began operations, expecting that the notes would circulate readily. They were mistaken: not over \$300,000 were issued. But in 1741 Parliament not only extended to the colonies an act forbidding the issue of bills not payable in coin at the end of the term, but made the directors liable to the holders of the bills for their face with interest. As a large part of them had been issued at a discount, the partners (though many had little to lose) were threatened with ruin, and Parliament had to permit relief measures. One of these partners, who lost all his property, was the father of Samuel Adams.

Land Crabs. Almost all shore-crabs will withstand exposure to the air for some hours without suffering injury, and many of them are regularly so exposed at ebb tide. It is not surprising, then, that some of them have wandered far from the seashore into the fresh-water streams and the moist woods and mountain forests, or even largely forsaken the vicinity of water and established themselves on dry hillsides. The land crabs, par excellence, belong to the family *Gecarcinidae*, in which the carapace is thick and hard, strongly arched above, rounded, bent downward and truncate in front, and vaulted in the branchial region. The branchial chamber is spacious and lined by a spongy membrane which retains moisture for a

LAND GRANT—LAND-SNAIL

long time and thus keeps the gills damp. Six or seven genera and several species inhabit the warmer regions of both hemispheres. One species (*Gecarcinus ruricola*) is common on many of the West Indian islands, is excessively abundant on some of the Bahamas and occurs in southern Florida. They abound at the eastern end of Cuba, and were a source of immense annoyance to the inexperienced soldiers of the United States army in the campaign of 1898 against Santiago de Cuba. On Jamaica and the other larger islands they inhabit a zone in the hills from one to three or four miles from the shore, where they live in burrows beneath stones or under the roots of trees, from which they emerge at night to seek their chiefly vegetable food. They are large, robust creatures with extremely powerful claws, which a pugnacious disposition leads them to use freely. Mating takes place in the spring, and during the rainy season in May a common impulse causes them to migrate in vast armies to the sea, where they bathe and deposit their eggs, which are washed up and buried in the sand by the waves. There is no metamorphosis, but the young develop directly and hatch in nearly the adult form. By resident naturalists and travelers who have observed it, this animal's march to the sea is described as a most impressive sight. Most of the males form an advance guard which is followed in two or three days by the females and remaining males. They are said to proceed in a direct line and to climb over, instead of passing around, every obstacle, even houses. After discharging the eggs, bathing, and resting, the crabs return to the hills and in midsummer close their burrows with leaves, grass, etc., and retire to their inmost recesses to moult. At this time, while in the soft-shelled state, they are in high favor for the table, and are dug out of their burrows in large numbers by the natives. A related species (*Ucauna*), the Brazilian mangrove-crab, is remarkable for the regular inspiratory and expiratory changes of the air in the branchial chamber.

The *Thelphusidae* are river crabs rather than land crabs, but a number of species inhabit the damp forests of warm countries. In Japan a well-known species (*Thelphusa dehaanii*) is frequently met with in the mountains at an elevation above 2,000 feet. Some terrestrial species are mentioned in the article HERMIT CRAB.

Land Grant, a concession or subsidy made by the United States Congress to assist railroad companies to secure funds, by the sale of bonds secured by lands so granted, to construct lines of railway through parts of the United States where the local traffic would not pay the running expenses. About 215,000,000 acres of land were given to the various railroads of the country by the government. The Illinois Central received a strip of land 12 miles wide, running the whole length of Illinois; the Northern Pacific received 47,000,000 acres; the Atlantic and Pacific, 42,000,000; the Union Pacific, 13,000,000, and other roads in proportion.

Land League, an Irish organization founded by Charles S. Parnell, which came into

being at a meeting held in Dublin 18 Nov. 1879. The principal tenets of the association were the "three F's"—fixity of tenure, fair rent, and free sale (of the tenant's interest): but many speakers at Land League meetings, held in different parts of the country, went so far as to demand that the soil should belong to the cultivator. Opposition by direct violence was deprecated, and recourse was had to boycotting. (See BOYCOTT.) This state of things continued till the end of 1880, when 14 members of the Land League, of whom the most important were Parnell, Dillon, Biggar, T. D. Sullivan, and T. Sexton, were indicted. The chief counts were "conspiring to prevent payment of rents, to defeat the legal process for the enforcement of payment of rents, and to prevent the letting of evicted farms." The trial, which took place early in 1881, was a fiasco, but it drew from Justice Fitzgerald the declaration that the Land League was an illegal body. A Ladies' Land League, under the presidency of Miss Anna Parnell, was then formed. It was denounced by Archbishop McCabe, and warmly defended by Dr. Croke, archbishop of Cashel, and T. D. Sullivan. The agitation increased, and the "No Rent" cry became more frequent. Gladstone denounced Parnell, and soon afterward Parnell, Dillon, Sexton, O'Kelly, and the chief officials of the League, were arrested and imprisoned in Kilmainham. They issued a manifesto calling on the Irish tenants to pay no rent during their imprisonment. The government replied by declaring the Land League an illegal body, and suppressed its branches throughout the country. The Ladies' Land League continued until the close of the year, when it was dissolved by the leaders of the Irish party. See IRELAND.

Land-locked Salmon, a salmon which inhabits an inland body of water, and can never go and come to the sea. The term applies in America only to salmon inhabiting certain lakes in eastern Canada and northern New England; and whether these salmon should be regarded as distinct species or merely as representatives of the Atlantic salmon modified to suit their local conditions, is a question upon which ichthyologists are not agreed. It is most convenient to follow the distinctions made by sportsmen, and regard the land-locked salmon as two species, the Sebago salmon and the ouananiche (qq.v.).

Land Office, United States, the department charged with the management and disposal of the public lands. For its constitution and history, see LANDS, PUBLIC.

Land-snail, an air-breathing terrestrial gasteropod mollusk, or snail of the family *Helicidae* or some nearly related pulmonate. These mollusks possess a well-developed, usually globose and more or less spiral, horny and brightly colored shell (except in slugs, q.v.), into which the whole animal may be withdrawn, and which has, usually, a lunate aperture, not closed by an operculum. Four retractile tentacles exist, the upper pair being the larger and possessing eyes at their tips. A distinctly developed so-called "foot" is present. The aperture by means of which air is admitted to the lung-chamber for the purpose of breathing exists on the right side, under the edge of the shell. The mouth possesses an upper mandible

LAND OF STEADY HABITS — LAND-TORTOISE

of horny consistence and toothed structure, and, as in other gasteropods, there is a tongue or lingual ribbon bearing many teeth. The food is generally of a vegetable nature, and snails are capable of doing great mischief in gardens, but none in the United States is noticeably harmful. The sexes are united in the same individual; but the copulation of two such hermaphrodite individuals is necessary for impregnation, which becomes mutual. The eggs are globular or oval, have coriaceous shells, and are laid singly in damp places, as under leaves, stones, etc.; *Bulimus* (q.v.) is noted for the comparatively large size of its eggs. These eggs and the snails themselves are eaten by birds, turtles and other enemies, especially in the tropics, where land-snails are more varied, numerous and conspicuous than in temperate regions. Some species, however, live in very cold climates, far to the north or high on mountain ranges. Those of cold climates hibernate in winter, creeping into sheltered places, and closing the aperture with one or more air-tight drum-head-like curtains of hardened mucus. In hot and dry places they protect themselves in midsummer against undue loss of moisture in the same manner.

The family *Helicidae*, which embraces not only the terrestrial genus *Helix*, but the bush-climbing, long-spined *Bulimus* (q.v.), and several smaller genera, includes thousands of species. Specimens are always most numerous in moist woods and in a limestone region than elsewhere. Many small terrestrial mollusks, properly called land-snails, belong to families other than *Helicidae*, as the *Orthalicidae*, *Bulimulidae*, and *Pupidae*, the last containing many minute American species, not larger than a pin-head, shaped like a grain of rice, and beautifully chased; *Stenogyridae*, in which are found the great agate-shells (*Achatina*) and sundry others of the tropics; *Succineidae*, represented by many small, glassy expanded forms of great beauty; and others, some of which contain shell-less and slug-like forms.

Utility of Snails.—Snails have been made of use medicinally in the past, and curative virtues are still attributed to them among European peasants. Among the Romans snails were held in high esteem as articles of food and even of luxury; and special parks or establishments named "cochlearia" were constructed for the purpose of fattening these mollusks. The practice of eating snails has never been very common in England, but Howard, the prison philanthropist, tried to encourage it. Howard cultivated the *H. varronis*, the largest of European species. In modern Europe, as in many parts of France, and in Vienna, especially during Lent, snails are largely consumed, especially among the lower orders. The proletarians of Naples are exceedingly fond of a soup made from *H. nemoralis*. The most valued species among modern epicures is the *H. vermiculata* or little hermit snail, found at Montpellier; and *H. aspersa*, the "garden-snail" of the English, is also regarded as very delicate when properly cooked. *H. pomatia* has a wider range as an edible snail, especially in France, where this species is extensively cultivated for market in appropriate enclosures called *escargotières*; thousands are also gathered from the vineyards and sold in the larger towns of southern France. It is im-

ported in pickle to the United States, and finds extensive sale.

Land of Steady Habits, a phrase applied to the State of Connecticut.

Land Surveying. See SURVEYING.

Land-tortoise, a terrestrial turtle of the family *Testudinidae*, order *Cryptodira* (see CHELONIA), a family characterized primarily by the possession of a strong box-like shell, completely ossified when young and covered with horny shields, into which the whole body may be withdrawn and in some forms wholly enclosed. The family also contains aquatic and amphibious forms (see POND-TURTLES; TERRAPIN), but these need not now be considered. American representatives are found in the box-turtles (properly so-called) of the genus *Cistudo*, in which the plastron is connected with the carapace by ligaments and is divided into two movable lobes, the transverse hinge being so perfect that the box can be completely closed after head, legs and tail have been withdrawn. The carapace is high and arched. The common box-tortoise of the United States (*C. carolina*) has become completely terrestrial, and has undergone some interesting structural modifications in consequence, among others a loss of webbing between the toes. It reaches about six inches in length, is highly variable in the arrangement of the blackish and reddish tints of its coloration, and each dorsal shield is nicely sculptured in concentric rings, but these become worn nearly smooth in old age. They wander about the woods, walking with the shell well lifted from the ground, and searching for food most diligently in the evening and early morning and in moderate and moist weather. Their food consists chiefly of snails, slugs, earthworms, crayfish, grubs, and the like, together with fungi and a little green stuff. In winter they hibernate, buried in soil or garden rubbish. They are fond of staying in one limited district, are easily tamed and exhibit some intelligence, but individuals differ much in these respects.

The typical land-tortoises, however, are those of the genus *Testudo*, in which the plastron has no hinged, folding part, and the feet are short and webless. The 40 or more species are scattered throughout the warmer parts of the world, excepting in Australasia. The small, convex, highly sculptured "Greek" tortoises of Europe and North Africa, so often kept as garden pets, are familiar representatives. They feed almost wholly upon green grass, leaves and vegetables. The captive made famous in Gilbert White's 'Natural History of Selborne' was one of these (*T. ibera*), and its shell is now preserved in the British National Museum. The gopher tortoise (q.v.) of Florida is a North American species; and a similar widely spread South American species (*T. tabulata*), which lives mainly on forest fruits, is often two feet long.

Gigantic Land Tortoises.—Certain terrestrial tortoises of very large size survived until the historic age, and in some cases still exist, on islands in the Indian and Pacific oceans. They are relics of a bygone period, when even larger

LANDE—LANDER

ones prevailed. Fossil bones in Miocene and Pliocene strata of India, western North America and other parts of the world, indicate tortoises of that period whose heads alone must in life have been nearly a foot in length, and beside those giants even the largest of the modern species so-called would look small. The presence of such turtles gave their name to the Galapagos (q.v.) group of islands off the coast of Ecuador, where each of the large islands of the archipelago supported a separate species, but all resembled one another in the relative small size of the head and great length of the neck. "The most peculiar looking are or were *T. ephippium* and *T. abingdoni*, the shell of which is extremely thin, with large lacunae in the osseous plates. The profile of the shell is saddle-shaped, with the horny shields partly concave and turned upward at the sides. The general color of these and other Galapagos tortoises is black." Toward the close of the 19th century all that remained of these tortoises were caught and distributed alive to various parks and zoological collections in North America and Europe, where they will be cared for and will probably continue their race. They eat grass and leaves of succulent plants, as lettuce; their food in the Galapagos having been mainly cactus and a lichen (*Usnea*).

Other giant tortoises inhabited the islands of the Indian Ocean until within the historic period, and a few remain in captivity. In 1808 there was still living in England a specimen of *T. sumeiri*, once existing in thousands on the Seychelles, whose history was known since 1766, when it was already of large size. Other species inhabited Madagascar, where they became extinct prehistorically, Bourbon, Mauritius and Rodriguez. They were utilized as food by the voyagers of the 17th and 18th centuries; were wastefully slaughtered by the European colonists, and carried in shiploads from island to island, until at last none remain but a few captive specimens.

Consult: Günther, 'Gigantic Land Tortoises' (1877); Gadow, 'Amphibia and Reptiles' (1901); Baur, 'American Naturalist,' Vol. XXIII. (December 1889).

Lande (Fr. *länd*), in France, a name given to a sandy plain unsuited for bearing grain. From the vast extent of landes (about four fifths of the total area) which it contains, the third department of France, in point of size, derives its name. The landes lie to the north of the Adour, while the country to the south of that river is fertile. Of the whole area (about 2,250,000 acres), nearly one half is waste, a third under wood, and little more than a sixth arable. The landes are very thinly populated, the inhabitants gaining subsistence by fishing, by such agriculture as is possible, and by keeping cows and sheep. The shepherds make use of stilts, that their increased height may give them a greater range of vision, and, when fatigued, sit on a pole with a head somewhat like that of a crutch, and while away the time in knitting.

Lan'der, Frederick West, American military officer: b. Salem, Mass., 17 Dec. 1821; d. Paw Paw, Va., 2 March 1862. He was educated at the Norwich (Vt.) Military Institute, and became a civil engineer. He was employed in making surveys across the continent by the

United States government for the purpose of finding a suitable route for a transcontinental railroad and served in the Army of the Potomac in the early part of the Civil War.

Lander, Jean Margaret (Davenport), American actress: b. Wolverhampton, England, 3 May 1829; d. August 1903. Her stage career began in childhood, and her parents brought her to this country in 1838, where she played for four years, then traveled in Europe (1842-8), playing as Julia in 'The Hunchback' in England and on the Continent, returning to the United States in 1849. She acted with great success in the principal cities until 1860, when she married Gen. Frederick West Lander (q.v.) and retired from the stage. After his death in the Union army in 1862, Mrs. Lander joined the Hospital Corps of the army, and for more than a year she and her mother were in charge of the hospital at Port Royal, S. C. After the War she returned to the stage and again enjoyed great popularity in a number of important roles, some of which she originated in this country. Her final appearance was made in Boston in 1877, in an adaptation of 'The Scarlet Letter.'

Lander, Louisa, American sculptor: b. Salem, Mass., 1 Sept. 1826. In early youth she manifested her taste for sculpture by modeling heads for dolls, and carving bas-reliefs on alabaster and other soft substances. As she grew older she modeled likenesses of members of her family, and executed cameo heads. She went to Rome in 1855 and became the pupil of Crawford, and soon after finished in marble 'To-day,' a youthful figure emblematic of America, and 'Galatea.' Among her subsequent works are: a bust of Hawthorne; a spirited statuette of Virginia Dare, the first English child born in America; a life-size statue of Virginia; a reclining statue of Evangeline; 'Elizabeth, the Exile of Siberia'; a statuette of Undine, and one of 'Ceres Mourning for Proserpine'; numerous portrait busts; 'A Sylph Alighting'; and 'The Captive Pioneer.' She was a sister of F. W. Lander (q.v.).

Lander, Richard, English African explorer: b. Truro 8 Feb. 1804; d. Fernando Po 6 Feb. 1834. He became a domestic servant; in that capacity accompanied Captain Hugh Clapperton as his servant on his second expedition into the interior of Africa 1825. After Clapperton's death in 1827 he returned to the coast, and in 1829 published 'Records of Captain Clapperton's Last Expedition to Africa.' In the spring of 1830 he set out with his brother John on an exploring expedition, under the auspices of the English government, and from Badagry, near Cape Coast Castle, they proceeded to Boossa on the Niger, and after ascending the river for about 100 miles, traced its course downward to the sea, and proved that it entered the Bight of Benin by several mouths. They were the first also to discover that it was fed by the Benue. Their journal was published in 1832, entitled 'Journal of an Expedition to Explore the Course and Termination of the Niger,' and was translated into several languages. While on a trading expedition in the delta of the Niger, he was wounded by the natives, and died soon after.

LANDGRAVE—LANDON

Land'grave (German *Landgraf*), a title assumed by certain territorial counts of the German empire to distinguish them from the inferior counts. There were originally three landgraves, those of Thuringia, and of Upper and Lower Alsace, who were princes of the empire. The title was assumed by Louis III. of Thuringia about 1130.

Landlord and Tenant, the relation of renter to rentee; not necessarily of land, except as all dwellings or industries must have land for a *locus* (see LAND, IN POLITICAL ECONOMY), but of any of its material incumbrances. The landlord need not be the owner: he may himself be a lessee or tenant granting occupancy or use to a sub-tenant. It is sufficient that his title is superior to that of the one who holds through him. The difference between the latter's interest and that of the landlord is known as the reversion of the latter; but there is obviously no reversionary interest unless the grant is specifically limited to a less volume than the grantor's, and none unless it is inferior in kind. Historically, the relation originated in the practice of inféudation in the Middle Ages, when all holdings were a chain of vassalships, when even kings did homage for portions of their possessions, and no property was held by any but kings, except as vassal to some overlord. The feudal incidents were abolished by the English statute of Quia Emptores in 1290. The modern mercantile relation of lessors and lessees is the creation of statute, judicial decisions, and the specific agreements of written contracts.

The mutual obligations of the contracting parties in law are natural consequences of the relation. The landlord on his part must protect the tenant from any other claim of occupancy; must not evict him or suffer him to be evicted, and if he does either, is liable in damages. He is not, however, under any obligation to protect him against violence, trespass, nuisances, or other unlawful acts of outsiders; nor to furnish habitable buildings, usable implements, or anything whatever of specific quality unless specially agreed on. The doctrine of *caveat emptor* is also extended to *caveat lessor*; he must form his own conclusions and run his own risks. The tenant cannot question or interfere with the landlord's title, even if the latter be worthless: his own is derived from it, and must stand or fall with it. Nor does any length of occupancy enable him to plead the latter in bar of the landlord's right, by the statute of limitations, under common law; but he very generally can by statute after a certain period, though never till the period of his tenancy has expired. Of old the feudal tenant could do at once much more and much less than this: he could not under any circumstances get the landlord's property into his own hands, but by a legal fiction of which the law sanctioned the use (feoffment or common recovery), he could grant to a third party what he did not himself own, so that the third party could retain it; the wrongful grantor, however, forfeited his own estate to the landlord. Statutes long since abolished these fraudulent conveyances.

The tenant must keep the premises in repair; if he lets them go to ruin or deteriorate from non-use he is liable in damages. By common

law he must rebuild premises destroyed by fire; most States of the Union abrogate this right, however. The tenant must not commit waste; but he may cut wood for fire, repairs, or fencing, and if he is a tenant at will or for life he has a right to the crops.

Obligations by agreement may of course be almost anything. Stipulation of rent usually forms a part; permission to make improvements not to be removed is most usual, sometimes obligation to make them of certain sorts; and an agreement not to assign the lease without the landlord's permission. The landlord may agree to renew the lease or to pay for improvements, or permit removal of fixtures, etc. An agreement to pay a reasonable rent has been held to be implied without being specified in the lease. All such rights and duties extend to the successors to the parties, including assignees.

Landois, läñ-dwá, Hermann, German zoologist: b. Münster, Germany, 19 April 1835. He studied for the priesthood, but in 1859 turned his attention to science, and in 1873 was appointed professor of zoology at the Academy of Münster. He is the author of 'Sound and Voice Apparatus of Insects' (1867); 'Text-Book of Zoology' (1870); 'Text-Book of Botany' (1872); 'Voices of Animals' (1875); 'Text-Book of Instruction in the Description of Nature'; and other popular works of a like character.

Landois, Leonard Christian Clemens, German physiologist: b. Münster, Germany, 1 Dec. 1837. He is a brother of H. Landois (q.v.), and was educated at the University of Greifswald and has been professor of physiology there from 1872. He is widely known as an original investigator and has published: 'Le Diagnostique des Maladies des Yeux' (1877); 'Manuel d'Ophthalmoscopie' (1878); 'Traité complet d'Ophthalmologie' (1886); 'Lehrbuch der Physiologie' (10th ed. 1899); etc.

Land'on, Letitia Elizabeth, English poet, better known by her initial signature "L. E. L.": b. Chelsea, England, 14 Aug. 1802; d. Cape Coast Castle, Africa, 15 Oct. 1838. She wrote much for the then fashionable annuals, and was long popular both as poet and prose writer. In June 1838 she was married to a Mr. George MacLean, and sailed with him to Cape Coast Castle in Western Africa, where he was governor. She died there soon after her arrival, from an accidental over-dose of prussic acid, which she had been in the habit of using medicinally. Her chief works are: 'The Improvisatrice and Other Poems' (1821); 'The Golden Violet' (1827); 'The Venetian Bracelet' (1829); 'Ethel Churchill,' a novel (1831); and 'Romance and Reality,' a novel (1837).

Landon, Melville de Lancey ("ELI PERKINS"), American author: b. Eaton, N. Y., 7 Sept. 1839. He was graduated at Union College in 1861, and soon after joined the Union army, from which he retired in 1864, having reached the rank of major. He became a cotton-planter in Arkansas and Louisiana, traveled in Europe, and was for a time secretary of the United States legation at St. Petersburg. His writings have made him known chiefly as a humorist, but have dealt with serious as well as lighter subjects. He has published: 'Saratoga in 1901' (1870); 'History of the Franco-Prus-

LANDOR — LANDS

sian War' (1871); 'Wit, Humor and Pathos' (1875); 'Wit and Humor of the Age' (1880); 'Kings of Platform and Pulpit' (1887); 'Thirty Years of Wit' (1890); 'Eli Perkins on Money—Gold, Silver or Bimetallism' (1895); and other works.

Lan'dor, A. Henry Savage, English traveler and painter: b. Florence, Italy. He is a grandson of Walter Savage Landor (q.v.), and has traveled in eastern Asia, America, Australia and Africa. Among his writings are 'Alone with the Hairy Ainu'; 'Corea, or the Land of the Morning Calm'; 'A Journey to the Sacred Mountains of Siao-on-tai-shan'; 'China and the Allies' (1901).

Landor, Walter Savage, English poet and prose writer: b. Ipsley Court, Warwickshire, 30 Jan. 1775; d. Florence, Italy, 17 Sept. 1864. He was educated at Rugby and Oxford, from the latter of which he was rusticated in 1793 for breach of discipline and never returned. He published a small volume of poems in 1795, and a long poem, 'Gebir,' in 1798. This latter he subsequently translated into Latin verse, being one of the most accomplished Latinists of his time. He succeeded to a large property on the death of his father, but sold it off, determining to live abroad. In 1808 he raised a body of men at his own expense for the defense of Spain against France. In 1811 he married and settled at Florence, where many of his works were written. Having separated from his wife he returned to England in 1835. In 1858 he went back to Italy, which henceforth remained his home. His fame chiefly rests on his 'Imaginary Conversations' between celebrated persons of ancient and modern times, which is a model of a pure, vigorous, finished English style. Among his other works are: 'Count Julian,' a tragedy (1812); 'Hellenics' (1847); 'Pericles and Aspasia,' imaginary letters (1836); 'Pentameron and Pentalogue' (1837); and the dramas 'Andrea of Hungary' and 'Giovanna of Naples.' Consult Life by Forster (1871); Colvin, 'Landor' (1881).

Land'rail. See CORNCRAKE.

Lan'dreth, Burnet, American agriculturist: b. Philadelphia 30 Dec. 1842. He was educated at the Polytechnic College, Philadelphia, was captain of infantry during the Civil War, serving in the Army of the Potomac, and since the war period has devoted himself to the promotion of higher agricultural and allied interests in many important fields of service. He was chief of the Bureau of Agriculture at the Centennial Exhibition, director-in-chief of the American Exhibition in London, and is a member of many American scientific societies; also holds honorary membership in similar bodies in European countries, in India, and in Japan; and is Chevalier and Officier du Mérite Agricole de France. He founded and is president of the Association of Centenary Firms of the United States, and is head of the seed-house of D. Landreth & Sons, established in 1784 in Philadelphia. He has published several works on agricultural subjects.

Landry, Auguste Charles Philippe Robert, Canadian author and statesman: b. Quebec 15 Jan. 1846. He was graduated from Laval University in 1866; then took a course in agricultural science at the College of Sainte Anne, and

devoted himself to farming. He served for several years in the militia, rising to the rank of lieutenant-colonel. In politics he is allied with the Conservatives; he was a member of the Quebec Assembly 1875-6; was elected to the Canadian House of Commons in 1878, where he served till 1887, when he was defeated at the general election; in 1892 he was called to the Senate. He became president of the Quebec Exhibition Company in 1894, is a member of several agricultural societies, and was elected president of the Council of Agriculture in 1896. He has written 'Traité populaire d'Agriculture théorique et pratique' (1878); 'L'Eglise et l'Etat' (1883); and numerous papers on political and scientific subjects.

Lands, Public. The subject may be divided into five sections: (1) The acquirement of the lands by the nation; (2) the objects and methods of disposal; (3) the manner of acquirement by individuals; (4) the government system of management; (5) general statistics.

1. The 13 States as finally delimited contained 341,752 square miles, increased by the treaty of peace with Great Britain to 830,000. Their Western lands *in posse* were ceded to the general government as a common possession and trust fund, first by New York to remove obstacles to the formation of the Confederation (q.v.); then by the rest of the northern States and Virginia before the adoption of the Constitution; the others gradually followed, Georgia coming last in 1802. It was understood, and is implied in the Constitution, that this was eventually to be erected into States; but meantime Congress must decide on their disposal to the settlers who were ultimately to form those States, and could reserve as *enclaves* within the States whatever tracts it chose. The Ordinance of 1787 (q.v.) is a monument to its action in administering the territory north of the Ohio. For the further accessions to our territory, see ANNEXATION. But after these State or treaty cessions, there still remained Indian claims to vast tracts, which could only be quieted by purchase or war, and in fact required much of both. Great tracts were bought, and the Indians who refused to remove from the remainder east of the Mississippi were gradually deported beyond it. (See INDIAN TERRITORY; and for the most extreme case of forcing a removal, CHEROKEES and CHEROKEE CASE.) The reservations have embraced in all more than 100,000,000 acres, but have themselves later been largely thrown open to settlement, by purchase from the Indians.

2. The first thought in handling the public lands was revenue: "to effect a gradual discharge of the domestic debt, and furnish liberal tributes to the federal treasury" ('Federalist'). As the country grew richer this policy was abandoned, and two others took its place,—to induce settlement of the territory, and to provide funds for public uses where general taxation would have been unpopular or perhaps unconstitutional. The latter have included grants to private individuals for eminent public services, to educational and charitable institutions direct and to States for them, to public improvements like roads, canals, and railroads, and to States for them (the latter first), and lately for a giant irrigation fund.

The first policy naturally led to its being sold to syndicates in vast tracts; the price, at

LANDS

first fixed at a minimum of \$1 per acre, was reduced to 66 $\frac{2}{3}$ cents, and two great sales were made in Ohio, to a New England and a New Jersey company. The second resulted in Cincinnati, but its 1,000,000 acres conflicted with Indian and military reservations, and only 310,000 acres were actually sold. This policy aroused great discussion: some claimed that the land should be sold to settlers in such lots as they wished; others declared that if so done the Eastern States would be depopulated,—the States were already bidding against each other to sell their own lands. Massachusetts offered Maine lands at 50 cents an acre to check western emigration, and the Illinois Spaniards offered theirs for nothing with a temporary exemption from taxation, and stocked at that. Hamilton made a classic report in 1790, the basis of an important part of the present system, and in 1796 Congress voted to sell the lands in quantities a mile square at \$2 an acre. Up to 1801 the total sales were 1,484,047 acres, all in Ohio. But the sales were so slow at the last that in 1799 nothing was turned into the treasury from this source, and in 1800 only \$443. In May 1800 a credit system was introduced, one fourth down and the rest in three years. The result was a great increase in sales, but also in so much chance speculation that a large part of the payments were defaulted. Congress disliked to oust the settlers, and relief acts were regularly passed for many years. In April 1820 the credit system was abolished, and lands sold for cash in lots as small as 80 acres, at \$1.25 per acre. The debts still owed were over \$21,000,000 in December 1820; they were not wholly discharged—partly through payment for arrears and more by relinquishment of lands—till 1830. Under the new system, by 1840 the sales had been some 76,000,000 acres. After the panic of 1837 the pre-emption system (see Section 3) was introduced, with a bitter fight,—as it was thought to encourage speculators, intruders, and squatters, who would not pay until forced,—and for some years it was confined to special licenses which were really relief acts for previous settlers. In September 1841 a permanent pre-emption act was passed, supplemented by the act of 5 March 1843. This was confined to surveyed lands; in 1853-4 it was extended to unsurveyed ones, so that intending settlers could take their choice of the best lands everywhere. In 1854 a Graduation Act (q.v.) was passed, to sell off cheaply lands which had been long in the market. From 1852 on a homestead law was one of the platform issues; first to grant 160 acres free to any settler, then to charge 25 cents an acre after five years, finally passed in 1862 substantially as at present,—five years' continuous residence and improvement on a quarter-section, and then a free patent. The results of this policy are given in the final paragraph. The pre-emption law has recently been repealed on account of the shameless collusive frauds on the government. In 1878 a Timber Culture Act was passed, granting not exceeding 160 acres to any one proving that he had planted 150 acres of timber; this, too, has been repealed.

Of the gifts, the chief personal ones were in bounties to the Revolutionary soldiers and to those of the War of 1812, and to a few individuals like Lafayette. After the Mexican War, some 60,000,000 acres was given in bounties to

soldiers and officers. Grants were also made to those who would take land on specified frontiers, to form a buffer settlement. The grants for public improvements have been lavish. The first were wagon roads; then came canals, for which over 4,000,000 acres were granted in five States between 1824 and 1866; then by act of 1850, all swamp and overflowed lands within the bounds of any State were granted it as a fund to construct dikes and drainage. The first railroad grant was made to Illinois in 1850 to construct the Illinois Central Railroad; as ever since, alternate sections of land on each side were given. Several scores of others have been given to other States. The greatest gift of the sort, however, was for the construction of the Union Pacific Railroad, which had to be given direct because the lands for many hundred miles were in districts where no States had arisen. (See CREDIT MOBILIERS OF AMERICA.) About 155,000,000 acres were granted in all, but some reverted to the government for failure to fulfil conditions. The educational gifts have been great: the States admitted previous to 1850 had 1-36 of their area reserved for a school fund, those since then 1-18, some 70,000,000 acres altogether; in 1862 each State had a tract proportional to population for an agricultural college—about 10,000,000 acres; each of the last six States has been granted a tract for a university, over 1,000,000 acres in all, with other gifts for education, public buildings, etc., amounting to 25,000,000 acres in all. Finally, in 1902 the entire receipts from the sale of lands in 17 States and Territories were set aside as an irrigation fund, calculated ultimately to produce several hundred million dollars.

3. There are several methods by which private entry has been made on public lands. The pre-emption law, recently repealed on account of fraud, allowed any one to receive a full title to 160 acres of land after six months' residence and improvement, on paying \$1.25 an acre; there were several exceptions to the lands that might be taken, and no one who already owned 320 acres, or who deserted his own land to take up the new, was entitled to the privilege. Despite this, it has been a huge engine of fraud: its excuse being that it was for many years the only way in which the unoccupied lands could be settled up. Less rapidity of settlement might not have been injurious. The Homestead Acts (q.v.), five years' residence and no payment, made the same exceptions of land and persons, otherwise both were the same as under the former system. This affords far less chance of fraud, and is the one system now in use. Another method is to announce a public auction to the highest bidder at \$1.25 an acre, the unsold part being retained for private sale. Military land warrants to soldiers or their families are another method. The Timber Culture Act, now repealed, has been mentioned.

4. The General Land Office classifies its lands in seven divisions: (1) Agricultural lands. These are rated either as "double minimum," within a specified distance of works of internal improvements, and sold at \$2.50 an acre; or minimum, at \$1.25 an acre. (2) Town sites: either sold at public auction for \$10 an acre, or inhabitants of cities or towns granted the privilege of entry at \$1.25. (3) Mineral lands, varying from placer locations at \$2.50 an acre to

LAND'S END — LANDSCAPE GARDENING

mining rights at \$5; not to exceed 1,500 x 600 feet, nor go below 1,500 x 50, thus varying from 20.66 to 1.72 acres. (4) Timber and stone, unfit for cultivation, 160 acres limit, \$2.50 an acre. (5) Saline, containing salt springs; offered first at public auction for \$1.25 an acre, then held for private sale at the same price. (6) Coal, limit of 160 acres to a person and 320 to a company, save that the latter (if at least four persons) on expending \$5,000 can enter 640 acres more; \$10 an acre if over 15 miles from a railroad, \$20 if less. (7) Desert, limit 640 acres, price 25 cents on entry, with an affidavit of intending to irrigate it within three years; which done, \$1 an acre more secures a full title.

The method of survey is the rectangular system, devised by Jefferson; under which an immigrant can travel a thousand or two thousand miles into a new territory and find his farm without delay or doubt. It was adopted in 1785; the township of six miles square and the section of one mile were Monroe's suggestion. A base line and meridian line are first determined; and from the former, townships of the above size are established, and numbered north and south. From the meridians chosen, ranges a mile square are charted, and numbered east and west of the principal meridian. Thus, "Northeast quarter of Section 11, Township 17 south, Range 3 west of the fourth principal meridian," can be reached at once; and boundary marks being always placed at the intersection of divisional lines, the special farm can be determined without trouble. The first principal meridian established was that dividing Ohio and Indiana, with the Ohio River as its base, and the meridian 82° 51' west. This controls surveys in Ohio. Since 1785, 24 initial points (intersection of principal bases with surveying meridians) have been used.

These lands are under control of the General Land Office at Washington; a bureau first established in the Treasury Department 25 April 1812, placed under presidential control in 1836, and transferred to the Interior Department on its organization in 1849. The head is the commissioner. It issues and records all government land patents, whether on private claims, congressional grants, or any other ground; there are three chief clerks (of surveys, of public lands, and of private claims), a presidential secretary to sign land patents and affix the official seal (a duty formerly discharged by the President), and a recorder to countersign them,—all appointed by the President and confirmed by the Senate. The commissioner makes annual report to Congress; and the office issues maps showing government reservations and unappropriated lands, circulars of information, etc., besides auditing all accounts relating to these lands. The commissioner and all employees of the office are forbidden to deal in the public lands directly or indirectly. There is also a State land office established in each State with more than 100,000 acres of unsold lands, each having a register and a receiver appointed by the President for four years; the former receives applications and issues patents, the latter receives and collects for the money. In 1902 there were 115 district land offices, and 17 surveyors-general.

5. In 1902 (June 30) the total amount of public domain lands from the first had been 1,809,539.846 acres (2,827,406 square miles). Of this, the amount now surveyed and ready for sale was

301,979.307, unsurveyed and unappropriated in Alaska 367,983.506, outside of Alaska 223,992.663; reserved, 151,161.638; appropriated, 704,422.726. Of course a very large part of these unsurveyed lands are mountain or moor, permanently unavailable; but a great quantity is still left worth appropriating. How rapidly this is being taken up will be shown by the following table of operations at the General Land Office for the past five years (year ending 30 June):

	No. original Homestead Entries.	No. acres sold.	Cash sales.
1898.....	44,980	8,453,896.92	\$2,277,995.18
1899.....	45,776	9,182,413.16	3,070,137.34
1900.....	61,270	13,453,887.96	4,379,758.10
1901.....	68,648	15,562,796.30	4,972,160.79
1902.....	98,829	19,488,535.30	6,261,927.18
Total.....	319,503	66,141,529.04	\$21,251,744.98

In other words, of the lands outside Alaska, an amount equal to over $\frac{1}{8}$ was taken up in five years, and 1-27 in a single year. In 1902 there were also given in grants to railroad roads and wagon roads 5,008,131.66 acres. It is evident that in a very few years the last acre of cultivable land will have been disposed of. This process is accelerated by bogus claims used by ranchmen to fence in great quantities of land for grazing purposes, which it is almost impossible for the government fully to suppress. Of the sales, the chief amounts were in Montana, South Dakota, Idaho, Utah, Nevada, and Minnesota, in order of amounts—of course in Utah and Nevada largely for mineral lands.

Land's End, England, a headland in Cornwall, about 60 feet in height, consisting of granite cliffs, and forming the western extremity of England. There is a lighthouse on the rocks, called Longships, about a mile to the west. Here is the entrance to the English Channel from the Atlantic Ocean.

Landscape Gardening — otherwise, as sometimes called, landscape architecture — is a decorative art that so selects and arranges buildings, roads, paths, lawns, trees, and shrubs as to render beautiful the areas needed around houses and within cities and towns. In this reference the term tree means a woody plant with a single trunk, and the term shrub means woody plant with many trunks. The Roman, and subsequently the Italian, villa was supplemented by a garden into which the architectural and sculptural elements of the villa were freely extended. Terraces with stone foundations and balustrades lead down broad stairways to flower gardens disposed in geometric pattern and frequently accompanied by fountains with stone curb and ornate centrepiece. Casino, grotto, pergola, arch, vase, and even statues increased this formal character; and in consistency therewith the trees, shrubs and hedges were pruned or clipped, and sometimes trimmed into geometric shapes, thus making the so-called topiary work. This formal or architectural style was followed, along with other elements of Italian culture, by the French, until in the 17th century Lenôtre gave it a broader treatment more suited to a level country and peaceful conditions. This formal style prevailed also

LANDSCAPE GARDENING

in England until in the same century a naturalistic style arose which has ever since formed the counterpart and rival to the formal style. It discards the statue, reduces architecture to indispensable bridge and shelter, conceals roads and paths, displaces the terrace by the lawn, and the exotic pattern bedding or the flower bed by the flower border. The herbaceous perennials proper to this style are not eclipsed in beauty or fragrance by their exotic rivals; and, with shrubs and trees, they are freed from the shears to attain their full growth. Shrubs and climbers bind house to earth, and furnish boundaries to the grounds, while flowers range in front of them, or are relegated to a separate section. This naturalistic style has spread throughout northern Europe and the United States, being here the favorite with the late F. L. Olmsted (q.v.) in broad, restful effects produced in many city parks of the land.

The city home-grounds must choose one of these styles to exclusion of the other, and at present the natural style generally prevails; but the city or private park, and even the ample country home-grounds, can combine the two by assigning each its distinctive place, namely, the formal style near the residence—provided that be of dignified architectural style—or the city entrance to the park, and the naturalistic style beyond this and next to the fields or the woods. Thus, the Dresden Park, originally small and formal, has been enlarged by naturalistic grounds; while Central Park, New York, planned on the naturalistic scheme, yet includes the Mall ending in a terrace. Indeed, this composite style, as Edouard André names it, may furthermore include, according to favorable conditions, varieties such as a water garden, a bog or marsh garden, a rock garden, a wild garden, and a sub-tropical garden, each with its characteristic shrubs and herbs. The picturesque style, which F. A. Waugh proposes as a third leading style, approximates this wild variety; though, of course, like other varieties, it may easily expand into a whole park, as must happen in a mountainous district. The Japanese gardening also belongs to this variety, which has irregularity as its chief trait. The aviary and animal collection need never occupy more than one section of one of the parks in a metropolitan park system; but free singing birds and playful animals, such as the squirrel, should enliven every park, great or small, and will do so as soon as our predatory habits have yielded to the mild influences of art.

The principles of landscape gardening, like those of other decorative arts, include in the first place conformity to structure; then, unity of style; next, a variety in unity of the art elements known as mass, proportion, balance, surface, line, color, tonality, chiaroscuro, and texture; and, finally, finish and significance. The application of these principles obviously allows ample scope for originality of treatment. Structural conformity includes relation of house to grounds and of these to locality. A complete plan should be prepared for the park, and even for home-grounds, just as it usually is for a house; and no subsequent fancies should be allowed to disturb the integrity of this scheme for the whole. For home-grounds there are ordinarily needed three distinct sections. The first of these is the lawn between the front of the house and the street. If a front fence is

maintained, a border of shrubs should accompany it to give seclusion. Otherwise this border should run along the base of each house and from each house to the next, in order to seclude persons on the veranda or back lawn from the gaze of strangers. The second section is the area at the side and back of the house, which should be enclosed, by hedges or by belts or groups of shrubs, from the other sections and from adjoining properties. This second area should adjoin the living-rooms of the house, and may be simple turf with a flower border along the boundaries—in accord with the naturalistic style, or be divided into terrace, game courts, flower garden, and the like—in accord with the formal style. The third section embraces the kitchen-yard, laundry-yard, and stable, provided with an independent entrance, and screened by lattice with climbers or by shrubs from the street, as well as from other sections. The park structure must regard entrances, roads, paths, game courts, boat-houses, refectory, greenhouse, and the locations suitable for varieties in the composite style.

Unity of style is violated oftenest by introduction of statues or pattern bedding into grounds of the naturalistic style. In the composite style, the pattern bedding, flower garden, or rock garden should be detached from sharp contrast with other elements by hedge, shrubs, or sunken panel. Such unity does not exclude native or acclimated perennials and annuals from use in the home-grounds in front of the hedges or the boundary shrubs, which is, indeed, their ideal place, furnishing a shadowed foil, enlivened by the colors of the flowers.

The prime requisite of variety is that of mass in the grouping of trees or shrubs apart from the lawn or the flower beds. The mere "lover of flowers," untrained in landscape gardening, usually violates this principle by scattering shrubs or trees promiscuously over the grounds at his disposal. Even shrubs or herbs of one kind will be massed with advantage wherever space allows more than one specimen. Such grouping, especially at gateways and prominent curves of roads, will furnish varied views and unexpected beauties; while in other places it will entirely screen ugly objects, or reveal beautiful ones in varying degree. But single shrubs are admissible near the house, walk, or boundary, provided they are specimens of some choice plant.

The variety of proportion in its narrower sense of unequal, vertical divisions, as of a facade or a face, results from placing herbs, shrubs, and trees in this order receding from the house or the centre of the area. This order also gives a curving transition from horizontal ground to vertical tree; and, of course, it also affords each object the best display possible without seriously obstructing another. The whole plantation should be so planned as when mature to be in proportion to the extent of the grounds. In application to gardening, symmetry reduces to balance, that is, an equivalence instead of an equality of parts about a medial line. Variety in surface is secured by sloping, raising, or hollowing the lawn as a whole, and by raised beds or sunken panels for the formal garden. For small areas the concave lawn is best, because giving an effect of greater extent than is really the case. Variety in line must be sought equally in sky line, border line, bed

LANDSEER— LANDWEHR

line, and road line. The naturalistic style achieves this end by ovate curves, otherwise variously known as catenary, infinite, swelling, or sweeping curves. The curves of a road should be justified by a plantation, pool, or other impassable object, and the curves of a border by a larger shrub or a group of herbaceous plants. Bays in a tree border lead into vistas which suggest distance and extent of grounds. The formal style achieves variety in line by geometric curves and angles. Variety in color should be sought, not only in flowering herbs and shrubs, but in trees by introduction of those with yellow or red foliage. But the effects chiefly prized are quiet, restful ones, whereas violent contrasts, especially with geranium and coleus against a mowed lawn in pattern bedding, are generally decried. Brilliant masses in the formal style should be carefully harmonized, or be separated by low shrub hedges, bunches of ornamental grass, white flowers, or gravel walks. Tonality is likely to be violated by dark evergreens placed near light green deciduous trees. The degree to which the beauty of a landscape depends on chiaroscuro is fully revealed only by the photograph, which omits the colors that always accompany light and shade in nature. The same grouping that gives mass secures chiaroscuro also. Texture in a plant depends upon the number, shape, disposition, and tissue of its leaves, and varies widely from one plant to another. It therefore supplies an element of variety distinct from the size, shape, or color of the plant, be it herb, shrub, or tree. It is obvious that all the above mentioned qualities must be supplemented by a careful finish, which calls for constant care.

Finally, landscape gardening, like all other arts, has significance besides form. It reveals nature's patience, kindness, and serenity; and thus proves to be the great restorative to men jaded with life's cares. Again, the simple and healthful pleasures of outdoor life moderate the ever increasing demand for the expensive and wasting luxuries of our modern society. Moreover, the landscape designer can convey the simplicity, boldness, or dignity of his own creative mind to the impressionable observer by means of landscape gardening.

EDMUND BUCKLEY,
Editor 'University Lessons in Art.'

Landseer, Sir Edwin Henry, English painter: b. London 7 March 1802; d. 1 Oct. 1873. Hampstead Heath was the scene of some of his early studies, and on one of his early productions now at Kensington his father has written "at the age of five." Following the advice of Haydon he studied the Elgin Marbles, the wild beasts, in the Tower and Exeter Exchange, and dissected every animal whose carcass was obtainable. His life is merely the record of his works. In the Academy's exhibition for 1815 he exhibited the 'Portrait of a Mule,' and the 'Heads of a Pointer-Bitch and Puppy.' In 1818 he contributed several studies of animals to the Academy and the British Institution. In that year a picture exhibited at the exhibition of the

Oil and Water Color Society in Spring Gardens, 'Fighting Dogs Getting Wind,' secured great applause. In 1820 he painted his 'Dogs of St. Gotthard.' In 1821 he exhibited 'Ratcatchers,' a 'Prowling Lion,' and other works of great spirit. In 1822 he received the premium of £150 from the British Institution for the 'Larder Invaded.' The 'Cat's Paw' appeared at the Academy in 1824, and was sold for £100. In 1826 he was elected A.R.A., and in 1830 became R.A. In 1827 he exhibited 'The Return from Deer-Stalking'; a 'Fire-side Party,' 1829; 'High Life,' and 'Low Life,' 1831; 'Spaniels of King Charles' Breed,' 'A Jack in Office,' 1833; 'Bolton Abbey in the Olden Time,' 1834; 'The Drover's Departure,' 1837; 'The Return from Hawking,' and the 'Shepherd's Chief Mourner,' 1837; a 'Distinguished Member of the Humane Society,' and 'There's Life in the Old Dog Yet,' 1838; in 1840, 'Laying Down the Law'; in 1844, 'Coming Events Cast Their Shadows Before,' and in 1846, 'The Stag at Bay'; in 1849, 'The Forester's Family'; in 1850, 'A Dialogue at Waterloo'; in 1851, 'A Scene from the Midsummer Night's Dream'; in 1853, 'Night and Morning,' and 'The Children of the Mist.' His later works include, 'Saved,' 'Deer-Stalking,' 'A Flood in the Highlands,' 'Wild Cattle at Chillingham,' his celebrated work of sculpture, the Lions in Trafalgar Square, and others. Landseer's pencil was productive, and besides many works not here named he produced portraits of horses, dogs, and other animals. In 1850 he was knighted; in 1855 he received the gold medal of the Paris exhibition. He declined the presidency of the Royal Academy offered him on the death of Sir Charles Eastlake (1865).

Land'slide, or Landslip, the slipping or sliding of land, through the failure of supporting strata, from its original position. They are due to a variety of causes. Water, particularly in its changing forms through frost and thaw, is the chief agent in their production. The wearing away of supports by water, the cracking of underlying materials by summer droughts, and the rending of existing crevices by the thawing of water frozen in them, are some of the commonest modes by which they are brought about. Sometimes a mass of land resting on an inclined bed slides for a considerable distance before it is arrested by a level surface; thus, in 1772, the Solway Moss, loosened by excessive rains, rolled over 400 acres of cultivated land, reaching in some parts to the roofs of the houses. The fall of the Rossberg in Switzerland, and the slip at Charmouth, near Lyme Regis, are other familiar instances. In 1902, in British Columbia a remarkable landslide occurred destroying an entire mountain village and causing the death of nearly 100 persons.

Landsturm, länt'stoorm, in Germany, a local militia, consisting of those of the reserve who are too old to serve in the LANDWEHR (q.v.). The landsturm is never called on to serve out of its own district except in case of invasion.

Landwehr, länt'vär ("national defense"), in Prussia, a term applied to that part of the military force of the state which is not kept constantly under arms, but during peace follows ordinary trades, and is only summoned into

LANE

active service on the breaking out of war or some internal emergency. In 1805 Austria organized a landwehr; a Russian landwehr was employed in 1812; and in 1871, the system was extended to the whole German empire.

Lane, Anna Eichberg King, American author: b. Geneva, Switzerland, 1856. She is daughter of the late Julius Eichberg (q.v.), a distinguished Boston musician, and received her early education in that city. Her first husband was Tyler Batcheller King, of Boston; in 1868 she was married to John Lane, the publisher, of London and New York. She has written many short stories and poems, among the latter being her national hymn, 'To Thee, O Country!' Her prose writings include: 'Brown's Retreat,' 'Kitwyk,' and 'American Wives and English Housekeeping.'

Lane, Edward William, English Orientalist: b. Hereford 17 Sept. 1801; d. Worthing, Sussex, 10 Aug. 1876. He published 'Manners and Customs of the Modern Egyptians' (1836), and made one of the most famous translations of the 'Arabian Nights' (1838-40). This work was the first translation of consequence into English which was made directly from the Arabic, all previous translations having been made through the French. It contained valuable illustrations and numerous scholarly and indispensable notes. The translations of Burton and Payne were subsequent to it. The world is indebted to him for many valuable works on Egypt, and especially for his 'Arabic-English Lexicon' (1863-74), which cost him 20 years of unremitting labor. The succeeding parts came out from 1877 to 1882 under the editorship of S. Lane-Poole, the whole forming a dictionary indispensable to the student of Arabic. See ARABIAN NIGHTS.

Lane, George Martin, American educator: b. Charlestown, Mass., 24 Dec. 1823; d. Cambridge, Mass., 30 June 1897. He was graduated from Harvard in 1846 and after four years at the universities of Berlin and Göttingen returned to America and became professor of Latin at Harvard in 1851. He held this chair until 1894 when he became professor emeritus. He published 'Latin Pronunciation' in 1871, in which he contended for the continental pronunciation of the language as against the 'English method.' He left unfinished a Latin Grammar, completed by Morgan (1898). The famous ballad of 'The Lone Fishball' was written by Professor Lane.

Lane, Henry Smith, American politician: b. in Montgomery County, Ky., 24 Feb. 1811; d. 1881. He studied law, and was admitted to the bar; removed to Indiana in 1832, and while engaged in his profession became prominent in Whig politics. After serving as State senator (1837), he was twice elected to Congress (1838 and 1840), and in the Mexican War lieutenant-colonel of an Indiana regiment. The dissolution of the Whig party was followed by a preliminary organization which led to the formation of the Republican party, and in this movement Lane was conspicuous, acting with other leaders who planned the first Republican national convention, held in Philadelphia in 1856, and of which he was permanent chairman. A coalition of Republicans with members of the disappearing American party in 1859

elected him to the United States Senate, but after a contest he was unseated in favor of his Democratic competitor. He was elected governor of Indiana in 1860, and in the same year became United States senator, serving one term.

Lane, James Henry, American politician and soldier: b. Lawrenceburg, Ind., 22 June 1814; d. Leavenworth, Kan., 11 July 1866. He was admitted to the bar in 1844, enlisted as private in an Indiana regiment in 1846, served in the Mexican War, became colonel, and at Buena Vista commanded a brigade. Returning from the war, he was elected lieutenant-governor of Indiana; from 1853 to 1855 was a Democratic representative in Congress; in the latter year removed to Kansas, joined the Free-State party, acted as president of the Topeka and Leavenworth constitutional conventions, and became major-general of the Free-State forces. In 1856 the Free-State legislature elected him to the United States Senate, but he was not allowed to sit. He was a prominent actor in turbulent scenes, and was twice indicted, once for treason and again for murder: on the second charge he was tried and acquitted. In 1861 Kansas was admitted to the Union, and Lane was elected United States senator, but entered the Federal army and in the same year was appointed brigadier-general of volunteers, serving with ability until March 1862, when his commission was canceled. The 'Great Southern Expedition' from Kansas (1861-2) and other military schemes of the period were conceived by Lane, but came to nothing. As commander for recruiting in the Department of Kansas (1862) he came into collision with the State authorities and was charged with attempted usurpation. In 1865 he was again elected to the United States Senate, suffered from paralysis in the following year, and died by his own hand.

Lane, Joseph, American soldier and politician: b. Buncombe County, N. C., 14 Dec. 1801; d. Oregon 19 April 1881. In 1816 he went from Henderson County, Ky., to Warwick County, Ind., where he was for some time clerk in a mercantile establishment, and in 1822-46 served in both houses of the State legislature. He resigned from the senate in 1846 to enlist as a private in the 2d Indiana volunteers, was soon commissioned colonel of the regiment, and in the same year was promoted brigadier-general. He was wounded at Buena Vista, defeated Santa Anna at Huamantla, and was brevetted major-general, U. S. A., for this service. After the Mexican War he was appointed governor of Oregon territory, was Democratic delegate from Oregon to Congress in 1851-7, defeated the Rogue Indians at Table Rock in 1853, and in 1859-61 was a United States senator. He was nominated for the vice-presidency in 1860 on the unsuccessful Breckinridge ticket.

Lane, Sir Ralph, English administrator in America: b. Northamptonshire, England, about 1530; d. in Ireland 1604. In 1583-4 he held a command in Ireland, in 1585 took the direction of the colony that Raleigh was establishing in Virginia, sailed in that year in the fleet commanded by Sir Richard Grenville, and was left with 107 colonists at Roanoke Island, while the fleet returned to England (25 August). He was thus the first governor of Virginia. The

LANE — LANG

location proved unsuitable, provisions ran low, and there was trouble with hostile Indians. On 19 June 1586 the colony sailed for England in the fleet of Sir Francis Drake. In 1589 Lane was a colonel in Drake's expedition against Portugal, and in 1591 helped to quell a rebellion in Ireland. Letters by him may be read in Hawks' 'History of North Carolina' (1857); and in Hale (editor), 'Archæologia Americana,' Vol. IV. (1860).

Lane, William Coolidge, American librarian: b. Newton, Mass., 29 July 1859. He was graduated at Harvard in 1881, and was assistant librarian there from 1887 to 1893, when he became librarian of the Boston Athenæum, continuing in that position until 1898, since when he has been the librarian of Harvard University. From 1886 to 1900 he served as secretary and treasurer of the publishing board of the American Library Association, and in 1898–9 was president of the association.

Lane-Poole, Stanley, English archæologist: b. London 18 Dec. 1854. He is a nephew of E. W. Lane, the Orientalist (q.v.). He was educated at Corpus Christi, Oxford; in 1874–92 was employed in the coin department of the British Museum; was sent by the British government on archæological missions to Egypt (1883) and Russia (1886); was employed by the Egyptian government in archæological research at Cairo (1895–7); and in 1898 became professor of Arabic in Trinity College, Dublin. Among his works are: 'Social Life in Egypt' (1883); 'The Moors in Spain' (1887); 'Saracenic Egypt' (1900); 'Medieval India' (1902); and 'The Story of Cairo' (1902). He also edited many volumes, and prepared the extensive catalogue of the Oriental and Indian coins in the British Museum (1875–92).

Lane Theological Seminary, a divinity school founded at Cincinnati, Ohio, 1829. It was opened for students three years after its foundation, and its endowment in 1902 amounted to \$480,929; its income \$18,078; it had five instructors and 20 students. Although it is under the control of the Presbyterian Church it receives students from other reformed bodies. No tuition fees are charged, board is low, and there are 39 scholarships, each of the value of \$2,000. The college stands on a lot of sixty acres; there are five professors' houses, and a library containing 19,000 volumes.

Lanessan, Jean Antoine de, zhōn āñ-twāñ dē lāñ-ē-sāñ, French naturalist and publicist: b. Saint-André-de-Cubzac, Gironde, 13 July 1843. He entered the health corps of the French marine service, after studying medicine at Bordeaux, and was engaged as surgeon on the coast of Africa and China until the Franco-Prussian war. He was elected to the National Assembly in 1881, and came into notice as a republican journalist. Being interested in colonial matters he was appointed governor-general of Indo-China in 1891; and his writings have done much to promote French colonization. His principal works are: 'De Proto-plasme végétal' (1876); 'La Matière, la Vie et les Etres Vivants' (1879); 'L'Expansion Coloniale de la France' (1888); 'Principes de Colonisation' (1897).

Lanfranc, lāñ'frāñ (Fr. lāñ-frāñ), Anglo-Norman ecclesiastic, the first archbishop of

Canterbury after the Norman Conquest: b. Pavia, Italy, about 1005; d. Canterbury, Kent, 24 May 1080. After studying law in his native city he left Italy about 1039, and founded a school of law at Avranches, which soon became one of the most popular in Europe, but entered the Benedictine monastery of Bec, and in 1046 was chosen its prior. About 1053 he came into close relations with William of Normandy, and though he at first condemned William's marriage with his cousin, he afterward (1059) went to Rome to procure the papal dispensation for it. William accordingly made him prior of his new foundation, the abbey of St. Stephen at Caen (1062), and in 1070 made him archbishop of Canterbury in place of Stigand. Lanfranc was William's most valued counsellor and continued in the reign of William Rufus to exercise great influence in the government of England. See Freeman, 'History of the Norman Conquest.'

Lanfrey, Pierre, pē-är läñ-frā, French historian and publicist: b. Chambéry 26 Oct. 1828; d. Pau, France, 15 Nov. 1877. He was educated in the Jesuit college of his native town and in Paris, and became well known by the publication of works in support of political and religious liberalism. These include: 'L'Eglise et les Philosophes au XVIII. Siècle' (1855); 'Essai sur la Révolution Française' (1858); 'Histoire Politique des Papes' (1860); 'Lettres d'Everard' (1860), a social novel in epistolary form; 'Le Rétablissement de la Pologne'; and 'Etudes et Portraits Politiques' (1863). His most important work is a 'History of Napoleon I.' (1867–75), which is strongly hostile to Napoleon. It was left incomplete at his death. In 1871 he was elected to the National Assembly by the department of Bouches-du-Rhone, and took his seat with the republican left. He was ambassador at Berne 1871–3, and in 1875 he was elected a life senator.

Lang, Andrew, Scottish author: b. Selkirk 31 March 1844. He was educated at St. Andrews and at Balliol College, Oxford; was elected fellow of Merton, Oxford, in 1868; in 1888 was appointed Gifford lecturer on natural religion at St. Andrews; became a constant contributor to periodical literature; and published an extensive list of volumes on a wide variety of subjects, being recognized as the most versatile of present-day writers. His wide learning appears in his prose renderings of the 'Odyssey' (1879; with Butcher), and the 'Iliad' (1882; with Myers and Leaf), and 'Homer and the Epic' (1893), a defense of the unity of the poems; in his works on comparative mythology and religion, 'Custom and Myth' (1884), 'Myth, Ritual, and Religion' (1887; new ed. 1899); 'The Making of Religion' (1898), and 'Magic and Religion' (1901); and in his studies of Scottish history, such as 'A History of Scotland from the Roman Occupation' (1900 et seq.). Some of the most interesting of his work is to be found in 'Letters to Dead Authors' (1886); 'Letters on Literature' (1889); 'Angling Sketches' (1891); 'Essays in Little' (1891), and other causeries. He published also collections of *vers de société*, 'Ballades in Blue China' (1880), and 'Rhymes à la Mode' (1884); and further in verse, 'Ban et Arrière Ban' (1894), and his most ambitious poem, 'Helen of Troy' (1882). Mention should also

LANG—LANGEVIN

be made of 'Cock-Lane and Common Sense' (1894), a discussion of the spiritualistic question; and the biographies of Lockhart (1896) and Tennyson (1901).

Lang, Benjamin Johnson, American musician: b. Salem, Mass., 28 Dec. 1837. He studied music under his father, an organist and piano-forte teacher, and at 15 began work as teacher and organist. In 1855 he went to Germany for further study, which for three years he pursued under the instruction of Liszt, Albert Jaell, and others. Returning to Boston, he at once attained prominence as organist, pianist, teacher, and conductor; became organist of the Handel and Haydn Society in 1859, and conductor of the same in 1865; conductor of the Apollo Club in 1868; and of the Cecilia Society in 1874. In 1869 he made a second visit to Europe, and gave concerts in Berlin and other cities. As a member of the concert committee of the Harvard Musical Association he has done much in the interest of musical culture, and through this and other organizations has secured the production of many new works. The introduction of Wagner to the American public was in no small part due to his presentation of that master. While he has accomplished much work as a composer, few of his compositions have been published.

Lang, John Marshall, Scottish Presbyterian clergyman and author: b. Glasford, Lanarkshire, 4 May 1834. After completing his education at Glasgow University he took charge of several churches in succession, but returned to Glasgow in 1873, and was appointed to the Barony Church, where he had previously been installed in 1865, but left it for Edinburgh in 1868. In 1900 he was elected vice-chancellor and principal of Aberdeen University. He is the author of 'Gnostic Sects and Heresies' (1873); 'Heaven and Home' (1875); 'The Last Supper of Our Lord' (1881); 'Life: Is it Worth Living?' (1883); 'Ancient Religions of Central America' (1882); 'The Church and the People' (1893).

Lang, Margaret Ruthven, American composer: b. Boston 27 Nov. 1867. She studied the pianoforte under her father, B. J. Lang (q.v.); the violin under Louis Schmidt in Boston, and (1886-7) with Drechsler and Abel in Munich; composition with Victor Gluth in Munich; and orchestration (1887) under G. W. Chadwick, Boston. Her piano solos, songs, etc., have been received with high appreciation in musical circles; her 'Dramatic Overture' has been performed by the Boston Symphony Orchestra, and the Chicago Orchestra has several times given 'Witichis,' Theodore Thomas conducting.

Lang, Wilhelm, vil'hēlm läng, German journalist and essayist: b. Tuttlingen 16 July 1832. Among his works are: 'Michelangelo Buonarrotti as a Poet' (1861); 'David Friedrich Strauss' (1874); 'Wanderings in Peloponnesus' (1878); 'From Suabia: History, Biography, Literature' (in 7 parts, 1885-90), a collection of delightful essays; 'The German Party in Würtemberg 1866-91' (1892).

Lang'bridge, Frederick, English clergyman and author: b. Birmingham 17 March 1849. He was graduated at Oxford University and adopted the profession of private tutor and schoolmaster. He is now rector of St. John's, Limerick. He has published 'Gaslight and

Stars' (1892); 'A Cracked Fiddle' (1892); 'Ballads for the Brave' (1890); 'Love Has no Pity' (1901); etc.; and many books for young people.

Lang'dell, Christopher Columbus, American lawyer: b. New Boston, Hillsborough County, N. H., 22 May 1826. He studied at Harvard, was graduated from its law school in 1853, in 1853-70 practised in New York, in 1870 became professor of jurisprudence in the Harvard law school, and in 1871 dean of the law school faculty. In 1895 he retired. He was an originator of the so-called "case" system of legal study, and was otherwise prominently identified with the progress of professional education in this country. His publications include: 'Selection of Cases on the Law of Contracts' (1870; enlarged ed. 1877); 'Cases on Sales' (1872); 'Summary of Equity Pleading' (1877; 2d ed. 1883); and 'Cases in Equity Pleading' (1878).

Lang'don, John, American statesman: b. Portsmouth, N. H., 25 June 1741; d. there 18 Sept. 1819. At the outbreak of the Revolutionary War he embarked in the patriotic cause, and in 1775 he was a delegate to the Continental Congress, but resigned office in June 1776, on becoming navy agent. In 1777, while speaker of the New Hampshire assembly, he pledged a large portion of his property for the purpose of equipping the brigade with which Stark defeated the Hessians at Bennington. Subsequently he was a member and Speaker of the State legislature, a member of the Continental Congress, a delegate to the convention which framed the Constitution of the United States, and president of New Hampshire. He was one of the first United States senators from New Hampshire, which office he held until 1801. In politics he acted with Jefferson, who upon assuming office in 1801 offered him the post of secretary of the navy, which he declined. From 1805 to 1812, with the exception of two years, he was governor of New Hampshire; and in 1812 he was offered by the Republican congressional caucus the nomination for the office of vice-president of the United States, which, on the score of age and infirmities, he declined. The remainder of his life was passed in retirement.

Langdon, Samuel, Congregational clergyman and educator: b. Boston, Mass., 1723; d. Hampton Falls, N. H., 1797. He was graduated from Harvard in 1740 and was pastor at Portsmouth, N. H., 1747-74. In 1774 he became president of Harvard, resigning in 1780. In the New Hampshire Convention he ardently advocated the ratification of the Federal Constitution.

Lange, läng'é, Julius Henrik, Danish art critic: b. Vordingborg 10 June 1838. After leaving the University of Copenhagen he traveled in Italy, and thereafter devoted himself to study of the history of art. Among his works are: 'On Art Values' (1876); 'Danish and Foreign Art' (1879); 'Gods and Men in Homer' (1881); 'Art and Politics' (1885); 'Bastien Lepage and Other Painters' (1889); 'Thorwaldsen's Representation of the Human Figure' (1893).

Langevin, läñzh-väñ, Sir Hector Louis, Canadian statesman: b. Quebec 26 Aug. 1826. He was called to the bar in 1850, was editor of the 'Mélanges Religieux' in 1847, and of the 'Courrier du Canada' ten years later, and was

LANGEVIN — LANGLEY

appointed Queen's Counsel in 1864. Entering the Canada Assembly he became a member of the executive council, and at the union of the provinces in 1867 was made secretary of state for Canada, was subsequently minister of public works (1869-73); postmaster-general (1878); and minister of public works (1879). He retired from public life in 1891.

Langevin, Jean François Pierre La Force, zhōn frāñ-swā pē-är lä förs, French-Canadian Roman Catholic bishop: b. Quebec 22 Sept. 1821; d. 26 Jan. 1892. He was educated at the Quebec Seminary, was ordained priest in 1844, and consecrated bishop of Ramonski in 1867. In 1870 he founded the College of Ramonski, and in 1886 was appointed assistant to the apostolic throne. Among his publications were: 'Histoire du Canada en Tableaux' (1860); 'Cours de Pédagogie' (1865).

Langevin, Louis Philip Adelard, Canadian Roman Catholic prelate: b. St. Isidore, La Prairie County, Quebec Province, 23 Aug. 1855. He was educated at Montreal College; studied theology at the Sulpician Grand Seminary and St. Mary's College, Montreal; was ordained priest in 1882; was appointed professor of moral theology in the Catholic University of Ottawa; and in 1893 became rector of St. Mary's Church of Winnipeg. In 1895 he took office as archbishop of St. Boniface, Manitoba. He founded many parishes, and educational and missionary institutions.

Lang'ford, John Alfred, English journalist and lecturer: b. Birmingham 12 Sept. 1823. He has worked on the editorial staff of the Birmingham *Daily Press*, *Daily Gazette* and *Morning News*. He was teacher of English literature in the Birmingham and Midland Institute (1868-74). His publications include poems, essays, local histories, the chief of which are 'Prison Books, and Their Authors' (1861); 'The Praise of Books' (1880); 'A Century of Birmingham Life' (1868); 'Staffordshire and Warwickshire, Past and Present' (1874); 'A Life for Love, and Other Poems' (1900); etc.

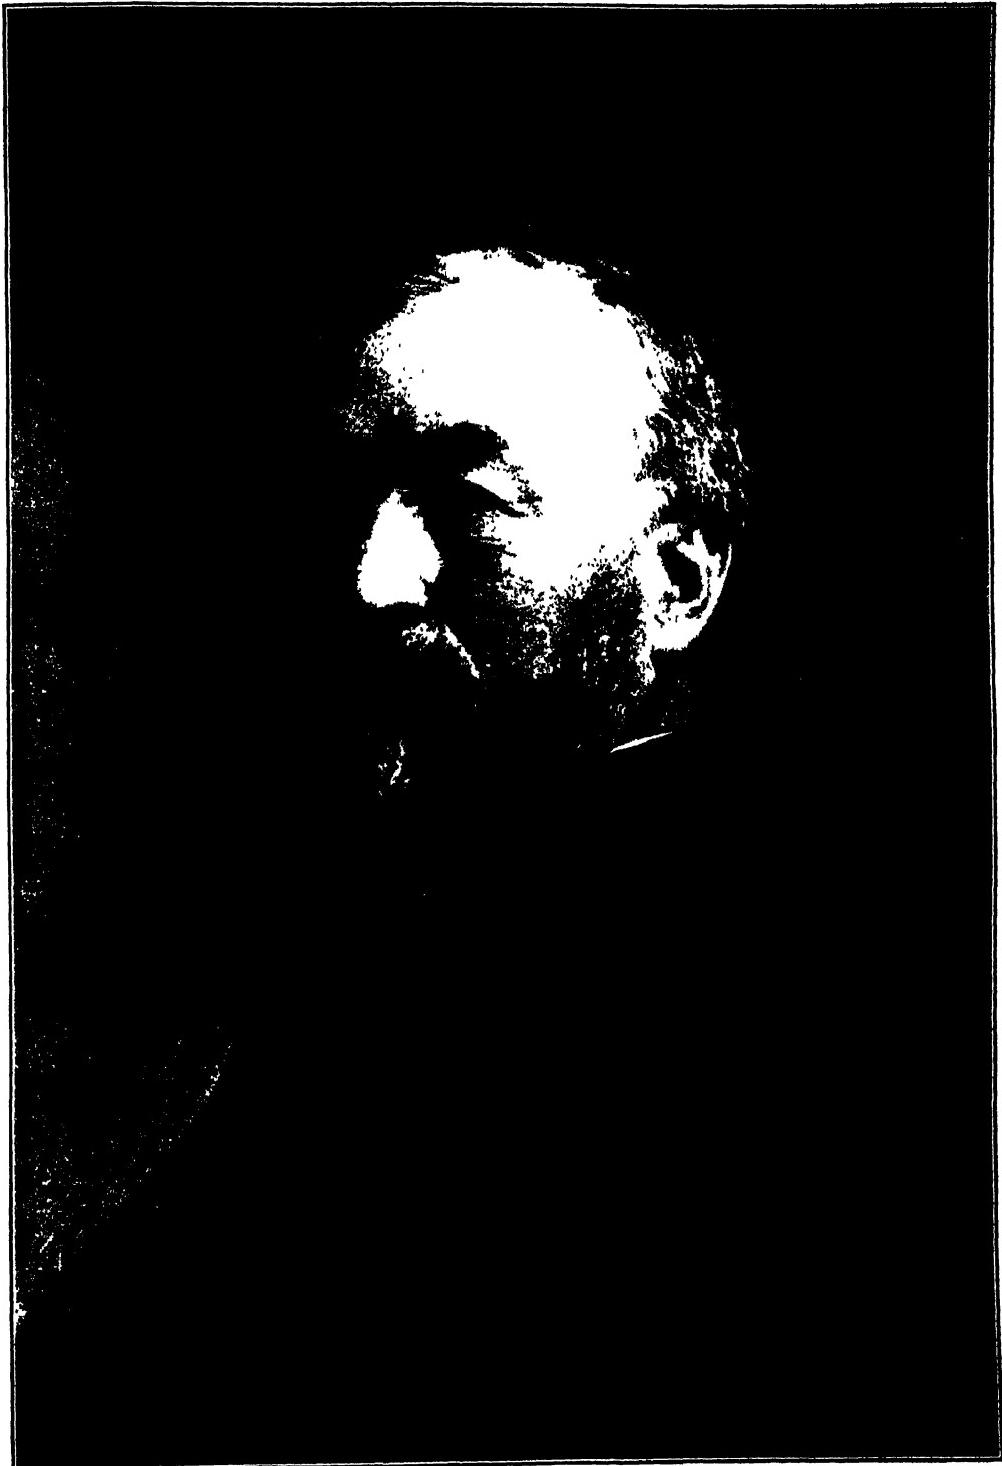

Lang'horne, John, English poet and translator of Plutarch: b. Kirkby Stephen, Westmoreland, March 1735; d. Blagdon 1 April 1779. Having taken orders, he became a curate in Essex in 1761, and rector of Blagdon, Somerset, in 1766. In 1777 he was installed a prebendary of Wells Cathedral. He wrote verses and stories once popular, but he is remembered now only by the translation of Plutarch's Lives which he made with his brother William (1721-72). This work, originally published in 1770, has passed through many editions.

Langland, läng'länd, Langeland, or Longland, William, English poet: b. Cleobury Mortimer, about 1332; d. about 1400. Little is known of him except from tradition, according to which he was educated at Oxford, and became a monk of Malvern. The familiarity of the author with the Scriptures and the church fathers indicates that he was an ecclesiastic; several local allusions in the poem, and the fact that its scene is the "Malverne Hilles," prove that it was composed on the borders of Wales; and internal evidence fixes its date at about 1362. It narrates the dreams of Piers Ploughman, who, weary of the world, falls asleep beside a stream in a vale among the Malvern hills; and while satirizing in vigorous allegorical descrip-

tions the corruptions in church and state, and the vices incident to the various professions of life, and painting the obstacles which resist the amelioration of mankind, presents the simple plowman as the embodiment of virtue and truth, and the representative of the Saviour. Its ancient popularity appears from the large number of MS. copies still extant, most of them belonging to the latter part of the 14th century. It was a favorite of religious and political reformers, and several imitations of it appeared, the most important of which was 'Piers Ploughman's Crede,' written about 1393 by some Wycliffite, assailing the clergy, and especially the monks. In 1550 the 'Vision of Piers Ploughman' was printed by the reformers, and so favorably received that three editions were sold within a year. This poem is a remarkable example of a system of verse, derived from the Anglo-Saxons, and marked by a regular alliteration instead of rhyme. There are two classes of manuscripts, which give the text with considerable variations. The best edition both of the 'Vision' and the 'Crede' is that of Wright (1856, new ed. 1897); and of the 'Vision,' that of Skeat (1886). Consult Jusserand, 'Piers Plowman: a Contribution to the History of English Mysticism' (1893), and 'Literary History of the English People' (1894).

Langley, läng'lī, Samuel Pierpont, American astronomer and physicist: b. Roxbury, Boston, 22 Aug. 1834. He entered the practice of architecture and civil engineering, became an assistant in the Harvard Observatory in 1865, and later assistant professor of mathematics in the United States Naval Academy, and in 1867 was appointed director of Allegheny Observatory. In 1887 he became secretary of the Smithsonian Institution. He organized in 1881 an expedition to Mount Whitney, Cal., where he was successful in re-establishing the color constant and in extending the invisible solar spectrum. He also devised the bolometer, or thermic balance, a contrivance for detecting minute differences of radiant heat and measuring accurately to less than one ten thousandth of a degree Fahrenheit. His name became generally known through his ineffective experiments in connection with the problem of mechanical flight. A sum of \$5,000 was voted him by Congress for the carrying out of his ideas. The general plan of his airship as tested consisted in the use of the aéroplane as a means of support; but neither this support nor the propulsive power was found adequate. Among his writings are: 'The New Astronomy'; 'Experiments in Aéro-Dynamics'; and 'Internal Work of the Wind.'

Langley, Walter, English painter: Birmingham, England, 1852. After attending the National School, Birmingham, he qualified himself as a lithographer, meanwhile studying in the local school of art. He there gained the National scholarship and studied at South Kensington two years; settled in Newlyn, Cornwall, 1882. He had been awarded a gold medal for painting both at Paris and Chicago. Among his watercolor paintings are: 'Among the Missing'; 'Departure of the Fleet'; 'Disaster'; 'After the Storm.' His oil paintings include: 'Never Morning Wore to Evening but Some Heart Did Break'; 'Motherless'; 'Bread-winners'; etc.

SAMUEL PIERPONT LANGLEY,
SECRETARY OF THE SMITHSONIAN INSTITUTION.

LANGOBARDI — LANIER

Langobardi, län-gō-bär'di. See LOMBARDS.

Lang'shan, a breed of small, active "Asiatic" fowls, long held in esteem by poultry-raisers; cocks weigh 10 pounds. Two varieties are approved—the pure white and the glossy black. See Poultry.

Lang'ston, John Mercer, American educator: b. in Louisa County, Va., 14 Dec. 1829; d. Washington, D. C., 15 Nov. 1897. He was born a slave, but when six years old was emancipated, and in 1849 was graduated at Oberlin College, where he was also (1853) a graduate in theology. Admitted to the bar in Ohio (1854), he practised law in that State for 13 years, and in 1869 was appointed professor of law at Howard University, Washington, D. C.; became dean of the law department, and in 1873 vice-president of the university. In 1871 he was appointed a member of the board of health of the District of Columbia, and was afterward elected secretary of the District. From 1877 to 1885 he was United States minister and consul-general in Haiti, and when he returned to this country he was made president of the Virginia Normal and Collegiate Institute at Petersburg. He was elected to Congress in 1888. He published "Freedom and Citizenship," a collection of addresses (1883).

Lang'ton, Stephen, English cardinal: b. about 1150; d. Slindon, Sussex, 9 July 1228. He was educated at Paris and while on a visit to Rome in 1206 Innocent III. created him a cardinal and nominated him to the see of Canterbury, consecrating him archbishop next year. King John refused to allow Langton to take possession of his see, and it was not till England had been placed under an interdict, John excommunicated and threatened with deposition, that the king yielded. Langton was acknowledged in 1213, and in August joined the insurgent barons, and acted with them in compelling John to sign Magna Charta. He crowned Henry III., and in 1223 demanded of him the full execution of the charter. He was the author of some theological treatises, and the division of the Bible into chapters has usually been attributed to him. Consult: Hook, "Archbishops of Canterbury."

Lang'try, Lily, English actress: b. Island of Jersey 1852. She was the daughter of the Rev. W. C. Le Breton, Dean of Jersey, and as the "Jersey Lily" (a name given by Millais to the portrait of her which he had painted) was famous for her singular beauty and social graces. In 1881 she made her first appearance on the stage at the Haymarket Theatre in "She Stoops to Conquer." She paid several professional visits to the United States, and in 1903 she starred in a play written by herself in collaboration with J. Hartley Manners.

Language. See ETYMOLOGY; PHILOLOGY; SCIENCE OF LANGUAGE; SPEECH; WRITING.

Languedoc, läng'gwē-dök (Fr. län-gé-dök), France, a former province, now forming the departments of Aude, Tarn, Hérault, Lozère, Ardèche, and Gard, as well as the arrondissements of Toulouse and Villefranche, in the department of Haute-Garonne; and the arrondissements of Puy and Yssingeaux, in the department of Haute-Loire.

Langur, län-goor', a monkey of the genus *Semnopithecus*, represented by numerous large

leaf-eating species from Ceylon and India eastward to China and Borneo. They form a transition group between the gibbons and the catarrhine monkeys, and include a large number of well-known species, with long hind legs and tails and no cheek-pouches, such as the entellus, or sacred monkey of India, the wanderoos of Ceylon, the lutongs of the Malayan islands, and several less known forms.

Lanier, la-nér', Clifford Anderson, American author: b. Griffin, Ga., 24 April 1844. He studied at Oglethorpe College, leaving at the end of his sophomore year, desiring to enter the Confederate army, for which, however, he was then too young. In 1862 he volunteered as a Georgia soldier; served in Virginia; was signal officer of a blockade-runner in 1864, and suffered shipwreck. In 1865 he became superintendent of schools at Montgomery, Ala. He has written "Thorn Fruit," a novel; "The Mate's Race with the Banshees"; "Love and Loyalty at War," and other stories; "Dialect Poems," with his brother, Sidney Lanier (in Poems of the latter); "Apollo and Keats on Browning, and Other Verses" (1902); etc.

Lanier, Sidney, American poet: b. Macon, Ga., 3 Feb. 1842; d. Lynn, N. C., 7 Sept. 1881. His father, Robert Lanier, a lawyer of Macon, came from a family noted for a love of music and art. An ancestor, Jerome Lanier, a Huguenot refugee, was well known at the court of Queen Elizabeth as a musical composer; another forebear, Nicholas Lanier, was director of music at the court of James I. and Charles I., and first marshal of the Society of Musicians incorporated at the Restoration. Sidney Lanier's mother, Mary Anderson, belonged to a prominent Virginia family also noted for decided talent for music and poetry. The poet's artistic temperament was therefore a direct inheritance. As a child Lanier was passionately fond of music and without any instruction learned to play on the guitar, piano, flute, and violin. A critic said of him in later years: "In his hands the flute was transformed into a voice that set heavenly harmonies into vibration." This passion for music also showed itself in his keen sensitiveness to rhythmic effect. At 14 he entered the sophomore class of Oglethorpe College, Georgia, and after three years graduated with distinction. He was tutor in the college until the outbreak of the Civil War, when he joined the Confederate army as a private soldier. He fought in several important battles, was transferred to the signal service, and finally became signal officer of a blockade runner. In the autumn of 1864 he was captured and confined in Point Lookout Prison. He had taken advantage of every leisure moment to pursue his studies in literature, modern languages, and music, and during his long idle hours in prison he gained a complete mastery of the technique of the flute. He was released in February 1865, and made his way on foot to Macon, but the fatigue of the journey added to the previous hardships of camp and prison caused a severe illness which did irreparable damage to his lungs. The years that followed were years of hand-to-hand fight for a subsistence. For two years he was clerk in a hotel in Montgomery, and there wrote his novel "Tiger Lilies," a book of power and promise, but hastily written and poorly sustained; he taught at Prattville, Ala.,

LANIGAN — LANMAN

and studied and practised law with his father for five years in Macon. In December 1867 he married Miss Mary Day of Macon, and her belief in his genius, her willingness to endure with him privation and hardship made possible the valiant struggle and the achievement of the next 14 years. In the autumn of 1873, after an unsuccessful attempt to re-establish his health by a winter in Texas, he determined to move to Baltimore, where he could find greater opportunities for culture. He played the flute in the Peabody orchestra; in the intervals of hemorrhage he wrote articles for magazines; he gave lectures on literature in private schools; and thus, with the generous aid of his father, he supplied the necessities of his family. His study of languages, of Anglo-Saxon and early English texts, of English and of foreign literature, was incessant and systematic. In February 1879 he was appointed lecturer on English literature at the Johns Hopkins University, and this position he held until his death. His two principal courses of lectures at the university are embodied in his 'Science of English Verse' (1879), a thorough and suggestive treatise on English metre, declaring that English verse depends on stress, not accent, and that it is based on certain easily recognized musical rhythms, and 'The English Novel' a masterly treatment of the development of the idea of personality and its place in the modern novel. Again and again Lanier was driven by illness to Texas, to Florida, to North Carolina, but he was never idle; he studied much, he thought largely on all vital subjects, on love, life, art, economics, religion, and now and then he gave to the world poems of exquisite truth and beauty. In the spring of 1881 it became evident that the unequal fight was nearing its end, and as a last resort he tried tent life in the mountains of North Carolina. The last illness came at Lynn, in Polk County, and on a morning of early September he passed away.

Lanier's most important prose works besides those already mentioned are: 'The Boy's Froissart' (1878); 'The Boy's King Arthur' (1880); 'The Boy's Mabinogion' (1881); 'The Boy's Percy' (1882); 'Shakespeare and his Forerunners' (1902). His best known poems are: 'Hymns of the Marshes'; 'Clover'; 'The Song of the Chattahoochee'; 'The Crystal'; 'Corn'; 'The Symphony', and 'The Centennial Meditation.' The distinctive characteristics of his poetry are a wholesome outlook upon life, a constant recognition of the highest in character and in thought, and a varied fresh and melodious rhythm. His passion for good and love, his robustness, his high conception of the meaning and power of the love of man and woman, proclaim his close kinship to Browning. In questions of social economics Lanier was abreast of his time; he believed in the rights of the individual, he hated the iron hand of unjust trade, but he realized that these problems must be solved in the "patient modern way." He knew that the great poet must be an artist in sound and color, as well as a thinker, and that no labor was too arduous for perfecting verse forms; to attain perfection in his art the poet must make the mechanical verse fulfil its vast possibilities, he must gain the mastery over imagination, so that imagination may become his servant. But for Lanier there was no art for art's sake; art was consecrated to man and to God. Like all

true poets he lived near to nature, and he has described our Southern scenery with loving faithfulness warmed by vivid imagination. He has given new meaning to "our forests of live-oak beautifully braided and woven with intricate shades of the vine; to our broad fronded fern and keen-leaved canes." The luxuriance of the southern forests, the wealth of undergrowth, the warmth, the color, the singing birds live in his poetry, but there is no undue heat, no tropical languor. Whittier has not been more faithful to the rocky coasts, to the snowstorms of New England, than has Lanier to the South. Consult his completed poems with memoir by W. H. Ward (1881-4). **EMILIE McVEA,**
See'y Southern Association of Southern Women.

Lanigan, George Thomas, American journalist and poet: b. Canada 10 Dec. 1845; d. Philadelphia 5 Feb. 1886. With Robert Graham, he founded in Montreal the 'Free Lance,' a satirical and humorous journal, later published as the 'Evening Star,' and afterward in the United States was connected with the New York *World* and other journals. His writings include: 'Canadian Ballads' (1864); 'Fables Out of the World' (1878), by 'George Washington Aesop.' He will be longest remembered by his 'Threnody' (for the Ahkoond of Swat), one of the most successful of humorous poems.

Lankester, Edwin Ray, English zoologist: b. London 15 May 1847. Educated at Downing College, Cambridge, and Christ Church, Oxford, he was elected a fellow and lecturer of Exeter College, Oxford, in 1872. In 1874-90 he was professor of zoology and comparative anatomy in University College, London, and from 1891 till 1898 Linacre professor of human and comparative anatomy at Oxford. Since 1898 he has been director of the natural history department of the British Museum. Elected a fellow of the Royal Society in 1875, he became its vice-president in 1896, and in 1885 he was awarded one of its royal medals. In 1884 was prominent in founding the Marine Biological Association, now located at Plymouth, and in 1869 became chief editor of the 'Quarterly Journal of Microscopic Science.' Lankester's works include the following: 'A Monograph of the Fossil Fishes of the Old Red Sandstone' (part I., 1870); 'Comparative Longevity in Man and the Lower Animals' (1870), an Oxford prize essay: 'Contributions to the Developmental History of the Mollusca' (1875); 'Studies in Apus, Limulus, and Scorpio' (1881); 'On Food' (1882); and 'The Advancement of Science' (1890), nine essays and addresses.

Lan'man, Charles, American author: b. Monroe, Mich., 14 June 1819; d. Washington, D. C., 4 March 1895. He was educated at the Academy of Norwich, Conn., and went to New York, where he was in business from 1835 to 1845. He then returned to Monroe as editor of the 'Gazette.' He afterward joined the staff of the 'National Intelligencer' at Washington, D. C. He was private secretary of Daniel Webster in 1850, and secretary to the Japanese legation in Washington in 1871-82. He was among the first to explore the mountains in North Carolina. Among his writings are: 'A Tour to the River Saguenay' (1848); 'Private Life of Daniel Webster' (1852); 'Dictionary of Congress' (1858); 'The Japanese in America' (1872); 'Biographical Annals of the Civil Gov-

LANMAN — LANSING

ernment of the United States' (1876); 'Hazard Personalities' (1886); etc.

Lanman, Charles Rockwell, American Orientalist: b. Norwich, Conn., 8 July 1850. He was graduated at Yale in 1871; studied Greek and Sanskrit there, and from 1873 to 1876 pursued studies in Orientalism at Berlin, Tübingen, and Leipsic, returning in the latter year to accept a fellowship at Johns Hopkins University. Since 1880 he has been professor of Sanskrit at Harvard. He has lectured at many institutions on Oriental subjects; has traveled in India, and from 1879 to 1884 was secretary of the American Philological Association, edited its 'Transactions' (Vols. X.-XIV.), and in 1890 became its president. He was corresponding secretary of the American Oriental Society from 1884 to 1894 and in 1896, and has served it as vice-president since 1897. His published works include: 'Noun-Inflection in the Veda' (1880); a 'Sanskrit Reader, with Vocabulary and Notes' (1884-8); 'The Beginnings of Hindu Pantheism' (1890); 'Rāja-Cekhara's Karpūra-mañjari,' a translation of a Hindu drama of 900 A.D. (1900); and numerous contributions to Oriental and other journals.

Lanman, Joseph, American naval officer: b. Norwich, Conn., 11 July 1811; d. 13 March 1874. Entering the navy as a midshipman in 1825, he was commissioned lieutenant in 1835, commander in 1855, captain in 1861, and commodore in 1862. In the two attacks on Fort Fisher (1865) he led the line with the Minnesota, winning signal praise from Rear-Admiral D. D. Porter in his official report. He was raised to the rank of rear-admiral in 1867, and after further efficient services, in 1872 he was retired.

Lan'ner, the name of a small "noble" falcon formerly in high repute among European falconers of mediæval times, the identity of which, however, is not quite clear. It was probably the handsome reddish-gray *Falco feldegg* of the Mediterranean region, still highly valued among Bedouin falconers for its docility and graces. The name is extended to other African and Asiatic hawks of similar appearance and qualities.

Lanoe, Falconer. See HAWKER, MARY ELIZABETH.

Lan'olin, a fatty substance obtained from the grease of sheep's wool, and consisting chiefly of cholesterin. The wool-grease is saponified by means of caustic soda, and the resulting emulsion is diluted with water. The lanolin then separates in fine particles, which, by the aid of a centrifugal separator, may be obtained in a creamy mass. The lanolin of commerce contains about 30 per cent of water. Lanolin is very generally used as a basis in the preparation of salves and ointments, since it does not grow rancid, and is itself antiseptic to a certain extent. It absorbs water, and penetrates the tissues of the body much more freely than lard or vaseline.

Lans'dell, Henry, English clergyman, traveler, and author: b. Tenterden, Kent, 10 Jan. 1841. As secretary to the Irish Church Mission, he has been prominent in philanthropic movements, traveling extensively about the world. In Siberia he investigated the prisons, publishing the results of his observations in

'Through Siberia' (1882); 'Russian Central Asia' (1885); 'Chinese Central Asia' (1893). Since 1892 he has been chaplain of Morden College, Blackheath, Kent.

Lans'downe, Henry Charles Keith Fitz Maurice, 5th MARQUIS OF, British statesman: b. 14 Jan. 1845. He was educated at Eton and Oxford, and entered in politics as a member of the Liberal party. He was one of the Lords of the Treasury (1869-72); Under-Secretary for War (1872-4); and in 1883 successor of the Marquis of Lorne as Governor-General of Canada. His period of office was marked by the completion of the Canadian Pacific railway, a peaceful arbitration of the fishery dispute with the United States, and the crushing of Riel's rebellion. In 1888 he was made Viceroy and Governor-General of India, in 1895 joined Lord Salisbury's cabinet as secretary for war, and in 1900 was appointed secretary of state for foreign affairs.

Lans'ford, Pa., borough in Carbon County, on the Central railroad of New Jersey, 44 miles north of Reading. It is the centre of the anthracite coal fields. It was settled in 1845, and was incorporated in 1876. The government is administered by a burgess elected every three years and a borough council which controls the local administrative offices. Pop. (1890) 4,000; (1900) 4,800.

Lan'sing, John, American jurist: b. Albany, N. Y., 30 Jan. 1754; d. 12 Dec. 1829. He studied law in Albany and New York; was engaged in practice at the beginning of the Revolution, during a period of which he served as military secretary to Gen. Schuyler. In 1784 he was elected to Congress, and while a member of that body was elected to the lower house of the New York legislature, where he was chosen speaker in 1786, in which year he also became mayor of Albany. For a short time he represented New York in the Constitutional Convention (1787), which he left because he held that he had been sent to participate in an amendment of the Articles of Confederation, and not in the forming of a new constitution. In 1788, at the New York convention, his opposition to the ratification of the Constitution was stoutly maintained. He served on the New York-Vermont boundary commission; in 1790 was appointed a judge of the New York Supreme Court, and became chief justice in 1798. From 1801 to 1814 he was chancellor of the State.

Lansing, Mich., city, capital of the State and county-seat of Ingham County, at the junction of the Grand and Cedar Rivers, and on the Chicago & G. T., the Lake Shore & M. S., and several other railroads, 85 miles northwest of Detroit. It is the farming trade centre for the surrounding region, and is engaged in the manufacture of agricultural implements, flour, stoves, machinery, beet sugar, canned goods, carriages, wagons, trunks, wheelbarrows, artificial stone and knit goods. It contains the State Capitol, built at a cost of \$1,500,000; State Hospital; State Library, containing 105,000 volumes; United States government buildings; State School for the Blind; and the State Industrial School; State Agricultural College with a farm of 675 acres; and has electric light and street railroad plants; water power from the river; which is spanned by several bridges; National

LANSING MAN — LANTHANUM

and State banks; about 20 churches; daily, weekly, and monthly periodicals; and an assessed property valuation of over \$6,000,000. Under a charter of 1897, the city is governed by a mayor and council elected every two years. The waterworks and electric light plants are owned and operated by the municipality. The city was settled in 1837, laid out for the State capital in 1847 and incorporated in 1869. Pop. (1890) 13,102; (1900) 16,485.

Lansing Man, a term applied to a collection of human bones, found near Lansing, Kan., 20 feet below the surface of the earth, under a stratum of carboniferous limestone. The skull which was well preserved measured: Maximum length 188 mm.; breadth 138 mm.; cranial index 73.4. From the date of this discovery a few years ago, men of science have been divided in their opinion as to the antiquity of the remains. According to some scientists this skull is one of the oldest ever found in America, having belonged to a human being who lived on this continent prior to the glacial period; and as such, is of the same age, if not older, than that of the Pithecanthropus, found in Java, by Dr. Dubois. The opposition holds to the contrary, pointing to the fact that while of a rather low type of man, the skull differs very little from that of a modern Sioux Indian, and is not at all like that of the Java skull, which belonged to a being midway between the highest type of kula-kamba chimpanzee and the lowest type of negro. In the opinion of Prof. Upham, the Lansing skeleton offers probably the oldest proof of man's presence on this continent; yet it is only a third, probably only an eighth, as old as the flint hatchets of St. Acheul. It has been estimated that man in the Somme Valley and other parts of France, and in southern England, made good palæolithic implements fully a hundred thousand years ago. When the earliest man came to America cannot probably be closely determined. It may have been during the glacial period; it may have been earlier. In Prof. Upham's opinion, the Lansing discovery gives us much definite knowledge of glacial man, dolichocephalic, low-browed, and prognathous, having nearly the same stature as our people to-day. Prof. Williston believes that the Lansing man was doubtless contemporary with the equus fauna, well represented in the late Pleistocene deposits of Kansas, which include extinct species of the horse, bison, mammoth and mastodon, moose, camels, llamas and peccaries. He was also the contemporary of the late palæolithic men of Europe, whose advanced implements showed that they had developed beyond the stages of primitive savagery.

Lansquenet, läns'kē-nēt, in Germany, a foot soldier, originally one belonging to the army of the Emperor Maximilian in the 15th century; afterward, a soldier of fortune; a soldier who gave his services to any one who paid highest. The name became corrupted into lance-knight. Also the name of a game at cards now obsolete, and originally played in the 15th century. It is similar to faro.

Lan'tern, or **Lanthorn**, (1) a small metallic frame used for carrying a lamp or candle in, consisting of a case or vessel made of tin. Lanterns were used by the ancients in augury. They were also carried before troops on the march by night, being then borne on the top of pikes, and

so constructed as to throw lights only behind them. Dark lanterns are provided with only a single opening, which can be closed up when the light is required to be hidden, or opened when there is occasion for its assistance to discover some object. See **LAMP**.

(2) In architecture, a small structure on the top of a dome, or in other similar situations, for the purpose of admitting light, promoting ventilation, or for ornament, of which that on the top of the capitol at Washington may be referred to as an example. In Gothic architecture the term is sometimes applied to *louvers* on the roofs of halls, etc., but it usually signifies a tower which has the whole height, or a considerable portion of the interior, open to view from the ground, and is lighted by an upper tier of windows.

Lantern-fish, a general term for the luminous fishes of the depths of the sea, most of which belong to a single group (*Iniomii*). See **DEEP SEA EXPLORATION**; **DEEP SEA LIFE**; **FISH**; **ICHTHYOLOGY**.

Lantern-flies, homopterous bugs with membranous forewings concealing the folded hinder wings when the insects are at rest, and the head greatly prolonged and said to be light-giving in some tropical species. They feed upon plants and deposit their eggs in slits cut in the bark. The best known species is the candle-fly (*Fulgora laternaria*) of tropical America, but the luminosity alleged of it is an old story not recently verified. Many other popular beliefs are attached to the insect. It is said in Brazil, for instance, to be so poisonous that anything against which it strikes its long beak will fall dead. Several small and non-luminous species of this family occur in the United States. Consult Brunner, 'Am. Naturalist,' Vol. XXIII., 1885, p. 835.

Lantern of Demosthenes. See **LYSICRATES**, MONUMENT OF.

Lanterns, Feast of, a religious ceremony held in China on the 15th day of the first month of the year. It derives its name from the vast number of lanterns which are hung out of the houses and in the streets. The lanterns used are often of great value, being richly ornamented with gilding, painting, japanning, and sculpture, and some of them are of great size, reaching nearly 30 feet in diameter, and are so constructed as to resemble halls or chambers.

Lanthanum, a rare metallic element resembling cerium in its general properties, discovered by Mosander, in 1839, in the Swedish mineral cerite. It has the chemical symbol La, and an atomic weight (for O=16) of 138. Its melting point is between that of antimony (840° F.) and silver (1740° F.). It has a specific gravity of 6.16, and a specific heat of 0.0448. It is a white metal, moderately ductile and malleable. It oxidizes rapidly upon exposure to the air, and decomposes water slowly when cold, and rapidly when hot. It dissolves readily in acids, with the formation of corresponding salts, which are mostly colorless, with an astringent taste. The metal is prepared by the reduction of its chloride by metallic potassium, and the subsequent removal of the potassium chloride that is formed, by washing with alcohol. Neither lanthanum nor its salts are of any industrial importance. The name is from a Greek word meaning "concealed," in allusion to

LANZA — LAO-TSE

the fact that lanthana, the oxid, was for a time confused with the oxids of other rare metals belonging to the cerium group. Lanthanum occurs, as a silicate, in the minerals cerite, gadolinite, orthite, and allanite; as a carbonate in lanthanite occurring in Lehigh County, Pa., and Essex County, N. Y.

Lanza, lán'zā, **Gaetano**, American mathematician and engineer: b. Boston 26 Sept. 1848. He was educated at the University of Virginia, and for two years was an instructor there; has been an instructor and assistant professor at the Massachusetts Institute of Technology; since 1875 professor of theoretical and applied mechanics; also since 1883 in charge of the department of mechanical engineering. He is a fellow of the American Academy of Arts and Sciences, a member of the British Association for the Advancement of Science, and of other scientific bodies here and in Europe. He has published 'Applied Mechanics' (1885), and his writings include many papers presented to scientific societies.

Lanzarote, lán-thä-rö'tā, one of the Canary Isles, about 90 miles from the African coast; greatest length, 36 miles; breadth, 15 miles. Its coast is in general very bold, and presents ranges of basaltic cliffs rising in some parts to 1,500 feet; its interior contains several mountains, the loftiest of which has a height of 2,000 feet. The only port of any consequence is Arrecife. Pop., 16,409.

Laoag, lä-wäg', Philippines, capital of the province of Ilocos Norte, Luzon, on the Grand de Laoag River, 4 miles from its mouth. It is picturesquely situated in a fertile plain and is well built; it is open to the coastwise trade and is the centre of shipment for the agricultural products of the region. The name signifies "clearness" from the fact that the sky and atmosphere are almost continuously clear. Pop. 37,000.

Laocoön, lä-ök'ō-ön, a priest of Apollo at Troy. As he was sacrificing a bull to Poseidon on the shore, two serpents swimming from the Island of Tenedos advanced to the altar. The people fled, but Laocoön and his sons fell victims to the monsters. The sons were first attacked, and then the father. Winding themselves round him, the serpents raised their heads high above him, while in his agony he vainly endeavored to extricate himself from their folds. They then retired to the Temple of Pallas Athene, where they took shelter under her shield. The people saw in this omen Laocoön's punishment for his impiety in piercing with his spear the wooden horse consecrated to Athene. The story has frequently furnished a subject to the poets, but it is chiefly interesting to us as having given occasion to a fine work of sculpture—the Laocoön group, now in the Vatican. It was discovered in 1506 on the site of the baths of Titus. Pope Julius II. bought it and placed it in the Vatican. Its preservation was perfect, except that the right arm of Laocoön was wanting: this was restored by a pupil of Michelangelo. This group is of the dramatic Rhodian school, and by no means belongs to the best style of Greek sculpture. Yet it has been much treated of in literature, especially by Goethe, Heine, Lessing, Winckelmann, and Herder. It represents three persons

in agony, but in different attitudes of struggle or fear, according to their ages. Pliny declares it was made of one stone by the sculptors Agesander, Polydorus, and Athenodorus, all natives of Rhodes, and the two latter, probably sons of the former.

Lessing makes it probable that those three artists lived under the first emperors. It may be fairly doubted whether the statue mentioned by Pliny is the same as that we now have; acute observers have found that the group does not consist of one block, though the junctions are carefully concealed. To this it may be answered that they were not perhaps perceptible in the time of Pliny. Several copies have been made; one in bronze, from a model by Giacopo Tatti or Sansovino, which was carried to France. Bacio Bandinelli made a copy which is in the Medici Gallery at Florence. Good casts of the group are to be found in all important collections of statuary. Consult: Lessing, 'Laokoon oder über die Grenzen der Malerei und Poesie' (1880); Robert, 'Bild und Lied' (1881); Kekule, 'Zur Deutung und Zeitbestimmung des Laokoons' (1883).

Laodicea, lä-öd-i-sé'a, the ancient name of four places in Asia Minor. (1) Laodicea, now called by the Turks *Eski Hissar* (Old Castle), an ancient ruined city, once the capital of Greater Phrygia, 120 miles east of Smyrna, the site of one of the seven primitive Christian churches of Asia. Nothing but very extensive ruins of inferior architectural merit remain to point out the locality of this interesting city. (2) See **LATAKIA**. (3) Now Ladik, a city of Lyconia, north of Iconium. (4) An ancient city of Syria, founded by Seleucus Nicator, which stood to the northeast of Baalbec, in a plain watered by the Marsyas.

Laos, lä'ōs, a territory in the Indo-China peninsula surrounded by the Shan states, Anam, Tonkin, and the Chinese province of Yun-nan. Its extent and the number of its inhabitants are unknown, but they have been estimated at one and a half million. The country is intersected by mountain ranges and traversed by the Mekong or Cambodia River, the alluvial valley of which produces abundant sugar, rice, tobacco, etc. Laos exports to the neighboring states a considerable quantity of ivory, gold, silver, precious stones, silk, etc. The inhabitants are reported to be connected with the Burmese in their racial, social, and religious peculiarities. The capital is Ching-Mai.

Laosaurus, lä-ō-sâ'rūs, a genus of unarmored, herbivorous dinosaurs (q.v.) of the suborder *Ornithopoda*, whose remains are found fossil in the Jurassic rocks of western North America.

Lao-tse, lä'ō-tsā, or **Lao-tseu**, Chinese philosopher: b. Kiuh-jin 604 B.C. The date of his death is unknown. He was the founder or reformer of one of the most ancient and important religious sects of China, known as the Tao, or sect of reason. He was a historiographer and librarian to a king of the Chow dynasty; traveled to the borders of India, where he may have become acquainted with Buddhism; met Confucius and reproached him for his pride, vanity, and ostentation; was persuaded to record his doctrines in a book, which he did in the 'Tao-ti-king' or 'The Path to Virtue'; and on

LA PAZ—LAPIS LAZULI

completing this task is reputed to have disappeared into the wilderness, and there ascended to heaven. According to him silence and the void produced the Tao, the source of all action and being. Man is composed of two principles, the one material and perishable, the other spiritual and imperishable, from which he emanated, and to which he will return on the subjugation of all the material passions and the pleasures of the senses. Lao-tse's moral code is pure, inculcating charity, benevolence, virtue, and the free-will, moral agency, and responsibility of man. Since the 2d century of our era the sect has continued to extend over China, Japan, Cochinchina, Tonquin, and the Indo-Chinese nations.

La Paz, lā pās (Sp. lā pāth), a department of Bolivia, bounded on the north by Brazil, on the east and south by the departments of Beni, Cochabamba, and Oruro, and on the west by Peru. Its area has never been accurately determined; according to a recent conservative estimate it is 75,742 square miles. Extensive tracts in the northern portion are still unexplored, and the boundary disputes with Brazil and Peru add a large element of uncertainty. Calculations based upon the extreme Bolivian claims give the fabulous area of 275,413 square miles. The department is divided into 9 provinces, as follows: La Paz, Yungas, Larecaja, Muñecas, Campolican, Omasuyos, Pacajes, Sicasca, and Inquisivi. Each provincial capital has a municipal council and is administered by a sub-prefect. The provinces are subdivided into cantons, administered by corregidores. The entire department is subject to a prefect, representing the national government. Some of the highest peaks of the Bolivian Andes rise above the great Titicaca basin (itself 13,000 feet above sea-level) in the southern half of this department, which portion has a temperate and moderately salubrious climate (see **LA PAZ**, the capital, etc.). Chief products are copper, silver, tin, gold, coca, wheat, barley, potatoes; in the torrid lowlands of the north, sugarcane, rice, tobacco, and coffee; and from the forests along the tributaries to the Amazon are obtained rubber and cinchona. Cattle and sheep are bred in large numbers on the upland pastures. The census of 1 Sept. 1900 shows the population to be 423,800.

La Paz, Bolivia, capital of the department of the same name, and, temporarily, of the republic (see **SUCRE**). It is the metropolis and commercial centre of Bolivia, situated in the Quebrada del Choqueyapu, 650 feet lower than Lake Titicaca (from which the distance by road is about 45 miles) and yet quite 12,250 feet above the level of the sea. The latitude of La Paz is $16^{\circ} 29' 54''$ S., lon. $68^{\circ} 29' 38''$ W., and mean annual temperature about 50° F., or somewhat less than that of Paris. The annual range of temperature at La Paz, however, is very different from that at Paris, the summers being less hot, the winters less cold, and the extremes of temperature 19.4° F. to 73.4° F. The clearness of the sky occasions rapid loss of heat by radiation; the nights are therefore much colder than the days. Though the thermometer often falls below freezing-point, plants are rarely frozen, for the reason that the air at this great height is very dry. It is a substantially built but unimpressive city with ill-paved streets rising at a

steep grade from the small river which flows through its midst; it has, however, a beautiful Alameda or promenade, a cathedral, many churches, and some noteworthy public institutions—a museum, library, university, professional schools of various kinds, and courts. Up to 1903 the city remained without railway connections, the nearest stations on existing lines of railway being Oruro, terminus of the line from Antofagasta, and Puno on Lake Titicaca; to the latter point a railway was being constructed. Lines of telegraph connect La Paz with Oruro, Cochabamba, Colquechaca, Puno, and Santa Cruz. According to the census of 1900, the population is 57,000.

La Paz, Mexico, capital of the southern district of the territory of Baja California, the capital of the northern district being Ensenada de Todos Santos. It is pleasantly situated between the coast range and the bay, and has commercial dealings principally with San Francisco, Mazatlán, Guaymas, San Blas, and Mzanillo. Pop. 4,737.

Lapeer, lā-pēr', Mich., city and county-seat of Lapeer County, on the Michigan C. and the Grand T. R.R.'s, 60 miles north of Detroit, 45 miles west of Port Huron, and 41 miles south of Bay City. It was first settled in 1836 by A. N. Hart and was incorporated as a city in 1868. The municipal government is administered by a mayor and city council of 8 members elected every two years. The city has four banks, capital \$250,000, and has numerous large factories, stone works, planing mills and iron foundries. The Michigan Home for the Feeble Minded is located here; also the Lapeer Business College, High School, and various church buildings. Pop. (1890) 2,753; (1900) 3,297.

E. T. WOODRUFF,
Editor of the 'Clarion.'

La Perouse, Jean François de Galaup de, zhōn frān-swā dē ga-lōp lā pā-rooz, French navigator: b. near Albi, Languedoc, France, 22 Aug. 1741; d. after 1788. He served in the French navy against England (1778-83) and sailed in August 1785 with two ships on an exploring expedition to the Pacific, and by sailing through La Perouse Strait, between Saghalien and Yezo, discovered that each of these was a separate island. In February 1788 he sailed from Botany Bay; and after this no more was heard from him. In 1826 it was fully ascertained by the English Captain Dillon that both of the French ships had been wrecked in a storm on a coral reef off Vanikoro, an island lying north of the New Hebrides, and in 1898 a few relics of his party were found there. An account of the early portions of La Perouse's voyage prepared from journals sent home by him, was published under the title of 'Journey Round the World.'

La Piedad, lā pē-ā-dad', Mexico, town in the state of Michoacan, near the northern boundary, on the Lerma River, 62 miles southwest of Guanajuato. It is the centre of a large agricultural district. A fine bridge crossed the Lerma at this point. Pop. (1901) 11,200.

La'pis-laz'uli, the sapphire of the ancients, is a highly prized ornamental stone. It was long supposed to be a simple mineral, but now has been shown to be a variable mixture of lazurite, hauynite, diopside, amphibole, musco-

LAPLACE—LAPLAND

vite, calcite, pyrite and other minerals. The most important mineral in the stone is lazurite, which is itself a highly complex compound, essentially $\text{Na}_4(\text{Na}_2\text{Si}_3\text{O}_8)\text{Al}_2\text{Si}_5\text{O}_{12}$, but containing also in molecular combination varying amounts of haüynite and sodalite. Lazurite is usually massive, has a hardness of 5 to 5.5, a specific gravity of 2.45, and rich azure-blue color. This color is characteristic also of lapis-lazuli, which, before the discovery of the artificial ultramarine, was powdered and concentrated into this excellent pigment. Exceedingly costly vases, mosaics, engraved gems and other ornamental objects have been made from lapis-lazuli, it being especially esteemed in Russia. Its most important localities are in Siberia, Persia, China, and Chile.

Laplace, Pierre Simon, pē-är se-môn lä-pläs, MARQUIS DE, French mathematician and astronomer: b. Beaumont-en-Auge (Calvados) 23 March 1749; d. Paris 5 March 1827. He studied the higher mathematics at the academy of Beaumont, in 1767 went to Paris, and there by the influence of D'Alembert became professor of mathematics in the Ecole Militaire. By his brilliant memoirs on the theory of probability he attracted wide notice, and in recognition was elected *membre-adjoint* (1773) and titular member (1785) of the Academy of Sciences. He was appointed examiner in the Royal artillery corps (1784), and professor of analysis at the Normal College (1794); and in 1816, for the elegance of his style in the 'Exposition du Système du Monde' (1796) was admitted to the Académie Française, of which in 1817 he became president. Appointed by Napoleon minister of the interior (1799), he was shortly dismissed, being, according to the Emperor, "below mediocrity as a minister," and aiming to "conduct the government on the principles of the infinitesimal calculus." He was, however, given a seat in the Senate, became its vice-president, and in 1803 chancellor. He also held the post of president of the bureau of longitudes, and was a member of the commission for the establishment of the metric system. Nichol called him the "titanic geometer," and he has been styled also "the Newton of France." Among the more important of his remarkable investigations are the discovery of the inequality in the movements of Jupiter and Saturn; his researches in probabilities (contained in the 'Théorie analytique des Probabilités' 1812, and the 'Essai Philosophique sur les Probabilités' 1814); his improvements in the lunar theory; and his theory of the tides. His chief work is the great 'Mécanique céleste' (1799–1825), a compendious solution of the problems of physical astronomy, and one of the greatest contributions ever made to science. It was translated into English by Nathaniel Bowditch (q.v.) (1829–39), who said: "Whenever I meet the words of *il est aisé à voir* [it is easy to see] I am sure that hours and perhaps days of hard study will be necessary." A collection of Laplace's works in 13 vols. was made by the French government (1878 et seq.). Consult the life by Kaufman (1841); and Arago, 'Biographies of Scientific Men' (in Eng. trans. 1859).

Lapland, an extensive territory in the north of Europe, between lat. 64° and 71° N., and from the shores of Norway east to those of the White Sea; area, about 130,000 square miles,

of which more than a half belongs to Russia; and the remainder is shared in nearly equal proportions between Sweden and Norway. Both from its geographical position and its physical conformation Lapland, or the country of the Lapps, is one of the most forbidding regions of the globe, consisting either of rugged mountains, some of them covered with perpetual snow, and many of them only for a short period free from it, or of vast monotonous tracts of moorland wastes. This extensive territory appears to have been at one time wholly occupied by the people to whom it owes its name; but its southern and better portions have been gradually encroached upon by Norwegians, Swedes, and Finns. The Lapps call themselves Sabme or Sabmeladsjak (the Norwegians call them Finns), belong to the Ural-Altaic stock, and are consequently closely related to the Finns (Suomi). As a race they are the shortest people in Europe (four or five feet in height). They are spare of body, with dark, bristly hair and scanty beard, and short, often bandy, legs. Though not very muscular they are capable of great exertion and fatigue, and frequently live to a great age. The mouth is large, the lips thick, and the eyes small and piercing. The Lapps are usually distinguished as Mountain, Sea, Forest, and River Lapps. The Mountain Lapps, the backbone of the race, are nomads; they move constantly from place to place in order to find sustenance for their reindeer herds, their only source of wealth. In summer they go down to the fiords and coasts, but spend the rest of the year in the mountains and on the plains of the interior. The Sea Lapps, mostly impoverished Mountain Lapps, or their descendants, dwell in scattered hamlets along the coast, and live by fishing. The Forest and River Lapps are nomads who have taken to a settled mode of life; they not only keep domesticated reindeer, but hunt and fish. The nomad Lapps live all the year round in tents. The reindeer supplies nearly all their wants, except coffee, tobacco, and sugar. They live on its flesh and milk; they clothe themselves in its skin, and use it as a beast of burden. It is computed that there are 400,000 reindeer in Lapland, for the most part semi-wild. In his personal habits and in his clothing the Lapp is the reverse of cleanly. He is, however, very good-natured, rather prone to self-indulgence, and miserly and selfish. His imagination is easily excited, and he is readily susceptible to religious impressions of a sensational type; a notable "epidemic" occurred at Koutokeino in Norwegian Lapland in 1848–51. The Lapps all profess Christianity; those of Norway and Sweden belong to the Lutheran Church, those of Russia to the Greek Church. The Norsemen treated the Lapps as a subject race as early as the 9th century, but had to reconquer them in the 14th; the Russians followed in the 11th, and the Swedes in the 16th. From the 13th to the 17th century the Lapps were kept in a state little better than slavery by Swedish adventurers known as Birkarlans. But at the present day both the Scandinavian governments bestow on them every consideration. The number of Laplanders is not supposed to exceed 25,000 of all descriptions, of whom Norway has nearly 15,000, Sweden about 7,000, the rest belonging to Russia. Probably one third of them are nomadic. Consult: Du Chaillu, 'Land of the Midnight

LAPLAND LONGSPUR—LAPWORTH

Sun' (1881); Tromholt, 'Under the Rays of the Aurora Borealis' (1885); 'The Testimony of Tradition' (1890).

Lapland Longspur. See LONGSPUR.

La Plata, lä plä'tä, Argentine Republic, the new capital of the province of Buenos Ayres. The important question of the location of the capital of the republic was not settled by law until Gen. Julio A. Roca became president. By custom, however, Buenos Ayres was the seat of the national government, and of the provincial government as well. This anomaly was ended during President Roca's first term. Congress passed a law by which the city of Buenos Ayres was declared to be the capital of the republic; the legislature of the province of Buenos Ayres decided to build a new city, which should be the provincial capital. The cornerstone of La Plata was laid on 19 Nov. 1882, in a barren waste a few miles from the village of Ensenada and about 24 miles below Buenos Ayres, on the south shore of the Rio de la Plata. The port of La Plata, built in Ensenada, is in communication with the city by means of a railroad and a canal, which is navigable by seagoing vessels. In less than three years from the date of its foundation the new capital had a population of 30,000, and, in addition to the public buildings, 3,631 brick and stone houses were either completed or in course of construction. It is said that the public buildings alone have cost about \$40,000,000. The city is laid out on the same plan as Washington, D. C., with diagonal avenues 97½ feet wide, streets 58½ feet wide; and 23 public squares. Among the principal buildings are: the Government House, Treasury Department, Capitol, City Hall, Police Department, Provincial Bank, Hypothecary Bank, Bourse, Department of Engineers, Department of Justice, Museum and Public Library, Astronomical Observatory, Great Central Railway Station, etc. There are several handsome churches, two theatres, and a race-course. Railways connect this port with nearly every province of the republic. Permanent residents in 1901 numbered 35,410, and in addition there is a large floating population.

La Plata, Rio de, rē'ō dā, an estuary on the southeastern coast of South America, between Uruguay and Argentina; an outlet for the united waters of the Paraná and Uruguay rivers. The enormous outflow, which in volume is exceeded only by that of the Amazon, creates powerful currents; treacherous shallows are formed over the washings brought down from the interior of the continent; and the low-lying southern shores afford no shelter from storm winds. Therefore navigation in this estuary, which is 143 miles wide at its mouth, and about 190 miles long, narrowing gradually above Montevideo and Buenos Ayres, combines the perils of river and open sea. On the north shore there is one good natural harbor—that of Montevideo; on the Argentine side well-directed efforts are being made to supply natural deficiencies by building massive docks, dredging deep-water channels, and completing other extensive harbor improvements (see ARGENTINA, BUENOS AIRES, and LA PLATA). The region to which the Rio de la Plata, with the Uruguay, Paraná, and Paraguay rivers, gives access, is of vast extent. In the later years of Spanish dominion it was comprised in the viceroyalty of

La Plata, from which the states of Argentina, Uruguay, Paraguay, and Bolivia have been carved; and to-day the southern portions of that region sustain some of the most progressive of all Latin-American communities. Early in the last century Great Britain attempted to secure control of this continental gateway, a position which, as it now appears, would have enabled her to win in the south a colony possessing very great resources—another Canada, at least. In 1806, when England and Spain were at war, Spain being the ally of Napoleon, Major-General William Carr Beresford, with about 1,600 men, arrived off Buenos Ayres, and captured the city quite easily. But a few weeks later the invaders were driven out. A much larger army, commanded by General Whitelocke, was sent in 1808 to recapture Buenos Ayres, and a separate force succeeded in taking possession of Montevideo. But the British were defeated on the south shore; General Whitelocke capitulated on the day of the attack, withdrew to his ships, and surrendered Montevideo.

MARRION WILCOX,

Authority on Spanish America.

Laporte, la-pôrt', Ind., city and county-seat of Laporte County, on the Chicago & W. M., Lake Erie & W., and several other railroads; 59 miles east of Chicago. It is the farming trade centre for the county; and is also engaged in the manufacture of woolen goods, agricultural implements, wheels, hubs, etc. It is an attractive summer resort, having several beautiful lakes in its vicinity; contains a handsome court house, city hall, St. Rose's Academy, and public library; and has an electric-light plant, waterworks supplied from one of the lakes; several churches, National and State banks, daily, weekly, and monthly periodicals, and an assessed property valuation of nearly \$4,000,000. In the winter large quantities of ice are cut at the lakes here and shipped to Chicago. Pop. (1890) 7,133; (1900) 7,126.

Lap'wing, a plover (*Vanellus vanellus*) found throughout temperate Europe and Asia, across the whole breadth of which it breeds. In the summer a few are found as far north as Norway, Iceland and Greenland, and in winter they migrate for the most part to Africa, and India. In its habits the lapwing much resembles the American killdeer; and, like that bird, it is hated by gunners on account of its alarm-cries. This pursuit and the market demand for its flesh, and more especially for its eggs, have greatly reduced its numbers, especially in Great Britain. The lapwing is noteworthy for the long flowing crest on the head, the contrasting white and deep iridescent green of its plumage, and for its peculiar jerking, yet rapid flight.

Lap'worth, Charles, English scientist: b. Faringdon, Berkshire, 1842. He was trained as a schoolmaster at Culham College, taught at Galashiels, Scotland, 1864 to 1875, at St. Andrews, 1875 to 1881, and at Birmingham University. In 1892 he became president of the geological section of the British Association in Edinburgh. His great work has been in the field of theory with regard to 'rock-fold,' and the investigation of graptolites. Among his works are: 'The Geological Distribution of the Rhabdophora' (1880); 'Intermediate Text-Book of Geology.'

LARAMIE — LARCOM

Laramie, lär'a-mē, Wyo., city and county-seat of Albany County, on the Laramie River and the Union Pacific railroad; 58 miles west of Cheyenne, the State capital. It is the shipping and trade centre for a large stock-raising and mining section; and is also engaged in manufacturing; has large deposits of gold, silver, lead, graphite, antimony, cinnabar, and other minerals, and rolling mills, lime-stone quarries, plaster mills and railroad and machine shops. It is the seat of the University of Wyoming, the State fish hatchery, Agricultural Experiment Station, and the State penitentiary; contains public and college libraries and St. Joseph's Hospital; and has electric light plants, water-works, daily and weekly newspapers, and an assessed property valuation of over \$1,500,000. Laramie was first settled in 1867 by employees of the Union Pacific railroad, incorporated in 1869 and chartered as a city in 1884. The municipal government is vested in a mayor and a council of six members elected biennially. Fifty per cent of the population are American born, 20 per cent Scandinavian and 10 per cent German. The city owns and operates the waterworks. Pop. (1890) 6,388; (1900) 8,207.

W. E. CHAPLIN,
Editor of the "Republican."

Laramie Mountains, a Rocky Mountain range which extends through Wyoming and Colorado, and bounds the Laramie Plains on the east. The highest point is Laramie Peak, 10,000 feet high. Coal is the principal mineral found in this range.

Laramie Plains, a plateau in southern Wyoming, about 7,500 feet above sea-level.

Laramie River, an important stream rising in northern Colorado and flowing into the North Platte at Fort Laramie in Wyoming. Its length is about 200 miles.

Larceny, the fraudulent appropriation of the personal property of another person without that person's consent. To constitute this crime the removal of the goods to any distance is not necessary, but it requires to be shown that the article has completely passed, for however short a time, into possession of the criminal. Concerning the kinds of things the appropriation of which is larceny, the common law restricted them to personal property as distinguished from real estate, but this distinction has been largely abolished by recent statutes. At one time in Great Britain the punishment for grand larceny was death; later it was restricted to transportation; now the punishment for larceny is imprisonment, the same as in the United States, and depends on the previous character of the prisoner. See also THEFT.

Larch, a genus (*Larix*) of coniferous trees characterized by a pyramidal habit of growth; small linear leaves arranged in clusters upon the older branches, singly and spirally upon the young twigs, often conspicuous pistillate flowers which develop small, erect, globose or oblong cones, the attenuated scales of which are not deciduous at maturity. The species, of which there are less than a dozen, are natives of the colder parts of the northern hemisphere. The best known one in the United States is the American larch, hackmatack or tamarack (*L. Americana*), which grows generally in wet, peaty soils and shallow swamps, or occasionally

upon drier upland soils, from Hudson Bay to Pennsylvania, and westward to Manitoba and Illinois. It attains a height of 60 or more feet, and has nearly horizontal branches. Its wood is hard and very durable, but light in proportion to its size. Being very straight and slowly tapering, the trunks are much used for telegraph poles, scaffold-supports, fence-posts, railway-ties, and in ship-building. It is less planted for ornamental purposes than the following species because its branches are less pendulous and less leafy.

The European larch (*L. decidua* or *L. europaea*) grows usually upon dry uplands and a wide range of soils, but rarely in moist ground. Its range is from the mountains of southern Europe to the far north, where it is among the few hardy trees; in Asia it has a similar distribution. In height it exceeds the tamarack, often reaching 100 feet, and since it is of rapid growth, and is used for an even larger number of purposes than the preceding, it is often planted for commercial purposes, windbreaks, and for ornament. The timber which is rich in resin and is practically exempt from insect attacks, is valued for wet situations. It is little used for planks because it warps badly. Since it does not ignite readily and does not splinter it was largely used in wooden battle-ships. Its bark, which contains tannin, is somewhat used for making leather; its stems yield Orenburgh gum resembling gum arabic; and its leaves in warm climates exude Branon manna, a sweetish, turpentine-flavored manna (q.v.).

The other species more or less resemble the foregoing in habit and uses. The most beautiful and ornamental is probably *L. leptolepis*, a native of Japan. It attains heights of 70 and 80 feet and is remarkable for the brilliant autumn colors of its foliage. All the species except the Himalayan larch (*L. griffithii*), which seldom exceeds 40 feet in height, are hardy throughout the United States. The timber of the western larch (*L. occidentalis*), a native of the Pacific Coast region from Oregon northward, is considered the best yielded by coniferous trees. The tree is the largest of the genus, often reaching a height of 150 feet.

The only insect seriously harmful to the larch is a sawfly (*Nematus erichsonii*), whose young hatch in early summer from eggs previously inserted into the young shoots, and immediately begin feeding upon the leaves. This pest is occasionally sufficiently numerous to defoliate large tracts of forest.

Larcom, Lucy, American poet: b. Beverly, Mass., 1826; d. Boston 17 April 1893. In her youth she was a factory girl in Lowell, Mass., and to the 'Lowell Offering,' a magazine conducted by the operatives in the cotton-mills, made contributions which attracted the favorable notice of Whittier. For three years she studied at Monticello Seminary (Godfrey, Ill.), for six taught in Wheaton Seminary (Norton, Mass.). She was editor-in-chief of 'Our Young Folks,' a Boston magazine, later merged with 'St. Nicholas,' in 1865-74. She edited several collections of verse, and published 'Ships in the Mist, and Other Stories' (1859); 'Poems' (1868); 'An Idyl of Work, a Story in Verse' (1875); 'Childhood Songs' (1877); and 'Wild Roses of Cape Ann, and Other Poems' (1880); 'A New England Girlhood Outlined from Memory,' an autobiography

LARD—LARK

(1899). Her collected poetical works appeared in 1884. Her poems of New England life were especially effective, perhaps the best-known being ‘Hannah, Binding Shoes.’ Consult: Addison, ‘Life, Letters, and Diary of Lucy Larcom’ (1894).

Lard, the melted and strained fat of swine, which differs in its situation from that of almost every other quadruped, as it forms a thick, distinct, and continued layer betwixt the flesh and the skin, somewhat like the blubber in whales. The greater part of the finer sorts of the lard of commerce is procured from the abdominal part of the animal. Lard is rather soft, white, and readily fusible at 100° F. It consists of stearine, which is a solid, and oleine, which is a liquid fat; but it usually contains small quantities of impurities, and it is to them probably that it owes its becoming occasionally rancid. It is used as a lubricant, but it is sometimes mixed with oils of better quality as an adulterant.

Larderel'ite, a native hydrous borate of ammonium, crystallizing in the monoclinic system, and having the composition $(\text{NH}_4)_2\text{O} \cdot 4\text{B}_2\text{O}_5 \cdot 4\text{H}_2\text{O}$. It occurs at the Tuscan lagoons, and was named for Larderel, a Tuscan borax manufacturer. The mineral gives off ammonia when heated, and is used, to a certain extent, as a commercial source of ammonia.

Lard'ner, Dionysius, Irish physicist: b. Dublin 3 April 1793; d. Naples 29 April 1859. He was graduated from Dublin University in 1817 and was made professor of astronomy and physics in the University of London in 1828. From 1840 to 1845 he lived in the United States, where he gave popular scientific lectures in many towns. He wrote several notable mathematical treatises; and edited, himself becoming one of the chief contributors, a ‘Cabinet Cyclopaedia’ (134 vols., 1829–46). Among his other writings are: ‘Manual of Electricity,’ etc. (1841); ‘Treatise on Heat’ (1844); ‘The Steam Engine’ (1852); ‘Natural Philosophy and Astronomy’ (1851–2).

Lareau, lä-rō', **Edmond**, Canadian author: b. St. Gregoire, Quebec, 12 March 1848; d. 1890. He was educated at the College of Ste. Marie de Manoir, at Victoria College, and at McGill University, and was admitted to the bar in 1870. In 1876 he became professor of law in McGill University, and in 1886 was elected in the Liberal interest to the provincial legislature from Rouville County. His works, written in French, include histories of Canadian law (1872), and literature (1874), and ‘Historic and Literary Miscellanies’ (1877).

Laredo, lä rá'dö, Texas, city, county-seat of Webb County; on the Rio Grande, and on the Mexican N., the International & G. N., and the Rio Grande & E. P. R.R.'s; about 150 miles west of San Antonio. It is situated in an agricultural and stock raising region, and in the Rio Grande coal belt, with valuable iron ore deposits in the vicinity. Laredo was settled by the Spaniards in 1767, and was incorporated in 1848. The Spaniards found here Indians who tilled the soil and built houses. The early missionaries established here a mission some years before a permanent settlement was made. The chief manufacturing establishments are extensive con-

centrating and sampling works, brick yards, furniture factories, foundry and machine-shop products, stock-yards, grain-elevators, and large coal yards. It is the trade centre for a large section of the southwestern part of Texas. It is connected with Nuevo Laredo, on the Mexican side of the Rio Grande, by bridges. Some of the prominent buildings are the court-house, the jail, the Mexican National Hospital, the Mercy Hospital, and the Ursuline Convent. It is the seat of the Laredo Seminary, established in 1882, under the auspices of the Methodist Episcopal South Church, and the Ursuline Academy. The park of 65 acres is an attractive feature of the city. Pop. (1890) 11,319; (1900) 13,429.

Lares, lä'rēz, a class of deities among the ancient Romans. Their worship was closely connected with that of the Manes, but only the spirits of good men were honored as lares. All the household lares were headed by the *lar familiaris*, who was revered as the founder of the family, and when the latter changed their residence he accompanied them. In the mansions of the rich the images of the lares had their separate department, the *lararium*; in the dwellings of the lower classes they generally stood upon the hearth in a kind of shrine. When the family took their meals some portion was offered to the lares, and on festive occasions they were adorned with wreaths.

Lari'at. See LASSO.

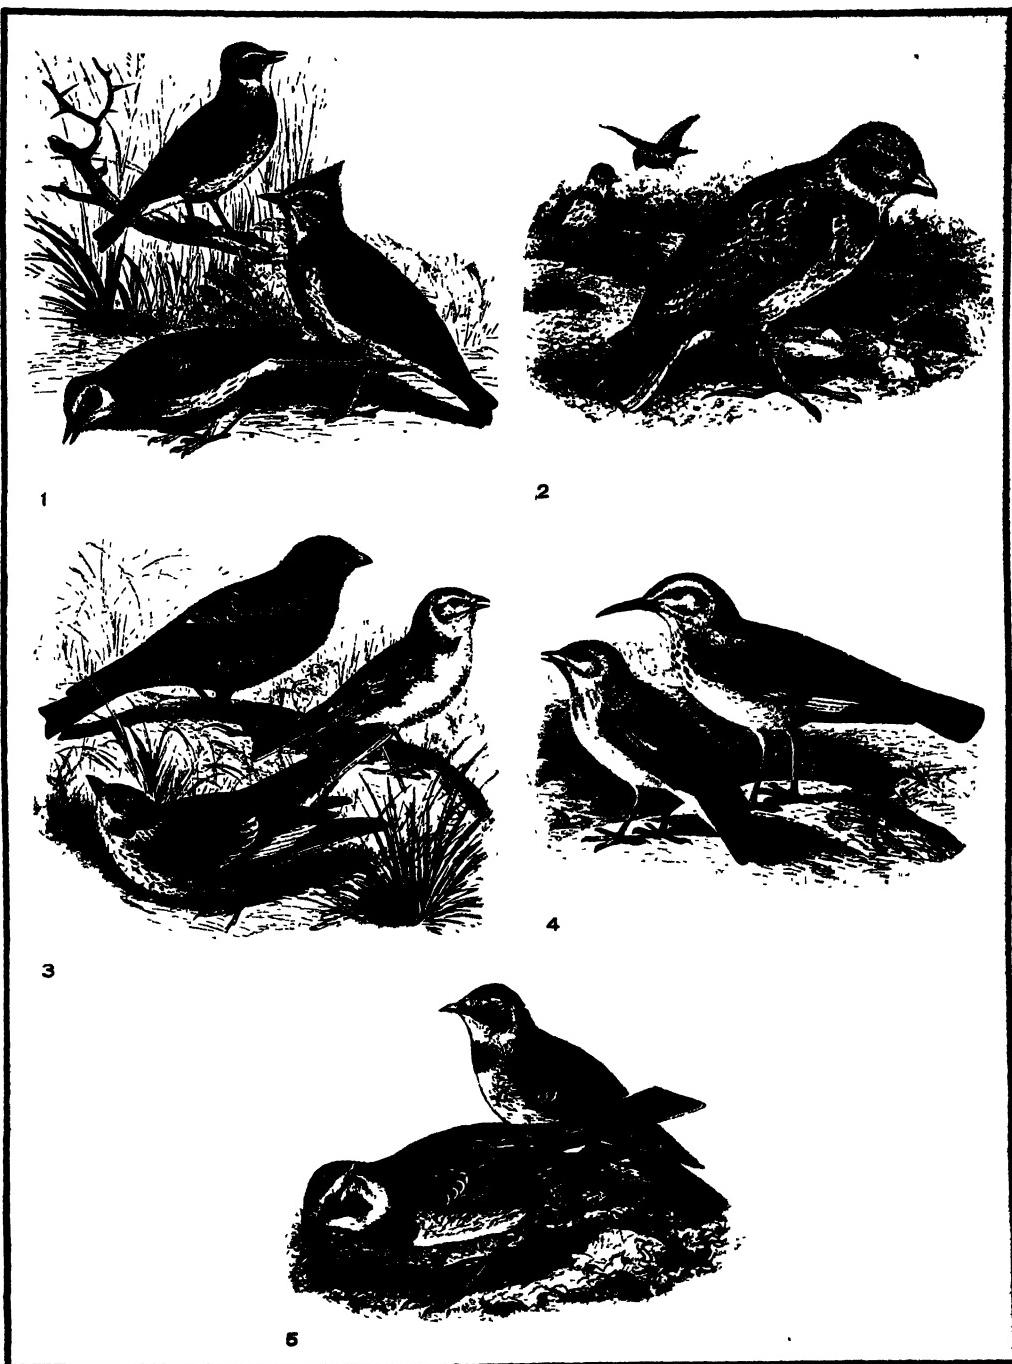

Lar'idæ, the family of sea-going birds which includes the skuas (*Stercorariae*), gulls (*Larinæ*), skimmers (*Rhynchopinæ*), and terns (*Sterninæ*); but some naturalists regard the skuas and skimmers as each of family rank. They are practically cosmopolitan, although the great majority are restricted to sea-coasts and islands.

Lariosaurus, lä-r-i-ō-sā'rūs, a genus of fossil reptiles, of the family *Nothosauridæ*, allied to the plesiosaurs, which were lizard-like in shape, rarely a yard long, and had heads of moderate size with numerous prehensile teeth. Nearly complete skeletons of *L. balsami* are obtained from the black Triassic shales near Lake Como, and from the German Muschelkalk. Consult Woodward, ‘Vertebrate Paleontology’ (1898).

Larissa, lä-rēs'ä, Greece, city in Thessaly, on the Salamvria River, 35 miles northwest of Volo, with which it is connected by railway. It was celebrated in ancient times for its bull-fights, and was the rendezvous place of Julius Caesar's army before the battle of Pharsalia. It is now the largest, richest, and most populous city in Thessaly, and the seat of a Greek archbishopric. Pop. 15,373.

Lark, a bird of the family *Alaudidae*. Larks are small, ground-keeping birds, with small awl-like beaks, the long tarsi scutellated posteriorly, and the claw of the hind toe usually greatly lengthened; the wings vary much in length, but are usually short, as also is the tail. The normal coloration is light brown with darker longitudinal streaks, the under parts being whitish and the breast usually spotted. There is frequently a crest, or decided blackish marks about the head; while the desert forms are, as usual, pale and ornamented. Larks dwell in open grassy places, making their nests on the

LARKS.

ground or among rocks, sometimes elaborately; and laying spotted eggs; they are sociable, but hardly gregarious. Some frequently perch on trees, and most of them soar while singing, as is well known of the sky-lark (q.v.); and the song of many resembles that of this renowned musician. It is a physiological peculiarity of the family that larks molt only once a year. The food consists of insects and their larvæ, worms, small seeds, buds, berries, etc. The flesh of all is considered a dainty, and great numbers are caught annually on both sides of the Mediterranean to be sold in the markets. The family includes about 100 species, divided among about a dozen genera, of which only one, *Otocorys*, with probably but a single species (the horned lark, q.v.) is found in America, and only a single species occurs in Australia. The remainder of the family belongs to Europe, Asia, and Africa, where familiar types are the sky-lark and wood-lark (qq.v.).

The name is also given to many more or less similar birds of other families, as to several of the pipits and Old World warblers; while the meadow-lark (q.v.) of the United States is a starling.

Lark-bunting, a fringilline bird of the western plains of the United States, the male of which in summer is solid black, except a conspicuous white patch on the wings, and the female brown-streaked. The habits of the pair are terrestrial, and the male soars in singing after the manner of the sky-lark and with some similarity in notes. A very different bird, one of the smaller plains sparrows (*Chondestes grammacus*), is known as the lark-finches. Consult Keyser, 'Birds of the Rockies' (1902).

Larkspurs, a genus (*Delphinium*) of annual and perennial herbs of the order *Ranunculaceæ*, characterized by palmately lobed or divided leaves, and showy racemes or panicles of large irregular flowers. Many of the species, of which there are about 60 in the north temperate zone, are cultivated for ornament, and have developed numerous improved varieties, some of which are double-flowered. The most popular annual species is *D. ajacis*, which attains a height of about 18 inches and bears showy blue or violet, sometimes white flowers throughout the summer. Of the perennial species, *D. formosum*, *D. grandiflorum* and *D. hybridum* are most popular in America, and have yielded the largest number of horticultural varieties. They are all natives of Asia, become two to four feet tall, blossom during mid-summer, and are noted for their beautiful tints of blue, their hardiness and ease of cultivation. If cut down immediately after flowering they often blossom a second time before frost. Among the best known American species are *D. mensisii*, *D. scopulorum* and *D. nudicaulis*, which range from the Pacific Coast to the plains region; and *D. exaltatum*, *D. tricorne* and *D. carolinianum*, found most commonly east of the Mississippi. The larkspurs thrive best in rich, deep, sandy loam well exposed to the sun. The annuals are propagated from seed, as are many of the perennials, which are also increased by cuttings taken in early spring or from second growth in summer. Established clumps may be divided in fall or spring. Since the seeds are very slow in germinating they are usually sown in autumn out of doors, or in early winter in a greenhouse.

Larned, lär'néd, **Augusta**, American author and journalist: b. Rutland, N. Y., 16 April 1835. She was educated at the Watertown and Potsdam seminaries and at Spiegel Institute, New York; has been contributor and correspondent to periodicals; editor of the 'Revolution' (woman's rights); editorial writer for the 'Christian Register,' Boston, for many years; and is author of the 'Roundabout Road' series of papers which appeared in the New York *Evening Post*. She has also published 'Home Stories'; 'Talks with Girls'; 'Tales Retold from Grecian Mythology'; 'The Norse Grandmother'; 'Tales from the Eddas'; 'Village Photographs'; and 'In Woods and Fields.'

Larned, Josephus Nelson, American author and librarian: b. Chatham, Ontario, Can., 11 May 1836. He was a member of the editorial staff of the Buffalo *Express* 1850-69; and editor, 1869-72; he was then superintendent of public education in Buffalo for a year, and in 1877 became librarian of the Buffalo Library, a position which he held for 20 years. He was president of the American Library Association in 1893-4. He edited and published (1902) 'The Literature of American History,' a bibliography, in which the "scope and comparative worth" of each book is indicated in short annotations by historical students. His other works include 'Talks about Labor' (1877); 'History for Ready Reference' (1895); 'Talk about Books' (1897); 'History of England for Schools' (1900); 'A Multitude of Counselors' (1901); and 'Primer of Right and Wrong' (1902).

Larned, Walter Cranston, American lawyer and author: b. Chicago 30 Nov. 1850. He was graduated at Harvard in 1871; studied at the Harvard Law School, 1871-2, and in Europe, 1872-4; was admitted to the bar in 1874, and has since practised in Chicago. He is the author of 'Arnaud's Masterpiece: a Romance of the Pyrenees'; 'Churches and Castles of Mediaeval France'; and 'Rembrandt: a Romance of Holland.'

Larned, Kan., city and county-seat of Pawnee County, at the junction of the Arkansas and Pawnee Rivers, 240 miles southwest of Topeka. It is on the Missouri P. and the A. T. & S. Fe R.R.'s, and is the shipping centre of a large farming and stock-raising country. It has flour mills, grain elevators, machine shops and other industries and has electric light and waterworks. The city is governed by a mayor and council elected every two years. Pop. (1890) 1,861; (1900) 1,780.

La Rochefoucauld, François, frāñ-swā lä rōsh-foo-kō, DUC DE, PRINCE DE MARCILLAC, French courtier and moralist: b. Paris 1613; d. there 17 March 1680. He entered on a military career and was engaged as an officer at the age of 16 at the siege of Casale. In the wars and intrigues of the Fronde he served the party of the parliament, took part in the defense of Bordeaux (1650), and at the end of the civil war abandoned the pursuits of ambition for a life of repose and reflection. His house became a resort of the most distinguished wits and people of culture of the time, Boileau, Racine, Molière, Madame de Sévigné, and Madame de La Fayette. The first fruits of his literary activity were his 'Mémoires sur la Régence d'Anne d'Autriche,' a spirited representation of that time, published

LA ROCHEJACQUELEIN—LARVA

1662. In 1665 appeared anonymously the work by which he is now universally known, 'Réflexions, ou Sentences et Maximes Morales,' which passed through five editions in the course of the author's life and has been frequently republished. The best recent editions of the Maximes are those of Gilbert and Gourdault (1868-83), and Pauly (1883). The fundamental and prevailing thought in the book, that self-interest is the mainspring of all human actions, is presented with so much piquancy and variety of aspect that the reader forgives for a time the liberator of his race. His 'Correspondence' appeared in 1818. Consult Rahslede, 'Studien zu La Rochefoucauld' (1888); Bourdeau, 'La Rochefoucauld' (1895); Hemon, 'La Rochefoucauld' (1896).

La Rochejacquelein, Henri Du Verger, öñ-ré dù vér-zhá lá rôsh-zhák-läi, COMTE DE, French Vendean royalist: b. Chatillon 20 Aug. 1772; d. Nouaille 4 March 1794. On the outbreak of the Revolution he retired to La Vendée, and the peasants of La Vendée having taken up arms in the royal cause, he placed himself at their head, and addressed them in the short and pithy harangue: "Let us go to meet the enemy; if I draw back, kill me; if I advance, follow me; if I die, avenge me." After gaining 16 victories in 10 months he fell at Nouaille, shot by a Republican soldier whom he was offering quarter.

La Rochelle. See ROCHELLE, LA.

Larousse, Pierre, pé-är lá-roos, French encyclopædia maker: b. Toucy, Youne, 23 Oct. 1817; d. Paris 3 Jan. 1875. For several years he compiled educational text-books. In 1864 appeared the first volume of his great library of information, anti-clerical in tone, 'Grande Dictionnaire Universel du XIX. Siècle.' It was in 15 volumes, and was followed by an 'Encyclopédie du XVIII. Siècle.' He published also small condensed editions of the large works. His native town raised a statue to him in 1894.

Lar'rabee, William Clark, American Methodist Episcopal clergyman and educator: b. Cape Elizabeth, Maine, 1802; d. 1859. He was principal of Methodist academies at Cazenovia, N. Y. (1831-5), and Kent's Hill, Maine, and in 1837 was a member of the Maine geological survey. In 1840 he was appointed professor of mathematics and natural science in Indiana Asbury (now De Pauw) University, and in 1852-4 and 1856 was superintendent of public instruction in Indiana. He worked efficiently toward the improvement of educational methods in his denomination. Among the works published by him are: 'Scientific Evidences of Natural and Revealed Religion' (1850); 'Wesley and his Co-laborers' (1851); 'Asbury and his Co-laborers' (1853).

Larrabee, William Henry, American editor: b. Alfred, Maine, 20 Sept. 1829. He was graduated from Indiana Asbury (now De Pauw) University in 1845, was admitted to the bar but never entered practice, was assistant editor of 'The Methodist' of New York in 1862-5 and again in 1870-7, was associate editor of the Brooklyn *Daily Union* in 1865-70, and associate editor of the 'Popular Science Monthly' in 1879-1900. He contributed extensively to periodicals and encyclopædic publications, and wrote, with A. J. Schem, a 'History of the War in the East' (1877).

Lar'va, the young of an animal, when it differs from its parents in form and manner of life. In most invertebrates and in some of the lower vertebrates, the animal hatched from the egg is so different from the adult that in many cases the relationship was long unsuspected by naturalists, and the little creatures were given names as separate beings,—*zoëa*, *nauplius*, etc., now applied to the forms of larvæ they represent. These larvæ may grow by imperceptible degrees into the stature and likeness of the adult; or they may pass by comparatively sudden changes through a series of more or less different forms, until finally the adult form is reached and retained. In the latter case the development is said to be by metamorphosis (q.v.), most completely and familiarly manifested by insects. Whatever the method, the course of larval growth in its successive stages recalls the phylogeny of its race—that is, the course of its evolution in history. Thus each of the various phases of the larval life of any of the lower animals, like the foetal life of embryos of the higher ranks, indicates probable ancestral forms. Some of the most remarkable larvæ may be mentioned. Among the marine annelids a larva known as the *trochophore* or *trochosphere* (Fig. 1) is common. It has a short

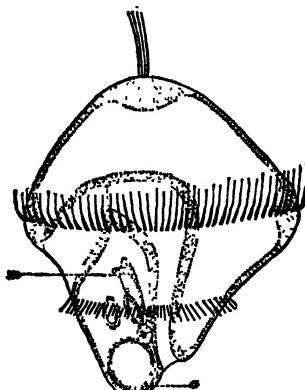

FIG. 1.—A trochophore: *a*, anus; *m*, mouth.

compact body, traversed by the alimentary canal, and has one or more bands of cilia around the body and a sensory patch at the top of the head. By feeding, this larva grows, the increase being chiefly in length, and with this increase, the joining or metamerism of the body, so noticeable in the adult, appears. Other worms have different types of larvæ, among them the *pilidium* of the nemertines (Fig. 2), shaped

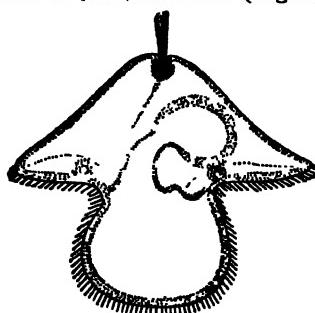

FIG. 2.—A pilidium.

LARVA

somewhat like a chapeau with enormous ear lapets. Between these is the mouth which leads to a large blind sac, the stomach of the worm. The worm itself develops inside the pilidium and later escapes from it to continue its existence, leaving the rest to die.

Among the mollusks larvae like the trocho-phore occur, and it is the existence of these larvae which leads naturalists to think that annelids and mollusks, so different in the adult, had a common ancestry. Later, with the appearance of molluskan characters, a larva known as the *veliger* may appear. This is characterized by a large disk on the top of the head, which serves for a time as a swimming organ and is later lost.

All of the lower and some of the higher crustacea pass through a so-called *nauplius* stage (Fig. 3). The adult crustacean consists of sev-

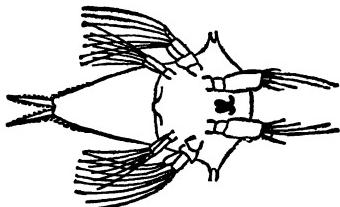

FIG. 3.—Nauplius of *Sacculina*.

eral segments, but the nauplius is without joints, has a single eye, a straight alimentary canal, the mouth being overhung by an enormous upper lip, and three pairs of appendages, which

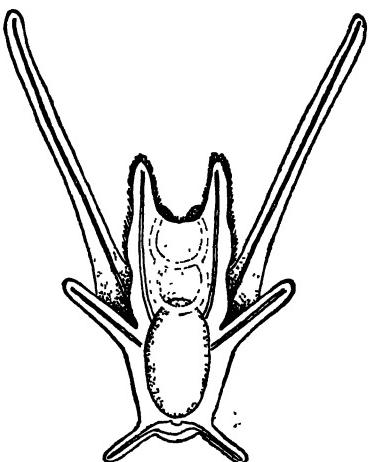

FIG. 4.—Pluteus of a sea-urchin.

later become changed into the two pairs of antennae and the mandibles of the adult. The first pair of the nauplian appendages are simple and apparently are only sensory, while the two remaining pairs are two-branched, and serve as swimming organs, the basal portions being also used as jaws to force food into the mouth which lies between them. In the higher crustacea two other and better developed larvae known as the *soea* and the *megalops* may appear.

Possibly the most remarkable larvae occur

among the echinoderms. These forms, exemplified by the starfish and sea-urchin, are noticeable for their radial symmetry, but in the larvae, of which there are several distinct types, not a trace of a radial arrangement of parts can be found. They are rather markedly bilaterally symmetrical, with well-marked dorsal and ventral surfaces, which, however, do not correspond with the upper and lower surfaces of the adult. Some of these larvae are more or less barrel-shaped, but in others, as the *pluteus* (Fig. 4) and *bipinnaria* (Fig. 5), the body is drawn

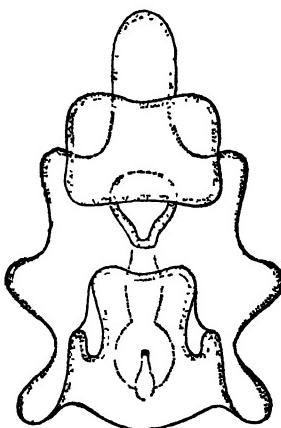

FIG. 5.—Bipinnaria of a starfish.

out into a number of processes, soft and flexible in the latter, but stiffened in the pluteus by internal calcareous rods. The starfish or sea-urchin later arises on one side of this larva, the processes are absorbed and the radial arrangement is superimposed upon the bilateral features in the adult, without, however, completely obliterating them.

The larval forms of insects vary greatly both in their form and in the completeness of their metamorphosis. They may be divided into two classes, the cruciform and the campodea-form. The former include those which are worm-like, such as the caterpillars (q.v.) of moths and butterflies, the grubs of beetles, the maggots of flies, and the like. They are the most numerous and conspicuous forms, and are active and voracious, and do nearly all the damage to be attributed to injurious insects. The campodeaform larvae are those which nearly resemble the parents, such as the nymphs of the dragon-fly and related groups. The second stage of larval life among insects is a very different existence, usually stationary and quiescent, and is called the pupa stage (see PUPA). Some larvae among insects and elsewhere may breed,—a phase of reproduction called paedogenesis (see PARTHENOGENESIS).

The value of the different forms and habits of life assumed by animals in passing through the larval stage or stages is that it tends to prevent the extinction of the species, since if at any moment all the adults were swept out of existence, the young living in a different station would continue to represent and revive the species. "This law is seen to hold good among the insects," as Packard points out, "where many species are represented in the winter-time

LARYNGISMUS STRIDULUS — LASALLE

by the egg alone, others by the caterpillar, others by the chrysalis, while still others hibernate as imagoes. Again, in the marine species, the free-swimming young are borne about by the ocean and tidal currents, and in this what in adult life are the most sedentary forms become widely distributed from coast to coast and from sea to sea." On the other hand, the larval forms of fixed marine animals serve as food for fishes, especially young fishes and numerous invertebrates, which, without this resource, would starve.

Among vertebrates larvae are rare, and appear only in the lower forms, those of the lamprey (*Ammocetes*), of eels (*Leptocephali*), of certain salamanders (*axolotls*), and of frogs (tadpoles), being the most noticeable.

J. S. KINGSLEY,
Professor of Zoology, Tufts College.

Laryngismus (lär-in-jis'mus) **Stridulus.** Laryngismus is spasm of the glottis, causing contraction or closure of the opening; laryngismus stridulus (also called Kopp's asthma, Miller's asthma, etc.), is spasm of the glottis usually associated with some disease, especially with the common ailment of children known as rickets.

Laryngitis, lär-in-jítís. See NOSE AND THROAT.

Laryngoscope, lä-řing'gō-sköp, an instrument used for examining the larynx. It consists of a little plane mirror attached to a stem, about four inches long, at an angle of 120° or more. This mirror is introduced into the mouth of the person to be examined, and held near the back of the throat, while a strong light is thrown upon it from a reflector worn upon the forehead, or held between the teeth of the examiner. In the strong light of the sun, or of an argand burner, the light thrown from the reflector is concentrated upon the laryngeal mirror, which lights up the parts to be examined, while it at the same time reflects the images of these parts into the eye of the examiner. In this way the mechanism of the human voice may be studied, and what is of considerable importance, disease if present can be readily detected, and the fitting remedy applied. The chief merit of introducing this instrument in a very complete form into medical practice must be assigned to Drs. Turck, of Vienna, and Czermak, of Prague, although Garcia, Liston, Babington, Avery, and others used a reflecting mirror to explore the recesses of the throat. It was not until the two German physiologists took up the subject in 1857 that the benefits arising from its use were fully recognized.

Laryngotomy, lär-ing-göt'ō-mí. See BRONCHOTOMY.

Larynx, the organ by which the voice is produced, situated at the upper part of the trachea or windpipe. The larynx is formed mainly by two pieces of cartilage, called the thyroid and the cricoid, one placed above the other. The thyroid is formed of two extended wings meeting at the middle line in front of a ridge; above and from the sides two horns project upward, which are connected by bands to the hyoid bone, from which the larynx is suspended. The thyroid cartilage rests and is movable upon the cricoid, moving backward or forward, but not from side to side. The cricoid cartilage is shaped like a signet-ring (Greek

krikos, a ring), the narrow part of the ring being in front. The cricoid carries, perched on its upper edge behind, the arytenoid cartilages, which are of great importance in the production of the voice. These various cartilages form a framework upon which muscles and mucous membranes are disposed. The mucous membrane which lines the larynx is thrown into various folds. These folds are called the true vocal cords, and by their movements the voice is produced. They are called true, as distinct from the false vocal cords which are above them, but take no part in producing the voice. The true vocal cords projecting toward the middle form

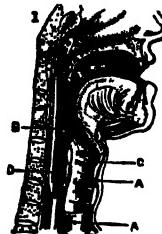

Fig. 1.
Larynx internally.

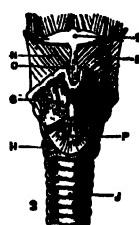

Fig. 2.
Larynx externally.

a chink, which is called the glottis. By the contraction of various muscles this chink can be so brought together that the air forced through it throws the edges of the membrane into vibration and so produce sounds. Variations in the form of the chink will effect changes in the sound. Thus the production of voice is the same as in musical instruments, the arrangements in the larynx being such as to produce (1) the vibratory sounds, (2) to regulate the sound, (3) to vary the pitch, and (4) to determine the quality of the sound. The rapid, delicate muscular movements involved are produced by nervous stimuli reaching the muscles from the brain. Thus the voice is produced in the larynx, and is modified by the rest of the respiratory passages. (See VOICE.) In the act of swallowing, the glottis is covered by a cartilaginous plate called the epiglottis. In the accompanying cut, Fig. 1, shows c, the larynx internally, b being the epiglottis situated above the glottis or entrance to the larynx, a the trachea, and d the cesophagus or gullet. In Fig. 2, j is the trachea, b the hyoid bone, n the thyro-hyoïd membrane, o the thyro-hyoïd ligament, g the thyroid cartilage, h the cricoid cartilage, p the crico-thyroid ligament. See NOSE AND THROAT.

La Salle, Jean Baptiste de, zhōn báp-test dē là säl, French priest and educator, called the father of modern pedagogy: b. Rheims 30 April 1651; d. Saint-Yon 7 April 1719. After completing the preparatory course of humanities, he entered the university of his native city where, at the age of 19, he took his Master's degree. Shortly afterward he went to the Seminary of Saint Sulpice at Paris; and, while living there, followed the theological courses of the Sorbonne. On Easter eve 1678, he was ordained priest, being already a titular canon of the Cathedral Church of Rheims; two years later, in 1681, after defending a thesis before the faculty of the University of Rheims he obtained the degree of Doctor in Sacred Theology.

A man of means and academic culture, he was also a friend of the people, a true philan-

LA SALLE

thropist, giving away all his patrimony in alms to help the deserving poor. He interested himself at an early period in education, especially the education of children belonging to the humbler classes. He noticed that nowhere was there a clear distinction drawn between primary and secondary education and that nowhere was there any provision made for instructing school-children in subjects of acknowledged utility to them in after life.

To correct this state of affairs he founded in 1681 a society of teachers under the name of Brothers of the Christian Schools (q.v.), enjoining them by rule to take the vows of religion but not to enter holy orders. By this latter regulation, he sought to free them from ecclesiastical duties so that they might be able to devote themselves unreservedly to the work of education. The rules and constitutions of the society were approved in 1724 by Pope Benedict XIII.

The first great change introduced by De la Salle and successfully carried out by his followers was the substitution of French for Latin as the language of the class-room. As in the case of antecedent reforms, this roused a swarm of wrathful critics; but it soon met with the approval of the universities and highest authorities in church and state.

The individual system of teaching was then in vogue, and as it seemed to him to involve loss of time and to favor idleness, he replaced it by the "simultaneous" method in which the teacher addresses himself to a numerous division and frequently to a whole class at a time. He insisted on the Socratic method of teaching for all subjects, rejecting the lecturing style as unsuited to elementary instruction. He also recommended the frequent use of object-lessons. Such thorough-going changes gave a great impetus to education inasmuch as it increased the efficiency of the teacher while diminishing his drudgery, and insuring substantial results. In due time, these bold innovations in educational methods brought about a general system of popular education in France as well as in other European countries, and merited for their author the title of Father of Modern Pedagogy.

In 1684 he opened a *Séminaire de Maîtres d'Ecole* for the formation of competent masters for the rural districts, which seminary was the first normal school or training college founded in Europe. Admission was by examination; and during the course, opportunities were afforded for practice-work by the free schools attached to the institution. In his endeavors to instruct the masses and educate the people, De la Salle established in Paris in 1699 regular public courses in science and art in which instruction was given to all comers on Sunday from 12 to 3, the session being always concluded by a short religious instruction. These schools were called *Ecoles Dominicales* and were, in some respects, the prototype of our Sunday schools. At Saint-Yon, near Rouen, he also founded a school of higher studies in which the students were allowed to select the courses best adapted to their wants.

De la Salle lived to see his society firmly established in France and his educational work appreciated at home and abroad. Among his published writings are *Le Devoir du Chrétien* and *La Conduite des Ecoles*; others are of an ascetical character and refer to the religious life.

This great educator and benefactor of the people was of a gentle yet firm disposition; severe to himself but kind and encouraging to others. The holiness of his life was proclaimed to the world by Pope Leo XIII. who on 24 May 1900, conferred on him the honors of canonization and enrolled him among the saints of the Catholic Church.

BROTHER POTAMIAN,
Manhattan College, New York.

La Salle, René Robert Cavalier, ré-nâr-kô-bär-ka-vâ-lê-ä, SIEUR DE, French explorer: b. Rouen, France, 22 Nov. 1643; d. Texas 20 March 1687. He sailed for Canada in 1667 with the hope of making his fortune there; became a fur trader at La Chine (so named for its supposed position on the route to China), explored Lake Ontario, established forts on the St. Lawrence, and was made by Frontenac commander of a fort which stood where Kingston, Ontario, now stands. Returning to France he received large grants of land in Canada, and was ennobled, but on the discovery by Marquette of the Mississippi, he left his new estate to seek the mouth of the great stream. His designs were favored by the French minister of marine, who supplied him with men and ships. In 1679 he had built and launched on the Niagara River a bark of 60 tons, the Griffin, crossed Lake Erie, and Lake St. Clair, and reached Green Bay. Here he loaded the Griffin with rich furs and sent it to meet the claims of his creditors at Montreal. He then proceeded in bark canoes and reached the banks of Lake Peoria. Leaving his lieutenants to continue explorations he returned to Fort Frontenac, where he learned of the wreck of the Griffin, and another ship sent with supplies for him from France. In the meantime his little band of explorers had been scattered through dissensions, but he succeeded in gathering them and descended to the mouth of the Mississippi, where he built a fort, and named the adjacent lands Louisiana. This was the great achievement of his life. After a visit to France he failed on his return (1684) with 4 vessels and 280 men, to locate the mouth of the Mississippi. He had a difference on this point with Beaujeu, the naval commander, who persisted in sailing on to Matagorda Bay. Here La Salle, to avoid further quarrels and recriminations, abandoned his companions; the colonists who followed him lost most of their supplies in a gale of wind, but managed to fortify the fort of St. Louis; they failed in their agricultural attempts, and sought in vain for gold. Their numbers were reduced to 35, and in 1687 he set out for a return to Canada. Two men, Dubant and L'Archevêque, who had embarked capital in the enterprise, were incensed at its failure, and in a quarrel murdered the nephew of La Salle, who, when he enquired into the matter, was shot dead from ambush.

Lasalle, la-säl', Ill., city in Lasalle County, on the Illinois River, the Illinois & Michigan Canal, and on the Illinois C. and the Chicago, R. I. and Pacific R.R.'s; 99 miles southwest of Chicago. It is the centre of a large trade by river, canal, and rail; is in a rich bituminous coal region; and is engaged in coal mining, zinc smelting and the manufacture of sulphuric acid, hydraulic cement, sewer pipe, bottles, clocks and ornamental pressed brick, and common brick. It is the seat of Saint Bede College and Saint Mary's Hospital; has a public library;

LA SALLE COLLEGE—LASSALLE

good sewerage system, waterworks, hospitals, a National bank, electric light and street railroad plants, and daily and weekly newspapers. The city was settled in 1830, and named in honor of La Salle, the explorer. It was chartered in 1852. The government is vested in a mayor and council. The city owns and controls the electric light plant and waterworks. Pop. (1890) 9,855; (1900) 10,446.

La Salle College, an educational institution in Philadelphia, Pa., founded in 1867 under the auspices of the Roman Catholic Church. It is under the management of the Brothers of the Christian Schools. In 1903 there were 24 instructors, 276 students, 8,700 volumes in the library, and the grounds and buildings were valued at \$250,000.

Lascar, läs-kär', a name generally applied to Indian sailors on board of British ships, as, for instance, the large steamers of the Peninsular and Oriental Company. The Lascars make good seamen, being both temperate and docile. They are mostly Mohammedans.

Las Casas. See CASAS, BARTOLOMÉ DE LAS.

Las Cases, Emmanuel Augustin Dieudonné Marin Joseph, èm-män-oo-él ö-güs-tán dè-é-döñ-nä mä-rän zhô-zéf läs käs, French historian; one of the companions of Napoleon at St. Helena: b. Chateau Las Cases, near Revel, 1766; d. Passy-sur-Seine 15 May 1842. He was educated at the school of the Oratorians in Vendôme, and at the military and naval schools of Paris, and when the Revolution broke out took part with the royalists. After the defeat of the Prussians in Champagne he fled to London, where he lived as a teacher. While here he executed his 'Atlas historique et géographique' (1802), which he published under the name of Le Sage. When the émigrés were recalled by Napoleon, Las Cases returned to Paris. Having entered the army of Bernadotte (1809) he gained the favor of Napoleon, who in 1810 made him chamberlain and count of the empire. After the disasters of Leipsic and Moscow, Las Cases commanded the 10th legion of the national guard. In 1814 he refused to assent to the request for Napoleon's abdication, and went to England, whence he subsequently sent in his adhesion to the Bourbons. After the return from Elba he went back to France, and after the final defeat of the emperor at Waterloo followed him to St. Helena. Here with his son he devoted himself to the care of Napoleon, and passed his evenings in recording the emperor's remarks, which were subsequently published in his 'Mémorial de Sainte Hélène, ou Journal où se trouve consigné, jour par jour, ce qui a dit et fait Napoléon pendant dix-huit Mois' (1822-3). Having written a letter to Lucien Bonaparte commenting freely on the treatment to which Napoleon was subjected, he was arrested, 25 Nov. 1816, sent to the Cape of Good Hope, presently taken to England, thence conveyed to the continent, and to Frankfort-on-the-Main, where he at last received his liberty after 13 months' captivity. He was not allowed to return to France until the death of Napoleon. In the reign of Louis Philippe he was elected in 1831 and 1839 to the chamber of deputies, taking his seat at the extreme left, or with the ultra opposition. He wrote, in addition to the works above mentioned, his own life,

'Mémoires d'E. A. D., Comte de Las Cases, communiqués par lui-même' (1819).

La Serena, lä sâ-râ'nâ, Chile, city, and capital of the department of Coquimbo (q.v.), on the Pacific coast, 215 miles north of Valparaíso. A railroad connects it with Coquimbo, 8 miles distant. Pop. (1900) 16,561.

Lasker, läs'kér, Eduard, German politician: b. Jarotschin, Posen, 14 Oct. 1820; d. New York 5 Jan. 1884. He was of Jewish descent, and after being educated at the Universities of Breslau and Berlin obtained a post in the municipal court (1851). He spent three years in England. On his return he entered the government service and was elected in 1865 to the Lower House. He sat subsequently in the Constituent North German Diet, and up to the time of his death in the North German and German Diet for the district of Saxe-Meiningen. He was associated with the 'Fortschrittspartei' or Progressives, and in 1866 assisted in forming the National Liberal Party. He took an active part in the civil consolidation of the German empire. Among his writings is: 'Zur Verfassungsgeschichte Preussens' (1874).

Lasker, Emanuel, German chess champion: b. Berlinchen 24 Dec. 1868. He chose mathematics as a profession, but eventually turned his attention to chess, playing with such success that since 1892 he has triumphed over all competitors both in tournaments and duel matches. He has outplayed, without losing a single game, Blackburne, Bird and F. Mieses of Leipsic. In 1892 he won the first prize in the London tournament; and in the International tournament at New York in 1893 beat all the best players, including Steinitz, champion of the world. A decisive match was arranged between him and Steinitz at Moscow and came off December 1896 and January 1897. Lasker won by 10 games to 2, 5 being drawn.

Las Palmas, läs päl'mäs, Canárias, the chief town of Grand Canary Island, and seat of the provincial government: an attractive place, with clean streets, a few handsome public buildings and churches, shaded walks, a well-defended small harbor, and a somewhat inadequate water-supply. The principal industries are the building and repairing of vessels, and manufacturing woolen goods, hats, leather, and glass. Population about 12,000.

Lassa, läs'sä. See LHASA.

Lassalle, lä-säl', Ferdinand, German Socialist: b. Breslau 11 April 1825; d. Geneva 28 Aug. 1864. He studied at the universities of Breslau and Berlin, and while there gained the friendship of such men as Böckh and Humboldt. Toward the end of 1844 he met at Berlin the Countess Hatzfeldt, who had contracted an unfortunate marriage, conducted her suit for separation, and brought it to a successful issue. He first made himself known as a leader during the democratic troubles of 1848, and was imprisoned for a year for alleged inciting to revolt. In 1858 he produced a work on the philosophy of Heraclitus, and in 1861 published his 'System of Acquired Rights.' Thereafter he proceeded to organize the working-classes, which caused the government to accuse him of sedition, and he was imprisoned for four months. He was at first allied with the party of the Pro-

LASSELL—LAST DAYS OF POMPEII

gressists, but in 1862 he broke with them; in 1863 he issued his famous 'Offenes Antwort-schreiben,' a brochure in which he sets forth his working-class programme; and later in the same year founded a Labor Union (Allgemeiner deutscher Arbeiterverein), and began the Socialist propaganda in Germany. In 1864 he published an attack on the Manchester school of economists under the title 'Herr Bastiat-Schultze von Delitzsch der ökonomische Julian, oder Kapital und Arbeit.' In the summer of the same year he was killed in a duel occasioned by a love affair. One of the chief points in his economic theory was that the "iron law of wages" tended always to reduce wages to the mere cost of living; to remedy this he proposed associations of the working classes in productive enterprises with capital furnished by the state. He left no such elaborate statement of his views of the nature of capital and capitalistic society as did Marx; nor did he influence the labor movement so much through his theoretical teachings as through his power and success as an organizer. Consult: Bernstein, 'Lassalle as a Social Reformer'; and Dawson, 'German Socialism and Lassalle.'

Lassell, lā-sē'l, William, English astronomer: b. Lancashire 18 June 1799; d. 5 Oct. 1880. His early education was scanty, and while serving a mercantile apprenticeship at Liverpool he made telescopes for himself, and in a private observatory which he built near that city he began his astronomical work, about 1820, and continued it until 1861. There he built and mounted reflecting telescopes equatorially, the first of the kind in use, and also invented a method of polishing the specula. With his own telescope he discovered the satellite of Neptune in 1847, observed the eighth satellite of Saturn in 1848, and in 1851 discovered two new satellites of Uranus. In 1861, at Valetta, on the island of Malta, he mounted equatorially a reflecting telescope, and at that place until 1865 he made observations, also describing new nebulæ and correcting many of his former results. In 1865 he returned to England, built an observatory near Maidenhead, and there spent the remainder of his life.

Lassen, lās'sēn, Christian, Norwegian philologist and linguist: b. Bergen, Norway, 22 Oct. 1800; d. Bonn, Prussia, 8 May 1876. He studied at Christiania, Heidelberg, and Bonn, at which latter university he became in 1830 extraordinary and in 1849 ordinary professor. With Eugène Burnouf he deciphered many Pali MSS., and the result of their labors was published by the Asiatic Society in an 'Essay on the Pali or Sacred Language from the Peninsula beyond the Ganges.' He published with Schlegel the 'Ramayana' and the 'Hitopadesa,' and was for many years editor of the 'Zeitschrift für die Kunde des Morgenlandes.' His works, which are numerous and valuable, relate to a variety of oriental languages and ancient history, embracing, among other subjects, translations from the Hindu philosophy, the history of Bactriana, Cabool, and India, and cuneiform inscriptions.

Lassen, Eduard, Danish composer: b. Copenhagen 13 April 1830; d. Weimar 15 Jan. 1904. He began his education at Brussels and in 1851 won the "Prix de Rome." Through Liszt

his opera 'Landgraf Ludwigs Brautfahrt' was produced in Weimar (1875), where he was made the following year "Kapellmeister" to the court. He retired in 1895. Of his compositions those which are most remarkable for talent and artistic sincerity are the operas: 'Frauenlob' (1860); 'Le Captif' (1868). He wrote two symphonies, and the music for Sophocles' 'Edipus,' and Goethe's 'Faust,' as well as numerous songs, etc.

Las'so, a long strong thong of buffalo-hide, rope, or leather, with a running noose at one end, used by ranchmen and hunters. It is thrown in such a way as to fall over the horns or head of the animal, the hunter coiling one end round a high pommel on his saddle. When he makes a successful cast the hunter spurs his horse to its fullest speed, and the horse or other animal is almost strangled or borne to the ground, and becomes an easy prey. Instead of a noose a leaden ball may be attached to the end of the thong, which is thrown so as to entangle the legs, neck, or horns of the animal to be captured. The lasso has been used in the South American wars: it was employed against the French sentinels by some of the semi-barbarous tribes whom Russia had pressed into her armies during the Crimean war.

Lasso-cells, or **Stinging Cells**, names applied to the cnidocytes of coelenterates. See NEMATOCYST.

Lassus, lās'ūs, **Orlandus**, or **Lasso**, lās'sō, **Orlando** (originally Roland Delattre), German composer: b. Mons in Hainaut 1520 or 1530; d. Munich June 1594. As a composer he was excelled only by Palestrina among musicians of the 16th century. About 1556 he went to Munich as chapel-master to Albert, duke of Bavaria, and in 1562 became chapel-master, an office which he held till his death. Among his more than 2,000 works are some 60 masses, many madrigals and songs, and the celebrated music for the Seven Penitential Psalms. In the royal library at Munich is the richest collection of his works. His sons published a collection of his motets, entitled 'Magnum Opus Musicum' (1604, 17 vols. folio). An edition of his collected works appeared at Leipsic 1893 (et seq.).

Last Days of Pompeii, The, a celebrated romance, by Edward Bulwer, Lord Lytton, published in 1834. The characters and scenes are suggested by the peculiarities of the buildings at Pompeii. Beginning a few days before the destruction of Pompeii, the story relates principally to two young Greeks, Glaucus and Ione, who are deeply attached to each other. The former is a handsome young Athenian, impetuous, high-minded and brilliant, while Ione is a pure and lofty-minded woman. Arbaces, her guardian, is the villain, who, under a cloak of sanctity and religion, indulges in low and criminal designs. His character is strongly drawn; and his passion for Ione, and the struggle between him and Glaucus, form the chief part of the plot. Nydia, the blind girl, who pines in unrequited affection for Glaucus, and who saves the lives of the lovers at the time of the destruction of the city, by conducting them in safety to the sea, is a touching and beautiful conception. The book, full of learning and spirit, is not only a charming novel, but contains

LAST OF THE MOHICANS—LATERAN

many minute and interesting descriptions of ancient customs.

Last of the Mohicans, The, an American novel by James Fenimore Cooper, published in 1826. It formed one of the celebrated Leatherstocking tales.

Last Rose of Summer, The, a famous song by Thomas Moore, published in his 'Irish Melodies.' The air was derived from an old melody, 'The Groves of Blarney.'

Last Sigh of the Moor, The, a large hill in the outskirts of the city of Granada, Spain. It is noted as the spot where Boabdil, the last Moorish monarch, took his farewell of the land of his birth, 2 Jan. 1492.

Las Vegas, läs vä'gä's, N. Mex., city and county-seat of San Miguel County, on the Gallivar River, a branch of the Pecos, and on the Atchison, T. & S. Fe railroad, 83 miles east of Santa Fe. There are here practically two towns, the old Mexican settlement, which is the county-seat, and the modern city lying to the east, first known as East Las Vegas, but incorporated in 1896 as the city of Las Vegas. The New Mexico Normal University is located here, and there is a public library, flour-mills, carriage and wagon shops, railroad machine shops, planning-mills, foundries and machine shop. The surrounding country is devoted to agriculture and stock raising and Las Vegas is an important wool market. The health resort known as Las Vegas Hot Springs is located 6 miles distant, at an elevation of 6,767 feet above the sea. Pop. (1901) 8,000.

Laszow'ski-Ger'ard, MADAME Emily de, Anglo-Austrian novelist: b. Scotland 7 May 1849. She was educated in the Convent of Kiedenburg in the Tyrol, was married to the Chevalier Miecislas de Laszowski, an Austrian lieutenant-general, and resides in Vienna. She published: 'Reata' (1880); 'Beggar My Neighbor' (1882), and other novels, written in collaboration with her sister, Dorothea Gerard, and 'Bis' (1890); 'The Tragedy of a Nose' (1898); 'The Extermination of Love' (1901); and other novels of which she is sole author. Her fiction has been popular both in England and America.

Latacunga, lä-tä-koon'gä, Ecuador, capital of the province of Leon and one of the oldest towns in the republic, containing an administration building, city hall, college, hospital, school for young ladies, five churches, two printing houses, manufactures of woolen and cotton fabrics, potteries, etc. Owing to its situation on a plain more than 9,000 feet above sea-level, it has an even and temperate climate, and the surrounding country is well adapted to agriculture and cattle-raising; but it is only 25 miles distant from the great volcano, Cotopaxi, and has repeatedly been destroyed by earthquakes. Pop. about 12,000.

Latchaw, John Roland Harris, American educator: b. Venango County, Pa., 7 Sept. 1851. He was graduated at Hillsdale College in 1881 and in 1895-6 studied at the University of Chicago. In 1881 he founded Barkeyville Academy in Pennsylvania, and conducted it until 1884, when he became president of Findlay College, where he was also lecturer on psychology and theology till 1893. From 1893 to 1895 he was minister of the First Baptist Church at Zanes-

ville, Ohio; held several other pastorates; was president of Defiance College, 1896-1902, since when he has been president of Palmer University. He has written: 'Outlines of Psychology, Its Method and Matter'; 'Citizenship in the Northwest Territory'; 'Outline Lectures in Theology'; 'Theory and Art of Teaching'; and is editor and publisher of the 'Truth Seeker' and joint editor of 'Unity Herald.'

Lateral Line Organs, a system of sense organs in the lower aquatic vertebrates, so called from the fact that part of the system makes a well marked line on the side of the body of fishes, although a larger but less conspicuous portion of the organs occurs upon the head. In their simplest form, as in the fish *Chimæra*, the organs are placed in grooves, but usually the grooves are closed into tubes with openings at regular intervals by which water obtains access to the canals. The distribution varies considerably in different fishes, but the most constant canals are one along the side of the body, one across the back of the head, and three rows, one above, one below the eye and one on the lower jaw. The sense-organs contained in the canals belong to a group of peculiar structures known as "nerve-hillocks" or "neuro-masts," and are further peculiar in their nerve supply, which is derived from the 7th (facial) and 10th (vagus) nerves. In the case of the amphibia these organs occur only in the aquatic forms. Hence, while they are present in tadpoles, they are lost, and with them their nerves, when the tadpole changes into a frog or toad. This would indicate that their function is in some way connected with an aquatic life, and only very recently has it been shown to be for the recognition of vibrations of low rapidity in the water. There has been accumulated considerable evidence to show that the ears of vertebrates are only specially modified parts of the lateral line system.

J. S. KINGSLAY,
Professor Zoology Tufts College.

Lat'eran, palace and church at Rome. The name is derived from Plautius Lateranus, head of a rich patrician family whose estates were confiscated by Nero, while he himself was put to death for complicity in the conspiracy of Piso. The palace afterward became an imperial residence, but was given to Pope Melchiades in 312 by Constantine the Great, and became the residence of the popes for a thousand years. Only one fragment of the palace of Constantine remains, the private chapel of the popes, and the end wall of their dining-room. The rest is all recent, the old palace having been rebuilt from designs of Fontana by Sixtus V. In 1438 Gregory XVI. turned it into a museum, and it contains many fine pictures and statues, and mosaics, notably the flooring taken from the baths of Caracalla in 1822 and containing 28 portraits of gladiators. The basilica of St. John Lateran is the original see church of the bishop of Rome. The see church was built by Pope Sylvester, Constantine joining with his own hands in the construction. It was consecrated in 324, overthrown by an earthquake in 896, rebuilt by Sergius III. in 911. This second basilica was destroyed by fire in 1308 and again after rebuilding in 1360, but restored by Urban V. 1370. The church consists of five naves. The transept is the most beautiful part of the building, and the

LATERAN COUNCILS — LATHROP

many colored marbles, the statues of the Apostles, the Tabernacle, beneath which the skulls of Saints Peter and Paul are said to be preserved, the grand mosaic of the Head of Christ above the arch of the tribune (a work of art attributed to the time of Constantine), are all notable features among the numberless examples of religious art to be found in the building.

Lateran Councils, five councils of the Roman Catholic Church, held in the Church of St. John Lateran, Rome, under the presidency of the pope. The first Lateran Council took place in 1123, under Calixtus II. The Concordat of Worms was confirmed, the indulgences granted to the crusaders by Urban II. were renewed; the consecrations performed by Burdin, the anti-pope, were annulled; the decrees against simony, marriage of the clergy, etc., were repeated. The second (1139), under Innocent II., laid the interdict upon King Roger of Sicily, excommunicated the Petrobrusians, and ordered Arnold of Brescia to keep silent. The third (1179), under Alexander III., decreed that a vote of two thirds of the total conclave should be required legitimately to elect a pope. The fourth, convened by Innocent III. in 1215, is the most important of all the Lateran Councils. Besides representatives of many princes, two Oriental patriarchs were present 412 bishops, and 800 abbots and priors. Seventy decrees were issued. The first, directed against the Cathari and Waldensians, contains a confession of faith, in which the term *transsubstantiatio* occurs for the first time. The second decides the Trinitarian controversy between Petrus Lombardus and Joachim of Floris (in favor of the former). The 13th forbids the foundation of new monastical orders. The 21st decrees that all the faithful shall confess at least once a year to his sacerdos proprius (*Mansi xxii. 953-1086*). The fifth (1512-17), which was not recognized by the Gallican Church, abrogated, on the command of Julius II., the Pragmatic Sanction issued by the Council of Pisa, and approved the concordat between Francis I. of France and the pope by which the "liberties" of the Gallican Church were abrogated.

Consult: Valentini, "Basilica Lateranense descripta ed illustrata" (1839); Buddeus, "De Conciliis Lateranensis," Jena (1725).

Lat'erite, a highly ferruginous, argillaceous rock, found in India. The laterite of the highlands results from the weathering of the underlying volcanic rocks. "Low-level laterite" is the surface-rock of the extensive low lands near the western coast; is formed from the debris of volcanic rocks of the region and of highland rocks.

Latham, la'tham, Robert Gordon, English ethnologist and philologist: b. Billingsborough, Lincolnshire, 24 March 1812; d. Putney, Surrey, 9 March 1888. He was educated at Eton and Cambridge and became professor of English literature in University College, London. He published numerous works on the English tongue, among them a "Treatise on the English Language" (1841; frequently republished); "History and Etymology of the English Language" (1849); "Handbook of the English Language" (1851); "Elements of Comparative Philology" (1862). His principal works on ethnology are: "Natural History of the Varieties of Man" (1850); "Man and his Migrations" (1851); "Ethnology of the British Islands"

(1852); "Ethnology of Europe" (1852); "Descriptive Ethnology" (1859); "Russian and Turk" (1878).

Lath'bury, Mary Artemisia, American author and illustrator: b. Manchester, N. Y., 10 Aug. 1841. She was educated at Manchester and at Worcester, Mass.; after leaving school engaged in teaching art, and subsequently in editorial work; and since 1876 has devoted herself to general literature and illustration. She is author and illustrator of "Fleda and the Voice" (1878); "Out of Darkness into Light" (1880); "Seven Little Maids" (1882); "Ring-Around-a-Rosy" (1884); "Idylls of the Months" (1884); "Twelve Times One" (1885); "From Meadow Sweet to Mistletoe" (1888); "Child's Story of the Bible" (1898); has also published other books, and is well known through her Chautauqua songs and hymns in church collections.

Lathrop, la'thrōp, George Parsons, American author: b. Oahu, Sandwich Islands, 25 Aug. 1851; d. New York 19 April 1898. He was educated in New York and in Dresden, studying in the latter city from 1867 to 1870, when he returned to New York and for a short time studied law. He went to England and there, in 1871, married Rose, second daughter of Nathaniel Hawthorne. (See LATHROP, ROSE HAWTHORNE.) From 1875 to 1877 he was assistant editor of the "Atlantic Monthly"; editor of the Boston *Courier* till 1879; resided afterward at Concord, Mass., and in New York city. Among his writings in prose and verse the following are best known: "Rose and Roof-Tree" poems (1875); "Study of Hawthorne" (1876); "Afterglow" a novel (1876); "A Masque of Poets" (1877); "An Echo of Passion" (1882); "In the Distance" (1882); "Spanish Vistas" (1883); "History of the Union League in Philadelphia" (1883); "Newport" (1884); "Gettysburg, a Battle Ode" (1888); "Dreams and Days," verses (1892); "Gold of Pleasure" (1892). With his wife he published "Annals of Georgetown Convent" and "A Story of Courage" (1894); and he brought out an edition of Hawthorne's works, with a biography (1883). The American Copyright League was founded (1883) by Lathrop.

Lathrop, John (also Lathropp, Laythrop), American clergyman: b. Yorkshire, England; d. 1653. He was educated at Oxford, took holy orders; was rector at Egerton in Kent; and about the year 1624, in London, became minister (succeeding Henry Jacob) of the first Independent and Congregational church organized in England. He and his congregation underwent annoyance and persecution at the hands of churchmen, and for a time (1632-4) Lathrop was imprisoned. During his confinement he was bereft by the death of his wife and by a division in his flock over a question of baptism, and in 1634 sailed to Massachusetts, where he settled as minister at Scituate, removing in 1639 to Barnstable. The records of these towns kept in "an original register" written by him are referred to as authority by Prince in his "Annals of New England."

Lathrop, John Hiram, American educator: b. Sherburne, N. Y., 22 Jan. 1799; d. Columbia, Mo., 2 Aug. 1866. He was graduated at Yale in 1819, from 1822 to 1826 was tutor there; adopted the profession of law, which he fol-

LATHROP — LATIN-AMERICAN LITERATURE

lowed for six years, then abandoned it for that of teaching. He taught at Norwich, Vt., and at Gardiner, Maine. Between 1829 and 1840 held professorships of mathematics, natural philosophy, law, history, and economics at Hamilton College; was president of the University of Missouri 1840-9; afterward became chancellor of the University of Wisconsin (1849-50); president of Indiana University (1859-60); professor of English literature at the University of Missouri (1860-2). He was again president of the University of Missouri in 1865, and until the time of his death.

Lathrop, Rose Hawthorne, American author: b. Lenox, Mass., 20 May 1851. She was educated in the public schools, having lived during the years 1853-60 in England, where her father, Nathaniel Hawthorne (q.v.), was United States consul at Liverpool (1853-7), and in Portugal; studied art in Dresden and London; and in 1871 married George Parsons Lathrop, with whom, until his death, she was associated in literary labors. She has been especially interested in the improvement of conditions for suffering and needy people, and in 1891 established Saint Rose's Free Home for Cancer, and Rosary Hill Home, in New York, where she afterward became head of a Dominican community of the Third Order and directress of a charitable home, her title being Mother Mary Alphonsa. Besides many sketches and stories, her writings include 'Along the Shore,' poems (1888), and 'Memories of Hawthorne,' with her husband (1897), with whom she also collaborated in other works. See **LATHROP, GEORGE PARSONS**.

Lath'yrus, a genus of plants of the pea family, the vetchlings or everlasting peas, which resembles *Vicia* but have fewer leaflets (usually two), broader petals, an obliquely truncate staminal tube, and a style longitudinally flattened and bearded on the inner face. The species are numerous and grow in sandy and waste places, or in meadows. *L. pratensis*, the meadow vetchling, a climbing plant, two or three feet long, with yellow flowers, is a familiar example throughout the whole northern hemisphere. Another species (*L. maritimus*) the beach-pea, is equally widespread. The roots of *L. tuberosus* are eatable. *L. sativus* and other species are used as green fodder for cattle in India, but are harmful to pigs; and several species contain a poisonous principle injurious to the human system. Nearly 60 species of the genus are cultivated for their handsome flowers—yellow, red, scarlet, purple, and blue. The larger kinds are well adapted for arbors and shrubberies, where they may climb upon some support.

Lat'imer, Hugh, English prelate, reformer and martyr: b. Thurcaston, Leicestershire, about 1490; d. Oxford 16 Oct. 1555. He was educated at Cambridge, took holy orders, and by and by began to preach Protestant doctrine, which led to vigorous opposition. He was made chaplain to Henry VIII. in 1530, and during the ascendancy of Anne Boleyn in 1535 was appointed bishop of Worcester. In 1538 he resigned his bishopric, not being able to accept the Six Articles, and was put in prison, but on the accession of Edward VI. he was released and became highly popular at court. This continued until Mary ascended the throne, when Latimer was

cited to appear, with Cranmer and Ridley, before a council at Oxford, and condemned. After much delay and a second trial, Latimer and Ridley were burned at the stake. His preaching was popular in his own time for its pith, simplicity, and quaintness, and his 'Sermons' are still read. Consult *Lives by Demaus* (1869); R. M. Carlyle (1890).

Latimer, Mary Elizabeth Wormeley, American author: b. London, England, 26 July 1822. She was privately educated and wrote largely for the press. Among her works are: 'Salvage'; 'Princess Amélie'; 'A Chain of Errors'; 'My Scrap-Book of the French Revolution' (1868); 'The Last Years of the XIXth Century' (1901); 'The Prince Incognito' (1902); and 'Talks of Napoleon at St. Helena with General Gourzand' (1903).

Latin America, a general name given to the countries and people in South and Central America; especially those races who come of Latin stock. These include naturally the Mexicans, the inhabitants of Central America and certain islands of the West Indies.

Latin-American Literature. The Rio Bravo del Norte, or Rio Grande, serves as a dividing line between what may be termed "Saxon America" and "Latin America." We of Saxon America are apt to look complacently upon ourselves as considerably in advance of our neighbors to the south, at least in material prosperity. But consider a moment the difference of circumstances under which we have grown. From the discovery of Haiti to the founding of Jamestown was 125 years; to the landing of the Pilgrims, 138. During those years Europe had been growing—England and Holland quite vigorously. The priority of Spain and Portugal was therefore a disadvantage: they reached the Western hemisphere in their intellectual infancy; England in her rough, growing youth.

The American possessions of Spain and Portugal were practically twice as remote as those of England. The English colonists kept close to the eastern edge of the continent, and to navigable waters; the most important settlements in Latin America were far inland, and could communicate with the outer world only by means of pack-mules. The maritime districts of the tropical regions were scarcely habitable by Europeans; and when the colonists moved into the interior, it was to be shaken by earthquakes, or terrified by the blaze of volcanoes. As the quest for gold was the chief motive with the Spaniards, they clustered around the old seats of aboriginal civilization,—the plateau of Mexico, Cundinamarca, Quito, and Lima. Subsequently communities of Europeans were established at Caracas, Santiago de Chile, the mouth of the Plata, and at various points along the Brazilian coast; but these did not attain prominence as literary centres until far into the 18th century. In the mean time, the intervening portions of the continent were pathless expanses of prairie and forest traversed by mighty rivers and lofty mountain ranges.

In the matter of acquiring and settling the new continent, the Church naturally took an active part. In addition to the bishops and the parochial clergy, whose duty was to provide for the spiritual needs of the European settlers, large numbers of the monastic orders were assigned to the conversion of the natives. By

-AMERICAN LITERATURE

far the most important of these religious bodies was the Society of Jesus, whose members are popularly known as Jesuits. They were the latest in making their appearance; but their great organizing ability enabled them to outstrip all the rest. It was not long before they had gathered tribes of wandering savages into civilized communities, and they established great cattle ranches and sheep farms, together with mills, workshops, warehouses, and routes of trade. Paraguay became in effect a Jesuit state, until its prosperity and the mistaken notion that there were rich gold mines within its limits raised combinations hostile to the order. The Inquisition was introduced in 1569. It had not only the oversight of faith and morals, but also the control of education and of the admission of books into the country. Such instruction as the "Holy Office" was willing to sanction was with scarcely an exception imparted by members of the monastic orders. The *frailes* in their monasteries taught gratuitously the elementary branches and the prayers of the Church; but these slender advantages were available only in the towns. Boys might also be taught writing and the four operations of arithmetic. As to the girls, they were taught by the nuns reading, prayers, and the use of the needle; a few added music and painting. Aristides Rojas, the Venezuelan historian, has related how the first municipal school was established in Caracas. It was 24 years after the founding of the city, and it required a mission to Spain and two years of lobbying to obtain the royal permission to have a school at all; and its field of usefulness was at first limited to Spanish grammar and rhetoric. Books could be imported only on permits, obtainable with difficulty, after close scrutiny and long delay. An equally strict surveillance was exercised over colonial literary productions; each volume of each edition had to be registered separately, after donating 20 copies to the legal and regal authorities; and the publisher had not even the privilege of fixing the price.

The Colonial Period.—It was in such arid and sulphurous soil as has been described that Latin-American literature had to germinate. The first cultivators had to overcome difficulties unknown to those of happier countries; and it is with a feeling of wonder mixed with reverence that we realize how patiently and successfully they did overcome them. Learning made its first appearance—where alone it could—among the monks. As their special mission was to convert the Indians, they diligently studied Indian languages, customs, and antiquities; and it is to the diligence of these men that ethnologists owe nearly all that is known of the ancient civilizations of Mexico, Peru, and Cundinamarca. Botany and vegetable pharmacy afforded another appropriate field; and the various colonial governments fitted out at different times as many as five botanical expeditions. The students of the mathematics found exercise in geodetic surveys; and a knowledge of mechanics was essential in the working of the mines. Clavijero furnishes a long list of those who had made translations into the native tongues. All with one or two exceptions belonged to the monastic orders; and their studies embraced 15 languages. Humboldt himself saw dictionaries and grammars of 14. Quesada says that printing was introduced into Mexico in 1535, and into

Lima in 1538; and that the first books printed in America were for the use of the Indians. In the remainder of the century there were written or printed 82 books for the religious instruction of the aborigines in Mexico, and 50 for learning the native languages.

In time higher schools, colleges, and universities were established in the principal colonies,—the instructors being, with scarcely an exception, ecclesiastics. The little Jesuit college of Bahia began its dubious existence in 1543, and another and larger one was established at Piratinha in 1554; and the roll of alumni of these two schools contains the most prominent names of early Brazilian literature and jurisprudence. The University of the City of Mexico opened its doors to students in June 1553; and two years later saw the establishment of the University of San Marcos, at Lima. In Ecuador, not to mention several colleges founded in the 16th century, the University of San Gregorio was opened at Quito in 1620; and the famous university of Santo Tomás at Bogotá dates its existence from the year 1627. The University of Chuquisaca (the modern Sucre) in Bolivia, the University of Córdoba in what is now the Argentine Republic, and the College of Santa Rosa which afterward became the University of Caracas, were all founded in the 17th century.

During the three centuries of the colonial period, no part of the world furnished a greater amount of historical material. The single national library of Santiago de Chile contains a catalogued collection of 2,740 manuscripts by the Jesuits alone. The material is indeed somewhat monotonous; and a larger space is devoted to monastic and episcopal interests than accords with our northern tastes. In reading these old authors, one is often reminded of the wide difference between the 16th or 17th century and some parts of the world in the 20th; as when Antonio de Leon Pinela, scholar and poet, historiographer of the Indies, authorized by royal order to lay three continents and the isles of the ocean under contribution for light and knowledge, seriously discusses the gravity of the sin of drinking chocolate on fast-days.

Foremost upon the long roll of early chroniclers stands the princely name of Ixtlilxóchitl, the descendant of the ancient chiefs of Texcoco. Three of the family acquired literary reputations; but the one here meant bore the Christian appellation of Fernando de Alva. His vast knowledge of native languages, songs, traditions, and pictographs procured him employment as interpreter to the viceroy; and about the beginning of the 17th century that ruler employed him to write in Spanish a history of his race. No one was equally qualified. His style alone has earned for him, from Europeans, the titles of the Cicero and the Livy of Anáhuac. His industry and his opportunities were equally great. He was personally acquainted with all the Indian sages—some over 100 years old—who had seen the empire of Motecuhzoma at the height of its glory. His work, in 13 books, began with the oldest traditions, and came down to his own time. The 13th book, dealing with the Spanish conquest, was printed separately in Mexico in 1829; but the whole is now accessible to the general reader in the French translation of Ternaux Compans. Carlos de Sigüenza y Góngora (1645-1700) acquired a high reputa-

LATIN-AMERICAN LITERATURE

tion for writing a similar history from the materials furnished by Ixtlilxochitl. Although far from being the only native work of importance, that of the Indian prince is the most interesting product of the aboriginal mind. The translator, in his preface, names other natives who attempted history. The most successful of these was Tezozomoc, who wrote (about 1598) a minute and circumstantial history of the Aztec nation. As he and Ixtlilxochitl were not of the same nation, they had their partialities, and do not always agree with each other or with the Spanish chroniclers.

Of the many writers belonging to the monastic orders who made valuable contributions to Indian ethnology and early colonial history, none is more widely known than Francisco Bernardino Sahagún, who went to Mexico as a young man in 1529 and died there in 1590, after spending 61 years in teaching the Indians. He acquired such facility in using the native tongues that he wrote his great work, 'Historia General de las Cosas de Nueva España,' in one of them. It is a fine tribute to his human sympathies and his justice to a fallen race, that his contemporaries accused him of paganism. In the latter part of the 18th century, Francisco Xavier Clavijero (1721-93), a Jesuit and a native of Vera Cruz, spent many years as a missionary among the Indians, acquiring an extensive knowledge of their languages, customs, and traditions. Upon the suppression of the Jesuits he was compelled to leave his country, and he took refuge in Italy, where he wrote in Italian his great work 'Storia Antica del Messico' (4 vols., 1780-3). Although the work is not free from the inaccuracy that belongs to almost everything written in that age and from materials so uncertain, it has been the great storehouse of information regarding the ancient inhabitants of Mexico.

No American historian of his time surpassed the Brazilian Sebastião Rocha Pitta (1660-1738), a graduate of the ancient Jesuit college of Bahia. His great work 'Historia da America Portugueza desde o seu Descobrimento até o Anno 1724' is the outcome of great labor and fidelity. Not a few of the early historical productions were in verse; but these were usually commemorative of some particular event. One of the most extensive of these rhyming chronicles was that entitled 'Elegías de Varones Ilustres,' written by Juan de Castellanos, one of the original *conquistadores* of Venezuela.

Numerous epics, half history, half romance, were written in Latin America about the episodes of the conquest. Of these the 'Arauco Domado' is one of the earliest and most famous. Of all the native American races, the Araucans of Chile possessed in the highest degree those qualities that make up the ideal of manhood.—bodily strength and activity, intelligence, honorable truthfulness, indomitable courage, and love of independence. The Incas had never been able to subdue them; and they resisted the Spaniards with varying results 186 years, when in 1732 their independence south of the Bio-Bio River was acknowledged by treaty. During one of the periods of Spanish success, when Santiago and Valdivia were founded, Diego Hurtado de Mendoza led a party to the conquest of Chiloé in 1558. Among his followers was a young poet, Alonso de Ercilla y Zúñiga, who began by the nightly camp-fires to write a narrative of

the war. Being afterward banished for supposed complicity in some attempt at revolt, he returned to Spain and lived in great poverty; but completed his poem 'La Araucana,' which has been praised as one of the truly great epics of the world. The Peruvian poet Pedro de Oña recast the epic and produced the shorter and inferior 'Arauco Domado.' It is to be regretted that from the fact of their living and writing in Spain, Ercilla y Zúñiga, together with Garcilaso de la Vega, the descendant of the Incas, cannot be reckoned among American authors. Another famous epic dealing with episodes of the conquest is the 'Lima Fundada,' composed by the Peruvian poet Pedro de Peralta y Barnuevo (1663-1743); a man of almost universal genius and attainments, as is attested by his numerous writings upon a wide range of subjects. A Mexican bishop, Bernardo Balbuena, who died in 1627, left a descriptive patriotic poem of great literary worth, entitled 'La Grandeza de México'; a pastoral called 'El Siglo de Oro,' the scene of which is laid in the New World; and 'El Bernardo,' an epic in three volumes.

Brazil presented in the 18th century two epic poets of distinction, José da Santa-Rita Durão and José Basílio da Gama. The former is best known to the present age by his epic 'Caramuru.' The hero, Diego Alvares Correa, is a personage of actual history,—a Portuguese adventurer, who with a number of others was shipwrecked on the Brazilian coast about 1509. They were able to save a good part of their effects, including arms and ammunition; and by the possession of these, Alvares became a powerful chief by the name of Caramuru (Man-of-fire), and played an important part in the history of the early Brazilian settlements. The poet has embroidered the tale with a golden thread of romance by introducing as his heroine the beautiful Indian maiden Paraguassú, the Brazilian Pocahontas. Da Gama's epic, the 'Uruguay,' although containing some fine descriptive passages, is not of equal merit. It is a polemic against the Jesuits, accusing them of trying to found an ecclesiastical empire; and fails to do justice to their civilizing influence.

No other American writer of colonial times was surrounded with such a halo of mystery and glory as Juana Inés de Azbaje y Ramírez (1651-94), more generally known as Sor Juana Inés de la Cruz. Her beauty, genius, and learning were alike celebrated in the most exalted terms; and she was called by her admirers "the Tenth Muse." She was the one peerless star of the viceregal court of Mexico. Suddenly, for reasons known to herself, she forsook domestic ties and the splendors of a court for the seclusion of a convent. But she could not escape from her fame; and the highest dignitaries in Church and state sought the wisdom that dropped from her inspired lips. Her modesty was equal to her other virtues; and when twice elected abbess she declined the honor. Her principal dramas, 'Amor es Laberinto,' 'Los Empeños de Una Casa,' and 'Ovilleros,' treat of love, jealousy, desertion, unrequited affection, and like human themes, and were written prior to her retirement into the religious life.

As is well known, the "Golden Era" of the literature of the Iberian peninsula, which reached its height during the lifetime of Camoens, of Cervantes, and of Lope de Vega, was fol-

LATIN-AMERICAN LITERATURE

lowed by a period of rapid literary and political decadence extending well into the 18th century. Numerous traces are to be found of an early influence, on the one hand of the Encyclopaedists, and on the other of Rousseau. More important still was the revival of interest in the physical sciences, which was particularly in evidence on the plateaus of New Granada and Mexico.

The pioneer of this movement was José Celestino Mutis, a native of Cádiz, who came to America in 1760 along with Mesio de la Cerdá, then recently appointed viceroy of New Granada. He was made professor of mathematics in the College of Nuestra Señora del Rosario; and it was due to his efforts that the Observatory of Bogotá was built, at that time the finest in the New World. He devoted 40 years to the botany of those regions, and determined the species that yield quinine, balsam of tolu, balsam of Peru, and other valuable products. He was also the patron and instructor of a whole generation of men whose names are honorable in the history of science. Of those none was more famous, or more unfortunate, than Francisco José de Caldas. He was one of the earliest scientists in America to make and record meteorological observations; and he measured with great accuracy the altitudes of Chimborazo and Tunguragua. He accompanied Mutis in his botanical explorations, and in 1804 was made director of the observatory. In 1816, when revolution was all abroad in Spanish America, a Spanish commander, Morillo, took possession of Bogotá. He knew the republican preferences of the professors; and they knew their consequent fate. On bended knees Caldas begged for a year of close confinement prior to his execution, in order that he might finish the great botanical work that had been in progress half a century, and the plan of which he alone understood: but he plead to insensate ears, and he and all the savants who had not effected their escape were butchered.

Meanwhile in Mexico, the astronomical observations of Velázquez y Cárdenas, Alzate y Ramírez, and León y Gama were attracting the attention of the French Academy and the leading astronomers of Europe: the Botanic Garden was established; and the Royal School of Mines and the Academy of Fine Arts were founded,—institutions which earned the unstinted encomiums of Humboldt.

The accession of Philip V., the grandson of Louis XIV. of France to the throne of Spain, was distinguished by the advent of French influences, and the founding of academies and literary societies. The Spanish Royal Academy and the Lisbon Royal Academy of Sciences were established in 1714, and numerous societies, formed upon French or Italian models, sprang up in the Peninsula and the colonies, being especially noticeable in Brazil and the regions of the Plata.

It is in colonial Venezuela that we first meet, on American soil, with the Basques of the Pyrenees—a people that are the living enigma of ethnology, without known kinship among the races of men. Shrewd, energetic, sturdy maintainers of liberty, they came over in great numbers in the 18th century, not to dig for gold, but to clear farms and introduce the culture of cocoa, cotton, coffee, and indigo. To them were largely due the material prosperity of

Venezuela and its readiness to cast off the Spanish yoke. The liberator Simón Bolívar was a Basque, as were many of his principal followers. For the past hundred years the stream of Basque emigration has been toward the region of the Plata, where they have contributed to make the Argentine Republic a second New England; but they are scattered everywhere, and recognized by their industry, thrift, and un-Castilian names, as Icazbalceta, the Mexican archæologist; Narciso Aréstegui of Peru, author of the historical novel '*El Padre Orani*'; the brothers Amunátegui of Chile, authors of '*Los Precursores de la Independencia de Chile*'; Anauazamendi, Arrechaveleta, Goicoechea, etc.

The Revolutionary Period.—The yoke of Spain, however legitimate, had long been felt to be heavy on the neck of her colonies; and the prostration of the Iberian peninsula beneath the heel of Napoleon furnished an opportunity for insurrections, which in 1810 broke out almost simultaneously in Mexico, Venezuela, New Granada, Quito, Chile, and Buenos Ayres. The last viceroys of Mexico and Peru departed in 1821; and the independent empire of Brazil was proclaimed 12 Oct. 1822. That date may be held to close the revolutionary period, considered as a struggle for national independence.

One poet of the revolution, José Joaquín Olmedo of Ecuador (1781–1847), rises far above all others for the sublimity and classic finish of his style, which earned for him the epithet of "the American Pindar"; and it is no exaggeration to say that he possessed a magnificence of rhetoric and a power of patriotic exaltation such as few poets besides the great Theban have exhibited. Olmedo's masterpiece is his '*Canto á Junín*', an epic ode without an equal in the Spanish language. Some of the patriotic poems of Numa Pompilio Llona of Peru are especially fine; and the sonnet to Bolívar by the Peruvian Adolfo García is one of the most beautiful compositions of its kind.

The name of Andrés Bello recalls all that is ripest and best in Latin-American scholarship, statesmanship, and patriotism. The teacher of Bolívar, the personal friend and companion of Humboldt, in the inception of the revolution Bello took his place by the side of his illustrious pupil. He prepared the great civil code that became law in 1855; and wrote treatises on international law, literary history, grammar, rhetoric, philology, pedagogics, and mental philosophy. To crown all, his poetic temperament, added to his clear and comprehensive intellect, made him one of the greatest masters of Castilian verse. His '*Agricultura en la Zona Tórrida*' is a magnificent georgic of the remote south; and not less admired is his '*Oración por Todos*'—suggested by Victor Hugo's '*Prière pour Tous*'.

Of the revolutionary heroes one of the most prolific writers was Carlos María de Bustamante (1774–1848), the author of the Mexican "declaration of independence." During the war he was four times a prisoner. His greatest literary work was a history of the Mexican revolution in six quarto volumes; and he was the author of several other considerable works on Mexican affairs.

The revolution in the region watered by the Plata was illustrated by the names and writings of Mariano Moreno, the disciple of Adam

LATIN-AMERICAN LITERATURE

Smith; Estebán Lena y Patrón, diplomat, editor, and poet, the author of 'La Libertad de Lima'; the philosophic Juan Crisostomo Lafinur, famed for his beautiful elegy on the death of Gen. Belgrano, the hero of Tucumán; and Vicente López y Planes, who wrote 'El Triunfo Argentino' in honor of the repulse of the English invasion of Buenos Ayres (1806-7), and also composed the national hymn of the republic. During the period under consideration, the literary tone of Brazil presented a more placid character, due to her exemption from the violent contests that were agitating the remainder of the continent. This difference of tone is finely exemplified in the writings of Domingo Borges de Barros, Viscount of Pedra Branca (1783-1855),—more frequently spoken of simply as Pedra Branca.

The Period of Independence.—Of the present 16 independent republics of Latin America, three great countries—Chile, the Argentine Republic, and Brazil—have attained in this century to greater importance than the early seats of aboriginal or viceroyal splendor. Chile had been a doubtful appendage of the empire of the Incas; after the downfall of that dynasty, the brave Araucans contested its possession with the Spanish invaders 180 years; and when at length they were driven to the regions south of the Bío-Bío River, the northern portion was held as a part of the vice-royalty of Peru until the time of the revolution. Independence was secured of the vice-royalty in 1817; and the next few years were taken up with domestic wrangling and political experiments, until the present constitution was adopted in 1833. Since that time there has been continuous progress and prosperity. The settlements in the region of the Plata and its great tributaries were made under unusual disadvantages; and it was only in 1776 that Buenos Ayres was made the residence of a viceroy, whose authority extended over the present Argentine Republic, Bolivia, Paraguay, and Uruguay. The existence of this government was neither tranquil nor durable; and active revolutionary measures were begun in 1813. Independence was secured and a federal constitution adopted in 1825. Half a century of domestic factions and foreign wars succeeded; and now the country has enjoyed 20 years of peace and prosperity, during which its growth has been rapid and healthy.

Politics and literature are much allied in Latin America. The beginnings of revolution had little to do with theories of government or abstract rights of man; they aimed at the immediate ends of free trade and relief from foreign domination. There has always been a tendency to run into dictatorial government. There is a permanent party—including the powerful influence of the Church—in favor of a strong personal government and a large amount of interference with individual interests. At the same time there have been large numbers with the apparent ideal of "every man his own law-giver, judge, and executioner." The contest has been between these parties, over the question of how much government people require. The Church and the older men generally have upheld rule and authority; literary men—the young, enthusiastic, and poetic—have as generally striven for larger freedom.

Writers on Political Science.—The necessities arising from the acquisition of national inde-

pendence caused such subjects as political economy, international and constitutional law, and public education, to occupy a prominent place in the minds of the founders of the new republics. Early in the century, treatises on these topics began to appear which won the encomiums of eminent European authorities. The valuable labors of Andrés Bello have been already referred to. Juan Bautista Alberdi, the Argentine jurist (born 1808), is entitled to take rank in the class of publicists represented in Europe by Guizot, De Tocqueville, and the Mills, and by Kent and Story in the United States. He was the author of the Argentine constitution, and of eight substantial works. A celebrated work of more recent date is 'La Reforma Política' of Dr. Rafael Núñez. He is an ultra-conservative, and his great treatise favors a "paternal despotism." Rafael Seijas of Venezuela is a distinguished jurist who has written ably upon international law; he is also a diligent student of English, French, and Italian literatures, upon which he has given to the public some interesting articles.

After Andrés Bello, few promoters of public education have better earned the esteem of their countrymen than Domingo Faustino Sarmiento, an Argentine born in 1811. While minister to the United States (1865-7) he made a careful study of the school system, and the results of his investigations were given to the world in an essay entitled 'Las Escuelas: Base de la Prosperidad de los Estados Unidos.' He was favored by the personal friendship and assistance of Horace Mann, the best-known educationalist that the United States has ever produced. Sarmiento was president of the Argentine Republic from 1868 to 1874. As a writer he was gifted with great originality and vigor of expression, which make his 'Recuerdos de Provincia' one of the most entertaining books of its kind. His masterpiece is entitled 'Facundo,' in which he presents in a series of glowing pictures a comprehensive survey of the points of difference between civilization and barbarism.

Historians.—History has always been well represented in the literature of Latin America. Most of the States have comprehensive histories, the fruit of much research, and written with careful regard to facts and form. There are also numerous historical works of more limited scope, devoted to certain districts or periods, or gathered around the achievements of individuals.

Father Suárez informs his readers that in collecting material for his history of Ecuador, he examined 10,000 packages of papers filed in the Archives of the Indies in Seville. León Fernández, finding no history of his native state of Costa Rica, set about collecting materials; and in 1881-6 he gave to the world 1,917 closely printed pages of documents, not previously edited, bearing upon the history of a country of less than a quarter of a million of inhabitants, whose first printing-press was set up in 1830. The history of Mexico from the earliest times to the death of Maximilian, by Niceto de Zamacois, fills 18 thick octavo volumes. Lorenzo Montúfar's 'Reseña Histórica de Centro-América'—a mere outline—makes seven volumes royal octavo; and the recent 'Historia General de Chile,' by Diego Barros Arana, comprises 13 octavo volumes. Another Chilean historian, Benjamín Vicuña Mackenna, has written an ac-

LATIN-AMERICAN LITERATURE

count of a single campaign, 'Historia de la Campaña de Tarapacá,' in two volumes of a thousand pages each; his collected historical works fill 15 volumes. The government of Venezuela is now publishing the historical essays of Arístides Rojas relative to that country in 14 volumes. The third volume of the 'Historia General de la República del Ecuador,' by Suárez, reaches only to the year 1718. Then there are the exhaustive works relating to Peru, of which we may mention the magnificent treatise of Raimondi, cut short in its fourth volume by the author's death in 1892. The tenth volume of the 'Historia de la República Argentina' by Vicente Fidel López has just appeared, and its venerable author is continuing the work with an industry unchecked by the weight of his 76 years.

Among special historical works which even the briefest enumeration would include, the most widely known are probably the twin histories of Gen. Bartolomé Mitre of Buenos Ayres (born 1821), bearing the titles 'Historia de Belgrano y de la Independencia Argentina,' and 'Historia de San Martín y de la Emancipación Sud-Americana.' Special mention should be given to the standard work of Rafael María Baralt of Maracaibo (1810-60), entitled 'Resumen de la Historia Antigua y Moderna de Venezuela,' which Arístides Rojas has more recently supplemented by seven "studies" on various epochs and aspects of the national history. Two histories written by Colombians rank very high; namely, the 'Historia de la Nueva Granada' by José Antonio de Plaza, and the 'Historia de la Revolución de Colombia,' by José Manuel Restrepo. The historical works of Mariano Paz Soldán are characterized by that patient accumulation of facts which is supposed to distinguish German scholarship; his reputation rests more especially upon his 'Historia del Perú Independiente de 1819 á 1827,' and his 'Diccionario Geográfico-Estadístico del Perú.'

Manuel Orozco y Berra gave to the public in 1880 an elaborate account of the ancient nations of Mexico in his 'Historia Antigua y de la Conquista de México,' in which he goes over the whole subject treated by Prescott, and adds a profusion of further details. Vicente Fidel López, author of the large 'History of the Argentine Republic' previously mentioned, has written two historical works of great interest to the ethnologist and antiquarian; they are entitled 'Las Razas del Perú Anteriores á la Conquista,' and 'Les Races Aryennes au Pérou.'

Brazil has produced several historical writers of merit. The standard history is by Fr. Antonio de Varnhagen, and is entitled 'Historia General do Brazil.' His descriptive passages are often particularly fine. He published in 1860 an interesting little book, 'A Caça no Brasil,' — the first of the kind that has appeared in South America, — describing the wild animals and the modes of pursuing them in the great forests and on the plains of that country. Pereira da Silva's 'Historia da Fundação do Império Brasileiro' is one of the standard works of Brazilian history.

Literary Critics.—Opinions on authors and books occupy a larger relative space in Latin-American literature than in that of Anglo-Saxon nations. Criticism deals less with the views and statements of an author than with his manner of presenting them; so by treating literature

as a fine art, along with painting and music, it becomes in itself a fine art, requiring artistic faculties carefully cultivated.

Criticism, as a fine art, has been cultivated in Latin America with surprising assiduity; and includes among its eminent masters such men as Torres Caicedo, Miguel Luis Amunátegui, and Calixto Oyuela, the author of 'Estudios y Artículos Literarios.' Rafael M. Merchán, the Cuban exile, of whom it has been elegantly said that he "writes with a gloved hand and a pen of gold," made his home in Bogotá, and became secretary to the President. His poetic temperament, wide reading, and fine discernment furnish the qualifications that make him above all a critic, and which shine conspicuously in his study on Juan Clemente Zenea and in his 'Estudios Críticos.'

Of all this wealth of critical discussion, no part affords more attractive reading than the works of Martín García Mérou, recently Argentine minister to the United States. They show a wide familiarity with the literatures of Europe and America, a delicate judgment, and that kind of fairness that can appreciate the merits of one with whom he does not agree. His essay on the poet Echeverría may be cited as one of his most thorough studies.

Those most interested in the subject of Latin-American literature are now eagerly awaiting the great work in preparation by Prof. García Velloso, of Buenos Ayres. It is to be a comprehensive history of the literature of the entire southern continent.

Novelists.—The novel did not begin to assume prominence in Latin America until about 1860; and the class of writers whose specialty is prose fiction is still relatively small. Jorge Isaacs, the Colombian poet, is widely known by his 'Maria,' a simple and pathetic story of rural life, a translation of which has been extensively read in the United States. His compatriot Julio Arboleda has given the public a bright contrast to this sombre picture, in his sparkling romance 'Casimiro el Montañés.'

The collection of stories known as 'La Linterna Mágica,' written by José T. del Cuellar, of Mexico, has been deservedly popular. Ignacio M. Altamirano, a Mexican lawyer and orator of pure Indian blood, has left a novel, 'Clemencia,' which for style and pathos has seldom been surpassed. The Mexican historian Orozco y Berra wrote a beautiful novel, 'Escenas de Treinta Años,' relating the experiences of an unfortunate disappointed invalid. Dr. J. J. Fernández Lizardi, generally known by the pseudonym of 'El Pensador Mexicano,' has revived the old Spanish picaresque type of romance in his 'Periquillo Sarmiento.'

The Argentine historian Vicente Fidel López is the author of a thrilling historical novel entitled 'La Novia del Hereje,' the scene of which is laid in Lima in the time of the Inquisition; but the favorite romance of the region of the Plata is the 'Amalia' of José Mármol, one of the most beautiful of modern novels. Chile has produced several noted works of fiction, among which the 'Alberto el Jugador' of the poetess Rosario Orrego de Uribe, 'La Dote de una Joven,' by Vicente Grez, and the historical novel 'Los Héroes del Pacífico,' by Ramón Pacheco, are much admired. 'Contra la Marea,' by the Chilean Alberto del So-

LATIN-AMERICAN LITERATURE

lar, is one of the most powerful of recent American novels.

Quite a number of romances have been founded upon Indian legends, or tell of Indian life and customs. Two of the best of these are quite recent,—the ‘Painé’ and ‘Relmú’ of the Argentine publicist Estanislao S. Zeballos, who, still young, combines every form of literary activity. The ‘Huincualal,’ by Alberto del Solar, is one of the most able productions of this class, and gives evidence of a diligent study of Araucan customs and character. The Brazilian novelist José Martinião Alencar wrote two famous Indian romances, entitled ‘Iracema’ and ‘Guarany.’ ‘Iracema’ develops the main feature of the story of John Smith and Pocahontas. The other novel tells how a young Indian loves a Portuguese woman. Carlos Gomes has transformed it into an opera which has become well known in Europe, retaining the name of ‘Guarany.’

Besides Martinião Alencar, Brazil has produced during the present century two highly successful writers of prose fiction,—Joaquim Manoel de Macedo and Bernardo Guimarães. Macedo was a doctor of medicine, a professor in the University of Rio, a member of Congress, and a prolific writer in prose and verse. His ‘Moreninha’ (Brunette), published in 1840, undertook for the first time to portray Brazilian society as it really was; it enjoyed extraordinary popularity, as did also his ‘Senhora,’ which some critics consider superior to ‘Moreninha.’ Guimarães is one of the most powerful and original writers of Brazil. ‘Ermitão de Muquem’ is considered his best novel. It is written in three versions or styles: one plain prose, one poetic prose, and one peculiar to the author, like the styles of Bentham and Carlyle. His ‘Seminaria’ is a romance with a tragic outcome, and is directed against the enforced celibacy of the clergy.

Poets and Dramatists.—The Spanish and Portuguese languages lend themselves so readily to versification that the amount of poetry produced is enormous. Juan León Mera published in 1868 a critical history of the poets of Ecuador, at a time when many persons were not aware that that country had ever possessed any. Cortés, in his ‘Parnaso Peruano,’ fills 800 pages with choice extracts from 44 of the leading poets of Peru; and the great anthology of Menéndez y Pelayo, consisting of four large octavo volumes of poetical selections, purports to give “only the very best that Spanish-American writers have produced in verse.”

Four names may represent the different styles of poetry cultivated in Mexico. Manuel Carpio, a physician by profession, was well read in Greek and Roman literatures, and a still more diligent student of Jewish lore. His ‘Tierra Santa’ is a work of great learning, not inferior to Robinson’s ‘Biblical Researches.’ He is best known, however, by his poems; one of which, ‘La Cena de Baltasar,’ shows remarkable descriptive power. Fernando Calderón is distinguished rather by the sweetness than the strength of his verse. The tenderness of his sentiments is well displayed in ‘Herman, ó la Vuelta del Cruzado.’ He was the author of a comedy, entitled ‘A Ninguna de las Tres,’ intended as a satire on those who return from foreign travel only to find fault with everything at home. José Joaquín Pesado has at

once tenderness, sublimity, and classic finish. In ‘La Revelación’ he has essayed to wake anew the harp which Dante swept; and he has given to his countrymen in their own tongue the odes of Horace and the psalms of David, along with some minor poems of rare beauty. Last of all, in ‘Los Aztecas’ he has sought to restore and interpret the hymns, chants, and lost lore of the primitive races of Anáhuac. Manuel Acuña, whose unhappy life extended only from 1849 to 1873, holds the place among Mexican poets that Edgar A. Poe does among those of the United States. In his nervous, delicate nature, poetry was a morbid secretion, like the pearl in the oyster; and he became the self-appointed priest and prophet of sorrow and disappointment. His most noted poems are ‘El Pasado,’ ‘A Rosario,’ and a drama entitled ‘Gloria.’

One of the most enduring masterpieces of Spanish-American verse is ‘Gonzalo de Oyón,’ a beautifully wrought tale based upon an episode in the early history of the country. Its author, Julio Arboleda (1817–62), held the foremost rank among the Colombian writers of the first half of this century. Another Colombian writer who reflects the sentiments of the past is Silveria Espinosa de Rendón, who laments the expulsion of the Jesuits in her ‘Lágrimas i Recuerdos.’ In Bogotá, Antonio José Restrepo is the poet laureate. The most celebrated of his longer poems are ‘Un Canto’ and ‘El Dios Pan’; in which the author shows himself to be a liberalist of the most pronounced type, who writes in utter fearlessness of all absolute rulers for man’s mind, body, or estate.

The extensive writings of Esteban Echeverría (1809–51) contain many passages that are weak and commonplace; but he stands forth as the national poet of the Argentine Republic, reflecting the life and thought found on its vast plains and along its mighty rivers. The productions to which his fame is chiefly due are ‘Avellaneda,’ ‘La Revolución del Sud,’ and ‘La Cautiva.’ The last-named poem, an Indian story of the Pampas, deserves a place by the side of ‘Hiawatha,’ which it resembles in the unaffected beauty of its descriptive passages and the flowing simplicity of its versification. Martín Coronado and Rafael Obligado, two of the leading poets of Buenos Ayres, are disciples of Echeverría, though of different types. Coronado’s verse is impassioned and dazzling; while Obligado’s muse loves the contentment of the family hearth or the shady banks of the majestic Paraná, where the stillness is broken only by the cry of a wild bird or the lazy dip of an oar.

The poems of Arnaldo Márquez and Clemente Althaus of Peru take a very high rank for their beauty and tenderness of sentiment as well as purity of style. The ‘Noche de Dolor en las Montañas’ and the ‘Canto de la Vida’ of the Peruvian Numa Pompilio Llona are compositions which will be admired for centuries. The ‘Romances Americanos’ of the Chilean poet Carlos Walker Martínez, and the ‘Flores del Aire’ of Dr. Adán Quiroga of Argentina, are collections of poems of great merit and originality. Compositions of remarkable beauty will be found in the ‘Brisas del Mar’ of the Peruvian Manuel Nicolás Corpancho, the ‘Armonías’ of Guillermo Blest Gana of Chile, and the ‘Flores Silvestres’ of Francisco

LATIN CHURCH—LATINS

Javier de Acha of Uruguay, José Batrés y Montúfar of Guatemala, a lyric poet of merit, is one of the most noted satirists of America. Matías Córdoba and García Goyena of Guatemala have been justly compared, as fabulists, to *Æsop* and La Fontaine.

Among Brazilian writers of the 19th century, two representative poets may be selected: Antonio Gonçalves Dias and Domingos José Gonçalves Magalhães. Dias was even more esteemed as a patriot than as a poet; and was much employed by the late emperor in carrying out educational and other reforms, in which that estimable sovereign was deeply interested. The successive issues of miscellaneous poems by Dias are now known collectively as his 'Canteiros,' and won the enthusiastic commendation of the Portuguese critic Herculão. He also left some Indian epics, and the two dramas, 'Leonor de Mendonça' and 'Sextilhas de Frei Antônio.' He was so far honored in his own country that his fellow townsmen erected a statue to his memory, with an inscription declaring him the foremost poet of Brazil. The best productions of Magalhães are a tragedy entitled 'Antonio José ou o Poeta e a Inquisição,' and 'A Confederação dos Tamayos,' the latter an epic founded on an outbreak of the Tamayo and other Indians.

Summary.—On looking across the Rio Grande at authors and books beyond, one is struck by some points that contrast with our northern life. There, public men are writers. Whether it be that political life stimulates literary activity, or that the latter is a passport to the former, presidents, senators, cabinet officers, judges, and ministers plenipotentiary, all write. Many of them read, write, and speak a number of languages.—an accomplishment so rare in Saxon America that an envoy is sometimes sent on an important mission without being able to speak the language of the country to which he is accredited.

Again, the literary men of the far South, with scarce an exception, write poetry as readily as prose. Nothing could be more incongruous than the idea of the average public man in the United States writing poetry. Something is due to the character of the language, that a stranger does not readily appreciate. In Spanish and Portuguese verse the words roll and swell, liquid and lengthy, like the waves of the sea, and tempt one to prolong the billowy movement. Latin-American verse is glowingly descriptive, or plaintive and tender, with an occasional tinge of melancholy; but it all possesses a healthy and natural tone, and has not yet been infected by the morbid unrest and hopeless cynicism that characterize much of the recent poetry of older nations.

The great bulk of the people from Texas to Cape Horn cannot read and write. Great efforts are put forth to remedy this state of things by general education, and much has already been accomplished. In the United States, books are intended for a reading class numbering many millions, and are made as cheap as possible, so as to come within their reach. In Latin America there are no millions to read, and the best books are addressed to a relatively small class. As sales are limited, large works of general interest or permanent value are published or aided by the governments, or by wealthy and public-spirited individuals.

Of the lighter literature of the southern republics, a large part first appears in the various *revistas* and other literary periodicals maintained in all the principal cities. It consists principally of odes, sonnets, short stories, and essays. These essays embrace every variety of subject: the authors traverse—often literally—the Old World and the New, view them geographically, ethnologically, sociologically, and write under such captions as 'A Winter in Russia,' 'The Bedouins of the City,' 'The Literature of Slang,' or 'The History of an Umbrella.' The subjects are generally treated, so as to be pleasant reading, and afford at least as much entertainment as information.

Novelists and dramatists are under a great disadvantage, having no protective tariff to save them from European, and especially French, competition. Editors and managers find translations cheaper and easier to obtain than native productions. There is happily a growing reaction in favor of native writers who represent American subjects as seen by American eyes. When the cultivated public becomes fully aware of the greater genuineness of these domestic productions, native talent will have an ampler field; and there is every reason to believe that it will be prepared to satisfy the fullest demand.

Latin Language and Literature. See ROME, *Language and Literature*.

Latin Union, The, a political alliance formed in 1865 by France, Italy, Belgium, and Switzerland, which countries entered into an agreement by which the amount of silver to be coined yearly was fixed for each member of the union. The coinage of all the countries was of like character, and to be received without discount on public and private account. Greece joined the union in 1868, Spain in 1871, and Servia and Rumania also became members. Some of the South American states also used the Latin Union coinage. Spain alone of the countries of the union coins a gold piece not used by the others. The unit of coinage in the Latin Union is the franc; it has different names elsewhere, as, in Italy the lira; in Servia, the dinar; in Spain, the peseta; but the value is always the same. It is the most widely circulated coinage system in Europe, being used by about 148,000,000 people.

Latins (*Latini*), the ancient inhabitants of Latium, in Italy. Janus, Saturn, Picus, and Faunus, who were deified by their subjects, are represented to have been the most ancient Latin kings. These ancient Latins formed a league of 30 cities, of which the town of Alba Longa

LATITUDE — LATROBE

became the head. Although Rome was a colony from Alba she became powerful enough in the reign of her third king, to seize upon that city, and raze it to the ground. Under Servius Tullius, Rome entered the Latin confederacy, and in the reign of his successor, Tarquinius Superbus, was acknowledged as head of the league. On the fall of the Tarquins the Latins regained their independence, and struggled long against the republic to maintain it; it was finally lost, however, by the decisive victory of the Romans near Mount Vesuvius (340 B.C.).

Latitude, a term used in astronomy and geography. The geocentric latitude of a heavenly body is its angular distance from the ecliptic, as seen from the earth's centre; its heliocentric latitude is its angular distance from the ecliptic, as seen from the sun's centre. The geographical latitude of a place is the altitude of the celestial pole above the horizon; or it is the arc of the celestial meridian intercepted between the zenith and the equator; its geocentric latitude is the angle at the earth's centre intercepted between the place and the terrestrial equator. To determine geographical latitude, the altitude of the pole is found indirectly from observations of a circumpolar star, or from meridian altitudes of the sun or known stars. At sea the sun's meridian altitude is observed with a sextant, its declination being given in the astronomical ephemeris. See also LONGITUDE.

Latitudina'rian, a term applied to those English divines of Charles II.'s time, who, from opposing strenuously both the High Church party and that of the Dissenters, incurred the enmity of both. It denotes one who commends or sanctions deviations from the strict principles of orthodoxy, and it is frequently used as a term of reproach.

Lati'um, lä'shü-üm, a name given to the residence of the Latins, in Central Italy, on the Tyrrhenian Sea, extending between Etruria and Campania. In the earliest times there was a large laurel grove situated on the coast, at the mouth of the Tiber, which extended as far as the city of Laurentum, to which it gave name. Farther on lay the little river Numicus and the sources of the Juturna; and still farther to the east was situated the city of Lavinium. Ancient Latium was much more thickly peopled and much more highly cultivated than the present Campagna di Roma, to which it pretty nearly corresponds; and it must have been healthier, though it was always considered an unhealthy region.

Latona, lä-tō'nä, was the mother of Apollo and Artemis. During her pregnancy she was persecuted by Hera, by whose command the dragon Python threatened her with death, and the earth was not permitted to allow her a place for her delivery. After long wanderings she found rest on the floating island of Delos. The giant Tityus having attempted to offer her violence, was killed by Apollo and Artemis. Latona is represented as a mild, benevolent goddess, in a sea-green dress. With Artemis she cured the wounded Aeneas, and crowned him with glory. When Artemis fled to Olympus from the anger of Hera, Latona carried to her her quiver and arrows, which she had left behind. She was worshipped chiefly in Lycia, Delos, Athens, and other cities of Greece. In

Crete a festival was celebrated in honor of her, called *Ecdysia*.

Latour d'Auvergne-Corret, Théophile Malo de, tä'ô-fél mälô dé la-toor dô-värn-yé-kor-rä, French soldier: b. Carhaix, Brittany, France, 23 Nov. 1743; d. Oberhausen, Bavaria, 27 June 1800. He early decided to become a soldier, and when the French Revolution broke out was among the first to rally round its standard, and distinguished himself in the army of the Pyrenees. Higher appointments were offered him but he declined, declaring that he was only fit to command a company of grenadiers, and was consequently named by Napoleon "First Grenadier of France." His corps generally made the vanguard, and was called "the infernal column." In 1799 he fought under Massena in Switzerland, and fell while attached to the army of the Rhine. His heart was embalmed and carried in a silver box by one of the company in which he had served; his name was always called, the oldest sergeant answering—"Died on the field of honor." As an author he made himself known by a singular work on the early history of Brittany, entitled, "*Nouvelles Recherches sur la Langue, l'Origine, et les Antiquités des Bretons*" (1792).

La Trappe, lä träp, the name of a Cistercian abbey founded by Count Rotrou of Perche in 1140. It was known as *Notre Dame de la Maison Dieu* and from its situation in a damp unhealthy glen, accessible only by a narrow stony passage was called *La Trappe* ("the trap"). The monks were as distinguished for austerity during the 14th and the 15th century as they subsequently became for licentiousness and violence when they were known as the "Bandits of La Trappe." The monastery, however, passed into the hands of Armand Jean le Bouthilier de Rancé in the middle of the 17th century. This brilliant abbot had early abandoned himself to wordliness, but became converted, introduced Benedictine monks into La Trappe and enforced severe discipline. The brethren rose at 2 A.M., retired at 7, slept on straw, were forbidden wine and flesh, spent each evening some time in digging their own graves, and never spoke excepting to say to each other, "Memento mori." Rancé discouraged literary pursuits but enforced constant manual labor; he died in 1700, and the Trappists were driven out of France by the Revolution. They founded a house at Valsainte, Switzerland, which was destroyed by the French in 1798, but they were again put in possession of La Trappe on the Restoration of the Bourbons. In 1829 the Trappist houses were closed by a royal decree, and all but nine monasteries were suppressed; these, however, were compelled to seek refuge in Algiers 1844, and the United States in 1848, where they established houses in Kentucky and Iowa. Consult: Gaillardin, "*Les Trappistes ou l'Ordre de Citeaux au XIX. Siècle, Histoire de la Trappe depuis sa Fondation*" (1844).

Latrobe, lä-tröb', Benjamin Henry, American architect: b. Yorkshire, England, 1 May 1764; d. New Orleans 3 Sept. 1820. He studied at the University of Leipsic, served in the Prussian army as cornet of hussars (1765-8), became an architect in England, in 1798 was appointed engineer of London, and came to Norfolk, Va., in 1796. He built the James

LATROBE — LATTER DAY SAINTS

River-Appomattox canal and the Richmond penitentiary; removed to Philadelphia, and there designed the bank of the United States, the bank of Pennsylvania, the old Art Academy and other structures; and supplied the city with Schuylkill water in 1800. The Roman Catholic Cathedral at Baltimore is also his work. In 1803 he was appointed surveyor of public buildings in Washington, and later was chosen architect of the Capitol. He effectively introduced the natural products of the States as architectural features, particularly in the corn-stalk pillars with capitals of the ears. After the burning of the capital by the British in 1814, he was appointed to rebuild it, but in 1817 resigned.

Latrobe, John Hazlehurst Bonval, American lawyer: b. Philadelphia 4 May 1803; d. Baltimore 11 Sept. 1891. He was the son of Benjamin H. Latrobe (q.v.). He studied at the United States Military Academy, was called to the bar in 1825, from 1828 until his death was counsel for the Baltimore & Ohio Railway Company, was the founder of the Maryland institute, invented a stove commonly known as the "Baltimore heater," was long identified with the American Colonization Society, and succeeded Henry Clay in its presidency in 1853. He also became president of the Maryland Historical Society, and published a 'Biography of Charles Carroll of Carrollton' (1824), a 'History of Mason and Dixon's Line' (1854), 'Personal Recollections of the Baltimore & Ohio Railroad' (1858), and other works.

Latrobe, Pa., town and borough in Westmoreland County, on Loyalhanna Creek and on the Pennsylvania railroad, 40 miles east of Pittsburgh. It is the centre of a large agricultural district. There are valuable deposits of coal and iron ores and mining is carried on to a considerable extent. Latrobe has a large number of manufactories, including steel works, cork works, paper, flour and lumber mills, glass-houses, brick-yards, etc. Pop. (1900) 4,614; (1903) 5,000.

Latrobite, a mineral named after C. I. Latrobe. It is found massive and crystallized in forms belonging to the triclinic system; but the crystals are not well defined; color, pale pink; scratches glass; specific gravity, 2.8; opaque; lustre vitreous. It is composed of silica, alumina, and lime, being a rare variety of anorthite (q.v.) or lime feldspar. See FELDSPARS.

Latrodec'tus, a genus of spiders of the loose-web building family *Theridiidae*, which contains certain large American species popularly considered poisonous, especially one (*L. mactans*) known in the tropics as the katipo. This spider, according to Emerton, is sometimes half an inch long, with a round abdomen and the whole body black except a bright red spot on the under side and one or more red spots over the spinnerets and along the middle of the back; the small and few males have in addition red vertical stripes on each side. This spider makes a large funnel-shaped nest among loose stones, which may spread out two or three feet. It is found all over the country from Canada to Argentina and Chile, and is everywhere feared, but there is no good reason for considering it any more poisonous than other spiders. Consult: Emerton. 'The Common Spiders' (1902).

Lat'ten, a species of brass used in the Middle Ages for metal work. Mines of latten are mentioned as existing in the time of Henry VIII., and the metal is often alluded to in ancient public records, without students of antiquity being able to determine what metal is meant. Three varieties were distinguished, the *black*, the *shaven*, and the *roll*. That used by English workmen used to be imported from Germany and the Netherlands, the finest kind being known as Cologne plate. Lattners formed one of the recognized crafts of London. In some localities the term is still applied to plate-tin.

Latter Day Saints, The Reorganized Church of Jesus Christ of (anti-polygamist), a continuation of the Church which was organized at Fayette, N. Y., 6 April 1830, with six members. This organization was effected by Joseph Smith, Oliver Cowdery and others. Joseph Smith, who was chosen president, was born at Sharon, Vt., 23 Dec. 1805. Subsequently with his parents he removed to Palmyra, N. Y., where, on the occasion of a religious revival in 1820, while alone at prayer he was visited by a heavenly personage who forbade him joining any of the churches in the neighborhood, as their creeds were all wrong. On the night of 21 Sept. 1823 he was again visited by the angel who told him of gold plates containing an account of the former inhabitants of America, which, with the Urim and Thummim, were buried in a hill near by. He visited this place but was forbidden to remove them at that time. Exactly four years later he was allowed possession of them. With the aid of Oliver Cowdery and others as scribes, and the use of the Urim and Thummim, he completed the translation of the plates, or Book of Mormon, by June 1829. March 1830, three witnesses, Oliver Cowdery, David Whitmer and Martin Harris, were permitted to see and examine the plates. They signed a statement that the voice of God to them declared the record true. Eight other witnesses saw and handled the plates. All these witnesses continued to bear this testimony until death.

From the time of organization the church rapidly increased. In January 1831, the headquarters were established at Kirtland, Ohio; and in the following year a great many located in Jackson County, Missouri, which was appointed the place of Zion. Here they were persecuted and mobbed; and in the fall of 1833, driven from their homes by violence. Three years later, the exiles from Jackson County, joined by the Saints from Kirtland and the east, located in Caldwell County. In 1838 a religious persecution resulted in imprisoning the leaders and driving the body of the Church from the State. In the spring of 1839, no charges having been sustained against the leaders, they were permitted to escape, and soon joined the body of the Church near Quincy, Ill. They purchased the town of Commerce, afterward called Nauvoo, and rapidly gathered there. For five years they enjoyed comparative peace and prosperity.

On 27 June 1844, the Prophet Joseph Smith, and his brother Hyrum, were murdered by a mob at Carthage, Ill. This threw the Church into much confusion. The membership at this time numbered about 150,000. The quorums were as follows: (1) The First Presidency,

LATTICELEAF—LAUD

consisting of the President and two counsellors, organized in 1833; (2) The Twelve Apostles organized in 1835, consisting at Joseph Smith's death of Brigham Young, president, Heber C. Kimball, Orson Hyde, Orson Pratt, William Smith, Parley P. Pratt, John Taylor, John E. Page, Wilford Woodruff, Willard Richards, George A. Smith, and Lyman Wight; (3) Seventies, composed of one or more quorums of missionaries of 70 men each, organized in 1835; (4) High Priests, a quorum without definite number, composed of local presidents; (5) Elders, organized into quorums of 96 each. Quorums of priests, 48 each; teachers 24 each; and deacons 12 each. The first bishop was Edward Partridge, ordained in 1831. He died at Nauvoo in 1840 and was succeeded in January 1841, by George Miller, who was acting in 1844.

The question now was, who should succeed Joseph Smith. The prophet himself had chosen and designated his son Joseph; but he, being only 12 years of age, a number of aspirants came forward, the more important being Sidney Rigdon, the only surviving member of the First Presidency; James J. Strang; William B. Smith, one of the Apostles, who, as brother of the prophet, claimed to be guardian for young Joseph, son of the prophet; and Brigham Young, who, together with eight other apostles, claimed the right of the Twelve to lead the Church. Young had the largest following; and in 1846 left Nauvoo for the West. (See MORMONS.) While at winter quarters near Council Bluffs, Iowa, in December 1847, he assumed the presidency of the Church, and led his followers to Salt Lake Valley, where he introduced such doctrines as Adam-God, blood atonement, and polygamy. None of these had been accepted by the Church, or taught by its authorities during the life of Joseph Smith.

In 1851, a number of persons and local organizations, some of whom had stood aloof from all factions, started a movement that resulted in a conference at Beloit, Wis., June 1852. This conference renounced all allegiance to Young, William Smith, Strang and others. At a conference 6 April 1853, seven apostles were chosen. Jason W. Briggs was chosen president and representative of the lawful heir in the presidency. Other officers were chosen, and thus the reorganization of the original Church was inaugurated. At a conference at Amboy, Ill., 6 April 1860, Joseph Smith, eldest son of the Prophet, accepted the presidency of the Church. 'The Saints' Herald,' the official publication of the Church, was commenced 1 Jan. 1860, at Cincinnati, Ohio. It was removed to Plano, Ill., March 1863. Since 1881 it has been published at Lamoni, Iowa. Joseph Smith has been its editor-in-chief since 1865. The Church held annual and semi-annual conferences until and including 1882, when the semi-annual were discontinued. The headquarters were at Plano, Ill., from 1863 to 1881; since then at Lamoni, Iowa. The quorums of the reorganization are organized in the same order which existed at the death of Joseph Smith. The doctrines are the same as promulgated during his life, as follows:

A belief in God the Eternal Father, his Son Jesus Christ, and the Holy Ghost.
That men will be punished for their own sins, and not for Adam's transgression.

That all men may be saved by obedience to the laws and ordinances of the gospel, namely, faith in God and the Lord Jesus Christ; repentance; baptism by immersion for the remission of sins; laying on of hands for the gift of the Holy Ghost; the resurrection of the body; that the dead in Christ will rise first; that men shall be judged, rewarded, or punished, according to the degree of good or evil they shall have done.

That a man must be called of God, and ordained by the laying on of hands of those who are in authority, to entitle him to preach the Gospel, and administer in the ordinances thereof.

In the same kind of organization that existed in the primitive Church.

That in the Bible is contained the word of God, so far as it is translated correctly. That the canon of Scripture is not full, but that God, by His Spirit, will continue to reveal His word.

In the powers and gifts of the everlasting gospel, namely, the gift of faith, discerning of spirits, prophecy, revelation, healing, visions, tongues, and the interpretation of tongues, wisdom, charity, brotherly love, etc.

That marriage is ordained of God; and that the law of God provides for but one companion in wedlock, for either man or woman, except where the contract is broken by death or transgression.

That the doctrines of a plurality and a community of wives are heresies. The Book of Mormon says: "Wherefore, my brethren, hear me, and hearken to the word of the Lord: For there shall not any man among you have save it be one wife, and concubines he shall have none."

That the religion of Jesus Christ, will, if its precepts are accepted and obeyed, make men and women better in the domestic circle, and better citizens, and consequently better fitted for the change that cometh at death.

That men should worship God in "Spirit and in truth," and that such worship does not require a violation of the constitutional law of the land.

The Church has been more aggressive in its fight against the crime of polygamy than any other organization. The local work is divided into the following organizations according to reports of 1903: Two States, Lamoni, Iowa; and Independence, Mo.; both organized in 1901; 74 districts: 62 in the United States, 2 in Australia, 5 in England, 2 in Wales, 2 in Canada, and 1 in Nova Scotia. The reorganization supports Graceland College and a home for the aged, both at Lamoni, Iowa. The reorganization has a membership of about 50,000. It is prosecuting missionary work throughout the United States, the Canadas, Australia, New Zealand, Society Islands, Sandwich Islands, the British Isles, Scandinavia and other countries.

HEMAN C. SMITH, *Church Historian.*

By H. H. SMITH.

Latticeleaf, lät'-is-lēf, or **Lattice-plant** (also called laceleaf and water-yam), a remarkable aquatic plant (*Aponogeton fenestratus*) of Madagascar, noteworthy for the structure of its leaves. The blade resembles latticework or open needlework, the longitudinal ribs being crossed by tendrils, and the interstices between them being open. The root, which is fleshy, and resembles that of the yam, is farinaceous and edible.

Laud, läd, William, English prelate: b. Reading, Berkshire, 7 Oct. 1573; d. London 10 Jan. 1645. He was educated at Oxford; took priest's orders in 1601; became vicar of Stanford, Northamptonshire, 1607, and rector of West Tilbury, Essex, 1609; was made archdeacon of Huntingdon in 1615 and dean of Gloucester 1616, and as king's chaplain in 1617 accompanied James I. to Scotland, where he attempted to enforce Episcopacy with no success. In January 1621, he became a canon of Westminster and in the following June bishop of St. David's. After the accession of Charles I., Laud was translated in 1626 to the see of Bath

LAUDANUM — LAUGHTER

and Wells, and in 1628 to that of London. In 1630 he was elected chancellor of the University of Oxford, which he enriched with a valuable collection of manuscripts, establishing also a professorship of Arabic. In 1633 he was promoted to the see of Canterbury. In 1634 he instituted rigorous proceedings against all who would not conform to the Church of England, and sought to extinguish all forms of dissent by means of fines, imprisonment, and exile. When the Long Parliament met (1640) the archbishop was impeached for high treason at the bar of the House of Lords by Denzil Holles and committed to the Tower. After three years he was brought to trial, but the lords deferred giving judgment. The House of Commons, however, passed a bill of attainder (January 1644), declared him guilty of high treason, and condemned him to death. He met his end on the scaffold at Tower Hill with great firmness. Consult: S. R. Gardiner, 'The Personal Government of Charles I.' (1871), and 'The Fall of the Monarchy of Charles I.' (1881); and 'Lives' by Hutton (1885); Benson (1887); Simpkinson (1894).

Laudanum, lä'dä-nüm. See OPIUM.

Laudonnière, René de, ré-nä de lō-dö-när, French navigator. Nothing is known of the date of his birth or death. His first appearance is in 1562 when he shared in Ribault's attempt to establish a Huguenot colony at Port Royal in South Carolina. He built a fort and founded a colony in 1564 at a point 12 miles up the Saint John's River, Florida. But his colonists were more men of adventure than of industry and were much molested by the Indians. They eventually compelled him to sanction an expedition against the Spaniards in Cuba. But the colony fell subsequently into such straits that 3 Aug. 1565, when Capt. John Hawkins reached Fort Carolina, as they had named their settlement, he found them without supplies or ships. On 29 August Ribault arrived with seven ships and 300 men, and superseded Laudonnière, who was ordered home to defend himself against charges of treason and tyranny. In Ribault's absence the Spaniards attacked Fort Carolina and massacred the colonists. Laudonnière escaped, took refuge in England, and did not return to France till 1566.

Laughing Gas, a name given to nitrous oxide after its remarkable physiological effects were discovered by Sir Humphry Davy in his 'Researches,' published in 1800. The effects are generally of a pleasurable kind, and the person under the influence of the gas is more or less excited, dancing, singing, laughing, or indulging in other violent motions. This by prolonged inhalation ceases, and stupor and anesthesia, or insensibility to pain, supervene. Hence the use of this gas in dental and surgical operations. See ANÆSTHETICS.

Laughing Jackass, the jackass-kingfisher (q.v.).

Laughing Philosopher, a characterization of Democritus of Miletus (q.v.). He laughed at the follies of man, and is distinguished by this epithet from the "weeping philosopher," Heraclitus, who mourned for human depravity and infatuation.

Laughlin, läf'lin, James Laurence, American political economist and educator: b. Deer-

field, Ohio, 2 April 1850. He was graduated from Harvard in 1873. In 1878 was appointed instructor of political economy there and was assistant professor 1883-7. From 1887 to 1890 he was president of the Manufacturers' Mutual Insurance Company of Philadelphia; in 1890-2 professor of political economy at Cornell; and in 1892 became head professor of the same department in Chicago University. In later years he has given special attention to the study of financial questions; in 1894-5 he prepared a scheme of monetary reform for the San Domingo government which was later adopted; and he has been a member of the monetary commission created by the Indianapolis Monetary Conference in 1897. He is a member of the International Institute of Statistics and of the Political Economy Club, of which he was one of the founders. He has written: 'Anglo-Saxon Legal Procedure in Anglo-Saxon Laws' (1876); 'Study of Political Economy' (1885); 'History of Bimetallism' (1886), a comprehensive treatment of the subject; 'Elements of Political Economy' (1887); 'Gold and Prices since 1873' (1887); 'Facts about Money' (1895); 'Report of Monetary Commission' (1898); 'Principles of Money' (1902); 'Reciprocity' (1903); and has prepared an abridged edition of Mill's 'Principles of Political Economy' (1884), with a short biography and a sketch of the history of political economy. He is editor of the 'Journal of Political Economy' and was one of the founders of the 'Quarterly Journal of Economics' to which he has contributed frequently.

Laughter, a movement of the muscles of the face, correlated with other movements of the entire body, usually indicative of mirth or happiness. The expression of laughter is not always indicative of a psychical appreciation of enjoyment, for it is well-known that idiots are prone to laughter which is often without any such significance. Many idiots constantly show a laughing countenance, the smile being more or less stereotyped; or they may grin, giggle, or chuckle at the slightest stimulus, whether of food, color, music, or personal contact. It is probable that in such cases laughter is purely an expression of physical contentment, rarely associated with higher or more complex ideas.

In children, laughter is more sensible, but the expressions of joy usually contain an element of uncontrolled exuberance. Thus they clap their hands, stamp their feet and jump around in pure excess of vital spirits. In adults the subject of laughter is extremely complex. As a rule, during laughter, the mouth is more or less open, the corners being drawn backward and usually somewhat upward. The upper lip is commonly raised. The drawing-back movement is seen best in the broad smile, or in moderate laughter; in out-and-out mirth the teeth are usually exposed by the raising of the upper lip. The cheeks are ordinarily drawn upward at the same time, and wrinkles are formed under the eyes. This movement in old persons makes a very characteristic feature, and the wrinkles so frequently found in their faces largely assist to interpret the sense of contentment indicated. Associated with laughter, there is often a change in the character of the eye. The bright and sparkling eye described by

LAUGIER — LAUNDRY MACHINERY

Darwin and others who have devoted much time to this subject is the eye of laughter. Often tears suffuse the eyes and destroy this appearance of brightness, but this is usually due to excessive laughter.

Numerous signs are produced during these expressions of joy. During laughter, the movements of the chest and larynx are almost exactly opposite to those that accompany the screams and cries of distress. In these latter the exspirations are prolonged and continuous, and the inspirations short and interrupted; whereas in joy the exspirations are usually short and the inspirations long.

"In all races of men," says Darwin, "the expression of good spirits seems to be the same, and it is easily recognized"; and he adds that "from the natives of New Zealand to the highly civilized Caucasian, much the same forms of emotional expression are to be observed." Laughter is often an indication of general character; it is seldom two persons laugh exactly alike; and the study of laughter becomes a study of muscular movements. The "spontaneous, hearty laughter of sincere feeling is very different from the affected and constrained laughter of insanity." Moreover, there are laughs which betoken peculiar constitutions of mind and character; laughs that are mechanical, nervous spasms, expressing nothing and expressed when there is nothing to laugh at, or perhaps something not to laugh at; laughs which, when they have not been acquired and are unconsciously formed, are signs of neurotic instability, but sure signs of guile when they are affected and consciously used—untrustworthy, anyhow, as laughter. Maudsley describes what he terms a "*quasi-pathological laugh*," which is the abortive and incoherent laugh of the person of insane temperament, which is laughter pulled up abruptly, followed by a sudden facial seriousness, or a change which affects only a part of the features, while the rest are unmoved. Consult: Darwin, '*Expression of the Emotions in Man and Animals*' (1892); Hughes, '*Die Mimik des Menschen*' (1900).

Laugier, Paul Auguste Ernest, French astronomer: b. Paris 1812; d. 1872. He studied at the Polytechnique and at the Paris Observatory under Arago. In 1843 he was elected to the Academy of Sciences, and was afterward attached to the Bureau of Longitudes. He was favorably known for his work on the subjects of solar equator and sun-spots.

Laumontite, lá'món-tít, one of the zeolite family of minerals. It usually occurs in masses made up of white, vitreous to pearly, monoclinic prisms. It is a hydrous silicate of aluminum and calcium, $H_2CaAl_2Si_4O_{10} + 2H_2O$. Upon exposure the normally colorless and transparent crystals quickly lose part of their water of crystallization and become white, opaque, brittle and much below the normal hardness of 3.5 to 4. Laumontite is rarer than most of the zeolites with which it is associated in many localities. Especially fine specimens are found at Nagyag, Transylvania, in Nova Scotia, New Jersey, Lake Superior, etc.

Laun, Friedrich, the pseudonym of the German novelist Friedrich Schulze (q.v.).

Launceston, läns'tōn, England, a borough and market town in the county of Cornwall, 24 miles north by west of Plymouth, and 2 miles west of the Tamar. It is situated on the side of a hill, is generally well built, and has a fine church, built of granite in the 16th century and restored in 1852; several chapels; a guildhall in castellated style; a masonic hall; a town-hall (1887); excellent market-places; a grammar, national and board schools. There are ruins of the old castle, and of a fine priory. Agriculture, tanning, and iron-founding are the chief employments. From 1832 till 1885 Launceston returned a member to Parliament, and before 1832 it was represented by two members. This town was long the capital of Cornwall; but Bodmin is now the assize town. It gives name to one of the six parliament divisions. Pop. (1901) 4,053.

Launceston, Tasmania, city in the county of Cornwall, 133 miles north of Hobart, at the confluence of the North and South Esk rivers, the united stream taking after this the name of the Tamar, which is navigable up to the town from the sea, a distance of 40 miles. The streets are regularly laid out and lighted by electricity. The principal buildings are the town-hall; the Albert Hall; the mechanics' institute, with library; a Church of England grammar-school; Wesleyan Ladies' College; a convent school, and other educational institutions; a new post-office; a custom-house; a museum and art gallery; the Academy of Music; military barracks; jail and court-house; hospital, etc. Wheat, oats, peas, and potatoes are the chief crops grown in the neighborhood, but fruit culture is steadily extending. Pop. (1891) 17,208; (1901), with suburbs, 20,358.

Launch, (1) in ship-building, a term comprehending the apparatus for launching a ship. (2) The largest boat belonging to a ship of war. It is only used for service which cannot be performed by the smaller boats, being hoisted on board and kept on deck just abaft the foremast, where it serves as a receptacle for lumber and stores. In large men-of-war the launch is sometimes decked over, and is capable of mounting several light guns. The corresponding boat of merchant vessels is called the long boat. The launch is from 30 to 40 feet long, having a beam from .29 to .25 of its length. It has 10 or 12 oars, and is carvel-built.

Launder, in mining, a wood water-gutter or pipe. A trough for conveying water to a stamp-mill or other hydraulic apparatus for comminuting or sorting ore. Also a trough or box to receive the slimes from the stamps.

Laundry Machinery. Laundry machinery as it is understood from the commercial standpoint, includes a class of mechanical devices developed during a comparatively recent period, to supplant the primitive processes of laundering that have existed during all time. While the use of laundry machinery in crude forms dates back for a considerable period, the past three or four decades mark the era of the development and manufacture of power machinery for laundering purposes, in a sufficient degree to warrant recognition as an independent branch of industry. This is due to the fact that the steam laundry is a modern institution; and the development and extent of manufacture of laundry machinery has gone hand in hand with

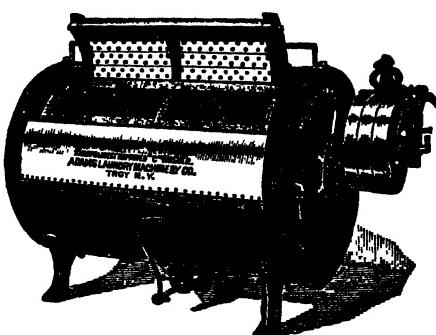

LAUNDRY MACHINERY

the growth of the laundry interest. The steam laundry of to-day performs on a large scale, and by improved mechanical devices, the processes of cleansing, that for centuries had been confined to hand work in connection with the running stream, or the wash tub of later years. The growth of the laundry as an organized business has been so rapid during the past quarter of a century, that its changing needs have made, and still keep, the invention and production of laundry machinery in a state of constant development of new ideas and forms. So that while the laundry machinery business has passed the embryotic stage, it may fairly be said in the opening years of the 20th century to be in an era of great advance, holding and to hold a much more important position as an independent and recognized branch of mechanical industry. The city of Troy, N. Y. (the birthplace of the collar, cuff and shirt industry, as set forth in an article under that head) was practically the home, and for many years was the centre, of the steam laundry interests of the country; an interest which has now extended to every city or place of any importance in the land. So general is the recognition of this fact, that the name "Troy Laundry" is still retained by hundreds of laundries in various parts of the United States, and is even seen abroad. It was natural, therefore, that the earliest organized movement to produce the machines demanded for laundering purposes should have been made in Troy. That city has always been and still remains a strong factor in the laundry machinery industry, which, however, with its diversified and growing interests is now located and strongly entrenched in various sections. All the manufacturers of laundry machinery are, however, located east of the Mississippi River.

The introduction, use and development of laundry machinery has been much more rapid and general in the United States than in Europe. American manufacturers are competing actively for the trade of all foreign markets. The greatest limitation to the development of the trade abroad is the conservatism of foreign nations in adopting the more advanced methods of laundering calling for the modern types of American machinery. While there are very many forms of laundry machinery in use, the most prominent examples of the art are included in those that perform the three most important functions of laundering, namely washing, drying and ironing.

Washing Machines.—The first process, washing, is performed by two types of machines, the dash wheel and the reverse wheel. The dash wheel consists of a large cylinder divided into pockets by partitions and revolving in one direction inside of an outer case. This machine is used principally in new work laundries. The more generally used washer is the reverse wheel. In this the goods are placed in an inside cylinder having perforations to admit the free passage of water, steam and soap among the goods. This cylinder runs in an outside shell or case, the water and steam being let in by pipes, and by automatic reversing devices the inside cylinder revolves several times in one direction, then an equal number in the opposite one. This action loosens up the goods and subjects them freely to the action of water and soap, and so removes the dirt from the garments. The inside cylinders are made of wood or brass and the outside cases of wood, galvanized iron or brass.

Drying Machinery.—The next process is that of drying. The goods are first taken from the washer and placed in what is known as a wringer or centrifugal extractor. This machine consists of a perforated copper basket, revolv-

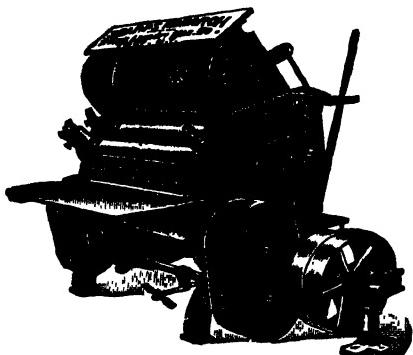

Reverse Washer.

ing rapidly inside an iron or steel curl or case, and making from eight to fourteen hundred revolutions per minute. The water is thrown out through the perforations in the basket by centrifugal force, and in about twenty minutes the goods are ready to be taken out partially dried. The drying process is completed by the use of a dry-room. The improved types include the cabinet room, made up of a series of racks or trucks arranged with bars or hooks to hold the collars, cuffs, shirts or other garments, and running on tracks into a cabinet made of wood or metal. The heat is supplied by a series of steam coils arranged horizontally or longitudinally in the room. Fans are used to circulate the heat among the goods and accelerate the rapidity of the drying process. The most recent development of the drying art is the automatic dry room. In this the goods are hung on hooks attached to an endless chain or wire cable, which enters into and occupies the room in a series of loops, and passes out at the other end of the room. The goods are dried in one time of passage, and are removed from the hooks by an automatic device so that they fall dry, into baskets on the outside of the room.

Ironing Machinery.—The third general division of laundry work is the ironing, for which many forms and styles of machines are used. For collars and cuffs, it is done on machines consisting of a combination of revolving covered drums coming in contact with revolving heated rolls, the goods being ironed as they pass through. The covered drum is wound with layers of felt, cotton flannel and muslin, forming a padding much the nature of that which covered the old-fashioned family ironing board. The heated rolls are highly polished and are heated by gas or steam. Formerly all these machines required the goods to be passed through several times for a perfect finish. The more modern types of ironers are known as "one pass machines." These have a series of heated rolls and drums so that the collar is put in at the front of the machine and comes out at the back perfectly ironed. Some of these ironing machines of modern production have a capacity of from 250

LAUNITZ — LAUREL

to 300 dozen collars or cuffs per hour. The length of the ironing surface of the heated rolls of collar and cuff ironing machines of different sizes varies from 12 to 48 inches. For the ironing of flat pieces such as sheets, table linen and towels, a machine known as the mangle is used, by which the goods are dried on revolving cylinders heated by steam. In the recent types of mangles great capacity is attained; in some the length of ironing surface reaches ten feet and requires several operators to feed the machine. For shirts, a separate class of ironers is required. These are the bosom, body, sleeve

Collar and Cuff Ironer.

and band ironers. The general principle and operation are, however, the same as in the collar and cuff ironers, previously described. The most recent development of shirt ironing machinery is a series of machines steam heated, and on which the finish is produced by pressing instead of ironing.

Other important machines not described above and which are used in laundering are starchers, shapers and dampeners. There are many other forms of laundry machinery made to cover parts of processes, and new forms and types are constantly being invented and put on the market.

JOHN T. BIRGE,
*Vice-President and Treasurer, Adams Laundry
Machinery Company.*

Launitz, Robert Eberhard, Russian-American sculptor: b. Riga, Russia, 1806; d. New York 1870. He studied under Thorwaldsen in Rome; emigrated to America in 1828, and in 1833 became a member of the National Academy. Among his works are the Pulaski monument at Savannah, Ga., and the battle monument at Frankfort, Ky.

Laupen, low-pēn, town in Canton of Bern, Switzerland, situated at the junction of the Sense and Saane, 10 miles southwest of Bern. It was the scene of a victory of Bern over Fribourg and allies in 1339.

Laura, the French lady celebrated by Petrarch as the object of his life-long passion: b. Beaumont, Provence, 1308; d. Avignon 6 April 1348. Petrarch has told us that he saw her for the first time in the Church of Santa Chiara at Avignon, on Good Friday 6 April 1327; that she was the mother of several children and died on Good Friday at the hour in which he had first seen her, and was the same evening laid to rest in the Franciscan Church. It would appear

that Laura was the daughter of Audibert de Noyes and was married to Hugo de Sade and bore him 11 children. There is no ground for supposing that Laura was a mere creature of the poet's fancy. But consult: Minich, 'Sulla Persona della Celebre Laura,' in 'Atti dell' Instituto Veneto' (Vol. IV., series 5, 1877-8); D'Ovidio, 'Madonna Laura' (in the 'Nuova Antologia' 15 July, and 1 Aug. 1888).

Laura, a small monastic community, such as was common in Egypt, Palestine and Syria. It formed a mean between the solitude of the hermitage, and the community life of the mediæval monastery. There was a superior, but no very definite rules. The cells were separately clustered like an encampment round the chapel. The brethren only met together twice a week, and subsisted on bread and water. Three monks occupied one cell, under Pachomius. A famous laura was founded by Chariton, a hermit, at Pharan near Jerusalem, and others in the 5th century by Sabas, a celebrated hermit. The Empress Eudocia, wife of Theodosius II, also instituted a laura. The derivation of the term laura is uncertain.

Laura'ceæ. See LAUREL.

Lauraguais, lō-ra-gü-ā', an ancient division of Languedoc, France, situated near Castelnary. It now forms parts of the departments of Aude, Tarne, and Haute-Garonne.

Lau'reate, Poet. See POET LAUREATE.

Laurel, lá'rēl, Miss., town in Jones County, on the Gulf & S. I., and the New Orleans & N. W. R.R.'s. In 1890 this was a village of 100 people, while in 1903 it had 7,000 population. The town owes its beginning to the sawmills of Eastman, Gardiner & Company, and of the Kingston Lumber Company. These sawmills have timber sufficient to last them at least 25 years. Laurel has the following important industries in addition to its sawmills: Laurel Cotton Mill, having 10,000 spindles and 640 looms, and employing 400 hands; Laurel Oil & Fertilizer Company—using 40 tons of cotton-seed daily; Lindsey Wagon Company; Brick & Tile Company, having a capacity of 30,000 bricks per day, and Mississippi Knitting Mills, with a capacity of 125 pairs of hose per day. It also has many smaller factories, as a machine shop, foundry, cotton compress, ice factory and electric light and power plant. The town has two national banks.

Laurel, a tree or shrub of the order Lauraceæ, having alternate, simple, often evergreen, exstipulate leaves; panicles or umbels of perfect flowers and one-seeded drupes or berries. The species, of which there are about 1,000, mostly tropical, are divided into about 40 genera and are most largely represented in Brazil and southwestern Asia. Among the best-known American members are the red bay (*Perssea carolinensis*), sassafras (*Sassafras officinale*), pond spice (*Litsea geniculata*) and wild allspice (*Lindera benzoin*), all of which are found east of the Mississippi. The tropical species are, however, more important. Among them are avocado or alligator pear (*Persea gratissima*), cinnamon, camphor-tree and cassia (*Cinnamomum*), and greenheart (*Nectandra rodiae*). The name is usually restricted, however, to trees

LAUREL-MAGNOLIA — LAURENT

of the type-genus *Laurus*, the few species of which are natives of southwestern Asia, but have become naturalized in the Mediterranean region, and are characterized by dark, evergreen leaves, small, dioecious or perfect, inconspicuous flowers in little axillary umbels, and small, succulent, purple, cherry-like berries. They sometimes attain heights exceeding 50 feet, but are usually scarcely more than a third of this height. The most popular species is the poet's or wreath laurel (*L. nobilis*), called in America sweet-bay. See BAY.

Among the numerous other shrubs known as laurels are the mountain-laurel (q.v.) and other species of *Kalmia*, the Portugal laurel (*Prunus lusitanica*), the cherry-laurel (*Prunus laurocerasus* and *P. caroliniana*), and the ground-laurel (*Epigaea repens*), better known as "trailing arbutus."

Laurel-magnolia, the sweet-bay. See BAY.

Laurence, là'rëns, **Saint**, Roman Christian martyr: b. Rome 10 Aug. 258. He was of Spanish race, and when, in the Valerian persecution Pope Sixtus II. was carried to martyrdom, Laurence as deacon and treasurer of the Church refused to give up the keys of the treasury, and according to tradition was put to death by being laid over a fire on bars of iron. The Escorial was built by Philip II. in fulfilment of a vow made on St. Laurence's day, 10 August, to the honor of that saint, the ground plan being after the pattern of a gridiron.

Laurence, Samuel, English painter: b. Guilford, Surrey, 1812; d. London 28 Feb. 1884. He was one of the most successful portrait painters of his day, and had as sitters many of his most eminent contemporaries; including Whewell, Browning, Carlyle, Dickens, Froude, F. D. Maurice, Thackeray, Tennyson and Lowell.

Laurens, là'rëns, **Henry**, American patriot and statesman: b. Charleston, S. C., 1724; d. there 8 Dec. 1792. He was a mercantile clerk in London and Charleston, and in the latter place established a successful business. An opponent of royal aggression, he was involved in numerous disputes with the crown judges regarding their decisions in marine law and the admiralty courts. Having withdrawn from active business, in 1771 he went to England, and was there one of the 38 Americans who in 1774 signed a petition to advise Parliament against passing the Boston port-bill. In 1775 he became a member of the first South Carolina provincial congress, in 1776 vice-president of the council of safety in that colony, and from 1 Nov. 1777, to 10 Dec. 1778, was president of the Continental Congress in succession to Hancock. He sailed in 1779 as minister to Holland for the negotiation of a treaty with that country, but his packet, the Mercury, was captured by the British, he was examined by the privy council, and from 6 Oct. 1780 was imprisoned for about 15 months in the Tower on suspicion of high treason. Having been exchanged for Cornwallis, he was sent to Paris, where with Adams, Franklin, and Jay, he signed the preliminary treaty of peace with Great Britain 30 Nov. 1782. His "Correspondence," edited by Moore, was published in 1861.

Laurens, Jean Paul, zhôñ pôl lô-rôñ, French artist: b. Fourquevaux, department of Haute-Garonne, in 1838. He studied in the

Ecole des Beaux-Arts at Toulouse, and became a pupil of Cogniet and Bida in Paris. His work is distinguished for boldness and vigor, and the tragic elements of his subjects are heightened by the dramatic realism of the artist. In point of moderation in treatment, and of taste in coloring, his compositions have received some adverse criticism, but his powerful effects are not called in question. In 1891 he was elected a member of the Académie des Beaux-Arts and president of the Société des Artistes Français. Among his pieces are: "Death of Tiberius" (1864); "A Voice in the Desert" (1868); "Execution of the Duc d'Enghien" (1872); "The Pool of Bethesda" (1873); "The Interdict" (1875); "The Austrian General Staff around the Deathbed of General Marceau" (1877); and "Napoleon and Pius VII. at Fontainebleau" (1894).

Laurens, John, American soldier: b. South Carolina 1753; d. there 27 Aug. 1782. He was the son of Henry Laurens (q.v.). He was educated in England, and in 1777 became an aide to Washington, whose secretary he also frequently was. From the battle of Brandywine (11 Sept. 1777), he participated, it is said, in all actions in which Washington commanded. He was severely wounded at Germantown, commanded the light infantry when the United American and French troops under Lincoln and D'Estaing attempted the capture of Savannah, and aided in the defense of Charleston when besieged by Clinton. In the spring of 1781 he was sent to France to obtain money and supplies. Contrary to diplomatic precedent, he requested and obtained an audience with the king, and secured the necessary assistance. He captured one of the two redoubts at Yorktown, and received Cornwallis' sword. He was killed in a skirmish on the Combahee River, S. C. What Washington called his "intrepidity bordering on rashness" won for him the sobriquet of "the Bayard of the Revolution." His correspondence, with a memoir by William Gilmore Simms, was privately printed in 1867.

Laurens, Joseph Augustin Jules, zhô-zëf ô-güs-täñ zhul lô-rôñ, French painter: b. Carpentras 1825. After studying painting under Delaroche he traveled in Persia, Turkey, and Asia Minor. As a landscape painter he obtained wide recognition and was also highly successful in his lithographic copies of Diaz, Bonheur, Corot, Tryon, etc. His pictures in color include: "Vue de la Grande Chartreuse" (1840); "Les Environs de Vaucluse" (1845); "Forêt de Fontainebleau"; "L'Hiver en Perse" (1867); and "Le Rocher de Vannes" (1867); which last is in the Luxembourg. He has published with original illustrations "Voyage en Turquie et en Perse" (1856).

Laurent, Auguste, ô-güst lô-rôñ, French chemist: b. La Folie, Haute-Saône, 14 Nov. 1807; d. Paris 15 April 1863. In 1838 he became professor to the Academy of Sciences of Bordeaux, which post he held for eight years. In 1848 he was made assayer to the mint and chemical adviser of the minister of war. His researches were very numerous, embracing all departments of the science, organic and inorganic, and opening up new fields and new views. He was one of the champions of the unitary system against the dualistic held by most of the chemists of the time. He was opposed also to

LAURENTIAN MOUNTAINS—LAURIUM

the electro-chemical theory, which his investigations into the derivatives of naphthaline did so much to shake, and maintained the doctrine of types—forms of constitution of bodies which admitted of parts being substituted by other elemental or compound substances without the type of the original body being altered. His views on general chemical theory appeared in a posthumous work entitled ‘Méthode de Chimie,’ translated into English by Odling, and published by the Cavendish Society 1855. Many of the doctrines there advocated as novelties are now universally accepted, and have become a fundamental part of modern chemical theory, classification, and instruction.

Laurentian (lā-rēn'shī-an) Mountains, a range in British North America, extending for over 3,000 miles from Labrador to the Arctic Ocean, forming the watershed between Hudson Bay, the Saint Lawrence, and the Great Lakes, and dividing the same bay from the sources of the Mackenzie River. The average elevation of this range is about 1,500 feet, while some of the peaks attain a height of 4,000 feet. The rock formation belongs to the sedimentary deposits known as the Laurentian system.

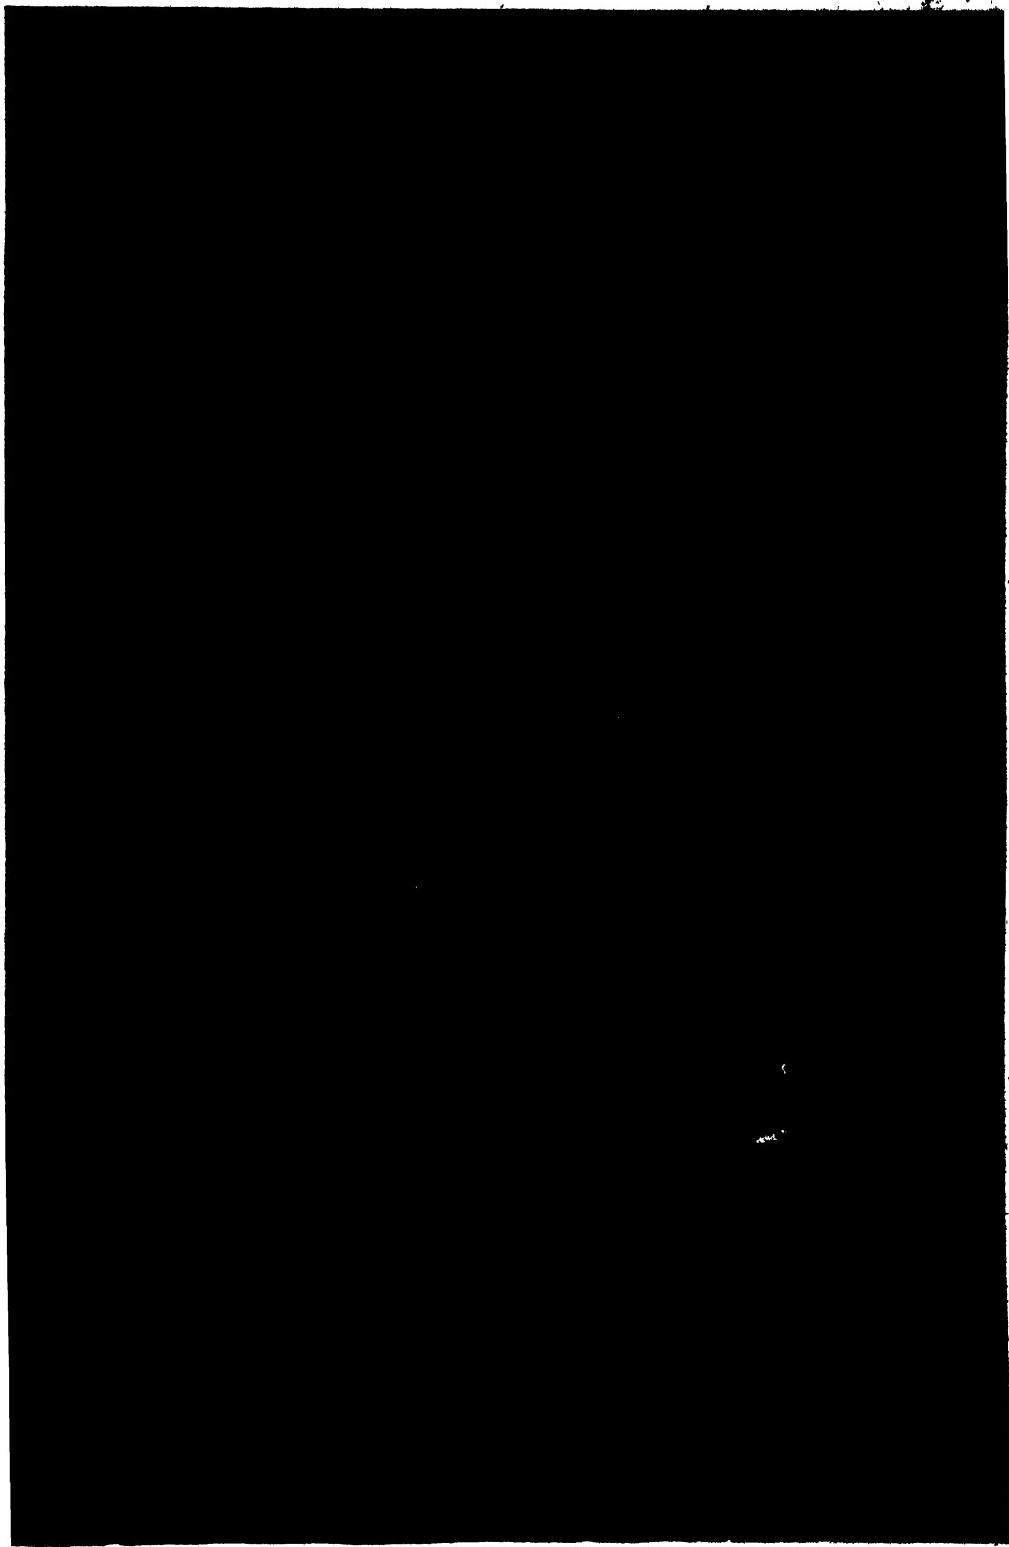

Laurentian System. The term Laurentian has been applied by certain Canadian geologists to a great series of rocks, partly of sedimentary and partly of igneous origin, that is typically developed on the Laurentian Hills north of the St. Lawrence River. Similar rocks occur elsewhere along the Height of Land, from Labrador to the western end of Lake Superior. The rocks are of very ancient date but the exact significance of the term Laurentian as a time division or as a lithologic name is in dispute. The typical Laurentian includes a series of gneisses, mica schists, quartzites and crystalline limestones with intrusive granites and greenstones. The total thickness may be 30,000 feet. Whether or not any of these rocks contain fossils is uncertain, though Dawson found certain peculiar markings in limestone which he believed were of organic origin. He named this supposed fossil *Eozoon canadense*. The term Laurentian is little used by American geologists, and the so-called Laurentian system is included in the Algonkian or with the upper and lower Huronian. In fact, about all that can be said of the age of the Laurentian rocks as a whole is that they are certainly pre-Cambrian.

Lauric Acid, or Dodecoic Acid, a fatty acid occurring (as glyceryl ether) in the berries of the bay-tree (*Laurus nobilis*), in pichurim beans, in cocoanut oil, and elsewhere. It may be prepared from the oils in which it occurs by saponification, followed by the fractional precipitation of the acids by means of barium acetate. Lauric acid has the formula $C_{12}H_{24}O_2$, and is insoluble in water, but very soluble in both alcohol and ether. From its solution in alcohol it crystallizes in the form of silky needles, melting at 110° F. With the metals it forms a series of salts called laurates, which, with the exception of barium laurate and the laurates of the alkali metals, are mostly insoluble in water. The glyceryl ether (also known as trilaurin, or laurostearin), has the formula $C_8H_{16}(C_{12}H_{24}O_2)_2$, melts at 113° F., and may be obtained from bay-berries by extraction with alcohol.

Laurie, low'rī, Simon Somerville, Scottish educator: b. Edinburgh 13 Nov. 1829. He was educated at the University of Edinburgh; for five years was a teacher on the Continent; and returning to Scotland held important positions in connection with education. In 1876 he was appointed to the professorship of the institutes and history of education in the University of Edinburgh. He has published many works, among which are: ‘Philosophy of Ethics’ (1866); ‘Primary Instruction in Relation to Education’ (1867, 6th ed. 1898); ‘Notes on British Theories of Morals’ (1868); ‘Life and Educational Writings of Johann Amos Comenius’ (1881, 6th ed. 1898); ‘Metaphysica Nova et Vetusta by Scotus Novanticus’ (2d ed. 1885); ‘Medieval Education and Rise and Constitution of Universities’ (1886); ‘Language and Linguistic Method in the School’ (1890, 3d ed. 1899); and ‘Historical Survey of Pre-Christian Education’ (1895, 2d ed. 1900).

Laurier, lō'rī-ā, Sir Wilfrid, Canadian political leader: b. St. Lin, L'Assomption County, Quebec, 20 Nov. 1841. He studied at L'Assomption College and law at McGill University (Montreal); in 1865 and 1866 was a vice-president of the Institut Canadien (Montreal), which formed the nucleus of a movement toward intellectual liberalism on the part of the younger French and was strongly opposed by the clergy; and in 1866 opened a law office at Arthabaskaville. In 1871 he was elected to the Quebec legislature, where he was an effective but infrequent speaker, and in 1874 was chosen at the general election to the Ottawa House of Commons for the Drummond and Arthabaska district; but his influence as a debater in the Canadian parliament was hampered by his ignorance of English. He was, however, quickly recognized as the leader of the Liberals in Quebec province, and in 1877 was selected for the portfolio of inland revenue in the Mackenzie administration. In 1878 he retired upon the return to power of Sir John Macdonald and the Conservatives. On 7 June 1887, he succeeded Blake as chief of the Liberal Opposition, though he himself advised the choice of an English-speaking Protestant; and in 1896 he became the first French-Canadian premier of the Dominion. In that post he has observed a policy of discrimination in favor of British products and of protection against the United States for at least so long as Canadian products are denied American markets. He has rendered great service through his strong opposition to antagonisms of creed and race. Consult his ‘Speeches,’ edited by Barthe (1890); and Willison, ‘Sir Wilfrid Laurier and the Liberal Party’ (1903).

Laurium, lā'rī ūm, Mich., village in Houghton County; on the Copper R. and Mineral R. R.R.'s. It adjoins Calumet, and is 7 miles from Lake Superior and 12 miles north by east from Houghton. It is situated in the Keweenaw Peninsula, in the northern part of the State, in one of the richest copper regions of the United States. There are but few manufacturing establishments; mattress factory, clothing shops, and cigar factories. There is considerable local trade. Copper mining is the chief occupation; some of the largest mines of the peninsula are in the vicinity. Pop. (1890) 1,159; (1900) 5,643; (1903) 9,000.

SIR WILFRID LAURIER.

LAURIUM — LA VALLIÈRE

Laurium, a mountain, 1,171 feet in height, near Attica, Greece. It was famous in ancient times for its silver mines. Since 1874 great heaps of slag have been profitably worked, and fresh deposits of argentiferous lead and of zinc ore have also been found so that the most important mining in the kingdom is carried on here.

Laurocerasin, a name proposed by Lehmann for the glucoside amygdalin (q.v.), when prepared from laurel leaves (*Cerasus laurocerasus*), or from alder bark (*Rhamnus frangula*).

Lausanne, lō-zān', city, and capital of the Swiss canton of Vaud, on the slope of the Jura Mountains, close to the shore of the Lake of Geneva, on which the village of Ouchy (where Byron wrote 'The Prisoner of Chillon') forms its harbor. Here Gibbon resided for many years, and the house in which he wrote the greater part of the 'Decline and Fall' is still shown. John Kemble was buried here. It has the University, founded in 1536, and a cantonal library of 125,000 volumes. There are large manufactories here of machinery, tobacco and chocolate. Pop. (1901) 47,039.

Laut, Agnes C., Canadian author: b. Ontario 11 Feb. 1872. In childhood she was taken to Winnipeg. She entered Manitoba University and studied there into the junior year, during which she withdrew on account of ill health, afterward spending her summers in the Rocky and Selkirk mountains. In 1895-7 she was an editorial writer for the Manitoba *Free Press*, Winnipeg; subsequently became correspondent of Canadian and English papers and of newspapers and magazines in the United States. She has written: 'Lords of the North' (1900); 'Heralds of Empire' (1902); and 'The Story of the Trapper' (1902).

Lauterbrunnen, low-tér-broon-ěn, the name of an Alpine valley and also a village in the Swiss canton of Bern, through which flows the Weisse Lütschine. The valley is surrounded by perpendicular walls of sandstone from 1,000 to 1,600 feet in height, down which pour about a score of waterfalls. Of these the finest is the *Staubbach* ("dust-stream"), 866 feet in height. The pop. of the village in 1900 was 2,547.

Lauzon, Jean de, zhōn dē lō-zōn, French colonial administrator: b. 1582; d. 1666. He was a member of the Hundred Associates, who organized to promote the settlement of New France. He seems to have directed most of his energies toward acquiring landed property in Canada for himself and his family, and gained for his son the sole right of fishing on 60 leagues of the St. Lawrence, with a title to the adjacent lands. His own title to the island of Montreal he sold to the Jesuits. He was for five years governor of New France (1651-5), but his policy was feeble and short-sighted. He returned to France before his second term was over.

Lauzun, Antonin Nompar de Caumont, än-tō-nän nōn-pär dē kō-mōn lō-zün, Duc de, a French courtier: b. Gascony 1633; d. 19 Nov. 1723. A poor nobleman from Gascony, he made his fortune at the French court by his elegant manners and wit and dauntless ambition, and became a favorite of many of the most emi-

nent and beautiful women, and of Louis XIV., who appointed him to various offices. In 1688 he escorted the queen of James II. and her infant son to France, and in 1689 took an active part in the fruitless expedition to Ireland. He was raised to the rank of duke in 1692. Lauzun figures frequently in the French literature of the 17th century, and even of a later period, particularly in the works of Mme. de Sévigné, La Bruyère, and St. Simon.

La'va, a name given to those products of volcanic eruptions sent forth in fiery streams from the interior of the earth, and which, though they become stationary on cooling, are, in consequence of the gases which accompany them, more or less inflated, and seldom form very dense rocks. The constituents of lava are entirely similar to those of basalt, greenstone, porphyry, etc., which were no doubt formed in a similar manner, and are in this respect completely identified with them.

Laval-Montmorency, François Xavier de, frān-swā ksav-ē-ä de lā-val-mōn-mō-rōn-sē, French Roman Catholic prelate: b. Laval, France, 30 April 1623; d. Quebec 6 May 1708. He became a priest in 1645, and in 1651 was appointed missionary bishop of Cochin-China, a post which he declined to become archdeacon of Evreux. In 1659 he came to Canada as apostolic vicar, with the dignity of bishop of Petra *in partibus*. There he established (1663) the Quebec Seminary. In 1674-83 he was titular bishop of Quebec. He was an active and influential figure in governmental affairs. Laval University at Quebec is named in his honor.

Laval (lä-väl') University, a French Catholic institution at Quebec, Canada, established in 1852. It is under direct control of the Roman Catholic authorities of Rome, and by virtue of its royal charter the visitor of the university is always the archbishop of Quebec. There are four faculties, theology, law, medicine and arts. In 1902 there were 384 students, 51 professors, and 140,000 volumes in the library.

La Vallière, Louise Françoise de la Baume le Blanc de, loo-ēz frān-swaz dē lä bōm lē blān dē lä vā-lē-är, French mistress of Louis XIV.: b. Tours 7 Aug. 1644; d. Paris 6 June 1710. She was descended from an ancient and noble family, and in 1661 was brought to court by her mother, where Louis presently noticed her. Her manners were amiable and winning, and her sweet and tender disposition rendered her attractive. What is still more extraordinary, notwithstanding her equivocal position, she possessed extreme, indeed morbid, delicacy and modesty. She bore Louis four children, but was always painfully sensible of the disgrace of their birth. Two of them died in infancy. When superseded by Madame de Montespan she retired into the Carmelite convent in the suburb of St. Jacques, where she took the veil in 1675. She is considered the author of 'Réflexions sur la Miséricorde de Dieu' (1680), a copy of which, dated 1688, with corrections by Bossuet, was discovered in the Louvre in 1852. A collection of her letters was published in 1767. Madame de Genlis wrote a historical romance founded on the events of her life, and Lebrun executed a penitent Magdalene, of which the face is from her portrait.

LAVATER — LAVERDIÈRE

Lavater, Johann Kaspar, yo'hän kä'spär lä'vä-tér, Swiss physiognomist: b. Zürich 15 Nov. 1741; d. 2 Jan. 1801. As a youth he was not distinguished for studious methods, but early manifested a fervent piety and remarkable powers of persuasion in public discourse. He developed a distinct poetic gift, and was first known through his verses in 1767. Two years later he took orders, became pastor of a Zurich church in 1764, and served in that calling with different churches in his native city until his death. He also enjoyed a contemporary popularity through his mystical writings, now almost forgotten. He is best remembered as the originator of a system of physiognomy, which, although of little practical account to-day, is often referred to by students and writers. The book in which he set forth his system is entitled 'Physiognomische Fragmente zur Beförderung der Menschenkenntniss und Menschenliebe' ('Physiognomical Fragments for the Promotion of a Knowledge of Man and of Love of Man,' 1775-8). It was ornately published, with a profusion of striking illustrations, including portraits of distinguished persons, features to which its fame is considered to have been largely due. Yet Lavater's observations display a penetration and insight into human nature and its varying traits which entitle him to some consideration as scientist and philosopher, and there is a residue of his teachings which the inquiring world still appreciates. He enjoyed an intimate acquaintance with Goethe, who contributed to the 'Fragments' a chapter on the skulls of animals, and strikingly portrayed Lavater in 'Wahrheit und Dichtung.' Goethe afterward became estranged from him, accusing him, not without some grounds, of hypocrisy and superstition, but probably in fact repelled by Lavater's intellectual bigotry. Still Lavater was a man of large and open heart, personally and socially as hospitable as he was mentally intolerant, and with characteristics of true saintliness. During the French occupation of Switzerland he gave proof of his patriotism, and his death resulted from a wound inflicted by a French soldier at the capture of Zürich in 1799. There are several English translations of the 'Fragments.' Consult: Lives by Gessner (1802), Heisch (English, 1842), Muncker (1883); and monographs by Steck (1884) and Von der Hellen (1888). See PHYSIOGNOMY.

Lavedan, Henri, öñ-ré lä-vé-dán, French journalist, critic, novelist, and playwright: b. Orleans 1860. He contributed under the pseudonym of "Manchecourt" a series of brilliant articles to 'Vie Parisienne,' 'Gil Blas,' etc., and in fiction has published: 'Mam'zelle Virtue' (1885); 'Queen Janvier' (1886); 'Lydie' (1887); 'Inconsolable' (1888); 'High Life' (1891); 'A New Game' (1892). Among his plays the most notable are: 'A Family' (1890), awarded a prize of 4,000 francs by the French Academy; and 'Prince d'Aurec' (acted in 1892).

Laveleye, Emile Louis Victor de, ä-mél loo-é vék-tôr dë läv-lâ, Belgian political economist: b. Bruges 5 April 1822; d. Doyon, near Liège, 3 Jan. 1892. He was educated at the Collège Stanislas, Paris, and at the University of Ghent, where he studied law, and in 1864 became professor of political economy in the University of Liège. Among his numerous writings are: 'History of the Provençal Language and

Literature' (1846); 'The Question of Gold' (1860); 'Property and its Primitive Forms' (1874), his best known work; 'The Religious Conflict in Europe' (1875); 'Contemporary Socialism' (1881); 'Elements of Political Economy' (1882); 'Money and International Bimetallism' (1891); 'Government in Democracies' (1891).

Lavender, a genus (*Lavandula*) of perennial herbs, sub-shrubs and shrubs of the order *Labiate*, consisting of about 20 species, native to the Mediterranean region and southwestern Asia. The best known are true lavender (*L. vera*) and spike lavender (*L. spica*), which like other members of the genus have narrow leaves crowded near the ground, and blue or violet two-lipped flowers in whorls which form more or less interrupted spikes. All the lavenders contain similar volatile oils (oil of lavender, oil of spike, etc.), for which the plants are cultivated, and which are obtained from the flowers by distillation with water. The principal use of these oils is in perfumery, but they have been used in medicine as stimulants, tonics and stomachics. The dried flowers are placed with clothing laid away in bureaus and chests, partly because their aroma repels moths, but chiefly for the sake of the pleasant odor imparted to the garments. The perfume called lavender water is a solution of oil of lavender in spirit, along with attar of roses, bergamot, musk, cloves, rosemary, and other ingredients, which after standing for some time is strained and mixed with a certain proportion of distilled water. Lavender plants do not thrive as well in America as in English gardens, but succeed best in light, dry, friable soil, well exposed to the sun. They are best propagated by means of cuttings of one year's growth; seeds are unreliable, since they are slow to germinate and usually produce plants of inferior quality.

Laveran, Charles Louis Alphonse, shärl loo-é al-fôns la-ve-ran, French physician: b. Paris 1845. He was graduated at the School of Military Medicine of Strasburg in 1867. In 1873 he was made a member of the faculty of Val de Grace, and after traveling in Algeria, was appointed professor of military hygiene and clinical medicine in that institution. In 1894 he was appointed director of the Eleventh corps in the Army Medical Service, and subsequently physician-in-chief of the Lille Hospital, and member of the French Academy of Medicine. He is the greatest living authority on malaria, of which disease he discovered the plasmodium. His most important published works are: 'Traité des Fièvres palustres' (1884); and 'Traité de Hygiène militaire' (1896).

Laverdière, lâ-vär-dé-är, Claude Honoré, Canadian author and teacher: b. Province of Quebec 1826; d. 1873. He was educated for the priesthood, which he entered 1851, and was appointed professor in Quebec Seminary and assistant librarian in Laval University. His claim to recognition rests on the efforts he made to unearth and publish to the world the heroic achievements of early French-Canadian settlers and explorers. His works are of extreme value and interest, and include: 'Jesuit Relations' (1858); 'History of Canada.' He also edited 'Voyages of Champlain,' with notes and a life of that explorer. A collection of French-Canadian songs and hymns was also made and published by him.

LAVIGERIE — LAW

Lavigerie, Charles Martial Allemand, sharl mär-sé-äl äl-män la-vézh-ré, French missionary: b. Bayonne 31 Oct. 1825; d. Algiers 26 Nov. 1892. After passing through the Seminary of Saint Sulpice at Paris he was appointed professor of ecclesiastical history to the Sorbonne in 1853. In 1863 he was made bishop of Nancy, and four years later archbishop of Algiers. His life work began by the establishment of his Central-African mission. On being made ecclesiastical administrator at Tunis he began fighting the slave-hunting and slave-barter which desolated the dark continent. For this purpose he agitated in the chief capitals of Europe, and secured pledges from England and Germany to enforce rigidly the anti-slavery article of the Kongo Conference. In 1890 he urged in France the Church's acceptance of the Republic, in which counsel it was considered that he was not without the concurrence of Leo XIII. He was made cardinal in 1882. His published works include 'Œuvres choisies' (1884).

Lavisse, Ernest, ér-nä lä-vës, French historian: b. Nouvion-en-Thiérache, France, 17 Dec. 1842. In 1888 he was appointed to the chair of modern history in the Paris Faculty of Letters and in 1892 was elected to the French Academy. His historical researches have chiefly to do with Germany, and among important works by him are: 'The Mark of Brandenburg under the Ascanian Dynasty' (1875); 'Studies of the History of Prussia' (1879); 'Frederick the Great Before his Accession' (1893); 'The Three Emperors of Germany: William I., Frederick III., William II.' (1888).

Lavoisier, Antoine Laurent, än-twän lô-rän la-vwa-zë-ä, French chemist: b. Paris 26 Aug. 1743; d. there 8 May 1794. He was the son of a wealthy tradesman; was educated at the Collège Mazarin; studied mathematics and astronomy under Lacaille, chemistry in the laboratory of Rouelle, and botany under Jussieu. In 1766 he received a prize offered by the Academy of Sciences (of which in 1768 he became an associate), for an essay on lighting the streets of Paris. Soon after this he traveled through France collecting material from which he constructed the first geological chart produced in that country, during the same period publishing a number of scientific treatises. In 1769 he was appointed farmer-general of the revenue. By means of his wealth and influence he secured special advantages for extending his investigations, which were also stimulated by the new discoveries of Priestley, Cavendish, and Black. In 1776 he was director of the government powder-works; sat on the commission of weights and measures in 1790; and in 1791 became commissary to the treasury. In May 1794 he was accused before the Convention as an ex-farmer-general, condemned by the Revolutionary tribunal, and guillotined. To Lavoisier modern chemistry looks as its chief founder; he organized its methods, reformed the old nomenclature, and virtually established for this science a new terminology. By his work mainly the old phlogistic chemistry was displaced, and he shares with Joseph Priestley (q.v.) the distinction due to the discovery and analysis of oxygen, to which he gave his name, Priestley having already called it "dephlogisticated air." "Lavoisier," says Huxley, "first showed, by the most conclusive experiments, what was really the

composition of atmospheric air" (1777). His chief works, as containing his most important discoveries, are his 'Traité élémentaire de Chimie' (1789); and 'Mémoires de Physique et de Chimie' (1805). Among his others are: 'Sur la Combustion en général' (1777); 'Réflexions sur le Phlogistique' (1777); 'Considérations sur la Nature des Acides' (1778); 'Méthode de Nomenclature chimique' (with Guyton de Morveau, Berthollet, and Fourcroy, 1787). His complete works were published by the French government under the title of 'Œuvres de Lavoisier publiées par les Soins de son Excellence, le Ministre de l'Instruction publique' (1864-93). There are many accounts of his life and work. Consult: Grimaux, 'Lavoisier d'après sa correspondance, ses Manuscrits, ses Papiers de Famille et d'autres Documents inédits' (1888); and Schultze, 'Lavoisier, der Begründer der Chemie' (1894).

Law, John, of Lauriston, Scottish speculator: b. Edinburgh 21 April 1671; d. Venice 21 March 1729. For the purpose of remedying the deficiency of a circulating medium, he proposed to the Scottish Parliament the establishment of a bank with paper issues to the amount of the value of all the lands in the kingdom; but this scheme was rejected. In consequence of a duel he fled from his country and visited Venice and Genoa, from which cities he was banished as a designing adventurer. He accumulated a large fortune by gambling, and at length secured the patronage of the Duke of Orleans, regent of France, and in company with his brother William established his bank in 1716 by royal authority. It was at first composed of 1,200 shares of 3,000 livres each, which soon bore a premium. This bank became the office for all public receipts, and there was annexed to it a Mississippi company, which had grants of land in Louisiana, and was expected to realize immense sums by planting and commerce. In 1718 it was declared a royal bank, and shares rose to twenty times their original value. A vast quantity of paper money was issued, the credit of which was unquestioned, whilst the national bonds remained at a price far below their nominal value. In 1720 Law was made a councillor of state and comptroller-general of the finances; but the shares sank in value as rapidly as they had risen. He was obliged to resign his post, after five months, and for personal safety to quit the kingdom. He lived afterward in great obscurity, finally settling at Venice, and died still occupied in vast schemes, and fully convinced of the solidity of his system, the failure of which he attributed entirely to enmity and panic. Various opinions have been entertained of the merit of his project, and by some it has been thought to have possessed feasibility, had it been carried more moderately into practice. A volume entitled 'Œuvres de J. Law' was published (1790). Consult Wood, 'Memoirs of the Life of John Law' (1824); Mackay, 'Memoirs of Extraordinary Popular Delusions' (1850); Thiers, 'Histoire de Law' (1858).

Law, John, American lawyer: b. New London, Conn., 1796; d. Indiana 1873. He was graduated at Yale and admitted to the bar in 1817, but soon after emigrated to Indiana, where he settled at Vincennes. He was quickly brought to the front as a lawyer; became successively prosecuting attorney, judge for eight

LAW

terms, and in 1838 receiver of public moneys. In 1855 he was appointed judge of the Court of Land Claims. He afterward served in the 37th and 38th Congresses on committees on library, agriculture, and Revolutionary pensions. He was descended from a long line of lawyers, which included the chief justice of the Connecticut supreme court, Jonathan Law, and was president of the Indiana State Historical Society.

Law, William Arthur, English playwright: b. 22 March 1844. He was educated at the Royal Military College, Sandhurst; served eight years in the army and retired as lieutenant. He acted at the Theatre Royal, Edinburgh, Surrey Theatre, and in the provinces, 1872-4, and in 1881 was engaged at the Savoy Theatre. Among his dramatic productions may be mentioned: 'A Night Surprise' (1877); 'Enchantment' (1878); 'Castle Botherem' (1880); 'All at Sea' (1881); 'Nobody's Fault' (1882); 'A Mint of Money' (1884); 'Gladys' (1886); 'Culprits' (1890); 'The New Boy' (1894); 'The Sea-Flower' (1898); 'New-Year's Morning' (1900); and 'A Country Mouse' (1902).

Law (Lat. *lex*, from *lego*, to collect), is in its general sense, a rule of action; in a more restricted signification, a rule of human conduct, or collectively a body of regulations adapted to a particular subject. The term may be variously defined, according to its application. The laws of nature, as expounded by men of science, are general propositions as to the order in which physical events have occurred, and will probably recur; the moral law, or the law of God, is a body of truth perpetuated into the form of rules for the guidance of human conduct. But when we speak of law we usually mean to indicate the law which is set and enforced by civilized states. Law, in this sense, derives its sanction, or binding force, from the penalties by which men are constrained to obey it or punished for breaking it. In the civil code of Louisiana, law is defined as a "solemn expression of the legislative will." Law, regarded as a body of rules for the direction of the individual in his relations with society, is known under various subdivisions, as civil law, criminal law, common law, martial law, constitutional law, international law, merchant law, and canon law, in matters of ecclesiastical jurisdiction. The earliest source of law is custom; the customary rules of a primitive community formed the basis of a civil law at Rome, as they form the basis of the common law in England and the United States. Customary law is rigid and formal; in a progressive society it is relaxed and improved by the use of legal fictions, by the influence of equity, and by legislation. At Rome, for example, the growing commerce of the city compelled the *prætor* to go beyond the civil law (which was a law for Romans only), and to devise a new law of nations, based on principles of equity, such as all civilized men could understand. When the Romans began to study Greek they identified this law of nations with the law of nature, as expounded by the Stoics (q.v.). The civil law, amended and rationalized by successive *prætors* and emperors, has furnished most of the nations of modern Europe with the greater part of their legal rules and ideas; even England, while refusing to borrow directly from the *Corpus Juris Civilis*

(body of the civil law), has derived no small part of her law from that source. Scotch law has largely drawn its principles and nomenclature from Roman law. It is usual to distinguish public law (constitutional and criminal) from private law (which applies to personal status, family relations, property and contract). Constitutional law is of especial importance in the United States. Canon law is not received, as an entire system, by any modern state; but its rules are followed in defining the powers and functions of ecclesiastical persons. The law of nations, or international law, is also divided into public and private.

Sacred Law.—Prior to the codex or early codes containing laws for the people, there were sacred books and doctrines which contained moral and spiritual rules and regulations for human conduct. The four famous law books of India were 'The Sacred Laws of the Aryas,' 'The Institutes of Vishnu,' 'Manu, the Moses of India,' and 'The Minor Law Books.' In China was 'The Book of Rites,' a work devoted to rules of ceremony and of behavior, together with the 'Four Books' of Confucius (q.v.), of equal canonical authority. There was also the Egyptian 'Book of the Dead,' and the Mohammedan 'Koran' (q.v.).

Laws of Moses.—The great Jewish historian and law-giver, Moses, of the tribe of Levi, is considered the author of the first five books of the Old Testament—Genesis, Exodus, Leviticus, Numbers, and Deuteronomy—or, as they are collectively called, the 'Pentateuch,' or the 'Five Books.' The Decalogue given through Moses, and many of the broader provisions of the Mosaic laws, form the basis of all present moral and legal codes. His institutions breathe a spirit of freedom, purity, intelligence, justice, and humanity, unknown to contemporary nations, and above all, of supreme love, honor and obedience to God. They molded the character of the Hebrews, and transformed them from a nation of shepherds into a people of fixed residence and agricultural habits. (See *Moses*.)

Early Law-Makers.—Among the early books on law was Aristotle's lost work on 'Constitutions,' there being 158 of these, one 'The Constitution of Athens,' being left to us in its entirety. Among creators of early constitutions was Solon (q.v.), the illustrious legislator of Athens and one of the seven sages of Greece. He framed a new code of laws and obtained from the citizens an oath that they would observe them for 10 years. It was Solon who declared

Ill fares the State where License reigns;
But law brings order and concordant peace.

Among the law-givers of the period were Gellius, Cicero, Caesar, Pliny, and Marcus Aurelius (q.v.), whose rules of civil law laid the foundation for Justinian's work. This was called 'The Pandects,' and was a digest of Roman law from the commentaries of the great jurists, made by 17 famous lawyers in 530-3 A.D.

Law in the Middle Ages.—In the 15th century Irnerius, a famous jurist at Bologna, revised the study of Roman law, and in the 16th century appeared the 'De Jure Belli et Pacis' of H. Grotius (q.v.), the distinguished Dutch scholar. This work and others have had no small influence on the laws of the present day. In the 17th century Samuel Puffendorf (q.v.),

LAW

eminent German publicist, produced 'The Elements of Jurisprudence,' and 'The Law of Nature and Nations,' which to an extent superseded the works of Grotius. Early in the 18th century Emmerick Vattel (q.v.), the Swiss publicist, wrote his famous work, 'The Law of Nations, or Principles of Natural Law Applied to the Conduct and Affairs of Nations and Sovereigns.' It was translated into various languages, and partly superseded the productions of Grotius and Puffendorf. Then followed Coke and Blackstone (q.v.), the eminent English lawyers, with their invaluable 'Commentaries'; Kent, Maine, Bryce, and others who are famous as law-makers and interpreters of the early codes.

The Ancient Codes.—In the days of the early Roman emperors began to appear the *Codex* or code; collections of laws and constitutions, the earliest being those of Gregorianus or Gregorius and Hermogenianus. The 'Codex Theodosianus' was executed by a commission of eight persons, appointed by Theodosius the Younger, in 429. The work was published and promulgated as laws in 438, and was declared to be a substitute for all the constitutions made since the time of Constantine.

In 528 the emperor Justinian appointed a commission of 10 persons, one of whom was the celebrated Tribonian, to compile a code, incorporating the previous codes of Gregorianus, Hermogenianus, and Theodosius, and also the Constitutions, Rescripts, and Edicts, subsequently issued. The work was performed in 14 months, and it was then declared that the new code should supersede the older compilations. The code of Justinian is of great importance for church history and law, as many edicts of the Christian emperors concerned religious questions. The Gothic codes or laws of the barbarians were all collected in a single code which bore the title of *Codex Legum Barbarorum*. Of these various systems, the first was that of Alaric, king of the Visigoths, augmented by the legislative labors of his successors. To this code was given the title of the Gothic law, *par excellence*, and it was the best and fullest of all the barbarian codes.

Charles VII. was the first of the kings of France who attempted, by a series of general *ordonnances*, to introduce something like uniformity into the legislation of France; and several of his successors, in particular Louis XI. and Henry III., entertained the idea of establishing a single code for the whole kingdom. A code having this object in view was subsequently prepared by Michel de Marillac, and published in 1629. It consisted of 471 articles, and is spoken of by French jurisconsults in terms of the highest praise. In Spain in the 13th century Alfonso X., the most learned prince of his race, prepared the Spanish code called 'Las Partidas,' and executed the Alfonso Tables.

The Code Napoleon (q.v.) was adopted in France in the 19th century. There were five codes, namely, the 'Code Civil,' published in 1804; the 'Code de Procédure Civile,' published in 1806; the 'Code de Commerce,' published in 1807; the 'Code d'Instruction Criminelle,' published in 1808; and the 'Code Pénal,' published in 1810; the first was called by way of eminence, by a law of 3 Sept. 1807, 'Code Napoléon.'

At the restoration its name was changed back to 'Code Civil,' and during the time of the second empire it was again called 'Code Napoléon.' The first book is entitled 'Of Persons,' and in 11 titles treats, (1) of the enjoyment and privation of civil rights; (2) of civil acts, such as the registry of births, marriages, and deaths; (3) of domicile; (4) of absences; (5) of marriages; (6) of divorce; (7) of the relations of father and son; (8) of adoption and official guardianship; (9) of the paternal power; (10) of minority, guardianship, and emancipation; (11) of majority, of guardianship of persons of age (interdiction) and judicial counsel. The second book is entitled 'Of Property and the Different Modifications of Ownership,' and in four titles treats (1) of the distinction of property into real and personal (*immeubles et meubles*); (2) of ownership; (3) of usufruct, of use and habitation; (4) of servitudes (easements, *des servitudes ou services fonciers*). The third book is entitled 'Of the Different Modes of Acquiring Property,' and in 20 titles treats, (1) of successions; (2) of donations *inter vivos* and testaments; (3) of contracts, or conventional obligations in general; (4) of engagements formed without a convention; (5) of the contract of marriage and the rights of the parties respectively; (6) of sale; (7) of exchange; (8) of the contract of letting to hire; (9) of partnership; (10) of loan; (11) of deposit and sequestration; (12) of contracts connected with chance (*aléatoires*), such as wagers and life-rents; (13) of powers of attorney; (14) of becoming security; (15) of transactions; (16) of bodily duress in civil cases; (17) of furnishing security; (18) of mortgages; (19) of taking and setting off by execution; (20) of prescriptions. Under the first empire the adoption of the 'Code Napoléon' was made obligatory on all the countries subject to the French. After the battle of Leipsic, in 1813, which freed Germany from the power of France, it ceased to be obligatory in the German states, but it continued to influence considerably their legislation. At present this code is recognized in the kingdom of Belgium (with some modifications), in the grand-duchy of Baden, in the kingdom of Italy, and elsewhere in Europe. In the United States it was a model for the code of Louisiana. (See *Code*.)

Legal Acts.—An act in law may be defined, (1) Anything officially done by a court, as the phrases "Acts of Court," "Acts of Sederunt," etc. (2) In bankruptcy, an act the commission of which by a debtor renders him liable to be adjudged a bankrupt. (3) In civil law, a writing which states in a legal form that a thing has been said, done, or agreed. (4) In evidence, the act of one conspirator performed in pursuance of the common design may be given in evidence against his conspirators. (5) Acts done, distinguished into acts of God (q.v.), of the law, and of men. (6) Legislative acts, enacted by a congress, legislature, parliament, etc. A statute, law, or edict, consisting of a bill which has been successfully carried through Congress, Parliament, or Legislature, and received the approval of the executive or chief ruler. (See *Act*.)

Jurisprudence is the general title covering the entire field of law, the science and study of law, and the knowledge of the laws, customs

LAW

and rights of men in a state or community, necessary for the due administration of justice. The various classifications of jurisprudence (q.v.) alphabetically arranged are as follows:

Admiralty Law in England and the United States is a system of jurisprudence administered by admiralty courts, which have jurisdiction over all marine torts, contracts, injuries, or offenses. Its civil jurisdiction extends to cases of salvage, bonds of bottomry or hypothecation of ship and cargo, seamen's wages, seizures under the laws of imposts, navigation, or trade, cases of prize or ransom, charter-parties, contracts of affreightment between different states or foreign ports, contracts for conveyance of passengers, contracts with material-men, jettisons, maritime contributions, and averages, and generally to all assaults and batteries, damages, and trespasses taking place on the high seas. Its criminal jurisdiction extends to all crimes and offenses committed on the high seas or beyond the jurisdiction of any country. (See ADMIRALTY LAW.)

By-Law is a law of a city, town, corporation or society. (See BY-LAW.)

Canon Law is the body of ecclesiastic Roman law. (See CANON LAW.)

Civil Law is the ancient Roman law, with the various modifications thereof which have been made in the different countries into which the law has been introduced. (See CIVIL LAW.)

Common Law is a rule of action which derives its authority from long usage or established custom, which has been immemorially received and recognized by judicial tribunals. As common law can be traced to no positive statutes, its rules or principles are to be found only in the records of courts and in the reports of judicial decisions. Common law is distinguished from the statute law and from equity. It is wholly overruled by the statute law. (See LAW, COMMON.)

Constitutional Law, a system of law established by the sovereign power of a state for its own guidance; the body of written public law. (See GOVERNMENT; LAW, CONSTITUTIONAL.)

Consuetudinary Law is that law which derives its binding character, not from the expressed, but from the tacit, consent of the general will of the community. As it is generally transmitted orally from age to age, it is often spoken of as the unwritten law.

Criminal Law is that branch of municipal law which relates to crime. (See LAW, CRIMINAL.)

French Law is the name given Norman dialect, or Old French, which was used in judicial proceedings from the days of William the Conqueror to Edward III.

Law of Merchants is the system of law which the courts of England and the United States apply to mercantile contracts. It is a branch of the common law, inferior in importance to no other, and in many respects quite distinct from any other. The principal subjects embraced within it are the law of shipping, including that of marine insurance; the law of negotiable bills of exchange and promissory notes; and the law of sales; all of which topics are treated of in this work specifically. The merchant law has grown up gradually, and, during the larger part of its existence, slowly. It originated undoubtedly in the customs of

merchants. That it stands out in English law more prominently and distinctly than in any other general system of municipal law, may be reasonably ascribed to the greater extent of the commerce of England for many ages. It occupies a similar place in our law, in part because we inherit the law of England, and in part because the same extent of commerce which produced this system of law in England preserves it in the United States. In the earliest records of English law, we have distinct intimations that England in all periods of its history from the reigns of its Saxon monarchs, had many ships and many merchants; that questions in relation to the interests and contracts of merchants came not infrequently before the courts; and that these questions were decided even then by a reference to the customs of merchants, which was sometimes only understood, but in other cases was distinctly expressed. In doing this the courts only obeyed a necessity, which was felt wherever commerce existed and was respected. It is not to be concealed, however, that the courts did this with some reluctance, and by steps which followed each other only at long distances. The reasons for this are obvious, and may be discerned the more easily because they have not yet ceased wholly to operate.

The common law was, at a very early period, a quite complicated but well arranged and exceedingly systematic body of law. To know this was the privilege of a few—to administer it gave wealth and dignity to a very few. The law was then a monopoly, and one of very great value, and it was guarded carefully by those who possessed it. Merchants did not wantonly disregard it; but they were compelled to find, or to invent, for the various exigencies of their commerce, rules and principles different from those which had grown out of the feudal system, and were intended mainly to govern titles to land and the relations of feudal rank, and were admirably adapted for this purpose. When these mercantile contracts came before the courts, the same necessity which had led merchants to find and introduce their new rules, acted upon the courts, and induced the courts, more or less willingly, to accept these rules as their rules also, and thus to make them law. But while some of these rules were only modifications of the existing rules of the common law, others of them were very distinct exceptions, and some were positive contradictions. It was perhaps wise in the courts to regard with jealousy rules of law made by no sovereign authority, and neither evidenced nor promulgated in any authentic way. Nor are we obliged to attribute to mere selfishness of any kind the reluctance of the courts of law to admit these usages to the full force of law, at all periods and even at the present day. But at all times the established rules which governed the business and the contracts of any set of men, must have been recognized as law; and even the Roman civil law acknowledged the binding force of mercantile usage as constituting law. In 1765, Lord Mansfield (q.v.) declared "the law of merchants and the law of the land is the same," and so the customs of merchants became the common law.

Law of Equity.—In England in the 18th century the law courts were divided into courts

LAW

of law and courts of equity. In the law courts the parties were compelled to proceed strictly according to the law and the practice, and the forms of pleading were so intricate that many cases were decided on the pleadings without the merits of the case ever being heard; and often when the cause was heard it was impossible to administer justice on account of the form of action, the parties to the action, and the cause of action on which suit had been brought. In the courts of equity they were not restricted by the technical pleadings; amendments could more readily be granted; the parties to the action could be changed by either dropping some or adding others; and the decree could be framed to meet the particular question involved; so that justice would be done to all the parties interested. After the Revolution the United States adopted the English system; but while some of them have kept strictly to that system and have had distinct courts of law and equity, other States have law and equity administered by the same judges and courts, at one time sitting as courts of law and at another time as courts of equity. Equity is divided into three great classes or divisions: Equitable titles, equitable rights, and equitable remedies. Equitable titles are those which are recognized only by a court of equity, as where, when a person gave value for a chose in action which was assigned to him, the assignment was not recognized at law, as it would violate the rules against champerty and maintenance, but equity allows the assignee to bring suit in the name of the assignor. Equitable rights arise where a guardian enters into a transaction with his former ward a very short time after the ward has obtained his majority. If within a reasonable time the ward returns what he received from the guardian, the guardian will, in equity, be compelled to return the property to the ward. Equitable remedies arise in those cases in which the law recognizes a right but cannot enforce it, as where a contract is made for the sale of a piece of property, if the seller refuses to convey, the purchaser's remedy at law is for damages for breach of the contract; but in equity the court will decree specific performance. (See EQUITY.)

Law of Honor.—(See HONOR.)

Law of Nations.—According to Wheaton this "may be defined as consisting of those rules of conduct which reason deduces, as consonant to justice, from the nature of the society existing among independent nations, with such modifications and deviations as may be established by general consent." International jurisprudence is a science of modern origin. In its present sense the law of nations was quite unknown to the two great states of Greece and Rome. In Greece the amphictyonic council bore in some sort the character of an international tribunal, but it concerned itself chiefly with the internal affairs of the members of the league; the few relations which Greece maintained with foreign nations were defined by special compacts, and the general principles of right were rarely invoked in their adjustment. The works of Cicero, Livy, and other writers of the best age of Rome, contain allusions which imply a recognized law of nations; yet it is certain that the Roman law, as it existed at the dismemberment of the Empire of the West, embodied no system of rules for governing the intercourse of states, or for

deciding questions of right which might arise between them. During the Middle Ages, the pope was often the judge and arbitrator in the affairs of nations. His authority reached its height when Alexander VI. presumed to parcel out the New World to Spanish and Portuguese princes. It is now generally recognized, that Hugo Grotius was the first to give a new form to the law of nations, or rather to create a science of which only rude sketches and undigested materials were scattered over the writings of those who had gone before him. Hallam says that the publication of the treatise by Grotius marks an epoch in the philosophical, and it may be said in the political history of Europe. It was very early translated into various European languages, and great jurists made it the subject of elaborate commentaries. In 1656 it was made the text of lectures on public law in the University of Wittenberg, and in 1661 a professorship was created in Heidelberg for expounding the law of nature and of nations from the writings of its author. The sources of international law are, according to Grotius, natural law, divine law, customs, and special compacts. In the celebrated reply made by the British government in 1753 to a Prussian state paper, the law of nations is said to be founded upon justice, equity, convenience, and the reason of the thing, confirmed by long usage. The principle of national justice, founded upon the laws of morality, is, then, the basis of the positive law of nations, that is to say, of the treaties, conventions, and usages which compose it. It is the office of right reason to apply this natural law of equity to the circumstances of each case; and it is the art of applying this law, according to justice and guided by reason, which renders international jurisprudence a particular science. Treaties and usages offer evidence of the general consent of nations, and are important sources of the law. The customary law of nations is further expressed in manifestos and declarations of war and in the decisions of prize courts. Finally, the concurrent testimony of the great writers upon the science, and the written opinions which official jurists give to their governments, are further evidence and depositories of the law of nations. (See INTERNATIONAL LAW.)

Law of Nature.—Laws and just rules of conduct which the Creator has prescribed to man, as a dependent and social being, and which are to be ascertained from the deductions of right reason. (See LAW, NATURAL.)

Law of the Land is the due process of law; the general, public, or common law of the land.

Maritime Law is the law of the sea; a branch of the commercial law, relating to the affairs of the sea, such as seamen, ships, navigation, etc. (See LAW, MARITIME.)

Martial Law is the law of military rule or occupation. (See MARTIAL LAW.)

Military Law, a branch of the general municipal law, consisting of rules ordained for the government of the military force of a state government, equally in peace and war. (See LAW, MILITARY.)

Moral Law, a law which prescribes to men their social duties. The moral law is summarily contained in the decalogue, written on two tablets of stone and delivered to Moses for the Israelites on Mount Sinai. (Ex. xx.) (See MOSES.)

LAW

Mosaic Law, the institutions of Moses, or the code of laws prescribed to the Jews, as distinguished from the Gospel.

Municipal Law, a rule prescribed by the supreme power of a state, declaring some right, enforcing some duty, or prohibiting some act; a statute; a collection of rules to which men living in civic society are subjected in such a manner that they may in case of need be constrained to observe them by the application of force. (See GOVERNMENT.)

Parliamentary Law is the name given the rules and precedents regulating the procedure of deliberative assemblies. Certain rules of parliamentary procedure have always been necessary for the accomplishment of the purposes for which deliberative assemblies are called. Experience has shown that restrictions must be placed on individual members in the general interest of the whole body; that mere customary rules are insufficient, and hence regular parliamentary codes must be prepared for the government of deliberative assemblies. In both England and the United States parliamentary law has become almost a distinct branch of the law, and its mastery is highly essential to the success of the legislator. The necessary officers of a deliberative assembly are a chairman, usually called speaker, president, or moderator, and a secretary or clerk. It is the duty of the presiding officer to call the meeting to order; to state clearly all questions brought before the assembly; to put motions properly made and in their proper order; to preserve order and enforce the rules of procedure; and decide questions of order subject to the right of appeal to the whole assembly. These are his primary duties, but he may in addition participate in debate, as any other member, and vote in case of a tie. It is the duty of the secretary to keep a record of the proceedings of the meeting, including a correct statement of every motion made and the manner in which it was disposed of; the names of members of all committees appointed; a true copy of every resolution passed with the affirmative and negative votes cast therefor, etc. (See PARLIAMENTARY LAW.) For rules governing debates, motions, appeals, etc., consult Cushing, 'Manual of Parliamentary Practice,' and Roberts, 'Rules of Order.'

The Courts and Law Practice.—For a general survey of judicial proceeding and the methods of courts, see the articles, COURT; JUDGE; JURY; JUSTICE. In the practice of law, especially during the 19th century, many new and distinct phases of legal classifications have arisen, such as Corporation Law, Pension Law, Law of Husband and Wife, Divorce Law, the Law of Negligence, the Law of Copyright, Election Laws, Insurance Law, Mining Law, Liquor Laws, Bankruptcy Laws, etc. These are generally treated under their respective titles.

Plaintiff and Defendant.—The parties to an action in law are called plaintiff and defendant, and the former is said to sue or prosecute the latter, hence the word suit instead of action. In some few instances the redress sought by a civil action consists in the recovery of some specific article of property wrongfully and unlawfully taken by the defendant from the plaintiff, but most frequently the object of an action is to obtain compensation in money for an injury complained of, which compensation is tech-

nically called damages. The action is said to terminate properly at judgment. Civil actions are those actions which have for their object the recovery of private rights, or of damages for their infraction. Criminal actions are those actions prosecuted in a court of justice, in the name of the government, against one or more persons accused of a crime. Transitory actions are those civil actions the cause of which might have arisen in one place or county as well as another. Local actions are those civil actions the cause of which could have arisen in some particular place or county only. Personal actions are those civil actions which are brought for the recovery of personal property, for the enforcement of some contract, or to recover damages for the commission of an injury to the person or property. Real actions are those brought for the recovery of lands, tenements, and hereditaments. Mixed actions are those which partake of the nature of both real and personal actions. (See DEFENDANT; PLAINTIFF.)

Law of Evidence.—Evidence in law may be oral or documentary. Oral evidence is the statements made by witnesses during a trial; and documentary evidence consists in the production of papers, on which is writing, marks, or characters capable of being read, which are submitted during the course of the trial. Oral evidence must in all cases be direct; if it is of something that was seen, by the person who saw it; if of something heard, by the person who heard it; if of an opinion, by the person who holds that opinion; or if the knowledge was acquired in any other manner, by the person who perceived it in that manner. The general rule is that hearsay evidence is not admissible. Documentary evidence may be either primary or secondary. Primary evidence of a document is where the document itself is produced for the inspection of the court. Either oral or documentary evidence may be given of any fact in issue or relevant to the issue. (See EVIDENCE.)

Law, Civil. See CIVIL LAW, THE.

Law, Commercial. See COMMERCIAL LAW.

Law, Common, in America. The layman who diligently searches the statute books of our several States must not flatter himself that he has so determined his own, or the legal rights and obligations, of his fellow citizens, and, upon that misapprehension, set forth upon such litigious adventures as this assurance would surely provide for him. He may have heard of the common law, and have thought it an obsolete system of jurisprudence, affording an interesting and curious field of study for the antiquarian, but as an active power supplanted entirely by modern statutes, which he assumes to present the whole body of the operative, substantive law. To warn the over-confident student against the consequences of such error, this article may, to some extent, serve a useful purpose. It is intended, however, to set forth briefly, without technical analysis, and in entirely popular form, the origin, development and present influence of that system of administrative law known both to laymen and to the profession under the title of the Common Law; the spirit, the forms and phrases of which still appear in our legislation and in the judicial utterances of the courts of every State of our Union save, perhaps, Louisiana, whose laws have their source in, and take their inspiration rather from, the Code Napoleon, which, in turn, was an offspring of the Roman law. With this exception, and except in the jurisdiction of the Federal Courts of the United States, the principles of the common law have within our Union full vigor and dominion, excepting, always, as they have been expressly modified or annulled by legislation. But even statutes are to be construed in reference to the common law, for it is not to be presumed that the Legislature intended to make any innovation upon the common law further than the case absolutely required, and this rule of construction has been held applicable to acts of Congress, though there is no common law of the United States (Kent's Commentaries, Vol. I., p. 464). The common law must, nevertheless, be invoked in the matter of construction of Federal statutes, for, though its jurisdiction is not conferred upon courts of the United States, where the statutes do not so provide; their powers are purely statutory, but, in their exercise, the Federal Courts give full recognition to the rules of the common law. The same oversight by the common law over legislation was long ago declared by Lord Coke, who held that the common law "doth control acts of Parliament and adjudge them void when against common right and reason."

Even to-day the most important personal or property rights of the citizen may be deter-

mined in our courts upon the authority of some ancient decision recorded in the Year-Books, yet having the same force now as at the time of its enunciation centuries since. And it may further be safely affirmed that no one of the fundamental propositions of the common law relating to the liberties of the citizen, has been wholly abrogated by legislation, the changes in the body of the law by this process having been more by way of development than excision. The sources in which this ancient, but still vigorous, system had its origin are to be sought in a past older than the recorded history of our English ancestors, or of their progenitors. Most of the vital principles which animate its substance may be directly traced to those rules of civil government and those stern precepts asserting personal and property rights first declared by the unwritten law, administered by the rude forest courts of the barbarian ancestor of our Saxon and Norman parents, and already established when Caesar led his victorious legions to the remoter boundaries of Gaul, where, in battle and in treaty, he came to know and respect those sturdy races whose primitive arms and crude laws have developed into, and still actuate, the powers which to-day and for generations have led in the advance of civilization the world over. Born of the rigor and the necessities of their hardy life, reflecting something of their higher aspirations, expressing, it is true, in its inception, the savage principle that made vengeance the impulse to secure the punishment of an evil-doer, or serve to deter one who would do wrong, this system of law has grown with the growth of the people who framed it. As they emerged from savagery, the law moved onward with their progress, and was modified by their enlightenment. The Roman Conquest left the imprint of its civilization and its distinct influence upon the laws of the northern subjects of the empire. So that by the time of William the Conqueror, though the dominant law by which he and followers were governed, and which he brought with him to England, was still essentially that of the German barbarian, there were grafted upon it many of the precepts, and much of the philosophy, of the Roman jurist. The necessities of the people, the teaching of their experience, usage based upon the morality of the time, were the foundations of their system of law; defined by no written code, claiming nothing of the mystery of an inspired origin, human in its every fundamental feature, sustained by the will, the intelligence, and the virtue of the people, from its beginning to the present day, it has had the vitality of human life itself and has survived through all the violent changes and revolutions of religious faith, and has maintained the vigor of its original purpose, the discharge of its intended functions, the establishment of laws for the conduct of human affairs, the determination and protection of personal and property rights, of men dealing and dwelling with their fellows — without which no society could long endure.

Lord Hale has said that the common law of England is "not the product of the wisdom of some one man or society of men, in any one age, but of the wisdom, counsel, experience, and observation of many ages of wise and observing men"; and that "Time is wiser than

LAW

all the wits of the world, and the law which has been tried by it, has its highest possible evidence in its favor."

That system, ancient in the days of Lord Hale's encomiums, approved by the wisdom of the generations who have followed him, is held in obedient reverence to-day, and each succeeding age has added to its substance and spirit, some contribution of learning, the results of new observations, of new experience, and of new enlightenment.

The bibliography of the common law is as wide as the field of its jurisdiction, and a recital of the volumes in which its precepts are recorded would far transcend the necessary limits of this article, nor would it lie within the scope of its intent. The subject has engaged the profound study of scholars, inspired the decisions of most learned judges, and by the evidence of its influence historians have traced the progress of nations. Its commentators have uniformly extolled its wisdom, its beneficence, and its unparalleled power, some even in their earnestness having used those reverential phrases which are appropriate to the Holy Scriptures themselves.

"The judges," Chancellor Kent has told us, "through the whole period of the Year-Books, were constantly urging the sacredness of precedents, and that a counsellor was not to be heard, who spoke against them; and that they ought to judge as the ancient sages taught." "If we judge against former precedents," said Fristot, C. J., "it will be a bad example to the barristers and students at law, and they will not give any credit to the books, or have faith in them."

This adherence to precedent has characterized the slow and conservative development of the system, even to our own time. It is still true that when no statute has expressly abrogated a rule of the common law, it remains the supreme law of our courts, if the facts and circumstances of the particular case make it applicable, even though the source of the rule must be sought in the conflicts of the Saxon sullenly defending his rights against the arrogant Norman baron, or in the controversies of the astute churchmen, who, in spite of hostile statutes, by ingenious turns of argument and construction, defended in the courts lands which they could no longer hold by arms.

A well-considered decision of Chief Justice Holt, Lord Coke, or in later times of Lord Mansfield, has to-day and in our country, all the authority it had when it first fell from the lips of the austere judge and terminated a controversy between litigants whose dust has long since mingled with the English earth. Our courts are bound by the letter no less than by the reason of the adjudication. They must not overrule a decision plainly in harmony with the principles of the law which demanded it, for the function of the court is exclusively judicial, and it may not, because of the apparent hardship of a particular case, usurp legislative power. If the rigor of a rule of the common law bear too hardly upon the citizen, or if it be in conflict with the conscience or conditions of the present day, legislative relief is a sovereign and effectual remedy, and is that which the common law has itself wisely provided, to meet changing conditions and circumstances.

The recorded evidence of the principles of the common law, to which the judges turn for guidance in rendering their judgments according to that law, is preserved in a multitude, ever increasing in numbers, of reports of decisions: first, of the Courts of England, the earliest of which are the Year-Books, black-letter tomes written in crabbed law French, seldom read to-day even by the most studious lawyers, because most of the decisions there recorded have passed by comment and reference into later works, but the decisions themselves are none the less active living factors in the law of to-day. These early reports cover a period of about two hundred years, from the reign of Edward II. to that of Henry VIII. From that time forward, with some early intermission, but later continuously, the adjudications of the English courts of high authority have been carefully, and, for the most part, accurately preserved, and these volumes, with the acts of Parliament, make up the body of the common law as it existed when the American Colonies declared their independence, and as it has been incorporated into our own jurisprudence. The ancient reports are instructive not alone for the letter of the decisions of the judges, but also because they are almost the only written records of the law; the text-books,—indeed, the writers competent to prepare them,—less than in our time, and in many instances, the annotations of the reporter, are the only statements of general legal principles and have the same weight of authority as the judicial decrees because they reflect the real genius of the law itself.

Lord Coke, Chief Justice of the King's Bench in the time of King James, is a notable illustration of this service to the law. His observations, deduced from the decisions in favor of the rights of the subject, and in restraint of royal prerogative, so angered that monarch that he removed the Chief Justice and directed that his commentaries be eradicated from the books, but that which Coke wrote is the law to-day, and the king who would have stayed its progress, might, indeed, be now forgotten except for this impotent effort, which gives him immortality beside King Canute, who, by his royal will, sought to hold back the waves of the limitless sea. This memorable incident of Lord Coke well illustrates that quality of the common law which has enabled it to survive all changes of dynasties and of nations. Royal ambition, popular violence, religious fanaticism, even the tumult of civil war, could not, except momentarily, change the tenor of its way or obstruct its constant advance toward the establishment of a stable, permanent system of justice. Flexible, and adaptable in its external forms, it absorbed in each period of its transition only those elements which were of permanent value. It never retrograded.

Of the ancient law of England, "planted here by the Conqueror," Lord Bacon, when entertaining the vain ambition that he could by his own genius embody all its vital principles within the fixed terms and phrases of a code, said, with rare vigor and felicity of speech: "Now of the laws of England, if I shall speak my opinion of them without partiality either to my profession or country, for the matter

LAW

and nature of them, I hold them wise, just, and moderate laws, they give to God, they give to Caesar, they give to the subject, what appertaineth. It is true they are mixed, as our language, compounded of British, Roman, Saxon, Danish, Norman customs; and surely as our language is thereby so much the richer, so our laws are likewise by that mixture the more complete."

Purified, invigorated, by the best thought and by the experience and intelligence of the generations since Bacon lived, the common law of America, imposed upon us by no "Conqueror," but brought here as their birthright by our fathers, zealously and jealously guarded, and sacred to them as their religion itself, immortal in its vigor and virtue, speaks to-day the very conscience of the state.

It remains only, for the purposes of this article, to briefly trace the processes and channels by which it has become the predominant law of America, wherever the Saxon race has inherited, or after his manner, taken possession of, the earth. If we have in mind our English origin, we shall readily understand why in the deeds by which our lands are conveyed we note a phraseology which had its occasion in feudal tenures, or mark the last struggles of the Roman Church for temporal possession, and why in the courts we still hear the technical words of the pleader used in ancient Westminster Hall, and why we observe the precise and often quaint verbiage of indictments upon which a prisoner is set to trial for his life, to which, indeed, the modern prosecuting officer still adheres with almost superstitious fidelity. Brought over seas by our English ancestors, as the law of England, it, of course, was our law through the Colonial period, and when our conflict with the mother country became inevitable, our patriots invoked the common law, the heritage of all English subjects, as the justification for their action. Their defiance of unconstitutional taxation was not the outbreak of Englishmen reverting to barbarism in the wilds of a new country, or of men impatient of the restraint of just laws, nor was it the outcry of some rabid revolutionary philosophy taught by an alien race, for it was to the constitution of England, embodied in her common law, that the colonists appealed to a king and ministry who had themselves forgotten its precepts. The arguments of the freemen of Virginia or of Massachusetts were the same with those uttered by the liberal nobleman or commoner in the Parliament of England, and the triumph of our revolution was no less a victory for the common law than for the exhausted Americans who had offered their lives and their fortunes to the defense of the principles it had inculcated. Here, again, a king had thought his will more potent than the law, and here again the royal prestige and prerogative met humiliating defeat before the resistless moral force of the law, that had made the people's rights and the constitution the dominant power of government, rather than the arbitrary will or ambition of the sovereign. So sacred to every colonist was this law that in the first intimation of organized resistance to England in the resolutions of the Convention of 1774, it was declared that the colonists were of right entitled to the benefit

and protection of the common law of England, and, as well, to that of the acts of Parliament existing at the time of colonization. As the common law had taught our fathers how to win their independence against a tyranny that ignored it, in gratitude, and seeking the preservation of their liberties through its precepts, it was embodied in the constitutions of the new states, where, proof against the vacillation, the passion, or the precipitate action of popular excitement, it should remain, the impregnable fortress, the last sanctuary, of the liberties of the people.

Through the blood of our ancestors, and by rightful inheritance, the common law is our birthright, which scarce needed, therefore, formal adoption by legislation or by the courts. But, that of record it might appear to all men, and be gainsaid by none, it has been inscribed upon the pages of our written law. The Constitution of Massachusetts declares (Article VI. of Chapter VI.): "All the laws which have heretofore been adopted, used, and approved in the Province, Colony or State of Massachusetts Bay, and usually practised on in the courts of law, shall still remain and be in full force, until altered or repealed by the legislature; such parts only excepted as are repugnant to the rights and liberties contained in this Constitution." Like provision was made in the constitutions of the other original States. The constitution of those States, not existing as colonies, embody by reflection like safeguards for the popular liberty and right, and all directly traceable to the body of liberties of the common law.

The courts, pursuant to the requirements of the constitutions, have declared their perpetual allegiance to the principles of the ancient law. A typical illustration is found in *Commonwealth v. Knowlton* (reported in 2 Mass. Reports, p. 530), where the Supreme Judicial Court declared that "our ancestors, when they came into this new world, claimed the common law as their birthright, and brought it with them, except such parts as were judged inapplicable to their new state and condition. The common law thus claimed was the common law of their native country as it was amended or altered by English statutes in force at the time of their emigration. These statutes were never re-enacted in this country, but were considered as incorporated into the common law. Some few other English statutes passed since the emigration were adopted by our courts and now have the authority of law derived from long practice."

So much, therefore, of the common law of England as our ancestors brought with them, and of the statutes then in force, amending or altering it,—such of the more recent statutes as have been since adopted in practice, and the ancient usages aforesaid,—may be considered as forming the body of the common law of Massachusetts, which has submitted to some alterations by the acts of the provincial and state legislatures and by the provisions of our constitution."

Again, the Massachusetts court, in *Commonwealth v. Churchill* (reported in 2 Metcalf at p. 118), held that the constitutional provision above referred to was to be "construed as adopting the great body of the common law,

LAW

with those statutes made before the emigration of our ancestors, which were made in amendment of the common law, so far as these rules and principles were applicable to our condition and form of government." And in the same case the court declared that it was unnecessary to show affirmatively that such rule or principle had been adjudicated before the Revolution, saying that "before the Revolution we had no regular reports of judicial decisions, and the most familiar rules and principles of law — those which lie at the foundation of our civil and social rights — could not be so proved. No, we rely on usages and traditions, and the well-known repositories of legal learning, works of approved authority, to learn what are the rules of the common law; and we have no doubt that these were the great sources to which the above pregnant provision of our constitution refers."

Though the Constitution of the United States in no words adopts the common law, as part of its composition, its provisions none the less recognize its existence and continuance as the law of the States, with which the National government might not interfere. It was because of a fear that, through the new Federal Constitution, some untried scheme of government might be imposed upon the people and the States, and in order that the old system of law, known and trusted, might still prevail, safe in the will and obedience of those who knew it best, that it was expressly declared that the Federal Government should have in none of its functions any powers save those expressly delegated to it by the Constitution. (*Re Barry*, 42 Fed. Rep., 113, 118, 120.) But, as has been above noted, the Federal Judiciary, trained to the faith of the common law, have uniformly held that even Federal statutes are to be construed in accordance with the principles of that body of law.

So, by the will of the people, wisely and deliberately exercised and manifest by the declarations of our courts and constitutions, the vast and complex, but stable, system of American law, has been builded upon the ancient foundations of the law of England, and the reflecting citizen of the British Empire, though realizing that the prestige of the arms of England was dimmed by the victories of our Revolution, yet is reconciled when he remembers that the same spirit that gave freedom to Englishmen, inspired the American patriots, and that the colonists demanded only that liberty of person and conscience which the common law had taught them was the birthright of all mankind.

HERBERT PARKER,
Boston, Mass.

Law, Constitutional, that part of public law which regulates the political organization of a State and so named because usually embodied in a written instrument called a constitution. It is sometimes spoken of as the organic or fundamental law of the State because it is the basis of all other municipal law. It differs from international law in being wholly municipal in character and from administrative law in that it regulates only in a general way, the organization of the government, leaving the details to be regulated by the rules of administrative law. It differs from ordinary statute law both as to its source and method of enactment and as to its content. While statute law is enacted, modified and

repealed by the legislature, constitutional law is usually enacted by a constituent convention especially chosen for the purpose while its validity is, in America at least, usually made to depend upon the approval of the electorate, to whom it is submitted by way of referendum. Hence it is commonly said that constitutional law is enacted by the people, whereas statute law is the work of their representatives. This distinction as to method of enactment, however, is not universal. In some States the same bodies which enact ordinary statute law also ordain and alter the body of constitutional law.

This is true in Great Britain, where the Parliament may alter the constitution in the same manner in which it may enact or repeal an ordinary statute. Likewise in France and in Germany the Parliaments may make amendments to the constitution subject only to the limitation that the French Chambers are required to observe certain formalities which they do not observe in passing ordinary statutes, and in Germany an extraordinary majority is required. In Switzerland the people participate directly in the enactment of their constitutional law, not only through the referendum (q.v.) but also through the so-called initiative by which they are empowered to draw up proposed constitutional amendments and submit them directly to the electorate for approval. For the different types of constitutions see the article CONSTITUTION.

The distinction between the content of constitutional law and that of ordinary statutory legislation is largely one of degree and in the States of the American Union this distinction is fast disappearing. Among the proper subjects of constitutional law are (1) the structure and powers of the government including a distribution of its legislative, executive and judicial functions, among separate and distinct organs; (2) a definition of the class empowered to participate in the choice of elective officers and the method by which that choice is to be exercised; (3) the determination of the qualifications, duties and privileges of those empowered to hold government offices and mandates; (4) the creation of a sphere of individual liberty — usually embodied in a bill of rights — upon which the government is forbidden to encroach, and (5) provision for a legal and orderly method of making changes in the constitution so as to avoid the risks and dangers of revolution. In addition to these subjects which may be denominated the essentials of a constitution scientifically drawn, it is common to incorporate therein various provisions relating to education, patents, copyrights, the army and the navy, the militia, corporations, public debts, rules of judicial procedure, regulations concerning official salaries, taxation and administration, etc., which according to strictly juristic tests are more properly subjects for statutory regulation. The effect of this practice has been to introduce into the domain of constitutional law a considerable amount of private law, thus derogating from the principle that the constitution should be exclusively an instrument of public law. On the other hand the usual difficulty of amending the constitution so as to adapt it to new conditions and exigencies has made it necessary to deal with certain subjects by statutory legislation, although they are properly matters that should come within the province of constitutional law. Notable instances are statutes for the government of dependencies. Thus

LAW

the ordinance of the old Confederate Congress of the United States, passed in 1787, for the government of the Northwest Territory, the various statutes for the organization of the other Territories of the United States, the acts for the government of the Philippine Islands and Porto Rico were of the nature of constitutions of government for the dependencies to which they applied. They were mainly instruments of constitutional public law, although cast in the form of statutes.

A final distinction between constitutional law and statute law is the element of paramountcy which belongs to the former. In all countries where constitutional law is a separate and distinct body of jurisprudence its prescriptions take precedence over all statutory enactments in case of a conflict between the two. In such cases the conflicting statute is said to be "unconstitutional" and is treated as invalid. The power of determining the fact of irreconcilability has been assumed by the judicial branch of the government in the United States and has been so long acquiesced in that the power will probably never be questioned, although it is not expressly conferred by the Constitution. In none of the continental European countries have the judiciaries assumed such power, and in England the "constitutionality" of an act of Parliament can scarcely arise, since that body is legally omnipotent. The rules for the construction of the prescriptions of constitutional law are essentially the same as those for the construction of statutes except that constitutions are more strictly interpreted and constitutional commands are more often construed as mandatory where similar provisions in statutes would be treated as directory only.

In the United States, and in fact in all countries having the federal form of government, there are two bodies of constitutional law, namely, that which is national in scope and that which is local, the former being paramount to the latter in case of conflict. In the United States that part which is federal or national consists of the Constitution "established and ordained by the people" in 1788, including the subsequent amendments thereto, together with the interpretations of the federal judiciary and the usages and customs which have grown up in connection with the administration of the government. Among the important principles which have been developed as a result of judicial interpretation may be mentioned the right of the government to acquire and administer foreign territory, the immunity of the national government, its instrumentalities and agencies from taxation by the States, the right of the government to issue legal tender paper currency both in time of war and in time of peace, the exclusive power of Congress over foreign and interstate commerce, the exclusive power of the States over all matters relating to the suffrage subject to the limitations of the 14th and 15th amendments, the right of the National government to undertake internal improvements, the right of the courts to declare laws unconstitutional, the right of Congress to abrogate a treaty, etc. Among the usages which have become for all practical purposes a part of Federal constitutional law may be mentioned: the ineligibility of the President for a third term, the obligation of presidential electors to vote for the party nominees, the power of the President to remove his appointees without the

consent of the Senate, the method of legislation by the committee system, the requirement that representatives in Congress shall reside in the districts from which they are chosen, etc.

Likewise the constitutional law of the individual States is embodied in written constitutions, in most cases prepared by constituent assemblies and approved by the electorate upon referendum, together with the amendments thereto and the interpretations of the State judiciaries. Several of the early State constitutions were prepared and put into effect by the legislatures or by irregular revolutionary assemblies without popular ratification.

With one exception (Delaware), no alteration can be made in any of the existing constitutions without the approval of the people at the polls, and but three of the constitutions now in force were put into effect without ratification by the electorate. The earlier constitutions were brief instruments containing but little more than the law for the organization of the government and the necessary safeguards for the protection of individual liberty, but the later ones are bulky documents containing a vast amount of private law relating to matters which are properly subjects of statutory regulation. This increasing tendency to amplification has resulted from the popular distrust of the State legislatures and the consequent desire to place the regulation of many matters beyond the power of the legislature to alter or repeal it. The effect has been to destroy in a large degree the scientific distinction between constitutional law and statutory law, to retard the constitutional development of the commonwealth, and to add confusion to the task of the student and the practical constitutional lawyer.

In Great Britain the existing body of constitutional law differs in several respects from that of the United States. In the first place it is not so much the result of revolution nor is it so nearly the finished product of a constituent assembly. It is more the product of evolution and growth and is more largely unwritten than that of the United States. Moreover, what is written is scattered through different acts instead of being contained in a single compact instrument. Finally, the Parliament being the chief source of constitutional as well as of statutory law there are no juristic tests upon which a distinction may be founded—a fact which has led Mr. A. V. Dicey, one of the most learned English commentators, to declare that the constitutional law of England is a "sort of maze in which the wanderer is perplexed by unreality." He questions whether English constitutional law is really law, and expresses the opinion that it is only a cross between history and custom, undeserving of the name of law. As the term is used in England, he says, it includes all rules which define the members of the sovereign power and regulate their relations to each other, which determine the mode in which the sovereign power is exercised, which prescribe the order of succession to the throne, which regulate the prerogatives of the chief magistrate, determine the form of the legislature, define the territory of the state, etc. Such of these rules as are enforced by the courts he calls collectively the "law of the constitution." The others which consist of understandings, habits or practices, and which are not enforced by the courts, he calls the "conventions of the

LAW

constitution," or constitutional morality. To the former class belong the rule as to the irresponsibility of the king and the responsibility of his ministers; to the latter belong the rules relating to the executive veto, the initiation of revenue bills and the resignation of ministers. Monsieur Boutmy, a learned French commentator on the British constitution, points out that the principal sources of the constitutional law of England are: (1) Treaties or quasi-treaties, such as the Acts of Union; (2) the common law; (3) solemn agreements, for example, the Bill of Rights; (4) statutes. Of the other European countries the constitutional law (*Staatsrecht*) of Germany is most nearly like that of the United States as to its source, content and dual character. The constitutional law of the French Republic may be dismissed within a sentence. It is embodied in a brief instrument of a few hundred words, contains a bare outline of the organization of the government, does not contain a solitary provision in behalf of individual liberty, and any part or the whole may be altered by the legislature at will.

JAMES WILFORD GARNER,
Professor of University of Pennsylvania.

Law, Criminal, is the whole body of legal rules and provisions affecting the commission and prosecution of crime. In this article we shall deal only with the general principles of criminal law, as it has also been treated under the titles, COURT; CRIMINOLOGY; LAW; LAW, NATURAL, etc., and under special cases such as MURDER, PERJURY, THEFT, etc.

The theories and doctrines of criminal law are, perhaps, more thoroughly based upon the principles of natural law (q.v.) than any other branch of legal science. The earliest conception of criminal law could not have taken place long after Cain killed Abel, for it seems to rest upon the principle of vengeance, which is born of even animal instinct. The law of retaliation is older than history, and the idea of amendment for every injury is a part of human nature. All the religions in the world's history have never been able to teach men to "turn the other cheek," but they have always willingly observed the law of "an eye for an eye, a tooth for a tooth."

The doctrine of criminal law is that the commission of an unlawful act not only requires the guilty person to make proper amendment in some form to the injured party, but that he shall also suffer just punishment at the hands of the state, in order to prevent the repetition of the crime, as well as to make an example him which would tend to deter others from the commission of crime in general. One of the objects of criminal law is to reconcile the rules of procedure with natural justice so as to insure the safe conduct and tranquillity of the state. It embraces the whole body of rules defining the doctrine and the acts of criminal offense; it prescribes for the apprehension of persons charged with crime, the proper procedure for

the trial of such persons, and their just punishment when found guilty. Many conflicting views exist among jurists in relation to the interpretation of criminal law, and there is a strong tendency to codify this branch—for instance, in the State of New York the Penal Code defines criminal offenses and provides for punishment, but it is left for the Code of Criminal Procedure to regulate the apprehension and trial of those charged with the commission of crime. Many of the State constitutions and the Constitution of the United States contain what is practically a codification of the laws regulating criminal procedure.

In ancient times and in the Middle Ages the law exercised the right of public vengeance, which had for its chief object the intimidation of the wrongdoer, and resorted to a great variety of grotesque and revolting punishments. The element of example, however, was not wanting, for the most horrible executions, chastisements, and tortures were devised and carried out in public places for the edification of the curious, whose minds must have been impressed with the horrifying spectacles. But in the 18th century a more enlightened jurisprudence opposed the old theory of public vengeance, and advanced the principle of a legitimate defense restrained within the limits of common interest. It was then, for the first time, recognized that the true and right object of criminal law should look to the amendment of the criminal, the amelioration of his condition, and the ultimate restoration to him of the rights of a free man, thus giving back to the world—not a criminal, but a good and useful citizen. From this standpoint, many members of the legal profession are opposed to capital punishment; and some are against corporal punishment, on the ground that it degrades the criminal and deprives him of all sense of pride and ambition, thus permanently unfitting him for making a return to the world of free society. Both in England and in the United States constant efforts are being made to reduce the number of capital offenses.

Everyone is amenable to punishment for crime, with the exception of infants and those of unsound intellect. And this latter exception is limited; it does not prevail in the case of a person committing crime in a lucid interval. Sometimes the fatuity of old age may save a person from punishment, and punishment is remitted in the case of a person who, although not an absolute idiot, is so weak as to be incapable of understanding the difference between right and wrong. Drunkenness is no excuse for the commission of crime, even if it has produced insanity at the moment of committing the crime. But if drunkenness is only the remote cause of the insanity, and the person is not at the time under the influence of liquor or drugs, the law gives him all the consideration that it would give to any other insane person. The cause of the insanity makes no difference; it is the fact *per se*.

A wide latitude in meting out punishment to those found guilty of crime is wisely permitted the judge, on account of the infinite variety of extenuating or aggravating circumstances which surround many cases. It can readily be seen that no code of laws could be made providing for exact or prescribed degrees of punishment, without thwarting the intentions of justice. And so the sentence is left in great measure to the discretion of the Court.

LAW

The details of procedure in criminal cases vary to some extent, according to the crime charged, but are substantially the same in all cases. After the warrant of arrest has been issued and the person charged with the commission of crime is apprehended, he is examined before a justice, at which time he may call witnesses in his defense. The justice may, according to his opinion of the evidence, discharge the accused, commit him to jail to await trial, or admit him to bail. The first step in the trial is the presentation of an indictment to the grand jury. The grand jury having been sworn by the judge, and having heard the witnesses, finds a "true bill" if they are satisfied that there is a *prima facie* case. The cause then goes to trial in open court before a judge and jury. The accused is entitled to counsel, and in case he cannot afford to engage counsel of his own choosing, the State (the judge) assigns counsel for him. The first proceeding is the selection of the jury (q.v.). When all of the twelve seats are filled, the jury is sworn and counsel for the prosecution opens the case. He may be private counsel, engaged by the parties bringing the action, but more often is the public prosecutor—the district-attorney. He examines the witnesses for the prosecution, bringing out all the salient points of the accusation. These witnesses are then cross-examined and re-examined under the rules of evidence (q.v.). Counsel for the prisoner then states the defense and examines witnesses, who are in turn cross-examined and re-examined as before. Then comes the summing up, first by counsel for the prosecution, then by counsel for the defense. The judge then sums up the case and charges the jury, instructing them in points of law on which the case may depend. They then retire and bring in the verdict, which must be unanimous. If they bring in a verdict of guilty, the prisoner is either sentenced or remanded for sentence; if not guilty, the prisoner is discharged. If the jury cannot agree on a verdict, they bring in a "disagreement," and the prisoner is remanded for a new trial. The prisoner has a right to be present during the trial, but should he so conduct himself as to make it impossible to proceed with the case, the Court may conduct it in his absence. The prisoner then has to face the additional charge of contempt of Court. Law, International. See INTERNATIONAL LAW; AMERICAN DIPLOMACY; UNITED STATES, DIPLOMACY OF.

Law, Natural. Many laws have been found necessary to regulate the conduct of man in his various relations to society which are more or less arbitrary according to the requirements of localized conditions, but underlying them all are the laws of nature.

If a man kill an animal, and eat of its flesh,

he has no reason to conceal the act; he goes his way with a full stomach and a clear conscience, and no one charges him with the commission of crime. He has simply conformed to the law of nature and answered the instinct of self-preservation. But if a man kill another man, his whole deportment, and even the expression of his features, indicate the consciousness of guilt and fear. Natural law might be said to be the law dictated by conscience, not law deduced from man's education and experience in the world—law regulating his own general rights and duties in relation to the moral government of God, or Nature, and his own moral capacity and accountability.

So natural law covers a man's duty to God, or Nature—the duties of man toward himself, such as self-preservation, temperance, etc.; the duties of man toward other men, or duties which arise from his relations to others near or dear to him; and finally the duties of man, generally and politically, to universal society, especially to the community in which he lives.

At different periods of the world's history men have had various conceptions of justice. Self-preservation was the basis of law among the Sophists of Greece and the Epicureans; the Stoics believed that natural law was founded upon reason and used the term "rational law." Aristotle conceived natural justice to be partly legal (made by man) and partly natural (dictated by God).

Natural law, or *jus naturale*, as defined by Roman philosophers and jurists, is that law which is naturally discerned by right reason, as opposed to the law found necessary and made by man for the safe conduct of the state under localized conditions, or by agreement for the preservation of international rights. Later, however, they distinguished *jus naturale* from *jus gentium*, the former being known by Ulpian's definition, "Natural law is that which nature has taught all living things," and the latter including the laws of expressed or implied agreement between men, or humanistic laws. Aristotle interpreted natural law simply as the law of nations; the Stoic conception was that natural law makes all men free, but that the law of nations permits slavery. The Epicureans thought that commercial trade or profit-making came under natural law. In the administration of Roman justice, natural law was often referred to in justification of an act of judgment, but the validity of a Roman law was never questioned because opposed to natural law.

During the Middle Ages natural law seems to have been considered mostly in its humanistic aspect, that is, in its acquired or necessary application to particular conditions. And in the development of English and Continental law there is seen to exist a stronger inclination to consult the flexible laws of human reason rather than the immutable rules of natural law.

During the 18th century the theories and doctrines of natural law formed an important part of the discussions in relation to jurisprudence, politics, and political economy. This was particularly true in relation to the rehabilitation of the laws relating to liberty, personal rights, property-holding, etc. But in the end utilitarianism played a more important part in the period of legal reconstruction and reform. When jurisdiction passed from ecclesiastical authorities to the people at large, the popular

LAW

theory that consciousness is the true interpreter of law (consult the writings of Marsiglio of Padua), in spite of its moral allurements had to be suppressed to the extent of eliminating its natural anarchistic possibilities. In England the populace gained the privilege of participating in the constitution of government mainly through the forced recognition of the natural-rights theories which they had long asserted against the crown.

The theory of natural law has ever had its adherents and its enemies. One reaction against it was notably set forth by Hobbes (q.v.). It can be variously construed, according to the philosophical reasoning of the definor. Some one reasons that polygamy is against natural law, another claims that marriage should never exist at all; this one claims that it is natural for man to worship a Supreme being, that one says that all religion is superstition and human weakness, and is not a natural desire. And so, what is a natural law to one may not be so interpreted by another. Unless, indeed, we assume that fundamentally all men's consciences are the same, the interpretation of natural law is dependent upon the moral sensibilities of the individual. See JURISPRUDENCE.

ARTHUR S. WITHERSPOON,
Editorial Staff, 'Encyclopedia Americana.'

Law, Maritime, a system of established legal rules which particularly relates to the affairs and business of the sea, to ships, their officers and crews, navigation, and to marine conveyances of property. The character and pursuits of marine life, and the commerce related thereto are of a nature peculiar to themselves, and these distinctive features were recognized at a very early period in the history of the civil and the common law, and were noted under the collective term merchant marine.

The ships of a nation are considered as a part of its territory wherever they may wander in the pursuits of commerce. Many of the most important principles of international law grew out of maritime transactions between the various countries of the world, and these principles are as sacred and as rigidly enforced as any of the laws founded upon the comity observed between the different powers. While the great mass of maritime law is the same in all commercial nations, yet in each country peculiarities exist as to some of its rules, and as to the manner in which they are enforced. These differences are owing in a large measure to the municipal laws of the various countries, and as a general rule affect only their own merchants or people in their relations to each other; whereas in matters affecting foreigners the law of the whole commercial world is rigidly observed and enforced. Any nation may adopt its own maritime code but still the mutual relations of commerce and intercourse demand that in all essential things there be a well established and generally observed uniform law founded on natural reason and justice. But every nation reserves the right to make such modifications as locality, the changes wrought by time, and the genius of its people and institutions may demand. The maritime law of each nation may be regarded as distinctively its own; the laws adopted by the respective maritime nations make the basis and groundwork of what is recognized as the maritime law of the world; and the laws of the dif-

ferent countries may have their local distinctions and peculiarities without affecting the general and harmonious integrity of the system, as the differences affect only their own citizens.

The High Court of Admiralty erected in England by Edward III. was of very extensive jurisdiction, embracing all maritime matters. The court has existed ever since in some form, although many modifications have been made. Many of the principles of the English maritime court were adopted by the United States when the separation from the mother country took place, in much the same manner that the English common law was adopted by this country. In the United States the Federal courts, more particularly the United States district courts, have jurisdiction in marine matters, both civil and criminal, the jurisdiction of the latter being original, and that of the Circuit and Supreme courts being appellate only. The jurisdiction of the Federal courts extends to navigable rivers of the United States, whether tidal or not, the lakes, and the waters connected therewith; and it has been decided that the jurisdiction of the Federal courts extends to navigable waters of a river lying entirely within one State. It has also been held that French consuls had no jurisdiction within the States, in matters of admiralty relating to French vessels. It has been conceded by the Federal courts that State laws upon the subject of pilotage conferred upon the State courts concurrent but not exclusive jurisdiction with that of the Federal courts.

It is difficult to conceive of a matter connected with marine affairs which has not been provided for in our marine laws, rules, and regulations, or by the decisions of our courts. On the civil side all matters relating to collisions, freights, charter-parties, demurrage (q.v.), salvage (q.v.), bonds of bottomry and respondentia or hypothecation of ship and cargo, seizure under the laws of impost, prize matters, general average, adjustments, libel for seaman's wages, or libel for other causes, liens for labor or materials, furnished for building or repairs upon marine crafts or for marine works, injuries to seamen, negligence of master or owners, surveys of vessels, towage, wharfage, jettison, marine contributions, dockage, and other kindred subjects are taken charge of and adjusted. Under the civil proceedings one of the most important in extent and complication is the law relating to customs. Through the customs and revenue regulations are derived immense sums of money, as a revenue for government, but an important provision connected with them is a fund which is expended in the maintenance of hospitals for the care of sick and injured marines. The admiralty laws have also a criminal jurisdiction, which extends to all crimes and offenses committed on the high seas, beyond the jurisdiction of any country, such jurisdiction, as generally understood, covering a marine league, or about three miles. The criminal jurisdiction of the United States admiralty court extends to the Great Lakes, as it has been held by the courts that the open waters of those lakes are high seas within the meaning of the statute of the United States. A crime committed on board a vessel in one of our navigable rivers would not give the Federal courts jurisdiction of the offense, but such an offense would be cognizable in the courts of the State within which it was

LAW

committed. An effort has been made, with a good degree of success, to make the practice in our courts uniform in marine matters, so that an action may be heard and determined in the same manner in one State that it would be in another, without being subject to the great and often embarrassing differences which prevail in the different State courts.

It is one of the chief merits of our marine law that it aims to care for our seamen in all of their relations to the hazardous business in which they are engaged. The term mariner includes all persons employed on board vessels during a voyage to assist in their navigation and preservation, and to aid in the purposes for which the voyage is undertaken. This includes masters, mates, sailors, surveyors, carpenters, coopers, engineers, firemen, pilots, waiters, male or female etc. The term shipping applies to all sorts of craft, whether propelled by wind, steam, or other power. It is true that there are certain rules and regulations which, from the necessity of the circumstances, apply specially to craft propelled by steam which do not apply to those which depend upon the wind to send them forward. The United States Congress has enacted laws by which both steam and sailing vessels are to be built, registered or enrolled, manned, victualed, and navigated. Those laws show a constant aim toward a more humane and enlightened treatment of the common sailor than formerly prevailed, and which in some countries prevails to-day. When an American seaman is discharged in a foreign country even with his own consent, or when the ship is sold there, and her company discharged, three months' extra pay is by our laws required to be deposited in the hands of the American consul for the seaman's benefit. Recent laws have prohibited the infliction upon sailors of corporal punishment, once so common, and which doubtless was sometimes as severe as that described by Dana in his 'Two Years Before The Mast.' Many other changes in the interest of the common sailors have been enacted by Congress, with a view to promote their health, comfort, and financial welfare. The master of a vessel, often called "ship's husband," while on voyages at a long distance from the home port, or the place where the vessel is owned, is charged with great responsibility, and he is clothed with an authority commensurate with that responsibility, to enable him to act promptly and efficiently in times of emergency and peril. He has full control of the ship and its cargo. He may abandon the vessel or lighten it by throwing the cargo or some portion of it into the sea. In case of shipwreck from which some portion of the cargo is saved, or the ship brought to land in a damaged condition, in the absence of an opportunity to communicate with the owners, he may sell such property as has been saved from the wreck when prudence or circumstances require it, and he has the right to decide what ought to be done under the circumstances. In case of necessity he may, in the absence of opportunity to communicate with the owners, raise money by bottomry loan on the ship or her freight, or by respondentia on the cargo, or upon them all, by bonds pledging them at a high rate of interest, known as marine interest. Such bonds are to be paid when the ship arrives at her destination or at some designated port. If she does not arrive it follows that the bond is

not good and payable. The holder of such bond acquires an insurable interest in the property so pledged, and may secure his loan in an additional manner by insurance. The master may make contract for repairs upon his ship, when beyond the reach of prompt communication with the owners, and his reasonable contracts so made will be binding upon the owners. It not infrequently happens that serious questions arise as to the necessity for any repairs, or as to the extent of such necessity. Such questions may be obviated, in any American port, at least, by the master calling for a survey. The proper course for a master to pursue when within reach of a court of admiralty is to apply to it for directions how to proceed, and the directions of the court will furnish him full immunity when faithfully followed.

Salvage is an important and interesting provision in maritime law. It is such compensation as may be justly due to persons by whose voluntary assistance a ship or its cargo has been saved for the owners when in great peril, or after being abandoned by the officers and crew. The right to salvage depends solely upon the question whether the property has been saved from the perils of the sea. The amount of salvage to which the salvors will be entitled depends very largely upon the extent of the risk or the perils to which the property was subjected, and the perils of making the rescue. In most of the cases reported our courts have given one half of the value of the property saved; in some instances a larger percentage, and in a few cases an award of seven-eighths has been given. Somewhat akin to salvage is the subject of contribution. It sometimes becomes necessary to lighten a ship in a storm by throwing overboard a part of the cargo. If the cargo belongs to several persons and the portion so thrown overboard belongs to one or to only a part of the owners, those whose property has been saved from impending danger by the jettison, as the throwing overboard is called, are required to contribute to the loser in what is termed general average. Demurrage is an allowance for damage by the detention of a vessel. A master is always obliged to proceed with such despatch as he can consistently with safety, and a merchant or other person who loads a vessel or receives a cargo is bound to give it reasonable despatch. It is usual in a charter-party, or verbally, to provide for the number of lay-days in which a vessel shall be loaded or discharged, and for every day in excess of the number so specified the person responsible for such delay is required by the law merchant to make proper compensation.

See ADMIRALTY LAW; BOTTOMRY; CHARTER-PARTY; COLLISION; FLOTSAM, JETSAM, AND LIGAN; HIGH SEAS; MARINE INSURANCE; RESPONDENTIA; SEAMEN; SHIPPING.

Law, Military, a term which applies to and includes such rules of action and conduct as are imposed by a state upon persons in its military service, with a view to the establishment and maintenance of military discipline. It is largely, but not exclusively, statutory in character, and

LAW

prescribes the rights of, and imposes duties and obligations upon, the several classes of persons composing its military establishment; it creates military tribunals, endows them with appropriate jurisdiction and regulates their procedure; it also defines military offenses and by the imposition of adequate penalties, endeavors to prevent their occurrence.

Distinction Between Military and Martial Law.—It is proper to observe, at this point, that the terms *military law* and *martial law*, though frequently confused, are by no means synonymous. Military law is in great part statutory in character and regulates the conduct of military persons at all times and in all places, without as well as within the territorial jurisdiction of the United States; that is, military law is applicable to certain persons, not only in time of peace, but in time of war as well, and its operation is not restricted to the territory of the United States, but follows its forces wherever they may go in the performance of lawful military duty or in the prosecution of a legitimate and duly authorized military undertaking. The Naval Articles of War, for example, do not cease to be binding upon the officers and men who constitute the crew of a vessel of war, when they pass from the territory of the United States into the high seas; indeed, by the comity of nations, those laws continue to be operative while such vessel is in the territorial waters of a foreign state. So, too, the Articles of War continue in force and have extra-territorial operation when any portion of the constitutional military forces enters foreign territory in the prosecution of a war lawfully declared by the Congress. The military laws of the United States had the same binding force in the armies of Generals Scott and Taylor while operating in Mexico that they had in respect to those portions of the army which remained within its territorial jurisdiction during that period. Military law has, also, chiefly to do with the acts and relations of military persons; it applies to the conduct of citizens in an exceedingly limited number of cases, in each of which there must be the express authority of an enactment of Congress.

Martial law, on the other hand, is not statutory in character, and arises, in every case, out of strict military necessity. Its proclamation, or establishment, is not expressly authorized by any of the provisions of the Constitution; it comes into being, as will hereafter be seen, only in the territory of an enemy in time of war, or in a part of the territory of the United States in which the proper civil authority is, for some controlling reason, unable for the time to exercise its proper functions. In the former case it is known as *military rule* or the *law of military occupation* and, as such forms a part of the Law of Nations. It disappears when such forcible resistance to the operation of the law has been overcome, or has ceased to exist, and the civil authorities have been enabled to resume the exercise of their appropriate functions.

Other Sources of Military Law.—While military law is in great part statutory, it is the

function of the higher civil courts to interpret the statutes enacted by the Congress, and to apply them to cases arising in connection with their execution: and the decisions of such courts are of equal authority with the statutes upon which they are based. Among other forms of written military law may also be mentioned the decisions of the President and Secretary of War in military matters; the opinions of the Attorney General and of the Judge-Advocate General; the general regulations of the Army and the general orders of the War Department. There is also a body of well established usages known among military men as "customs of war," which correspond, in binding force, to Customs at Common Law.

Courts-martial.—Military Law is enforced by means of certain tribunals, created for the purpose, called Courts-martial. These tribunals are created by the order of a proper convening authority, and are empowered by statute, to determine challenges, to try accusations against military persons, to reach findings of guilt or innocence respecting the same, and to impose appropriate sentences. Their sentences, however, have no legal validity, being in the nature of recommendations merely, until they have received the approval of a military commander, designated by law for this purpose, called the *reviewing authority*. With such approval or confirmation, however, their sentences become operative and acquire the same sanction as the sentences of civil courts having criminal jurisdiction, and are entitled to the same legal consideration. Courts-martial are classified, in accordance with their jurisdiction, into *General* and *Inferior Courts-martial*; the latter term including the Regimental and Garrison Court-martial, and the Summary Court.* The General Court-martial is the highest tribunal known to military law, and has the most comprehensive jurisdiction in respect to both persons and cases. It may try any person subject to military law for any offense over which such tribunals are given statutory jurisdiction. The jurisdiction of the minor courts is restricted as to the persons and cases triable by them, and as to the punishments which they may impose upon conviction.

Courts-martial differ from civil tribunals having criminal jurisdiction, not only in the nature and extent of their jurisdiction, as will presently be seen, but in the manner of their creation. Civil courts, whether of general or special jurisdiction, are created by statutes, which define their composition, endow them with appropriate jurisdiction, and determine the times when, and the place or places where their sessions shall be held. Courts-martial, on the other hand, though authorized by statute, are created, in every case, by proper military orders, issued by commanding officers having authority, under the Articles of War, to call them into being. When the cases referred to them for trial have been completed, or, in certain contingencies, at the discretion of the appointing power, they are dissolved by the authority that created them and simply cease to exist as military tribunals.

* The several military tribunals now authorized are shown in the following table:

Those having power to try and sentence:

{ The General Court-martial—Complete jurisdiction.
The Regimental Court
The Summary Court } Limited jurisdiction.
The Garrison Court

Those having power to investigate merely:

{ The Court of Inquiry.
The Regimental Court for doing justice.

LAW

The General Court-martial.—This court has the most extensive jurisdiction, both in respect to persons and cases, of any of the tribunals authorized by the Articles of War. It may try any military offender, whatever his rank, for any act made an offense by military law. This court may be convened at any time by the President, or by the Secretary of War acting in his behalf, by a general commanding a territorial division of an army in the field, or by a general or colonel commanding a separate territorial department. If the convening officer be the accuser or prosecutor, however, the court is convened by the President. In time of war two classes of persons are given authority to convene general courts-martial—commanders of divisions and commanders of separate brigades. This provision applies to the tactical organization of armies in the field, as distinguished from the geographical organization of military divisions and departments into which the territory of the United States and its insular possessions is habitually divided in time of peace.

Composition.—The statutes authorizing the several military tribunals known as courts-martial—contain the requirement that they shall be composed of *commissioned officers*—a term applied to persons in the military service, of and above the rank of additional second lieutenant, who have been appointed by the President, with the advice and consent of the Senate, and whose appointments are evidenced by commissions under seal, signed by the President and countersigned by the Secretary of War. The law requires that “general courts-martial may consist of any number of officers, from five to thirteen inclusive; but they shall not consist of less than thirteen when that number can be convened without manifest injury to the service.” Such judicial powers, therefore, as are vested by statute in a general court-martial become operative and may be fully exercised by a properly constituted tribunal composed of at least five members. A less number is without power to enter upon the trial of a case, to proceed with a trial already begun, or to perform any act of a judicial nature. The number of officers who shall compose a particular court is determined, in conformity to the terms of the statute, by the proper convening authority, and his conclusion in that regard is final.

The Judge-Advocate.—All courts-martial having general, as distinguished from summary jurisdiction, are provided with officers, detailed for the purpose by the proper convening authority, whose duty it is to prosecute cases coming before them in the name of the United States. The appointment of these officers is vested by statute in certain convening officers, who, as a consequence of their power to appoint courts-martial, are authorized to appoint judge-advocates for the same. The office of judge-advocate is a temporary employment created by statute; the general duties of the office are defined in the Articles of War, which empower the judge-advocate to prosecute in the name of the United States. Other statutes and regulations confer upon him the power to summon witnesses and in certain cases to compel their attendance by the issue of compulsory process. The law, regulations, and the custom of service thus vest in the judge-advocate the duty of preparing the case for trial and charge him with the responsibility of conducting the prosecution. In addition to

his duty as prosecuting officer in behalf of the United States, the Articles of War provide that the judge-advocate “shall so far consider himself counsel for the prisoner as to object to any leading question to any of the witnesses, and to any question to the prisoner, the answer to which might tend to criminate himself.” The duty of the judge-advocate toward the accused should not be regarded as confined to the limited province of “counsel for the prisoner” as the same is defined in the Articles of War. Where the accused is ignorant and inexperienced and without counsel—especially where he is an enlisted man—the judge-advocate should take care that he does not suffer upon the trial from any ignorance or misconception of his legal rights, and has full opportunity to interpose such plea and make such defense as may best bring out the facts, the merits, or the extenuating circumstances of his case.

Council.—An officer or soldier put upon trial before a court-martial is not entitled, as of right, to have counsel present with him to assist him in his defense, but the privilege is one which is almost invariably conceded; and where it is unreasonably refused, such refusal may constitute ground for the disapproval of the proceedings. A court-martial, however, is not required to delay an unreasonable time to enable an accused to provide himself with counsel.

The Interior Courts-martial.—The Regimental Court-martial.—The Articles of War provide that “every officer commanding a regiment or corps shall be competent to appoint, for his own regiment or corps, courts-martial, consisting of three officers, to try offenses not capital.” In addition to the commanders of regiments, properly so-called, the chiefs of such of the Staff Corps as include enlisted men in their personnel may convene these courts at posts or places occupied by troops under their direct military control and command. The strictly criminal jurisdiction of this tribunal having been transferred to the Summary Court by a recent enactment of the Congress, its functions are now largely restricted to cases which involve the redress of grievances alleged by enlisted men to have arisen in the administration of the commands to which they belong. It can now be lawfully convened for the trial of a soldier only in a case, properly referable to a Summary Court, in which the party defendant, being a non-commissioned officer, formally requests that the charges against him be passed upon by a regimental court-martial, or when such trial has been authorized by the officer competent to order the trial of the accused by a general court-martial.

The Garrison Court-martial.—While the Garrison Court-martial has the same jurisdiction in respect to offenses as the other inferior courts recognized by the Articles of War, its jurisdiction as to persons is considerably more extensive, and it may try enlisted men of any corps or arm of the service who are attached to, or form a part of, the command of the officer who has power to convene it. The regimental and garrison courts are each composed of three officers and, like the general court, are provided with judge-advocates whose duty it is to prosecute in the name of the United States: his duties have already been described. Their procedure is the same as that of the general court save that the testimony is not recorded.

The Summary Court.—This court is composed

LAW

of a single officer and may be convened "by the commanding officer of each garrison, fort or other place, regiment or corps, detached battalion, or company, or other detachment of the Army." The court may be appointed, however, and the officer who is to compose it may be designated by superior authority—that is, by the brigade, division, department, or post commander—when such a course is by him deemed either proper or desirable. The terms of the statute in respect to its constitution are thus seen to be extremely general and authorize the court to be convened by the commanding officer of a fort, camp, or other place, the garrison of which is composed of troops of the same or different corps; or by the commander of a regiment, battalion, separate company, or detachment in the field, without restriction as to its composition, for the trial of enlisted men charged with offenses falling within the jurisdiction of an inferior court in respect to the punishment which may be awarded upon conviction. When but one officer is present with a command the law requires that he shall constitute the court, and shall hear and finally determine such cases as are properly referable to it for trial.

As its name implies, the procedure of this court is summary in character. Cases are brought to trial within twenty-four hours after the arrest of the accused, or as soon thereafter as practicable, and the court sits at hours fixed by the post commander in appropriate orders or, in the absence of such orders, at the convenience of the court. The officer constituting the court is not sworn, but performs his duty under the sanction of his oath of office. The accused appears before the court and, as the right of challenge does not exist, is arraigned in the usual manner. If his plea be guilty, he is given an opportunity to make a statement and, if he so desires, to introduce testimony in respect to character. If the plea be not guilty, the trial is proceeded with in the usual manner; the witnesses are sworn, but the testimony is not recorded. The accused is given the opportunity to cross-examine the witnesses and to introduce testimony in his defense. The proceedings, finding, and sentence are approved and made operative by the signature of the reviewing authority, which is entered in the book itself, opposite the record of the trial. The commanding officers who are authorized by law to approve the sentences of Summary Courts have power to remit or mitigate the same. When the commanding officer sits as a Summary Court, no formal approval of the sentence is required by law; but he should sign the sentence, in such case in his official capacity as commanding officer, and date his signature.

Arrest and Confinement.—A military prosecution is instituted, in the case of an officer, by a military arrest. This is imposed by the proper commanding officer and requires the officer arrested to confine himself to his quarters or tent. These limits may be extended by proper authority, but a breach of close arrest is a serious offense at military law, involving the dismissal of the offender. In the case of an enlisted man the offender is placed in confinement pending his trial and, with a view to prevent abuses, it is required by law that—

No officer or soldier put in arrest shall be continued in confinement more than eight days, or until such time as a court-martial can be assembled."

Jurisdiction of Military Tribunals.—Courts-martial have power to try military persons only for military offenses, save in time of war, when certain persons who accompany the armies in the field are similarly triable. The punishments which a general court-martial may impose include the capital penalty and are specified in the Articles of War; the power of the inferior courts to punish is restricted to three months' imprisonment, with or without forfeiture of pay, including reduction to the ranks in the case of a non-commissioned officer. The procedure of courts-martial is substantially the same as that of civil courts having criminal jurisdiction. The accused may challenge any members for cause stated, but peremptory challenges are not allowed. The court and judge-advocate are sworn and testimony is received under the usual witnesses' oath. The allegations against the accused are embodied in "charges and specifications" which correspond closely to the indictment and counts at criminal law; upon these the accused is arraigned and may plead to the jurisdiction, in bar of trial or in abatement of the action, and the court may decide any issues so arising; when these pleas have been exhausted, or if none of them be resorted to, a plea to the general issue is made, upon which the case goes to trial on its merits. The rules of evidence are those which regulate the admission of testimony in criminal cases in the courts of the United States. The judge-advocate prosecutes in behalf of the United States and, when the prosecution has rested, the witnesses for the defense are heard and the case is submitted on arguments in which the judge-advocate has the right to begin and close. The court is then closed for deliberation and a finding is reached, as to each separate charge and specification, by a majority vote. An appropriate sentence is then imposed, the majority rule prevailing, except in the case of a capital sentence where a vote of two-thirds is necessary. The record is then forwarded to the officer who convened the court whose province and duty it is to take action upon—approve or disapprove, etc.—the proceedings after the same are terminated and the record has been transmitted to him for such action. This officer is ordinarily the commander who has convened the court. In his absence, however, or where the command has been otherwise changed, his successor in command, or, "the officer commanding for the time being," is invested with the same authority to pass upon the proceedings and order the execution of the sentence in a case of conviction.

In cases, however, of sentences of death or dismissal, imposed in time of peace, and of some death-sentences adjudged in time of war, together with all sentences "respecting general officers," while the convening officer (or his successor) is the *original* reviewing authority, with the same power to approve or disapprove as in other cases, yet, inasmuch as the law prescribes that the sentence shall not be executed without the confirmation of the President, the latter becomes in these cases the *final* reviewing officer, and the sentence, having been approved by the officer who convened the court, the record is transmitted to him for his action. If, however, the proceedings or sentence are disapproved by the original reviewing officer, the record is not transmitted to the President,

LAW OF FAMILY

as there is nothing left in such case for the action of higher authority. Where a general court-martial is convened directly by the President as commander-in-chief, he is of course both the original and final reviewing authority. The authority of a military commander as reviewing officer is limited to taking action upon the proceedings and sentence by approving or disapproving the same, wholly or in part, and directing the execution of the sentence, and to the incidental function, of pardoning or mitigating the punishments which have been approved by him. Action not included within these powers he is not authorized to take. The power to remit or mitigate sentences awarded by military tribunals is conferred, in express terms by statute, which provides that "every officer who is authorized to order a general court-martial shall have power to pardon or mitigate any punishment adjudged by it except the punishment of death or of dismissal of an officer. Every officer commanding a regiment or garrison in which a regimental garrison or summary court-martial may be held shall have power to pardon or mitigate any punishment which such court may adjudge.

BRIG.-GEN. GEORGE B. DAVIS,
Judge Advocate-General U. S. Army.

Law of Family, The. The term family is one of extensive import and great flexibility. It may embrace an indefinite number of persons, as those who are related by blood, or who are descended from a common ancestor; or it may mean those who reside under the same roof, as members of the one household. It has no technical meaning, in law; and, as a distinct entity, apart from the members of which it is composed, a family is not the subject of legal cognizance; and, even in respect of the management of the family and the natural and domestic relation of its members to each other, there are many things which, in the interest of society, the law holds sacred, and which public policy will not permit a court of justice to inquire into.

On the contrary, there are individual rights, duties and obligations, due from the members of the family to each other, arising from the social and contractual relations between them, which the law recognizes and enforces; and the collective term, being one of constant use in the framing of statutes, contracts, wills and other written instruments, requiring judicial interpretation and construction, it has long since acquired and now possesses a distinct though not a technical meaning, in law. Hence, for the purposes of determining the personal and individual rights of its members, and in order to arrive at a proper determination of the legal effect of the term, when used in such written instruments, it has become a word of considerable legal importance. This importance, however, arises not so much from the necessity of ascertaining the rights, duties and obligations of the family as a whole as it does from the necessity of determining those duties and obligations which its members, as individuals, owe to each other or which arise from the use of the collective term to designate the members of a class of persons instead of the individuals composing that class.

In contemplation of law, therefore, a family is defined to be a collective body of persons,

who form one household, existing under one head and one domestic government, including parents, children and servants, and sometimes boarders and lodgers; and, being a collective body, composed of many individuals, a family may consist of a man's household, including his wife, children or servants; or, it may be composed of his children, without a wife; or, in the absence of children, it may consist of his brothers and sisters, or next of kin, and, upon his decease may even include his heirs. Hence, it is not necessary, to constitute a family, that its head should be a father or mother, for brothers and sisters living together, without parents, may constitute a family, or, a family may consist of a widow, a widower, a bachelor, or a guardian in charge of a minor child, with their servants. In short, every collective body of persons, living together, within the same curtilage, subsisting in common, directing its attention to a common object—the promotion of its mutual interest and social happiness—and which lives with its head, as a part of the household, each member of which is dependent upon him for support, in whole, or in part, constitutes a legal family; and a separate dwelling is not necessary to complete the family, for many families may dwell under the same roof. But, since the law, in its relation to the family, operates only upon its members individually, and not upon the collective unit, as a whole, the subject is referable to the law of domestic relations, in its several branches of husband and wife, parent and child, master and servant and of boarders and lodgers, and, to those rules of construction which the courts have adopted, for the interpretation of those written instruments in which the term occurs; and, therefore, an intelligent understanding of the subject requires a consideration of each of these several branches of the law.

The relation of husband and wife, and parent and child, is based upon natural and moral law. (See LAW OF HUSBAND AND WIFE, THE.) It is the result of marriage alone; and marriage, being a "status, the result of a contract," is a civil institution, and needs none of the elements of a contract, for its support. While the relation of marriage, however, is thus primarily founded upon a contract which implies the mutual consent of the parties, when the contract is once entered into, the relation or status of marriage supersedes the contract through which it is brought about, and, when once established, it can neither be canceled, nor altered, by the voluntary consent or will of the parties, upon any new consideration, for it then becomes a civil institution or status, subject alone to the control of the public will and policy, and the rights, duties and obligations incident to the marital relation spring from, and are, thenceforth, governed by the laws of the State, and cannot be dissolved, except by the public consent, or, in the enforcement of some paramount rule of public policy, justifying a partial or absolute divorce. Being, thus, a civil institution or status, based upon natural and moral law, the relation of husband and wife and parent and child involves, in the highest degree, the natural principles of protection and dependence. From this doctrine, and from it alone, comes the rule that the husband and father is the head of the family, and, as such, has the legal

LAW OF FAMILY

right to regulate and control the household; and, in the exercise of this right, he may restrain his wife from squandering his estate, and may preserve his honor, by restraining her from keeping lewd or improper company; he has the right to the custody of his wife and children, and to the services of his wife, during coverture, and of his children, during minority, and, being the head of the family, he has the right to fix its domicil, and it is the duty of the wife and children to dwell with him there. Commensurate with these rights of husband and father, the wife is entitled to his support, affection, society and protection, and the law recognizes his natural and moral duty to maintain, protect and educate his children, and though this duty was unenforceable, by the courts, at the common law, it may now be enforced, in a proper case, under statutory provisions, generally, made for that purpose.

The husband's duty to maintain his wife, and to support and educate his children, is always in proportion to his situation and condition in life; and the duty of a father to provide for the maintenance and education of his children is independent of his obligation to provide for their mother, and is not affected by her misconduct.

Only menial or domestic servants who reside within the master's household are members of his family; and the relation, between them and the master, is purely conventional, arising alone from the contract of employment. By this contract, the servant is bound to render service to the master, in return for which he obligates himself to pay a stipulated compensation; and it is an implied condition of every contract of hiring that the servant shall yield obedience to the lawful and reasonable orders, commands and rules established by the master, for the conduct of his household. The servant is, therefore, to this extent, entirely under the control and direction of the master, and owes him respectful and decorous treatment. However, a servant is not bound to obey the master's unlawful and unreasonable orders, and, while the master has the right to use moderate correction, in the case of an apprentice, he has no right to inflict corporal punishment upon a servant, whether he be a minor or not, to enforce obedience to his commands, or for negligence or insolent behavior.

The servant being a part of the household the master is bound to provide him or her with board, and, where there is nothing, in the contract to the contrary, the servant's right to board continues, even during periods of sickness; but, in the absence of contract, the master is not bound to provide medical attendance to the servant, when taken sick in his service, nor when injured, while acting in the performance of his duties. The master owes the servant the further duty to use reasonable care to protect him from harm, while in the performance of his service, by furnishing him a safe place to work, as well as suitable instruments with which this work is to be done; and, for the master's neglect in these respects, he is liable for injuries occasioned thereby. But, whatever may be the servant's right to recover for breach of the contract of employment, the master cannot be compelled, by decree, order

or judgment of court, to retain him in his employ.

A lodger is one who rests, or dwells in a place, for a time, and lodging implies a temporary habitation. The difference, therefore, between a lodger and a tenant is, that while the tenant has exclusive possession of his habitation, the lodger has merely the use of it, without actual or exclusive possession, which remains in the lessor, subject to the use. The relation between a lodger and the family of which he forms a part, is, like that of master and servant, based upon contract, and is subject to its terms; and, it is a general rule, applicable to all such contracts, that when the owner of a house takes a person to reside in a part of it, though such person is entitled to the exclusive possession of the rooms, appointed for his use, with the uncontrolled right of ingress and egress, yet, if the owner retains his character, as master of the house, the person so occupying a part of it occupies it as a lodger only, subject to the master's control. A lodger may be a boarder, but the two terms are by no means convertible because a boarder may not dwell within the family of which he forms a part.

This, in brief, is the constitution of a legal family, with a naked outline of the legal principles governing the rights and duties of its members; but, inasmuch as the general term family is one of frequent and constant recurrence, in statutes, contracts, wills and other instruments, in writing, its legal importance becomes apparent, in connection with the construction and interpretation of such documents, and, for this reason, some brief reference to this branch of the subject is necessary to its clear elucidation and understanding.

Under the homestead and exemption laws, the term family includes a household composed of parents and children, and other relatives, or domestics and servants; and since, in order to constitute a family, there must be an obligation, upon the part of its head, to support the others, or some of them, and a corresponding state of dependence, on the part of those thus entitled to support, something more is necessary, under these laws, to constitute a family, than a mere aggregation of individuals, residing within the same house; and, while some courts have held that a homestead is "one or more persons actually occupying a homestead," others hold that a single man, or a widower having no persons living with him, other than his servants, is not the head of a family entitled to the benefits of the homestead laws. And, so, while under some exemption laws it is held that a widow, without minor children, occupying a portion of her deceased husband's house, and renting out the farm, upon which it stands, and even a deserted wife, without children, constituted a family; under others it is held that a single man does not constitute a family, although he maintains a household, and has servants and employees to care for it.

Within the purview of a statute providing for the organization of benevolent societies, to secure death-benefits to the "family or heirs" of its members, it is held that where a member was an old man, living, with a young woman, to whom he was not married, but who had lived with him in the same house for many years,

LAW OF FAMILY

and who had treated each other as father and daughter, constituted a family, under the statute, and that she was entitled to receive the benefit, upon his death. And, under statutes, subjecting the wife's property to liability for family expenses, it is held that the term "family" includes those who were living with her, as part of her household, including servants necessarily employed in the family, and constituting a part of it. So, where a statute provides an allowance, for the support of "a widow and her family" from the estate of her deceased husband, for a certain time, after his death, the term "family" is held to include, not only the widow and minor children, but also such persons as constituted the family at the time of his decease, whether servants, or children who had reached their majority; and also, a childless widow, and the children of the decedent's wife, by a former husband, if they were under age, and resided with her, are embraced within the term; but, under these laws, the term "family" does not include assistants, who may be necessary to keep the house and manage a farm, or boarders; and a boarder is not within a statute requiring or permitting service of process upon a member of the family of the person to be served. And, under a statute providing that upon the death of a man, having a family, and leaving a widow and minor child, certain property should not be deemed assets, but should be set apart for the widow, it was held that one who had not lived with his wife, for a number of years, and who, at the time of his death, was not keeping house, and had neither servants nor minor children, but had a daughter living with his wife, had a family, within the meaning of the statute.

In applying judicial rules of construction to the interpretation of contracts, where the collective term family, to designate a class of persons, instead of its members, is used, it is held that where a policy of beneficial insurance provides that, where the benefit is made payable to a class of persons, designated as the "family" or "heirs" of a member, the word "family" means next of kin, or those who would take in case of intestacy; and that the terms of a policy of fire insurance, which requires that "a family should live in the house during the whole year," are fully complied with where two servants are left to work about the place during the absence of the assured and his family. So, a transportation ticket issued by a railroad company, for the use of "the holder and his family," is held to enure to the benefit of an adult son living with his father as a member of the family, unless there be some restriction as to the meaning of the term, contained in the contract itself.

Upon the construction of a deed reserving, to the grantor "and his family," an old burying-ground, with a right of way thereto, it was held that a reservation, to his family, embraced not only the grantor's children, who were members of his household when the deed was made, but also, his heirs or lineal descendants generally.

It is a well recognized principle of law that a family in its collective capacity can have no heirs, and, at common law, bequests to a family were void for uncertainty; but, inasmuch as the modern rule of interpretation is to construe the provisions of a will so as to carry out, as near as may be, the intention of the

testator, the effect of this principle is now obviated, by construing the will liberally, in order to give effect to the testator's intention, and, to prevent, where possible, a forfeiture of property. (See WILL.) Thus, where a testator bequeaths property, in trust, the income of which is to be applied to his children and their "families," the word family is held to include his sons and daughters and their children, so long as they live together and form a portion of the same household, or, from their tender years, are entitled to support, as such. So, in a will providing for a reversion of property to the testator's "family," the term family is held to mean his widow and child, and, generally, the use of this term, in a will, is construed to include the testator's wife, as well as his children, if there be nothing in the context to show a different intention; but where the will is that of a deceased wife, the husband is not considered a member of her family, because he is neither next of kin nor heir to his wife; and, where it is the husband's will which is the subject of construction, the word family does not necessarily include a stepson, although it has been held that where a testator directs his trustees to maintain his "son, or his family," the use of the general term includes the son's widow and her children, by him, as well as a child by a former marriage; and, a power given by will, to the testator's widow, to dispose of property for the benefit of herself and "family," authorizes her to execute the power, in favor of an illegitimate son of one of the testator's children.

And, if a power in a will be given, for the benefit of a married woman and her family, the husband would be excluded from participation in its benefits, unless the words used be controlled or influenced by some expression showing a different intent; and, where a testator made a bequest to his son "for the support of himself and family, and for no other purpose," it is held that the will created a trust fund, for the use specified, and the son was not entitled to the bequest, in his own right.

In general, where in devises of real property, and in bequests of personality, the testator uses the word family to describe a class of persons, without other limitation, it may be safely concluded that the word family, so used, will be interpreted to mean "heirs," in respect of realty, and "next of kin" in respect of personal property, and the property, so devised or bequeathed, will, therefore, go to those who are entitled to take, as in case of intestacy, under the laws of descent and distribution.

Bibliography.—For reasons stated in the text, there is no distinctive treatise on the "law of family"; but the subject is briefly referred to in law dictionaries and encyclopedias under that title. However, for its consideration, in detail, reference must be had to works treating of the family relations generally, or of the various subjects into which it has been divided, by jurists and text writers, and to treatises upon the construction of statutes and other legal documents. As to these general and special subjects, reference is made to the following, viz.: Bouvier, 'Law Dictionary,' tit. "Family"; 'American and English Encyclopedia of Law,' tit. "Family"; Schouler, 'Domestic Relations' (5th ed. 1895);

LAW OF HUSBAND AND WIFE

PAUL JONES,
Attorney at Law, New York.

Law of Husband and Wife, The. In those communities where the system of monogamy prevails, the law of husband and wife is based upon marriage (q.v.), between one man and one woman, and is to be found in the provision made, by the law-making power, for the regulation and enforcement of the rights, duties and obligations arising from the relation thus established between them. And, in those jurisdictions in which the principles of Anglo-Saxon jurisprudence maintain, the law of husband and wife is embodied in the doctrines of the common law of England, as modified by the application of the principles of equity to the property rights of the wife, and by statutory charges affecting, in this and in other respects, the personal rights and duties of either the husband or the wife.

In its legal aspect, marriage is a status, the result of a contract; but, when the relation of marriage is once entered into, the contract, through which it is brought about, ceases to exist, and thenceforth the relation of husband and wife is governed alone by the laws of the State in which it exists, and it cannot afterward be modified or changed by the voluntary consent of the parties, nor can it be dissolved upon any new consideration, in so far as they are concerned. This can only be done by some action upon the part of the State, for reasons which may be considered sufficient to meet the demands of an enlightened public policy, or which may conserve the general welfare of the State.

The institution of marriage "has its foundation in nature," and is said to be "the parent and not the child of civil society";* and, being based upon natural law, involves, in the highest degree, principles of dependence and protection.

It was a principle of the common law that, upon marriage, the husband and wife became one person, inasmuch as the legal existence of the wife was absorbed or merged into that of the husband; and, while the legal identity of the husband was, in no wise, affected by the marriage, that of the wife was wholly suspended during coverture; and, under this principle, the

husband's dominion over the person and property of the wife became paramount during the continuance of the marital relation between them. For this reason, the wife was wholly incapable of entering into any contract, or of acquiring, conveying or encumbering real estate, in her own right, or of disposing of personal property, by gift or otherwise, without the husband's consent; nor could she sue or be sued alone. Indeed, she was rendered wholly incapable of doing any act *sui juris*, though she might act in any capacity which did not involve a question of her own status, and which was not inconsistent with her legal disabilities as a married woman. She was, therefore, enabled to act as the agent or trustee of another; but, being wholly incapable of entering into contracts in her own behalf, she had no power to appoint an agent to act for herself—not even her husband—and, when acting as trustee, the husband's consent and concurrence was necessary, because he was personally responsible for any breach which might have been committed in the execution of the trust of which she was the trustee.

To the legal disabilities of the wife, however, there were certain exceptions; and, even at the common law she had the right to act, as a feme sole, in case of necessity, or when she was absolved from the disabilities of coverture, by certain local customs. Thus, the wife had the right to act, as an unmarried woman, where the husband was an alien, or where he had been banished or transported for life, or, where he had abjured the realm, or, where he had been imprisoned as a felon; and, by the well-known custom of London, she was enabled to transact business, in her own name, in which her "husband meddleth nothing," and she was chargeable, under this custom, "as a feme sole, concerning anything that toucheth her craft."

Growing out of, and incidental to the marital relation, the common law imposed certain duties and conferred certain rights upon the husband and wife, the performance and enjoyment of which could not be avoided, unless under exceptional circumstances. Among these duties, the husband was bound to support and protect the wife, though there was no reciprocal duty upon the part of the wife to support the husband, except to the extent of her services; she was bound to "honor, love and obey" him, and allow him matrimonial intercourse and cohabitation, and both were entitled to the society and protection of the other; the husband, being the head of the wife, was entitled to the custody of her person, and the control of her property and services; he had the right to fix the marital domicil, and it was her duty to dwell with him there.

Collateral to the doctrine of the merger of the legal existence of the wife into that of the husband, all ante-nuptial contracts, between the husband and wife, were rendered void by the marriage, and, during coverture, they were incapable of entering into any contract with each other; and, upon the same ground, neither the husband nor the wife were liable for torts committed, by the one, against the other. However, the wife's ante-nuptial contracts and torts, with, and against third persons, were in no wise affected by the marriage, the

* This natural origin of marriage is generally recognized by the jurists of England and America; but the doctrine is by no means of universal application. For, when the revision of the laws of France was under discussion, by the Council of State, under the first Napoleon, that reformer is credited with having expressed the opinion, that, "*Le mariage ne dérive point de la nature. La famille orientale diffère entièrement de la famille occidentale. L'homme est le ministre de la nature, et la société vient s'entrer sur elle. Les lois sont faites pour les mœurs et les mœurs varient.*" Upon another occasion, the same authority is said to have maintained, that, "*Si l'homme ne vieillissait pas, je ne lui voudrais pas de femme.*"

LAW OF HUSBAND AND WIFE

husband being liable for their payment and satisfaction, even though he obtained no property from her, by the marriage; and, if he died, or, for any other reason, the coverture ceased, the obligation and liability of the wife for her ante-nuptial contracts and torts, in favor of third persons, were not extinguished, but were still enforceable against her, upon the termination of the marriage. Upon the other hand, for torts committed against the wife, by third persons, other than the husband, a right of action arose in her favor, although an action could not be maintained by her for their enforcement, without joining the husband in the suit; and damages, if any, recovered, collected and reduced to possession, by the husband during coverture, became the property of the husband, by virtue of his marital rights, and were subject to the payment of his debts, and went to his personal representative, upon his death.

Upon the common law doctrine that the husband was entitled to the *consortium* of the wife, he was entitled to maintain an action, against third persons, for the recovery of damages, for any act which interfered with this right, and, therefore, an action arose in his favor for the alienation of his wife's affections, even though the wrongdoers were the parents of the wife, although an action for the same cause was denied to the wife; the reason assigned for this denial being that the wife was incapable of maintaining an action for the enforcement of the right, without joining the husband, as a party plaintiff, and since any judgment, in an action for tort in her favor would have enured to his individual benefit, it was considered to be against public policy to allow the recovery of damages, in his own favor, for an injury which he himself had caused; but, since this objection applied only to the remedy, and not to the right, the principle upon which the action was based was held to apply to the wife as well as to the husband; and this being recognized, the right of action continued in the wife but was held in abeyance until the disabilities of marriage were removed by death, or otherwise, when it was enforceable by her, as a *feme sole*. Ordinarily, neither the husband nor the wife could be held liable for crime committed by the one against the other; but, to this rule there were certain exceptions, such as assault, manslaughter, and other crimes of an aggravated character, where the interest of the public, requiring the punishment of criminals overbalanced the mere private interests of the individuals, incident to the marital relation.

The liability of the husband or the wife for crimes, committed by either of them, against third persons, was in no wise affected by the marital relation, though, if the crime, complained of, were committed by the wife, in the presence of the husband, the *prima facie* presumption was that she acted under his coercion, and, in such case, the husband was liable, and not the wife. This presumption, however, was subject to rebuttal, and where it was overcome, by the circumstances attending the commission of the crime, she was liable, and not the husband.

The husband's natural duty to support the wife, as recognized at the common law, required him to supply her with all the necessaries

requisite and suitable for her maintenance, commensurate with his social position and condition in life; and this duty necessarily extended to supplies furnished to her, for her children's support, as well as for her own. If the husband failed to perform his duty in this respect, the wife was entitled to use his credit to obtain such necessities and supplies; and for this purpose, her authority to bind the husband was complete, and, being based upon a duty incident to the marital relation, and not upon contract, this authority existed, in favor of the wife, independent of the doctrine of agency, to which it has been generally ascribed.

The full performance of the husband's duty to support the wife was only excused by an abandonment upon her part, without cause; or, as the result of a divorce *a vinculo*, or, where there was a separation by mutual consent, upon a stipulation that he would make a suitable allowance for her support, which is regularly paid by him; and the husband was not relieved from the performance of this duty in case he turned the wife out of doors, or deserted her without cause, and failed to supply her with the means of support.

In consideration of the liability of the husband for the wife's ante-nuptial debts and torts, and of his duty to support her, according to his social position and condition in life, the common law vested in him, *jure mariti*, the ownership, enjoyment and control of her entire estate, real and personal, subject only to certain limitations growing out of the nature of the property which she owned, and its condition, at the date of the marriage. Under the operation of this doctrine, the husband became the absolute owner of all the personal property of the wife, in possession, whether acquired before or after marriage; and no act, upon her part, was necessary to vest the title to such personal property in him. He was also entitled to her choses in action, subject only to the condition, that in order to vest the title in him, they were required to be reduced to the husband's possession, during coverture, and this he was entitled to, without her consent; but the mere custody of a chose in action was not, in itself, such a reduction to possession, as to entitle him to its ownership; hence, in order to reduce the wife's choses in action to possession, some affirmative act, upon his part, was necessary to show an intention to acquire title in himself. If the husband failed to reduce the wife's choses in action to possession, however, during coverture, her title to such property continued unimpaired; he was entitled to the income therefrom, but her ownership and right of possession continued, and survived the coverture, and, upon the dissolution of the marital relation, she was entitled to its enjoyment, as though she had never been married. The husband's right to the real estate of the wife extended only to its use, and the enjoyment of its rents, issues and profits, during the marriage. Hence, he had no right, without her consent, to encumber her real estate, nor to change her realty into personalty, or to do any other act, the effect of which was to change the course of descent, or the right of succession to her heirs.

Besides these rights and interests of the husband in the wife's property, he was also entitled

LAW OF HUSBAND AND WIFE

to courtesy in her real estate, which became vested in him, upon her death, provided always, that issue was born of the marriage, and, as an offset to the husband's right of courtesy, the wife was entitled to dower in his real estate, regardless of whether issue was born of the marriage or not. This right of dower, it may be observed, was the only interest which the wife acquired in the husband's property, real or personal, by virtue of the marital relation; her right to any part of his personal property, whether before or after his demise, being entirely a matter of statutory enactment.*

The wife's property thus acquired, by the husband, in virtue of the marital relation, became the absolute property of the husband; he could alienate and dispose of it, and it became subject to the payment of his debts, as any other property, belonging to him.

While the natural rights and duties of the husband and wife, growing out of the marital relation, have always been respected and upheld in equity, courts of chancery, in England and America, have never recognized nor adopted the principles of the common law, respecting her property; and, in recent years, these principles have been materially changed, by statute, in both countries; and the tendency of modern legislation is to wholly emancipate the wife's property from the husband's ownership and control, and in this respect, at least, to treat her as a *feme sole*.

Thus, the common law rule, that ante-nuptial contracts between husband and wife were avoided by marriage, was so far modified in equity as to uphold and enforce settlements made, by the husband, for the benefit of the wife, where such settlements were made in consideration of the marriage; and, the same is true of provisions made by him, either before or after marriage, for the personal comfort and adornment of the wife, in the nature of *pin-money* and *paraphernalia*, or, where gifts of property were made, by third persons, for the separate use of the wife; and, courts of equity, in recognition of the wife's right to the acquisition and enjoyment of property in her own right, have even gone so far as to uphold gifts of real estate made, by the husband to the

wife, through the intervention of a third person. Courts of chancery have also recognized and enforced the wife's equity to a settlement in property which she owned, at the date of the marriage, where it was necessary for the husband, or his creditors or assignees, to invoke the aid of these courts, to reduce it to possession; or, where the husband married a ward of the court, without its consent; the maxim in the one case being that he who seeks equity must do equity, while in the other the settlement was compelled, as a punishment to the husband, for his contempt of court, in marrying a ward without the chancellor's consent.

The wife's equitable right to a settlement was the same, whether the property in question were legal or equitable in its nature. This equity to a settlement was, however, a personal right, which the wife alone could enforce, and being an allowance, made out of her own property, for her benefit and for the benefit of her children, might be waived by her, or entirely defeated, if she had a suitable provision otherwise made for her and their support; and the wife's right to a settlement was likewise barred by her fraud or misconduct.

This equitable right of the wife was enforceable, by actions brought and maintained directly in her own behalf, or, in actions brought by creditors or assignees of the husband in order to subject her property to the payment of his debts, or the acquirement of its possession, under an assignment from him. Although these rights of a married woman were fully recognized and enforced in equity, still she had no right to maintain or defend an action, in her own name, for their enforcement, the rule requiring that the husband should be joined, with her, in the suit, or, if his interests were adverse to hers, she came or was brought into court, as complainant or defendant, by or in the name of a next friend.

Aside from these equitable principles recognizing, and to this extent, enforcing the property rights of married women, the common law doctrine of the merger of the legal existence of the wife into that of the husband, and her right to hold and enjoy property, in her own right, has been materially modified, and in some jurisdictions entirely abrogated, by statute, and a married woman now stands, in respect of her separate property, generally, as though she were a *feme sole*; and, where, by statute, she is enabled to hold property in her own right, she may make any contract concerning its management and disposition, as though she had never been married. In some jurisdictions also the husband is wholly released from his common law liability to answer for the ante-nuptial contracts and debts of the wife, while in others, this liability is restricted to the value of the property which he acquires through the marriage, and generally he is released from all responsibility for her post-nuptial torts, unless committed, by his authority, direction or encouragement. So, the common law disability of the wife to acquire property has been generally removed by statute, and she may now acquire property, real or personal, by gift, bequest or devise, directly from the husband, or, from third persons; and, having the authority to acquire and hold such property, she has the right to convey it, without the husband's

(*) Under the civil law, the natural duties and obligations of the husband and wife are much the same, as they were at the common law; the husband is bound to protect and support the wife, according to his means and condition in life, while the wife owes the husband obedience; and, without his consent, she is incapable of acting in law. If, however, she engaged in business, as a sole trader she could bind herself, in any thing relating to her trade, without his consent. As regards property, however, the principles of the two systems, are, in many respects, different. Under the civil law, the wife's property is divided into dotal, or that which the wife brings to the husband, upon marriage, to assist in maintaining the common ménage, and extra-dotal, or that which forms no part of her dowry; and, extra-dotal property includes partnership or community property, *s. i.* such property as is acquired during the coverture, by the joint efforts and labors of both. In the wife's dotal property the husband has no interest except the enjoyment of its usufruct, while in the extra-dotal, or community property, both have a joint interest during life, the undivided moiety of which goes to the survivor, upon the death of either. Both the husband and the wife are enabled, under the civil law, to enter into contract respecting their separate property, in any way, not incompatible with good morals, or which is not in derogation of the husband's authority over the wife and his children, or which does not change the legal order of succession. *Vide Kent's Comm., Vol. II., pp. 183-187, and notes.*

LAW OF NATIONS—LAWES

consent, and, his joinder in conveyances of real estate, is only necessary to bar his right of courtesy, for the same reason that the wife was always required to join in the husband's deed in order to avoid her claim to dower in his lands.

When the wife is empowered, by statute, to acquire, hold and dispose of property, in her own right, she may enter into contracts for its management, protection and improvement, and for the enforcement of such contracts, she may sue and be sued as a *feme sole*; and the right of the wife to maintain actions, in her own name, is not necessarily restricted to actions respecting her separate property, but this right is now extended by statute, in many States, so as to include the maintenance of actions for personal wrongs and other injuries; and for these she may maintain actions, in her own name against the husband, as well as against others, without joining the husband, or suing in the name of a next friend.

The statutory emancipation of the wife, and her property, from the management and control of the husband, however, is not necessarily in all cases complete, and, being in derogation of the common law, the statute under which the right, whatever it be, is claimed, is to be construed strictly, and the right will not be upheld, unless expressly granted, or unless it arises, by necessary implication, from the terms of the statute under which it is sought to be enforced.

Law Schools. The first American law school was founded at Litchfield, Conn., in 1784 and discontinued in 1833. Though not connected with any university it seems to have made an excellent record. Of 1,023 graduates, 50 became members of congress, 15 United States senators, 40 judges of the higher State courts, 10 governors of States, 5 cabinet officers, 2 justices of the Federal Supreme Court, 1 vice-president of the United States and several foreign ministers. A course of lectures in law was delivered in the College of Philadelphia in 1791 by James Wilson, who had been appointed professor of law in that institution, but his work was discontinued before the close of the second course. In 1797 James Kent made a similar attempt at Columbia, but he gave only one course

of lectures. The Harvard Law School, established in 1817, was the earliest school in the country connected with a university and authorized to confer degrees in law. The course was lengthened to three years in 1877. There were no examinations for the degree till 1871, and none for admission till 1877. At the beginning of the year 1897 the rule came into force by which only graduates of approved colleges and persons qualified to enter the senior class of Harvard College are admitted as regular students. The Yale Law School was established in 1824, that of the University of Virginia in 1825, and the Cincinnati Law School in 1833. Law schools had exercised little influence on the legal profession in this country up to the time of the opening of the Columbia Law School in 1858. In 1878 there were 50 schools with 3,012 students; in 1901 there were 86 schools with 11,883 students. The increase in students in 23 years has been 294 per cent. See also EDUCATION, PROFESSIONAL, IN AMERICA.

Lawes, lāz, Henry, English composer: b. Dinton, Warwickshire, 1596; d. London 21 Oct. 1662. He was a brother of William Lawes (q.v.) and was educated as a classical musician. He became famous as a composer for masques and songs and he is eulogized by Milton in several poems. He set to music the poet's 'Masque of Comus' and supervised its production at Ludlow Castle in 1634. He published: 'Ayres and Dialogues, for One, Two and Three Voices' (1653).

Lawes, Sir John Bennett, English chemist: b. Rothamsted, Hertfordshire, 28 Dec. 1814; d. there 31 Aug. 1900. He was educated at Eton and at Oxford, whence he went to London, and there remained for a while engaged in the practical study of chemistry. Reaching his majority, he came into possession of his estate, where he undertook experiments in agricultural chemistry in the interest of a more scientific method of agriculture. In 1843 he employed Dr. (afterward Sir) J. H. Gilbert as superintendent of laboratory work at the Rothamsted farm, and uniting his own labors with those of his colleague, by a course of investigations, indoors and out, developed scientific processes whereby superphosphate of lime came to be used as a fertilizer. For over 50 years they carried on these labors together, and important practical results for improved agriculture are recorded to their credit. In 1899 Lawes transferred his laboratories and experimental fields, with an endowment amounting to about £100,000, to a board of trustees, in order to secure their permanent usefulness. Accounts of the Rothamsted experiments may be found in the 'Journal' of the Royal Agricultural Society of England; 'Reports' of the British Association for the Advancement of Science, 'Proceedings' and 'Transactions' of the Royal Society of London, 'Journal' of the Horticultural Society of London, 'Memoranda' of the Rothamsted station.

Lawes, William, English composer: d. Chester, England, 1645. He was an elder brother of Henry Lawes (q.v.), with whom he was associated in various musical matters, and not only wrote music for many of the songs of the time, but the music for Sandys' version of the Psalms, published in 1648.

LAWLESS — LAWNS

Lawless, Emily, Irish novelist, daughter of the 3d Baron Cloncurry: 1845. She has published several popular romances of Irish life, full of pathos and picturesqueness, among which are: 'A Millionaire's Cousin,' 'Hurrish: a Study' (1886); 'Grania,' her most powerful work (1892); and 'Maelcho,' a story of the rebellion of Sir James Fitzmaurice in the 16th century (1894). She is also the author of 'Ireland,' in the 'Story of the Nations' series (1890); 'A Garden Diary' (1901); 'With the Wild Geese,' poems (1902).

Lawley, Alethea Jane Wiel, English historical writer, 2d daughter of the 2d Baron Wenlock. She was married to Cavaliere Tatteo Wiel in 1890 and lives in Italy. She has published 'Vittoria Colonna,' a study (1888); 'Venice,' 'Story of the Nations' series (1894); 'The Romance of the House of Savoy' (1898); 'Verona,' in 'Mediæval Towns' series (1902); etc.

Lawn, finely woven white goods, cotton or linen, of an open texture; plain or printed. The white sleeves, which form a part of the dress of a bishop in the English Church, are made of lawn.

Lawn-tennis, a modern game, played on grass, gravel, cinder, or asphalt courts, with balls and rackets. The face of the racket is now invariably plane, and consists of a net formed of tightly-strung gut. The balls are of rubber covered with white flannel, about $2\frac{1}{2}$ inches in diameter, and 2 ounces in weight. For a game between two players (a single-handed game) the court is 78 feet long by 27 wide. It is divided across the middle by a net, the ends of which are attached to two posts, which stand three feet outside the court on each side. The height of the net is $3\frac{1}{2}$ feet at the posts and 3 feet at the centre. At each end of the court, parallel to the net and 39 feet from it, are drawn the base-lines, the extremities of which are connected by the side-lines. Half-way between the side-lines, and parallel to them, is drawn the half-court line, dividing the space on either side of the net into two equal parts called the right and left courts. On either side of the net, at a distance of 21 feet from it, and parallel to it, are drawn the service-lines. The players take up their positions on opposite sides of the net, and one of them, decided by tossing, called the server, standing with one foot behind and one foot on the base-line, serves the ball from his right court into the diagonally opposite court. The ball is served by being struck with the face of the racket while it is in the air, and the stroke is counted a fault if the service be from the wrong court, or if the server do not stand as directed, or if the ball do not strike the ground in the diagonally opposite court within the service-line. After a fault, the server must serve again from the same court, unless the stroke was a fault because served from the wrong court. The next service comes from the left court, and thereafter the courts are taken alternately. The non-server is called the striker-out, and it is his business to return the ball by striking it with the face of his racket. The server wins a stroke if the striker-out "volley the service," that is, strike the ball before it touches the ground, or fail to return the service or the ball in-play, or return the ser-

vice or the ball in-play so that it drop outside any of the lines which bound his opponent's court, or otherwise lose a stroke in accordance with the recognized laws of the game. The striker-out wins a stroke if the server serve two consecutive faults, or fail to return the ball in-play, or return the ball in-play so that it drop outside any of the lines which bound his opponent's court, or otherwise lose a stroke. On either player winning his first stroke the score is called 15 for that player; on either player winning his second stroke the score is called 30 for him; on either winning his third stroke his score is called 40; and the fourth stroke won by either player is scored game for that player. However, if both players have won three strokes, the score is called deuce; and the next stroke won by either player is scored advantage for that player. If the same player win the following stroke, he wins the game; but if he lose the next stroke, the score is again called deuce; and so on until one player win two strokes immediately following the score at deuce. The player who first wins six games wins a set, but with both at five a method of scoring similar to advantage is often introduced. Sides are changed at the end of every set. Three-handed and four-handed lawn-tennis differ in no essentials from the game as above described. The game of lawn-tennis as now known was introduced about 1875.

Lawns: Their Preparation and Care, a closely-mown turf maintained for ornament in parks and private grounds. It may or may not be dotted with trees, shrubs, or other specimen plants, or even with flower beds. These are, however, mere incidents, and since they usually detract from the natural beauties of an open sward, should usually be confined to the borders in irregular, rather than formal, order. The lawn thus becomes the canvas and the side-planting the frame for a natural picture in which the dwelling or other prominent feature is placed.

Whether the contour of the surface be level, convex, or concave, it should always be graded so as to avoid even slight irregularities, and where the land is rolling all three contours should be harmoniously blended so as to avoid breaks such as terraces, and so as to ensure the repose that comes from such blending. Except on sand and clay, lawns do well on practically all soils if properly prepared and maintained. After the grading, the land should be plowed, dug, or forked, as deeply as the soil will permit, even to the depth of two feet, then harrowed thoroughly, removing all stones and burning all rubbish, weeds, etc. A liberal dressing of complete fertilizer containing potash, phosphoric acid and nitrogen in readily available forms should be given, and where possible a covering of an inch or more of rich soil is often of decided advantage. Except for their containing seeds of weeds, animal manures are especially valuable, that of sheep and cattle being usually better than ordinary stable-manure; when the latter is applied it should always be after thorough composting and rotting to destroy weed-seeds. The surface being very smooth, the fertilizer well harrowed in and the wind asleep, seeding may be performed, preferably just before rain. The seed should be the purest that can be obtained, and may or may not be raked in, but the land

LAWRENCE

should always be heavily rolled. In the Northern States the popular grasses for lawns are Kentucky bluegrass, which is especially valuable for soils rich in lime, red-top and Rhode Island bent-grass. (See GRASSES.) Mixtures of several grasses are valuable because the grasses that start first choke out weeds and are later themselves choked out by the slower-growing blue-grass.

When the grass is three inches tall it should be cut with a scythe, and afterward with a lawnmower as occasion may require. In the autumn a dressing of well-composted manure should be given, and in the spring the strawy useless parts should be raked off before growth starts. After the frost is out of the ground the lawn should be rolled to compact the turf, which usually heaves more or less during the winter. It is further essential that weeding be performed every year, but especially during the first, second and third. If desired, a sprinkling of white clover (*Trifolium repens*) may be given by sowing the seed after or before the grass seed; being of different weights, they cannot be sown together. White clover may also be sown upon heavy and poor soils, where it will often make a good stand and a good precursor for grass. In the South, the grasses mentioned usually fail, and should be replaced by species that can withstand the climatic conditions. The most satisfactory and popular are Bermuda grass, joint grass, and St. Augustine grass. The first is usually propagated by passing the roots, freed from soil, through a feed cutter, sowing and harrowing the pieces.

Small lawns are frequently made by transplanting sod from old pastures, in which cases the turf is cut in long strips about 15 inches wide, rolled up and laid down like carpet, and then pounded or heavily rolled to press the roots firmly against the soil. The subsequent management should be that given seed-sown lawns. Owing to the dryness of the summers in many parts of the United States, lawns are often considered failures. Too frequently, however, these results follow imperfect preparation and improper management. As a rule lawns should not be watered while they are young or in the early part of the season, because this tends to keep the roots near the surface and to make the grasses less able to withstand dry weather. Water should therefore be withheld until the plants seem to be in dire need, and then it should be applied in what may seem excessive quantities.

M. G. KAINS,
Crop Expert.

Lawrence, lär'ëns, Abbott, American manufacturer and diplomatist: b. Groton, Mass., 16 Dec. 1792; d. Boston 18 Aug. 1855. In 1814 he became one of the firm of A. and A. Lawrence, which for many years conducted a prosperous business in the sale of foreign cotton and woolen goods on commission, and later established a cotton industry in Lowell, Mass., with his brother Amos (q.v.). He was a member of the 24th Congress, and again 1839-40. He was a commissioner in 1842 to settle the Northeastern Boundary question and arranged a basis for settlement with Lord Ashburton which was satisfactory to both the United States and England, and was minister to Great Britain in 1849-52; founded the Lawrence Scientific School of Harvard University, to which he gave \$100,000.

Lawrence, Amos, American merchant: b. Groton, Mass., 1786; d. Boston 31 Dec. 1852. He was educated in his birthplace at an academy founded by his father. He worked for many years as a clerk and in 1807 started at Boston a dry-goods business of his own, formed a partnership with his brother (1814), and began a large wholesale business. Lawrence and Lowell became the centres of this firm's manufacturing activity which soon placed them at the head of the cotton-spinning and weaving trade. Amos Lawrence retired from active business in 1831 through ill health, and spent much of his later years in promoting works of philanthropy and patriotism. The academy at Groton, of which he was a liberal benefactor, was named Lawrence Academy in his honor (1843); he contributed liberally to the raising of the Bunker Hill monument, and made large contributions to Williams College. Consult 'Extracts from the Diary and Correspondence of Amos Lawrence with a Brief Account of Some Incidents in His Life' (1855).

Lawrence, George Alfred, English novelist: b. Braxted, Essex, 25 March 1827; d. Edinburgh, Scotland, 23 Sept. 1876. He was educated at Oxford, studied law, but soon turned his attention to fiction and became suddenly famous by his novel 'Guy Livingstone, or Thorough' (1857). He was much read in America as well as in his own country, and 'Sword and Gown' (1859); 'Breaking a Butterfly' (1869); and his other fiction increased his popularity for the time, though he is now little read.

Lawrence, George Newbold, American ornithologist: b. New York 20 Oct. 1806. He was privately educated, was for some years in the drug business, but in 1867 retired, and thereafter devoted himself to ornithology. From 1846 he contributed to the literature of ornithology; and he also made an extensive and valuable collection of birds, including 8,000 specimens representing almost every variety found in the United States, and an excellent series of the birds of Mexico, Central America, the West Indies, and South America. This collection he sold to the American Museum of Natural History. He assisted Baird and Cassin in the preparation of 'The Birds of North America' (1866).

Lawrence, James, American naval officer: b. Burlington, N. J., 1 Oct. 1781; d. 5 June 1813. He entered the navy as a midshipman 4 Sept. 1798; in 1800 was made acting lieutenant, and in April, 1802, lieutenant, and served during the war with Tripoli; he was first lieutenant of the schooner Enterprise, and one of the party which boarded and destroyed the frigate Philadelphia in the harbor of Tripoli on the night of 15 Feb. 1804. Shortly before peace was concluded he was given command of a gunboat, and on his return to the United States, served as first lieutenant of the Chesapeake, and subsequently commanded the Vixen, the Wasp, and the Argus. In November 1810 he was promoted to the rank of master commandant, and given command of the Hornet. In 1812 he cruised in the Hornet with Commodore Bainbridge's squadron along the South American coast and at the mouth of the Demara River he met the British brig Peacock, which after a severe action of about 15 minutes he forced to sur-

LAWRENCE

render. When she surrendered, the Peacock was badly damaged and sinking, and Lawrence transferred the crew to his own ship. (See HORNET.) On 14 March 1813 he was promoted to the rank of captain and appointed to the frigate Chesapeake, then lying in Boston; the Hornet was also placed under his orders, and it was intended that the two ships should sail against the Greenland whale fishery. On 1 June 1813, when the Chesapeake was ready for sea, Lawrence sailed out of the harbor to meet the British ship Shannon; after a severe battle he was forced to surrender, and his ship was taken as a prize into Halifax. (See CHESAPEAKE AND SHANNON, BATTLE OF.) Lawrence was fatally wounded and died four days after the battle; throughout the action he showed the greatest coolness and courage, and his last words as he was carried from the deck were, "Don't give up the ship."

Lawrence, John, American statesman and judge: b. Cornwall, England, 1750; d. New York 1810. He emigrated to America in 1767, settled in New York, was admitted to the bar in 1772, and soon established himself in successful practice. An active patriot at the outbreak of the Revolution, he served in the army throughout the war, and on the termination of hostilities returned to New York, where for many years he was engaged in a large and lucrative professional practice. He was a member of the State senate, when in 1789 he was elected the first representative from New York city in the first United States Congress. He was a zealous and able defender of the measures of Washington, and on measures relating to the public credit and the national currency, to the neutrality of the United States as regards European belligerents, to indiscriminative foreign commerce, and to the promotion and security of all our commercial interests, spoke with eminent comprehensiveness and foresight. He represented the city of New York in the second Congress, and in 1794 was appointed by President Washington judge of the United States court for the New York district. He accepted this office at the particular solicitation of the bar, in consequence of his knowledge of admiralty law and the increasing number of admiralty cases. He resigned it in 1796 upon being elected to the United States Senate, of which body he was for a time president. He supported the measures of President Adams, upon whose retirement he resigned his seat and withdrew to private life.

Lawrence, Sir Thomas, English portrait-painter: b. Bristol 4 May 1769; d. 7 Jan. 1830. His father was an innkeeper, and the artist very early exhibited proofs of his talent for the art; he is said to have sketched portraits very successfully in his fifth year. At the age of six he was sent to school, where he remained two years; and this, with the exception of a few lessons subsequently in Latin and French, constituted his whole education. Young Lawrence, however, had access to the galleries of some of the neighboring gentry, in which he employed himself in copying historical and other pieces, and at the age of ten he had full employment as a painter of portraits in crayons. In 1787 the family removed to London, and Lawrence was admitted a student at the Royal Academy. His

subsequent career was successful and brilliant. He was elected in 1791 a Supplemental Associate by the desire of the king, being under the age (24) fixed by the laws of the institution. No other case of the kind has occurred. On the death of Sir J. Reynolds the next year he was made painter to the king. His reputation grew steadily, and he was soon considered the first portrait-painter of the age in England. His scene from the 'Tempest' was a successful attempt at historical painting. In 1794 he was made a Royal Academician. In 1815 he was knighted by the Prince Regent, who also employed him to take the likenesses of the allied sovereigns and the most distinguished persons of their suite. During their visit to England he finished the portrait of the King of Prussia, and went to Aix-la-Chapelle several years afterward to paint the Emperor Alexander; thence he went to Vienna, where he completed the portraits of the emperor, the archdukes, Metternich, etc., and in Rome painted Pius VII. and Cardinal Gonsalvi. These portraits are now in the Waterloo Gallery at Windsor, and are of great historical value. On his return to England he was elected president of the Royal Academy, as successor to West. This office he held till his death. His portraits are striking likenesses, and display a bold and free pencil; but they are, particularly his later ones, chargeable with mannerism, and are not considered to be successful in expressing the nicer shades of character. His income for the last 20 years of his life was very large, but he died poor, owing to the lavishness with which he spent money in acquiring the first-rate productions of his art, in assisting less fortunate artists, and in other ways. His valuable and unrivaled collection of drawings by the old masters was unfortunately dispersed after his death.

Lawrence, Sir William, an eminent surgeon and anatomist: b. Cirencester 16 July 1783; d. 5 July 1867. He received his early education at a private school, and in 1799 was apprenticed to the celebrated Abernethy, and was an inmate of his house for five years. In the third year of his apprenticeship he had given such proofs of his zeal and capacity that Abernethy appointed him demonstrator in anatomy at Saint Bartholomew's, and for 12 years he discharged the duties of his office with signal ability. In 1824 he became principal surgeon to Saint Bartholomew's Hospital, the office of surgeon to which he had filled from 1813. Within two years from this date he had discharged successively the duties of surgeon to the Eye Infirmary in Moorfields, and surgeon to the Royal Hospitals of Bridewell and Bethlehem. In 1816 he published an 'Introduction to Comparative Anatomy and Physiology,' and in 1819, 'Lectures on the Physiology, Zoology, and Natural History of Man,' which provoked the hostile criticism of theologians. In 1829 he succeeded Abernethy as lecturer on surgery to Saint Bartholomew's, and altogether he was connected with this hospital 65 years. Shortly before his death he was made a baronet. Few men of his time did more than he for the advancement of surgery. His treatise on 'Hernia' was a standard work, and that on 'Diseases of the Eye' (1833) marks an epoch in ophthalmic surgery. His lectures on surgery were published in 1863. He was twice president of

LAWRENCE

the Royal College of Surgeons, and on two occasions he delivered the Hunterian oration.

Lawrence, William, American politician; b. Mount Pleasant, Ohio, 29 June 1819; d. 8 May 1899. He was graduated at Franklin College (1838) and at the Cincinnati Law School (1840). He early became prominent in politics, and from 1845 to 1847 owned and conducted the 'Logan County Gazette,' and was afterward editor of the 'Western Law Journal.' He served in the lower house of the State legislature, and for five years as State senator, and from 1857 to 1864 was judge of the court of common pleas, and of the district court. After seeing some military service (1862), he was elected to Congress in 1865, and in 1880 appointed first Comptroller of the United States Treasury, from which office he retired in 1885. He has published several books on law, notably, 'The Law of Claims against the Government' (1875); and 'The Treaty Question' (1871).

Lawrence, William, American Protestant Episcopal bishop; b. Boston 30 May 1850. He was graduated at Harvard in 1871, and at the Episcopal Theological School, Cambridge, Mass., in 1875; was rector of Grace Church, Lawrence, Mass., 1876-84; professor of homiletics and pastoral theology at the Theological School above named, 1884-93; dean of the school, 1888-93. He was university preacher at Harvard, 1888-91. In October 1893 he was elected bishop of Massachusetts, to succeed Bishop Brooks, and was consecrated to that office, which he continues to hold, in the following year. He has published a 'Life of Amos A. Lawrence,' his father (1889); 'Visions and Service' (1896); 'Life of Roger Wolcott,' and other works.

Laurence, William Beach, American jurist; b. New York 23 Oct. 1800; d. there 26 March 1881. He was graduated at Columbia College in 1818, and after his admission to the bar in 1823 he practised in New York, where he attained eminence. He removed to Newport, R. I., in 1850; was elected lieutenant-governor of Rhode Island in 1851, and soon after became acting governor. He became widely known by reason of his connection with the "Circassian case" in 1873, before the American and British International Court in Washington, D. C., his arguments securing the case for his clients and leading to the only reversal of a decision by the United States Supreme Court that had ever occurred. He published 'History of the Negotiations in Reference to the Eastern and Northeastern Boundaries of the United States' (1841); 'Belligerent and Sovereign Rights as Regards Neutrals During the War of Secession' (1873); 'Disabilities of American Women Married Abroad' (1871); 'Administration of Equity Jurisprudence' (1874); etc.

Lawrence, Kan., city and county-seat of Douglas County, on both sides of the Kansas River, and on the Atchison, T. & S. Fe and the Union Pacific R.R.'s; 40 miles west of Kansas City. It is the farming trade centre for Douglas and parts of two other counties; and is principally engaged in manufacturing, which is greatly promoted by the excellent water power furnished by the river. It is the seat of the Kansas State University, Haskell Institute, and Government Indian Industrial School; contains a hospital, public library, and several public parks;

and has flour and paper mills, barbed-wire, ice, shirt, sash and door factories, and foundry and machine shops. There are electric light plants, waterworks, several National and State banks, daily, weekly and monthly periodicals, and an assessed property valuation of over \$1,000,000. The city was settled by an anti-slavery colony from the East in 1854 and was named in honor of Amos A. Lawrence. It was the first of the Kansas Free-State towns founded by the Emigrant Aid Society, soon after the passage of the Kansas-Nebraska Bill (q.v.). In 1856 a band of Missouri border ruffians sacked the town, which was defended by old John Brown (q.v.) and his sons. In 1863, the Confederate raider Quantrell attacked the town and killed 125 citizens. Pop. (1890) 9,900; (1900) 10,862.

Lawrence, Mass., city, and one of the county-seats of Essex County, on both sides of the Merrimac River, and on the Boston & Maine railroad, 26 miles northwest of Boston. It is one of the notable and leading manufacturing cities in the valley of Merrimac River, a stream fed mainly by the network of small rivers, brooks and storage lakes, rising in or lying at high levels, among the mountains and highlands of New Hampshire. Built at the lowermost available rapid upon the river, the city has the concentrated power of all the tributaries of that stream and receives benefit from the entire watershed feeding the main current—an area of 4,450 square miles. The water power developed at this point, amounting to about 15,000 horse-power, is remarkably uniform and reliable.

Water Power Plant.—In 1845-8 the "Great Stone Dam," located at Bodwell's Falls, near the old historic "Andover Bridge," was built of hammered granite. When finished this structure was considered the most complete and durable work of the kind then existing in America. It was bedded upon the underlying strata of blue stone or Merrimac schist, and was so thoroughly constructed that it has stood to this day without alteration or addition, seemingly a part of the ledges between and upon which it was built. This dam concentrated at one point, the power of three successive natural river rapids, the accomplished result being a fall of 26 feet, increased in height, when needful, by flashboards, to 30 feet. The overfall of water is in one unbroken sheet over a crest, nearly straight in line, 900 feet in length between the granite abutments. In addition to this unbroken span of solid stonework the protecting wings of the dam are 729 feet in combined length. There are two main canals, one along the northern bank of the river, one mile in length, and another upon the southern side, one half mile long; these distribute water power to the large mills and workshops. Steam power is also used in addition, by nearly all manufacturers, and, in some instances, it is exclusively relied upon.

Manufacturing and Business.—Lawrence may well be known to Americans as "The Worsted City," for the United States census of 1900 shows that, in the production of worsted and woolen dress goods, Lawrence leads in New England: the sum invested in that distinct business being \$29,854,901, and the value of goods produced annually \$25,584,744. Compared with the producing centres of the entire country, Lawrence leads in the amount of capital invested in any one locality in the worsted and

LAWRENCE

woolen dress goods industry, and in the value of that class of goods produced it is exceeded only by Philadelphia. It has been estimated by experts that the wool clip from about 12,000,000 sheep is used annually in the worsted and woolen mills of the city. Among wool growers and dealers of the world, the city is known as a leading consumer of that staple.

The three great manufacturing companies that lead in importance are Pacific Mills, having 5,600 people engaged in producing calicoes, lawns, delaines, serges, and other worsted dress goods, the American Woolen Company's Washington Mills, employing over 6,500 operatives in the making of worsted and woolen goods for men's wear, and Arlington Mills with nearly 5,000 people employed in the manufacture of ladies' worsted dress goods, worsted yarns, mercerized cotton yarns and "Worsted Tops" as specialties. The many other concerns producing textile fabrics are thriving and important. The making of book, news, cartridge and calendered papers is an established industry of much importance, and paper mill machinery is constructed on quite an extensive scale by enterprising companies and firms. The making of shoes is carried on to a limited extent.

Site and Environment.—The site was peculiarly adapted in its character and surrounding to the building up of an important industrial centre. The small Spicket River here enters the Merrimac from the north and the winding, shaded Shawsheen stream enters from the south. The location is healthful—a rolling plain flanked by low protecting hills. The topography of the site favored economical development. The rapid Merrimac River divides the city into nearly equal sections; the northern half has come to most importance and has the largest population and most important industrial establishments. The city was laid out in 1845-6 by the founders and promoters, and has been built largely in accordance with original plans. The principal streets make a slight angle at a turn in the river and are arranged to intersect with great regularity.

Public Works and Buildings.—The public works were liberally planned and thoroughly built. The waterworks, established in 1874-5, were so ample, in all the main features of the system adopted, that extensions have not made it necessary to reconstruct the pumping plant or the storage reservoirs. The source of water supply is the Merrimac River. The filtration beds that cleanse the current before it is distributed for use, were designed by an eminent sanitary engineer and constructed, in 1892, under the care and approval of the Massachusetts State Board of Health. The system was successful and has attracted the attention of the scientific in our own and foreign countries. Similar or modified plans have since been extensively adopted elsewhere. The experimental station of the Massachusetts State Board of Health, where important experiments in sanitation are constantly tried and tested by experts, is established here. Illuminating and heating gas and electric lighting and power are supplied by a single chartered company that well serves the public needs. The new court-house, erected in 1903, costing about \$250,000, is architecturally beautiful in design and commodious and complete in furnishing and outfit. A new post-office or United States government build-

ing, costing \$150,000, is in process of erection. No more commodious school buildings can be found in any city of the same population and class. The old city hall—the original "Town House," served, for a quarter century, almost every conceivable public use and is still a noticeable structure, answering the purpose for which it was erected.

Parks and Pleasure Grounds.—The founders of the city wisely reserved a common, of 17 acres, at the very centre of the business and residence section, as a public pleasure ground. No buildings are allowed upon this central park and no public reserve in the commonwealth is more nobly wooded or more truly the people's ground. About this central park the largest public buildings, the leading Protestant churches and many of the best residences are grouped. Four large outlying parks, in a nearly wild condition, but of much natural beauty, and several smaller squares are well cared for by an established park commission of five members. A playstead of several acres, exclusively for games and athletic exhibitions, is conveniently located.

Banks and Savings Institutions.—Five national banks have become established and are of undoubted stability. The three savings banks have deposits amounting to \$15,000,000, largely the savings of working people.

Churches and Charities.—There are 40 organized churches in the community, the Roman Catholics having much greater numbers and larger value in property than any one denomination and nearly equaling the other sects combined. There is an organized city mission. A General Emergency Hospital and Children's Home are maintained by the Ladies' Union Charitable Society, a Protectory or Asylum for orphans or destitute children, an endowed Home for Aged People, and every nationality in the community has its own relief, benefit, or social societies.

Government, Schools, Free Libraries and Lectures.—Municipal control is in the hands of a mayor, six aldermen, and 18 councilmen, all elected annually. The number of wards (six) and the number of government members has not changed since the first acceptance of the original charter. There are 30 organized public schools, the high school having 700 pupils housed in a new, elegant and commodious building recently erected at a cost of \$250,000. The lower grades are accommodated in houses of modern construction and furnishing. Evening schools are maintained as a part of the public school system and give to workers of every age and nationality a chance to advance in classical or English studies and also give special instruction in penmanship, mechanical and freehand drawing, bookkeeping and the natural sciences. A free course of lectures especially for industrial classes, upon scientific and miscellaneous subjects, has for many years been sustained by endowment. The free public library of over 50,000 volumes is patronized by all classes. The main library building was the gift of a generous citizen.

History.—Previous to 1845 the territory now included within city limits (about seven square miles lying in form nearly a square) was an unimportant section of two old, historic towns—Andover and Methuen. The inhabitants of the site numbered only about 350 souls and were nearly all the families of quiet farmers or river-

LAWRENCE—LAWSON

men; there was not a church building, warehouse for trade, or manufacturing establishment of any importance then standing in the entire district. In 1845-6 an associated company of manufacturers, financiers and merchants, the leading pioneer manufacturers and progressive business men of prominence in Massachusetts, after critical examination becoming satisfied regarding the rare value of the water power and, recognizing the peculiar fitness of the site for a manufacturing city, associated themselves together and procured an act of incorporation under the name of the Essex Company, chartered for the purpose of developing and controlling the water power and establishing factories and workshops at or near the site they selected. This company purchased lands covering nearly half the area of the contemplated town and secured land or flowage rights for several miles above the site chosen for the projected city. These associated founders and promoters decided to locate at the lowermost of three successive Merrimac River rapids below Lowell, at the confluence of the Merrimac, Spicket and Shawsheen rivers. Promoted, as the Lawrence building and manufacturing enterprise was, at the outset, by responsible and powerful sponsors, the "New City," as it was at first called, rapidly developed and became almost at the beginning important as an industrial centre. In less than two years from the commencement of operations in 1845, the settlement was organized as a separate town, taking the name of Lawrence in honor of the eminent merchant manufacturers of that name who were so deeply interested in establishing the town and city.

The city has had its calamities. Its industrial enterprises survived the financial reverses of 1857-8-9, only because of powerful support given by loyal defenders and business leaders. This time of trial was succeeded by the gloom attendant upon the "Fall of Pemberton Mill," 10 Jan. 1860, an occurrence that enlisted the interest and sympathy of the entire country. In the War of the Rebellion the city's volunteers were among the first to respond to the call for troops and were among the first to engage in conflict. A citizen, Sumner H. Needham, was the first martyr to fall in the ranks of the patriot soldiery in April 1861.

Local Characteristics.—The cosmopolitan character of the population is particularly noticeable. Forty-five per cent of the people were born in foreign lands and only about 25 per cent of the number are of full native parentage. The greatest immigration has been from Ireland, the British Isles, Germany, Canada, and considerable numbers from every nation of continental Europe and from some Oriental countries. Pop. (1900) 62,559; (1904 est.) 68,000.

ROBERT H. TEWKSBURY,
President of the Lawrence Savings Bank.

Lawrence, The, Commodore Oliver Hazard Perry's flagship at the Battle of Lake Erie in the War of 1812.

Lawrence, Saint, Gulf of. See SAINT LAWRENCE GULF.

Lawrence Scientific School, The, a part of Harvard University, Cambridge, Mass.; founded by Abbott Lawrence in 1847. The primary object of the institution was to afford an opportunity for special study and training in science

which the then existing foundations and departments of the university did not offer. Not the least of the important benefits it conferred during the earlier years of its existence was the bringing of Prof. Louis Agassiz into close relations with the university, a special chair of zoology and geology in the scientific school having been created for him by Mr. Lawrence in 1848. It was originally intended that the Lawrence Scientific School should be independent of Harvard College, and for many years it was so maintained, but in recent years it has gradually become merged with it until it now forms a part of the university, its government together with that of the college and the graduate school being under the faculty of arts and sciences. The courses offered include civil engineering, electrical engineering, mechanical engineering, mining and metallurgy, architecture, chemistry, geology, biology, general science, science for teachers, and anatomy and physiology. So far as possible the instruction relates rather to the principles of science than to technical work, the intention being to make the graduates ready for the apprenticeship of their professions. See HARVARD UNIVERSITY.

Lawrence University, Appleton, Wis., a Methodist Episcopal institution founded in 1847, and named in honor of its principal donor, Amos A. Lawrence, of Boston. In 1902 it had 34 professors and instructors, 600 students, 16,964 volumes in the library, and productive funds, \$205,020; grounds and buildings valued at \$210,000; benefactions, \$7,000; income, \$28,000.

Lawrenceburg, lá'rēns-bérg, Ind., city and county-seat of Dearborn County, on the Ohio River, and on the B. & O. and the C. C. C. & St. L. R.R.'s, 22 miles west of Cincinnati, Ohio. It was settled in 1817 and was first incorporated in 1847. The government is administered by a mayor, elected every four years, and by a city council, elected every two years. It has manufactures of flour, edge-tools, burial caskets, tubewell supplies, whiskey, wagons, barrels, etc. Pop. (1890) 4,284; (1900) 4,326.

Lawrenceville (lá'rēns vil) **School, The**, an American college preparatory school at Lawrenceville, N. J., originally founded in 1810 but refounded in 1882 as an endowed school known as the "Lawrenceville School on the John C. Green Foundation," at which time the English "home system" was adopted. In scope it corresponds to such English schools as Harrow or Rugby, and now contains about 400 pupils, with some 32 masters. There are 11 master's houses, with an Upper House and the Hamill House for the boys of the upper form, managed by boards of directors appointed by the boys themselves. There are five forms, each corresponding to one year's work. In addition to the buildings already named there are a large stone chapel, a spacious building for class-room exercises called Memorial Hall, and an immense gymnasium with swimming-pool, erected in 1902. Lawrenceville itself is a small village five miles northeast from Trenton and about the same distance from Princeton, southwest.

Lawson, Cecil Gordon, English painter: b. Wellington, Shropshire, 3 Dec. 1851; d. London 10 June 1882. He exhibited at the Academy,

LAWSON — LAY

in 1870, but many of his pictures were rejected by the hanging committee till 1878, when his 'Minister's Garden' and a 'Pastoral' at the Grosvenor made him famous. He was highly esteemed by the poet-painter Rossetti, and his works are now much valued. Consult: Gosse, 'Cecil Lawson, A Memoir.'

Lawson, John, American colonial surveyor-general: d. 1712. He was of Scotch birth; began his surveys in 1700, and was an intelligent observer, enterprising and circumspect, but fell a victim to the jealousy of the natives, who confounded the surveyor of their territory with those who despoiled them of it. He was captured by them during one of his explorations when in company with De Graffenreid, a Swiss baron who contemplated colonization. The latter was permitted to buy himself free, but Lawson failed to propitiate their hostility and perished by the fire torture. He left one of the most valuable of the early histories of the Carolinas, of their feeble condition, their resources and aspects, and their principal aboriginal tribes. It is entitled 'A New Voyage to Carolina, containing the Exact Description and Natural History of that Country, together with the Present State thereof; and a Journal of a Thousand Miles Traveled through Several Nations of Indians, giving a Particular Account of their Customs, Manners, etc.' (1709). The volume is a quarto of 258 pages, well illustrated with one of the best maps of the time, and with various other engravings, chiefly in natural history. It is now rare.

Lawson, Victor Fremont, American newspaper publisher: b. Chicago 9 Sept. 1850. He was educated at Phillips Academy, Andover, Mass. He inherited from his father an interest in a printing establishment, and in 1876 bought the Chicago *Daily News*, which, with his partner, he developed successfully, starting a morning edition in 1881 under the name of the *Record*. In 1888 he bought out his partner and became sole proprietor; in 1901 the *Record* was merged with the *Times-Herald*. He has been president of the Associated Press; has also been active in philanthropic work, and started the *Daily News Fresh Air Fund*, which supports a sanitarium for sick children of the poor.

Lawson, Sir Wilfrid, English statesman: b. Cumberland, England, 4 Sept. 1839. He early came into notice as a temperance advocate. In 1859 he was elected to Parliament, and in 1864 introduced a "Bill for the legislative suppression of the liquor traffic." In 1868 he was re-elected to Parliament with Mr. Gladstone's party as member for Carlisle. His local option bill passed in 1880, 1881, and 1883. After serving in Parliament two subsequent sessions he lost his seat in 1900. He is president of the United Kingdom Temperance Alliance.

Lawson's Cypress. See CYPRESS.

Lawton, Henry Ware, American soldier: b. Manhattan, Ohio, 17 March 1843; d. San Mateo, Luzon, 19 Dec. 1899. He entered the military service as a private 16 April 1861; became captain 17 May 1862. He was mustered out 25 Nov. 1865, but entered the regular army as second lieutenant the next year; was transferred to the Fourth cavalry in 1871; and promoted to captain 20 March 1879. In 1876 he was

conspicuous in the expedition against the hostile Sioux, took part against the Ute Indians in Colorado, in October 1879, and in the spring of 1886 was selected by Gen. Miles to lead a picked body of troops into Mexico in pursuit of Geronimo. At the end of three months Geronimo and his band were captured. At the beginning of the Spanish-American War Lawton was a lieutenant-colonel, and was made a major-general of volunteers 8 July 1898. He was in command of the Second Division of the Fifth army corps before Santiago, and at the close of the war was transferred to the Philippines where he began active operations against the insurgents and after capturing Santa Cruz, a Filipino stronghold, 10 April 1899, and San Isidro, 15 May, was placed in command of Manila, 1 June. In the autumn he began an offensive campaign looking toward the capture of Aguinaldo, and was killed in the battle of San Mateo.

Lawton, Okla., city and county-seat of one of three counties formed from the Comanche reservation and added to Oklahoma Territory, 6 Aug. 1901. By the day set for opening the town site to settlers, 25,000 people were encamped close to the town limits, forming a tent frontage of 8 miles. The city is named for Gen. Henry W. Lawton (q.v.), American soldier killed in the Philippines. The entire tract added to Oklahoma is larger than the State of Connecticut and contained within three months from the opening about 50,000 inhabitants. The other county-seats are Anadarko and Hobart.

Lay, Benjamin, British-American philanthropist: b. Colchester, England, 1677; d. Abington, Pa., 1759. His parents were Quakers, and he illustrated in his life the humane principles which the Society of Friends has so long conspicuously represented. At 18 he adopted a sailor's life, and for some years followed the sea. In 1710 he was married and lived again for a while at Colchester; afterward went to Barbados, where he became a merchant; but having aroused hostility by his denunciations of slavery, removed from the island to Philadelphia, where his anti-slavery agitation was continued. Of numerous tracts which he wrote on slavery one was published by Franklin, entitled 'All Slave-Keepers, that Keep the Innocent in Bondage, Apostates.' He was influential in bringing the Friends in this country to take a more decided stand against slave-holding. He did not, however, confine his reforming endeavors to one direction, but labored for a more humane treatment of criminals, and discouraged the eating of animal food, and the using of tea and tobacco. He is described as a singular figure, dwarfish and hunchbacked, and presenting an appearance of poverty. He was buried in the Friends' burying-ground at Abington.

Lay, Henry Champlin, American Protestant Episcopal bishop: b. Richmond, Va., 6 Dec. 1823; d. Easton, Md., 17 Sept. 1885. He was graduated at the University of Virginia, ordained deacon (1846) and priest (1848). He was consecrated missionary bishop of the Southwest (1859) and translated to the diocese of Easton (1869). During the Civil War the Episcopal charge of Kansas was assigned to him, that State being then erected into a diocese. The revision of the lectionary was largely due to Bishop Lay; while he was engaged on the Standard Prayer Book up to his death.

LAY—LAZARETTO

Lay, John Louis, American inventor: b. Buffalo, N. Y., 14 Jan. 1832; d. New York April 1899. In July 1862 he was appointed second assistant engineer in the United States navy, and in 1864 invented a new torpedo. By means of this apparatus Cushing destroyed the Albemarle, a Confederate ram. When Admiral Porter advanced up the James River after the evacuation of Richmond, Lay was employed to clear away the submarine obstructions. He was engaged by the Peruvian government to mine the harbor of Callao, in view of a Spanish attack, but his main work as an engineer and inventor was the construction of the dirigible torpedo, which bears his name and was purchased by the United States Government.

Layamon, lä'yä-mön, or **Laweman**, lä'män, British chronicler. He lived early in the 13th century, and was a priest ministering at Radstone, now known as Areley Regis, on the Severn, in Worcestershire. He is the author of a metrical romance, 'The Brut,' which is mainly an amplified version of the French 'Brut d'Angleterre,' the latter being itself a compilation with additions from Geoffrey of Monmouth's 'Historia Britonum.' As history or literature its value is slight, but it is of high philological importance, and exhibits the English language in its period of transition and before it had become Gallicized, as in the 'Canterbury Tales' of Chaucer. In fact, there are not more than 90 words derived from the French in the whole poem of 56,000 lines. Consult the London Society of Antiquaries' edition of 'Brut,' edited by Sir Frederick Madden (1847).

Layard, lä'ard, Austen Henry, English traveler and archaeologist: b. Paris 5 March 1817; d. London 5 July 1894. He was of a family originally French; was partly educated in Italy; began to study law, but gave up this work and entered upon a course of travels in the East. Before he was 23 he had traveled in most of the larger European countries; in 1840 he was on the banks of the Tigris; and before the end of his career had "won distinction as a traveler, archaeologist, politician, diplomatist, and student of the fine arts." In 1845 he began the excavations in Assyria (q.v.) for which he first became celebrated. The results of his discoveries on the site of Nineveh (q.v.) were published in 1849-53. In 1849 he was appointed attaché to the British embassy at Constantinople. At first he paid his own expenses in his researches, but afterward received generous assistance from Lord Stratford de Redcliffe, then English ambassador in Constantinople; and still later £3,000 voted by the House of Commons was used by the trustees of the British Museum for continuing Layard's excavations. He received from Oxford the degree of D. C. L. In 1852 he entered Parliament as a Liberal, and became under-secretary of state for foreign affairs in 1860. He was lord rector of the University of Aberdeen, 1855-6; in 1860 was again elected to Parliament, and 1861-6 again under-secretary of state for foreign affairs; in 1868 was appointed chief commissioner of works and privy councillor; went to Spain in 1869 as British ambassador; and 1877-80 was ambassador to the Ottoman Porte. In 1878 he received the Order of the Bath, and was made a foreign member of the Institute of France in 1890. He wrote much on the history of painting, was a

leading spirit in the Arundel Society, and a trustee of the National Gallery. His writings include 'Nineveh and Its Remains' (1849); 'Nineveh and Babylon' (1853); 'Monuments of Nineveh' (1849-53); 'Inscriptions in the Cuneiform Character from the Assyrian Monuments' (1851); 'Early Adventures in Persia, Susiana, and Babylon' (1887, 1894). Consult his 'Autobiography' (1902).

Laycock, lä'kôk, Thomas, English physiologist: b. Wetherby, Yorkshire, England, 10 Aug. 1812; d. Edinburgh, Scotland, 21 Sept. 1876. He was the earliest to put forth the theory of the reflex action of the brain. This was in 1844, and in 1855 he became professor of the practice of physic and of clinical medicine at Edinburgh University. He published 'Mind and Brain' (1860); 'Methods of Medical Observation'; etc., and wrote many professional papers on sanitary science, insanity, etc.

Lay'ering, in horticulture, is a mode of propagating plants by bending down a young branch and covering part of it with earth, thus causing it to shoot forth roots before it is separated from the parent stalk. The portion covered with soil has often a notch cut in it below, or a tight ligature is applied. The free return of the sap is thus prevented, and the formation of roots from buds is promoted. The time which must elapse between the cutting or binding of the shoot and its separation from the parent plant varies greatly, a few months sufficing in some cases, while two years are requisite in others. This mode of propagation is employed for pinks, hortensias, heaths, gooseberries, etc.

Laynez, lä'näth, or Lainez, Diego, dë-ä'gö, second general of the Jesuits: b. Almancio, near Siguenza, Castile; d. Rome 19 Jan. 1565. He studied in Alcalá and Paris, in which latter town he joined with Ignatius Loyola in founding the order of Jesuits. His especial work was to travel over Europe to gather new members, and spread the influence of the order, when the constitution of the order had been confirmed and approved by Pope Paul III. 1540. He was very successful in extending the Society of Jesus. He was a man of marked ability and as a consulting theologian took a conspicuous part in the Council of Trent. He had succeeded Loyola as general of the Jesuits in 1556. On the death of Paul IV. he avoided the chance of election to the tiara, and refused a cardinal's hat. Consult Boero, 'Vie du P. Jacques Lainéz' (1894).

Lazaret'to, a name given in Italy, and other parts of southern Europe, and also in Hawaii and in California, to isolated hospitals for such as are afflicted with contagious disorders. The name is derived from Saint Lazarus, who is the patron saint of lepers; and during the Middle Ages, when leprosy was common in Italy and other parts, the hospitals in which the lepers were confined received that name, and the lepers themselves were called lazzari. Howard wrote 'An Account of the Principal Lazarettos in Europe' (1789). Those buildings and enclosures attaching to seaport towns chiefly on the Mediterranean, where the crews and passengers of ships from places where contagious disease is known to prevail, are also called lazarettos. These lazarettos consist generally of various detached buildings, with courts between, the whole being surrounded by a wall, and

LAZARISTS—LAZULI FINCH

placed in an airy situation outside the town, or sometimes on a small island near the coast. See also QUARANTINE.

Laz'arists, or Fathers of St. Lazarus, a congregation of the Roman Catholic Church, originally known as "Priests of the Mission," founded at Paris by St. Vincent de Paul in 1625 for the purpose of supporting missions and ministering to the spiritual wants of the poor at home, and in foreign parts, especially Barbary. The foundation was confirmed by letters-patent of Louis XIII., May 1627, and the missionaries were erected into a congregation by Pope Urban VIII. in 1631. At the time of the Revolution they included 1,195 members and 63 houses. In 1817 they established themselves in the United States.

Lazarus, láz'a-rüs, Emma, American poet: b. New York 22 July 1849; d. there 19 Nov. 1887. Trained at home under the personal direction of her father, Moses Lazarus, a New York merchant of prominence in the social and business world, she early displayed intellectual promise. From her childhood books were her most precious possession and her mind was turned to poetry for its utterance—the Civil War inspiring her first lyric outbursts. Her earliest productions, 'Poems and Translations' (1867), were marked by a seriousness if not sombreness, incomprehensible in one so young, whose life, too, was full of happy anticipations. In her second volume, four years later, there was more artistic completeness, and a certain consciousness of power gave more strength to her verse. Her 'Admetus and Other Poems' (1871) was favorably received, and its classic atmosphere showed distinct talent, while, side by side with its imaginings in 'Admetus' and 'Tannhäuser' were its flashes of personal experience in 'Epochs' and the musical rhapsodies in 'Phantasies.' In 1874 her love for German literature was evidenced in her 'Alide,' a story of Goethe's Sessenheim period, so far as its background is concerned, wherein she has admirably incorporated whole passages from the 'Autobiography' to give naturalness to the episode. It is a charming romance, which won high praise from Tourgeneffs as the work of one who "is not a pupil in art any more" and "is not far from being a master." Her next book printed for private circulation, 'The Spagnoletto' (1876), a five-act tragedy of the 17th century, was remarkable at least for the new note in treatment, its stormy sweep of passion, so unlike the calm, reflective emotion of her precious poems. It was in 1878, when she was giving the finishing touches to translations from Heine, that a new theme was suggested to her—the translation into English of representative Jewish poets of the Spanish school. With enthusiasm she responded to the appeal, and, desiring to reproduce the spirit of the original, studied Hebrew with rare diligence and soon grew independent of German paraphrase. The ease with which she mastered the mediæval Jewish poets and the interest she displayed in Jewish history were preparations for a more important work. A little volume was shown her—"Der Tanz zum Tode" by Reinhard, based on historical data furnished by Franz Delitzsch, as a more elaborate treatment. Her 'The Dance to Death' was the result, for which she was un-

able to find a publisher until it was issued as a serial in a Jewish weekly, and appeared about the time of the Russian Jewish persecution of 1882, although it was written without any reference to those outbreaks. In the American movement to aid the refugees, she took a helpful part. She wrote in 'The Century' (May 1882) an impassioned article, 'Russian Christianity versus Modern Judaism,' wherein she championed her brethren and reputed their critics and assailants. In prose and verse she further strove to vindicate her ancestral creed and inspire its followers to brotherhood and useful activity. In 'The Century' for February 1883 she pleaded for "a restored and independent nationality and repatriation in Palestine." After her father's death in March 1885 her own health failed slowly and the end came in November 1887, just at the time when her powers were ripest and her opportunities seemed at their greatest. In addition to the volumes already named she published 'Poems of Heinrich Heine' (1881); 'Songs of a Semite'; 'The Dance to Death, and Other Poems' (1882). Her collected poems were issued in two volumes in 1889.

A. S. ISAACS,
New York University.

Lazarus, Jacob H., American painter: b. New York 4 Oct. 1822; d. there 11 Jan. 1891. Displaying early in life marked artistic taste, before his manhood he became a pupil of Henry Inman (q.v.), but soon established a studio of his own, and for nearly 50 years was a successful artist. In addition to his ability as portrait painter, he was an admirable critic of art in general. He painted the portraits of many eminent men of his time, among them those of Governors Sewell, Hubbard, English, and Walcott, of Connecticut; Governor Hoffman, of New York; John Van Buren, for the Manhattan Club; Gen. Schuyler, for the city of Philadelphia; Maj.-Gen. Halleck; Dr. Fordyce Barker, for the Academy of Medicine; John Amory Lowell and members of his family, for Harvard University; and the Rev. James Freeman Clarke. A scholarship bearing his name was given to the Metropolitan Museum of Art by his widow and daughter, supported by an endowment fund of \$24,000, the interest of which is awarded annually to the most proficient male pupil in the class of painting organized by the art school of the museum.

Laz'enby, William Paul, American scientific agriculturist: b. Bellona, N. Y., 5 Dec. 1852. He was graduated in agriculture at Cornell (1874) and elected teacher of botany, horticulture and forestry in that institution. He later was appointed on the staff of Ohio State University and for six years held the position of director of the Ohio Agricultural Experiment Station. He belongs to many scientific and agricultural societies, and has done much good service in lecturing before farmers' institutes and other associations. He is at present professor of horticulture and forestry in the Ohio State University, and secretary of the Ohio Medical University.

Laz'uli Finch, a small brilliantly blue finch (*Cyanospiza amara*) of the Western States, frequently kept as a cage-bird. It is much like its relative, the eastern indigo-bird (q.v.).

LAZULITE—LEAD

Laz'ulite, a mineral, which is not to be confused with lapis lazuli (q.v.), is found in Austria, Switzerland, Sweden, Brazil, and in North Carolina and Georgia. It occurs massive, and also well crystallized in monoclinic crystals of steep-pyramidal habit. It has a fine blue color and vitreous lustre, and is semi-translucent. It is moderately hard, but brittle; specific gravity, 3.1. It is a hydrated phosphate of aluminium, iron, and magnesium, but it also contains lime, and sometimes silica.

Lea, lē, Henry Charles, American author: b. Philadelphia 19 Sept. 1825. He entered his father's publishing house in 1843; became its head in 1865; and retired from business in 1880. He has actively engaged in public undertakings for civil and social advancement, and during the Civil War rendered conspicuous services in support of the Federal government. Between 1840 and 1860 he wrote many papers on chemistry and conchology, and after 1857 devoted his attention to European mediæval history. His chief works are: 'Superstition and Force' (1866); 'An Historical Sketch of Sacerdotal Celibacy in the Christian Church' (1867); 'A History of the Inquisition of the Middle Ages' (1888); 'Chapters from the Religious History of Spain' (1890); 'Formulary of the Papal Penitentiary in the Thirteenth Century' (1892); 'A History of Auricular Confession and Indulgences in the Latin Church' (1896); 'The Moriscos of Spain: Their Conversion and Expulsion' (1901). He was a son of Isaac Lea (q.v.).

Lea, Isaac, American naturalist: b. Wilmington, Del., 4 March 1792; d. Philadelphia 7 Dec. 1886. In early life he engaged in commercial pursuits, and from 1821 to 1851 was partner in a large publishing business; but from boyhood he was devoted to the study of natural history, and his various collections of minerals and fossils, and especially of shells, were valuable contributions to science. He was a member of the Academy of Natural Sciences of Philadelphia, and of the Philosophical Society of the same city, in whose 'Transactions' many of his observations were published; he was also elected to membership in learned societies abroad. His work in the study of fresh-water and land mollusks brought him special distinction. His principal publications are: 'Observations on the Genus *Unio*' (1827-33); 'Synopsis of the Family of Naiads' (1852-70). In the National Museum at Washington his vast collection of *Unionidae* and his gem collections are deposited. Consult: Scudder, 'Bulletin U. S. National Museum,' No. 23 (Washington). An account of Lea's work in conchology was published at Philadelphia in 1861 by G. W. Tryon, Jr.

Lea, Matthew Carey, American chemist: b. Philadelphia 1823; d. there 15 March 1897. His work in developing the chemistry of photography has served important purposes. Besides many articles treating of the chemical action of light, his publications include an authoritative 'Manual of Photography.' He was the eldest son of Isaac Lea (q.v.).

Lea'cock, Hamble James, American missionary: b. Cluff's Bay, Barbados, 14 Feb. 1795; d. Sierra Leone, Africa, 20 Aug. 1856. He was

educated at Codrington College, Barbados, took deacon's orders in 1826, and became assistant priest of St. John's parish, where he aroused great opposition by freeing his own slaves and offering to all slaves within the parish the privileges of the Church. Subsequently he was stationed at St. Vincent, and was pastor of St. George's, Charlestown, Nevis, whence he removed in 1835 to Lexington, Ky. From 1836 he held various pastorates, in 1848-55 was again in Barbados, and in 1855 went to Africa as the first volunteer of the West Indian Church Association for the furtherance of the Gospel in West Africa. He developed a large mission field at Rio Pongas, Sierra Leone. Consult the biography by Caswall (1857).

Lead, lēd, S. Dak., city in Lawrence County; on the Chicago & Northwestern and the Burlington & Missouri River R.R.'s; about 18 miles from the western boundary of the State. It was settled in 1876 and incorporated in 1877. It is situated in the Black Hills in a gold mining region. The chief industries are connected with mining, the manufacturing of mining tools and the outfits for mining camps. Some of the largest mines in the vicinity are the Homestake Gold Mining Company, which employs about 5,000 men; the Hidden Fortune Gold Mining Company, employing about 500; and in several other mines about 5,000 more miners are employed. The modern methods of mining have made the Black Hills (1903) the third largest gold producing region in the world, and Lead receives its share of the industrial plants connected with preparing the ore for market. The educational institutions are the public and parish schools, Black Hills Business College, the Hearst Free Kindergarten, and the Hearst Free Library. The Lead Coliseum and several churches are among the prominent buildings. The combined capital of the banks (1903) is \$50,000; and the value of the business transacted annually is about \$17,000,000. The government is vested in a mayor and a council of 10 members, two from each ward. Pop. (1890) 2,581; (1900) 6,210; (1903) 11,000.

JOSEPH FEEENEY,
Secretary Commercial Club.

Lead, one of the useful metallic elements, well known in chemistry and in the arts. From early times references to it are found in literature. It is mentioned in Exodus xv. 10, Numbers xxxi. 22, Job xix. 24, and Ezekiel xxvii. 12, and is supposed to have been imported into Palestine from Tyre, although it should be remembered that there are lead mines in Sinai and the Lebanon, as well as in Egypt. Articles made of lead by the ancient Romans, such as water-pipes, water-tanks, weights, rings, and small ornamental cylinders, are still preserved. Examples in the grounds of old churches show that the Roman method of making pipes from sheet-lead continued in use till late in the Middle Ages. Small lead-weights of curious forms have been found among Viking remains dating as early as the 10th century. Many of the European countries are known to have produced lead as early as from the 10th to the 14th century. The important lead mines of the world are in Europe and the United States.

Chemical Properties.—Lead (chemical symbol Pb, from the Latin name of the element, *plumbum*, atomic weight about 207), is a soft

LEAD

metal of a bluish-white color, tending to gray, with a bright metallic lustre when newly cut or melted. It soon tarnishes when exposed to the air, taking on a thin film supposed to be suboxide. But lead suffers less than most metals either from atmospheric agencies or damp soils. It can be scratched with the nail, and easily cut, and makes a mark upon paper. Its specific gravity varies from 11.352 in the ingot to 11.365 when rolled into sheets, and it melts at about 619° F. (326° C.). It is highly malleable and in a less degree ductile, but its tenacity is small—a wire 1-12th of an inch being unable to carry a load of 20 pounds. Lead is not a good conductor of heat or electricity. When gently heated it can be forced by pressure through perforations, and pipes. Water containing carbonic acid has a slight action on lead, carbonate being formed and dissolved, but this action is apparently hindered by the presence of some salts and accelerated by others. When lead is heated to redness in air it is oxidized, litharge (PbO) being formed. Lead is attacked by nitric acid and by hot strong sulphuric acid, but dilute sulphuric or hydrochloric acids have but little action. It is therefore largely used for the construction of sulphuric acid chambers and for chemical works plants. It alloys readily with many metals.
